

Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

SUMMARY

Our monthly supplement on "Electrical Engineering in Mines" is included in this issue, and opens with a practical illustrated article by Mr. J. P. Simpson on cables in shafts and main haulage ways, in which the author favours the use of armoured rather than lead-covered cables, and describes a system of supporting cables in shafts. An illustrated description of the electrical equipment of an ironstone mine, including some specially designed haulage controllers, follows, and a further illustrated article describes a three-phase winding plant in South Wales. An electric pumping plant in a New Zealand mine is also described, and other articles deal with the general question of electrical working in mines, a new electric safety lamp, and some electric mining plant seen at a visit to a well-known works. A summary is also given of electric mining patents published in December.

The electrodes of the Foster multiple-carbon flame arc lamp consist of from two to four cored carbons moulded together, and the arc burns from one pair of cores at a time, changing carbons as they are burned down. Striking and feeding is effected by a brake mechanism without any clockwork. Neither electrode is swung for striking, as owing to the wide angle at which the carbons are placed, a simple lift of the brake mechanism suffices. With a four-carbon electrode, 24 in. long, from 40 to 50 burning hours are obtained. (Page 3.)

The fourth and final report of the Royal Commission on Canals deals with the question of electric haulage on canals, chiefly from the point of view of organisation. No definite expression of opinion is given upon the subject, although the opinions of Continental and American engineers in favour are recorded. The appointment of an Inland Waterways Board is recommended, and among the duties of this body is the decision under what conditions electric haulage may be introduced. (Page 4.)

Mr. Buxton, the Postmaster-General, has stated that during the last four years only about 3,250 telephones had been purchased abroad by the Post Office. Since September, 1909, he had not given a single order to any foreign firm for telephone work. (Page 4.)

In August, 1908, the Siemens & Halske Akt.-Ges. applied for a patent to cover a process for manufacturing a ductile alloy of tungsten and nickel from which filaments could be drawn and the nickel afterwards removed by heating. Opposition was entered to the grant of this patent by the British Thomson-Houston Co., who alleged that a patent granted in 1907 to W.

Digitized by Google

C. Arsem and assigned to them, was a master patent covering all processes of forming filaments by first mixing tungsten with a softer metal to form a ductile alloy from which the foreign metal can be afterwards extracted. The Acting Comptroller-General decided in favour of the British Thomson-Houston Co., but allowed the grant of the patent with certain amendments to the specification, including a reference to the Arsem patent. The Siemens & Halske A.-G. have appealed against this decision, however. (Page 5.)

REVIEWS appear of the Proceedings of the 32nd Convention of the National Electric Light Association, and several annual pocket-books and works of reference. (Page 6.)

WE have received a letter from Mr. C. Vicarino relating to the train-lighting system recently introduced into this country by the Tudor Accumulator Co. (Page 6.)

THE coroner's inquiry into the cause of the Clapham fire resulted in a verdict that it was due to the breaking of an electric lamp, which set fire to cotton wool and celluloid combs in the window. The verdict contained a warning against the dangers of such methods of window dressing. Evidence was given by Mr. S. G. C. Russell as to experiments which he had carried out, the result of which was to set fire to cotton wool and celluloid when a Tantalum lamp was broken and the pieces of filament allowed to fall. (Page 7.)

A NEW suction cleaner comprises a small centrifual blower which draws the dust up through a fan-shaped nozzle, and delivers it into a cloth bag. The latter allows the air to escape, but retains the dust. Nozzle, blower and motor are mounted together at the end of a pole. The apparatus takes only 100 watts. (Page 8.)

THE Dublin Corporation have decided to increase their electric lighting charges by 10 per cent. for a period of twelve months, owing to the loss which is at present involved upon the undertaking.—Liverpool Corporation are advised to give a trial to the Norwich system of charging for electricity.—Reductions in the charges for electricity supply are being made in Shoreditch.—The Aberdeen Corporation are taking steps to enforce Mr. Patchell's award concerning the supply of electrical energy to the local tramway company.—Owing to the inability of the Uxbridge and District Electric Supply Co. to work their undertaking profitably, the debenture holders propose taking charge of it. (Page 10.)

THE Belfast Tramways and Electricity Committee require water-tube boilers, superheaters, mechanical stokers, &c.—Stepney Borough Council require a turbo-generator, together with boilers, converting plant and switchgear.—Submarine cable is required by the Australian Postmaster-General. (Page 10.)

WE give details of the electrical bills which have been deposited for the next session of Parliament. An important proposal is the amalgamation of the Baker Street and Waterloo, Charing Cross, Euston and Hampstead, and the Great Northern, Piccadilly and Brompton Railway Companies, under the title of the London Electric Railways Co. The Yorkshire Electric Power Co. seek powers to invest capital in industrial undertakings purchasing electricity from the company, and several municipalities seek electric wiring powers. (Page 13.)

AMONG the specifications published by the Patent Office on Thursday last were two by A. F. Berry for methods of controlling the temperature of hot-plates supplied from auto-transformers. In one arrangement, the low-pressure heating winding is connected to different tappings off the transformer winding, and in the other, the heating winding is divided into parts which can be connected to the transformer separately or in series or parallel. A method of preventing the steel-tape armouring of cables from slipping and exposing the insulation is covered by E. A. Claremont and J. Stratton. C. H. Weber has a specification describing a process for manufacturing metal filaments which consists in first mixing the tungsten powder with pyridine or quinoline. In spite of opposition, a patent has been granted to J. Howden & Co., covering the automatic admittance of live steam into the low-pressure reservoir of an exhaust steam plant when the supply of exhaust steam fails. Opposition has been entered to a patent by A. Sang for a process for depositing metal on wires, &c., by heating the wire electrically in a powder of the metal or an oxide. A patent by J. G. Merryweather for a high-speed pump expires next Thursday, after the full life of fourteen years. (Page 16.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 6TH.

Royal Institution.

3 p.m. Juvenile Lecture V., "Electric Oscillations," by W. Duddell, F.R.S.

Röntgen Society.

8.15 p.m. At 20 Hanover Square, London. Paper by Dr. W. S, Lazarus-Barlow.

FRIDAY, JANUARY 7TH.

Institution of Mechanical Engineers.

8 p.m. At Storey's Gate, St. James's Park, London. "An Account of a Visit to the Power Plant of the Ontario Power Co., at Niagara Falls," by C. W. Jordan.

Electro Harmonic Society.

8 p.m. Smoking Concert at Holborn Restaurant, London.

SATURDAY, JANUARY 8TH.

Royal Institution.

3 p.m. Juvenile Lecture VI., "Electric Lighting," by W. Duddell, F.R.S.

TUESDAY, JANUARY 11TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee Meeting at Balfour House, Finsbury Pavement, London.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "The Testing of Rubber for Electrical Work," by Prof. A. Schwartz.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. Meeting at 207 Bath Street, Glasgow.

Illuminating Engineering Society.

8 p.m. At the Royal Society of Arts. Discussion on "Glare: Its Causes and Effects," to be opened by Dr. J. H. Parsons.

WEDNESDAY, JANUARY 12TH.

Association of Engineers-in-Charge.

8 p.m. At St. Bride's Institute, Bride Lane, Fleet Street, London. "Heating and Ventilation of Public Buildings," by T. W. Aldwinckle.

THURSDAY, JANUARY 13TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. Second Kelvin Lecture, "Lord Kelvin's Work in Telegraphy and Navigation," by Prof. J. A. Ewing, F.R.S.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science.

Smoke Nuisance Prosecution.—At the Glasgow Police Court, last week, the Craigpark Electric Cable Co. were fined 10s. for allowing black smoke to issue from their chimney for twenty minutes on November 29th. Local inspectors gave evidence to the effect that the boilers used are too small for the work required of them.

Agreement between French and German Firms.—The *Manchester Guardian* reports that a working agreement has been come to between the Felten Guilleaume Lahmeyerwerke A.-G. of Mülheim-on-Rhine, and Messrs. Schneider & Co. of Le Creusot. The arrangement is said to be the outcome of several large orders which have been executed conjointly by the Schneider Co. and the Société Anonyme d'Electricité Lahmeyer, of Paris, the French branch of the German company. These include a rolling-mill plant for the Terri Iron works, and a 1,500-h.p. single-phase locomotive for the Compagnie des Chemins de Fer du Midi. The above companies have also arrangements with Messrs. Escher Wyss & Co., of Zurich, with regard to Zoelly turbines.

Digitized by Google

THE FOSTER MULTIPLE CARBON FLAME ARC LAMP

THE "Q" type flame arc lamp, which is manufactured by the Foster Arc Lamp & Engineering Co., Ltd. (Worple Road, Wimbledon, S.W.), is noteworthy chiefly on account of the special electrodes which are used. As can be seen in the sketch in Fig. 1, these comprise four hard carbons with soft impregnated cores, moulded together so as to form one solid elec-

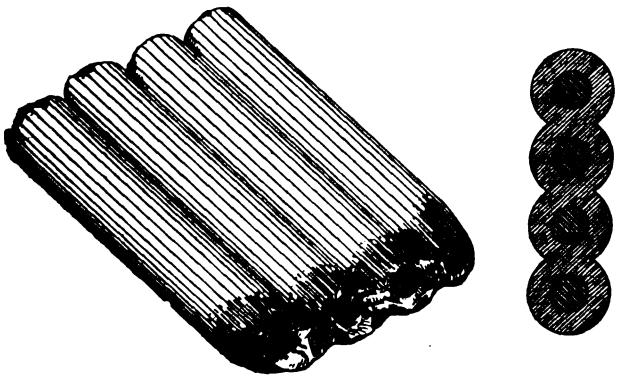

FIG. 1.—SKETCH AND SECTION OF QUADRUPLE CARBON. (Full size.)

trode. The arc burns from one pair of cores at a time only, and changes over from one pair to another as the carbons are consumed. A steady, silent burning without extinction of the arc during operation is claimed for this arrangement.

The two electrodes, which converge at an angle somewhat larger than is usual (nearly 25°), feed down by gravity, and are controlled by an improved design of brake mechanism without any clockwork. Contrary to the usual practice, both electrodes run in fixed guides, there being no swinging movement for striking and adjustment. The arc is struck by an upward movement of the electrodes in the directions of their respective axes, and the necessary separation is obtained without a large movement on account of the wide angle at which they converge. A very delicate feed and adjustment, without any possibility of overfeeding, is said to be secured by this means. A general view of the interior of the lamp is given in Fig. 2, and Fig. 3 illustrates the exterior and interior of the case, showing the ventilating arrangements.

With a four-carbon electrode, the burning hours are from 40 to 50 on one trim, according to the current taken, but 2- or 3-carbon electrodes can be used if desired. As the combined electrode offers a large section to the current, no wire core or other means of increasing the conductivity is required, and for this reason the cost of electrodes is said to be only 0·18d. per hour, or approximately 40 per cent. less than when ordinary metal-core carbons are used. The lamp is supplied for burning at 8, 10, or 12 amperes at a pressure of from 35 to 50 volts per lamp, and for both A.-C. and D.-C. circuits. There is ample space below the mechanism chamber and between the electrodes for the substitutional resistance in the case of series running, and the cut-out can also be fixed inside the lamp. A special arrangement of the globe collar at the base of the lamp ensures a good circulation of air in the globe to prevent a deposit of the fumes on the interior, which is of especial importance in long burning lamps. As the electrodes move only in the directions of their axes, they are made to fit the openings in the economiser closely, and thus prevent the fumes from reaching the mechanism. The clay economiser is supported by a copper ring fitted into a cast-iron base, to which is attached a blow-out magnet, as shown in Figs. 2 and 3.

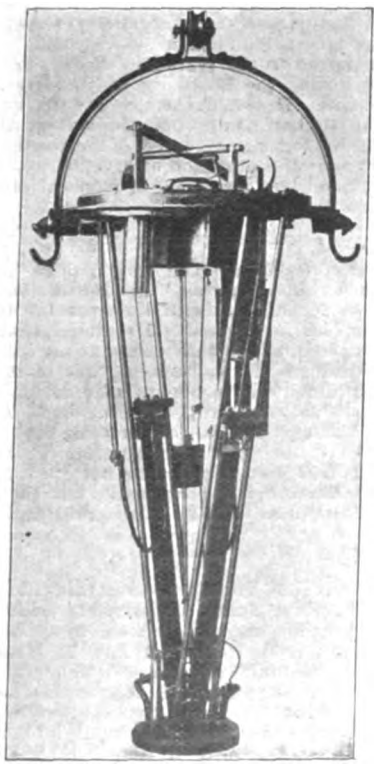

FIG. 2.—GENERAL VIEW OF MECHANISM.

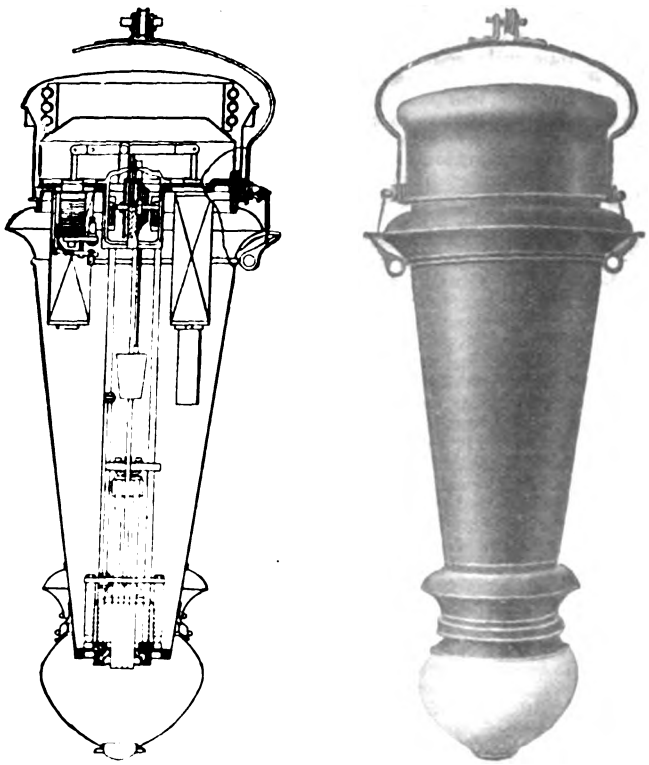

FIG. 3. SECTION AND EXTERIOR VIEW.

The brake-mechanism comprises a drum with three grooves and a scroll, all mounted on a single spindle, to which is fixed a clock spring. The chain which passes round the scroll is attached to a counter-weight sliding on a central rod, and is so arranged that it hangs from a smaller radius as the electrodes burn

Digitized by Google

away and descend. In this way the force tending to draw the carbons up is always the same whatever their length. The chains supporting the carbons are passed round two of the grooves in the drum, while the third forms the brake wheel. A steel brake-chain passes over this last, and is attached to a rocker operated by the rocking lever. This latter is controlled by the shunt and series solenoids in the usual way. Striking the arc is effected by the series coil causing the brake-chain to grip the wheel and turn it so as to lift the electrodes, and feeding is accomplished by the wheel being released so as to allow the electrodes to drop.

The whole of the mechanism is placed in the top of the lamp on a cast-iron frame with a weather-proof cover. A lamp for a quadruple section electrode weighs 44 lb. complete, and the overall length of the lamp is 3 ft. 4 in. The length of the electrodes is 24 in., and the diameter per carbon 9 mm. in the case of the 30-hour burning lamp. The lamps are supplied for three periods of burning, namely, 15 to 16, 25 to 30, and 40 to 50 hours.

ELECTRIC TRACTION ON CANALS

THE Royal Commission on Canals and Inland Navigations of the United Kingdom have just issued their fourth and final report. The Commission was appointed in August, 1906, and was presided over by the Right Hon. Lord Shuttleworth.

In our issue for February 28th, 1907 (Vol. I., p. 405), the evidence of Prof. E. W. Marchant, of Liverpool University, in relation to the use of electricity for haulage purposes on canals was given at length, and it is in connection with this aspect of the question that the following extracts from the report are given:—

The report recommends the amalgamation and bringing into working order of certain waterways which, taken together, would form four main routes connecting the Midlands or Birmingham district with the estuaries of the Thames, Mersey, Severn, and Humber, and deals at length with Continental views and practice as to traction, organisation of traffic and other matters connected with canals. It points out that recent experiments have been made in France and elsewhere by electric tractors running on rails laid on the tow-path. A system of this kind has been established on the canals d'Aire, de la Deûle, and the diversion of the Scarpe for a distance of 36 miles. By a decree of July, 1907, a concession was given to the Northern Electric Co. to establish electric traction on a crowded part of the St. Quentin Canal for a distance of 55 miles. This concession is for 40 years, and reserves to the State full control and the right to purchase. It is also proposed to use electric haulage on the new Canal Du Nord, now in course of construction, and the exclusive right of traction is conceded to the Chamber of Commerce of Douai for a term of 50 years as part of the means of raising revenue to meet the debt charges on the loan raised by them as a contribution towards the cost of the canal. Reference is also made to the use of electricity upon the Teltow Canal, where it is made obligatory, other forms of traction not being permitted.

The report adds that discussions at the recent International and Inland Navigation Congresses of European and American Engineers, show that the tendency is to accept electric haulage as the best and most economical form of traction on canals on which the traffic is, or may become, sufficient to repay the cost of installation. The following advantages of haulage by electric tractors instead of by steam tugs are set forth:—

(1) Assuming that the electric lines are laid on each bank, there will be greater regularity and uniformity of speed in the service than where tugs are used, and there will be less delay in despatching cargoes at short notice and at regular intervals.

(2) The banks and bottom of a canal are not so much injured by electric towing as they are by tug-towing. In the latter case the peculiar disturbance to the bottom, with consequential injury to the side-banks, caused by the motion of the screw, is added to the wave from the moving boats common to each mode of transport.

(3) In the case of electric towing there is a considerable economy of space and water in locks and lifts, because tugs and steam-boats, which by reason of the machinery have a smaller cargo-carrying capacity than barges of like dimensions, need not be taken through.

(4) The electric power, when once installed all along a line of waterway, can be utilised, not only for traction, but also for operating locks and other works, and lighting the waterway at night, and can even, perhaps, be utilised for factories establishing themselves along the waterway.

It has been contended that as the cost of installing electric traction is considerable, its use should be compulsory, and other forms of traction should be excluded. In experiments with electric traction in France where horse traction has been allowed to continue on the same sections, it has been found (1) that it was necessary to undertake extensive works, so as to give room for the rails and still allow room for horse haulage; (2) that a small proportion of slowly-moving boats was sufficient to prevent electric traction from giving all the increased speed of which it is capable. Continental experts are thus being led to these two conclusions: first, that other forms of traction, mechanical or animal, should be excluded; and secondly, that the exclusive right to supply power should be in the hands, either of the owner of the waterway, or in those of the concessionaires. To a certain extent these conditions would assimilate the system of canals to that of railways.

Special attention is drawn to one of the papers read before the Inland Navigation Congress held at St. Petersburg in 1908. This was a report of the proceedings of a sub-committee of the German-Austro-Hungarian Society of Inland Navigation in the preceding year on the "Towing monopoly and mechanical ship-traction on Canals." This Committee consisted of representatives of the Government of Prussia, Saxony, Austria-Hungary, and various expert representatives of inland navigation, and their report is accepted by the Royal Commission as embodying the best informed modern opinion. The Committee were unanimously of opinion that "electric towage from the bank is the most suitable means of economical exploitation of the canals." M. Kuhn, City Engineer of Vienna, in a report to this Committee, considered that electric haulage could only be advantageous if (*a*) the whole towing service is handed over to the owners of the electric towing installation; (*b*) if the goods transported are of such an amount as to make electric towing cost less than towing by tugs.

The Commission, after referring to the conclusion of Professor Marchant that even if the electrical system is not more economical than haulage by steam tugs, it is decidedly to be preferred on account of the auxiliary advantages which there are in using it, state that the subject is one of more than mere engineering importance, because it affects the question of the whole organisation of traffic upon main line waterways.

In conclusion, the Commission recommend the appointment, in connection with English and Welsh waterways, of a Central Waterway Board, consisting of three or five Commissioners, who should be paid, and give their whole time to the work. The four main routes of canals indicated above should, it is recommended, be transferred to the Waterway Board, as a first step, by the Act constituting the Board, or in an early scheme proposed by the Board. It would then be for the Board to consider whether if electric haulage is adopted on these or any other canals, and the tonnage conveyed is increased, the increase of traffic will pay for the provision of traction by, or on behalf of, the authority, and how low a rate of payment can be charged for this service without loss.

Manufacture of Telephones.—The daily papers report that in a speech made by Mr. Buxton, the Postmaster-General, at Islington, last week, he dealt with the question of purchasing telephone instruments in Sweden. He stated that during the four years he had been at the Post Office, about 3,250 telephones were purchased abroad. This, however, was in the early days of his administration, when one particular design of telephone instrument was in use, and only one firm made it, and that a Swedish firm. During the past year or two, however, this firm had started manufacturing the instruments in England, and since September, 1909, not only had he not given a single order to any foreign firm for telephone work, but the firm he had mentioned had supplied 13,000 telephones made in British workshops.

Magnetic Wheels for Tramcars.—According to the *Electric Railway Journal* (New York), experiments with a method of increasing traction by magnetic wheels have been conducted for some time by Mr. O. Heinze, of Lowell, Mass. The wheel contains four magnet coils, outside of which are four segments comprising part of the tread of the wheel, and a ring of 12 per cent. manganese steel is clamped between them and the wheel proper to send the magnetic circuit into the rail. The energising of the magnets is so timed that each succeeding section of the wheel is attracted to the rail just in advance of making contact with it, so that the device besides giving increased adhesion also assists acceleration. The current is cut off from each given segment as soon as it is no longer in contact with the rail. Tests have been made on a truck equipped with two 35-h.p. 550-volt standard railway motors, and weighing 13,000 lb. With the traction due to weight alone the motors developed a drawbar pull of 2,500 lb. With the wheels magnetised, the tractive effort was increased to 8,500 lb., or more than 300 per cent. The inventor does not claim to increase the traction by such a liberal percentage on an ordinary car, but states that a car equipped with his device should be able to mount grades that are otherwise impossible without a rack.

ELECTRICAL ENGINEERING
IN
MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "The Editor, Electrical Engineering, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

CABLES IN SHAFTS AND MAIN HAULAGE WAYS

By J. P. Simpson, M.I.M.E.E., Electrical Engineer to South Hetton Coal Co., Ltd., Murton Colliery

[*Editor's Note.*—The fact that the opinions expressed by the writer of this article differ in some respects from those published by Mr. H. J. Fisher in a former supplement make them none the less interesting. In both cases they are based on the author's actual experience.]

THERE is no part of an installation that requires more consideration than the cables in the shaft and main haulage ways, because they are subject to many variations in temperature, which cause them to expand and contract, and thus to be continuously moving. They are also subject to shocks and strains, due to material falling down the shaft, and falls of stone. In many shafts water is continually dropping, and for these reasons as dry a place as possible, and out of the way of guides and winding ropes, should be selected. Lead-covered cables should never be used in shafts, as the weight of the lead produces creep, which in time would cause faults to develop. The best and most substantial cables to instal in a shaft are double-wire armoured, the armouring of which should be wound spirally and in opposite directions, or cables armoured with steel tape, wound so that the armour is locked or wedged; but whichever class is used, they should be braided and compounded over the armour. Unarmoured cable should never be installed in shafts, owing to its being mechanically weak and not able to withstand a knock should anything fall down the shaft and strike the cable.

The writer has found that the best class of cable for shaft work is that in which the conductors are insulated with bitumen compounds, and the space between the insulated cores filled in with jute mixed with a plastic compound, so as to keep any moisture from creeping in. Two layers of cotton tape soaked in compound are wound over the jute, and, on top of this, marline is wound on spirally so as to give a round surface for the armouring; two layers of marline are wound in opposite directions over the armouring, and the whole is compounded together. Cables of this description have been installed in very wet shafts, and have been at work over two years at a pressure of 2,000 volts, and have never given the slightest trouble.

Shaft cable should always be installed in one length, where possible, as joint boxes are not reliable, and as cables are now made in such long lengths joint boxes can be dispensed with. The writer has installed cables in shafts which required a length of 500 yards to go from the power-station at bank to the distribution house underground. These cables were put down in one length, and were double-wire armoured, three-core, 37/14 cables.

A cable of this description must be substantially fixed, as it is not capable of supporting its own weight. The first cost of fixing shaft cables may be a large item, but it is worth the extra cost, because, unless they are well supported, they are sure to give trouble, and perhaps mean renewing the whole length of cable. The best method of fixing these cables is to support them at intervals of about 20 yards by hard wood clamps steeped in tar, and, where there is sufficient room in the shaft to run steel rope guides to carry the cables, no better method can be adopted. Fig. 1 is a rough sketch of the arrangement.

Two steel "I" girders are placed side by side with holes cut to allow the steel ropes and cables to pass through with a good clearance. These girders are then built into the shaft. Steel ropes are run down the shaft to the required depth, and fixed at the top side of the girders by forged clamps (Fig. 2), 12 in. deep, which bolt together and thus have a good hold of the steel rope. At intervals of about 20 yards forged clamps of similar shape, but 6 in. deep, are fixed to the steel ropes so as to support the wood clamps, which are gripped to the cables by six bolts; an iron strop is also put across these clamps in case they split and thus lose their hold. The clamps are hard wood bored out slightly less than the cables, so as to let them grip firmly, and are tapered away so as to allow water to run off. A tapered hole is also cut at the top to a depth of about 1 in., and leaving a clearance of ½ in. round the cable. When the cables are fixed into position, this hole is filled up with bitumen, which is allowed to run over the tapered top, the idea being to run any water off that may have got on to the cable, thus preventing it running down the entire length of cable.

Shaft cables are best if installed in cold weather, because one can be sure that the bolts are tight, having been tightened when everything is in a contracted state. If they are installed in summer weather it is, therefore, necessary to have all the bolts tightened up again when the cold weather comes. Wood casing should never be used in shafts, especially where there is water, as the wet casing will keep the cable in a wet condition, which in time will ruin the insulation; besides, wood casing prevents the cable from being examined as it should be. Whatever class of cable is used, it certainly should be an armoured one.

Where the cable comes out of the shaft into the seam it should be protected, in case anything falls down the shaft on to the cable; all that is necessary is to fix strong timber over the bend in a sloping position, so as to allow water or anything that may fall to run off. Fig. 1 also shows this arrangement.

The cables in the main haulage way are liable to risks not encountered by any other part of the installation. In some cases they extend for some distance inbye, and are, therefore, subject to any fall of roof, or, if they are run under the floor, they are subject

Digitized by Google

to strain due to the floor heaving or lowering. Lead-covered cable should never be used for underground work, owing to the bad water that has to be contended with in some instances, also, if lead-covered cables are open, rats and mice, which are numerous in many pits, eat away the lead covering, and in time will cause a breakdown. The only cables suitable for this class of work are (1) vulcanised india-rubber and braided; (2) vulcanised india-rubber, protected by galvanised wire or steel tape; (3) bitumen cables protected by steel armouring. The system in use will, to a certain extent, decide the class of cable to be employed, but the writer is of opinion that nothing but armoured cables should be used in a mine, especially in the main haulage ways. If armoured cables were used throughout in the mine, and the armouring made electrically continous throughout, and efficiently earthed, there would be no danger of shock should a fall of stone occur and damage the cable. To give an instance of this, suppose the stone struck a three-core or concentric armoured cable and pressed the armouring into the cores so as to cause a short circuit from one core to another, it would only trip the switch or circuit-breaker, and thus render the cable dead. Again, if separate cables are used, and the armouring is electrically continuous and well earthed, there will be no danger in touching the armour. But if unarmoured cables are employed, and a fall occurs and damages the cable, or a fault develops through any other cause, there would be a danger of anyone receiving a shock should he touch the place where the cable is damaged. Unfortunately, there are some colliery electricians who do not know the meaning of the words "Electrically continuous throughout, and earthed." The shaft cable should have its armouring connected to earth at bank, while at the opposite end the armouring should also be connected to earth (thus making sure that one good earth connection will still remain if the other breaks down), and the armouring of every sub-feeder which is fed from it should be connected to the shaft cable armouring. The cables leading into motor panels, or motors, should have the armouring connected to the framework. The earthing should consist of a proper earthplate, sunk in as damp a place as possible. A good earthplate can be made with a sheet of iron about 3 ft. square by ½ in. thick, with holes drilled to fix copper strip 1½ in. by ⅛ in., which should be laid edgewise, and fixed spirally on the iron. Wet coke should then be placed between the copper spirals, and a thickness of 18 in. placed under the plate for it to rest on. The earth connection should then be connected to both ends of the copper strip, and about 2 ft. of wet coke laid on top and round the plate. The coke should be beaten up very small; coke breeze is best if it can be obtained. It is not advisable to use water mains alone for earth connections, as they may be disconnected at any time, and thus cut the earth connection. The writer once saw an instance of this. The water main was used for a main earth connection, and a branch pipe that conveyed water some distance inbye was used as the earth connection for a motor some distance from the shaft; this pipe had to be disconnected for some extensions between the shaft and the motor, and the plumber broke a joint by cutting through a ferrule. As he broke this ferrule from the pipe, his chisel made connection between the two pipes, and caused a flash. There had been a slight earth on the motor at the inbye side, but, fortunately, he only received a slight shock.

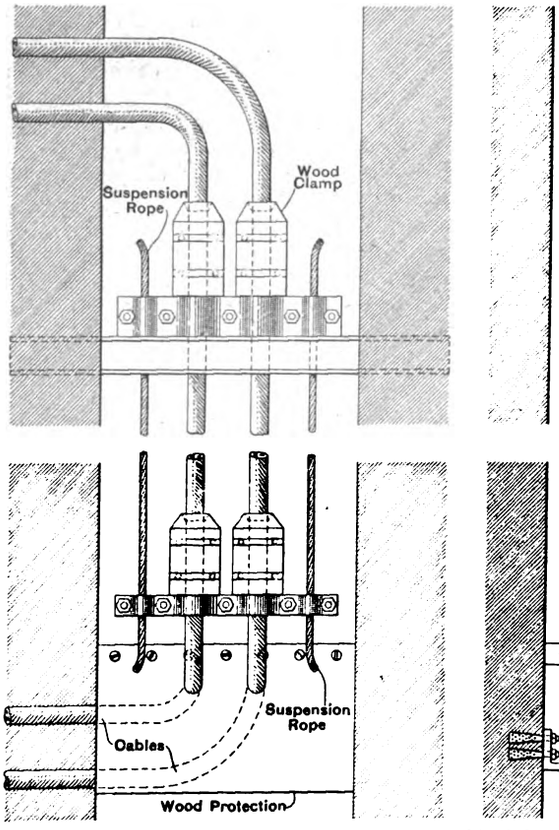

Fig. 1.—Sketch showing arrangement of Shaft Cables.

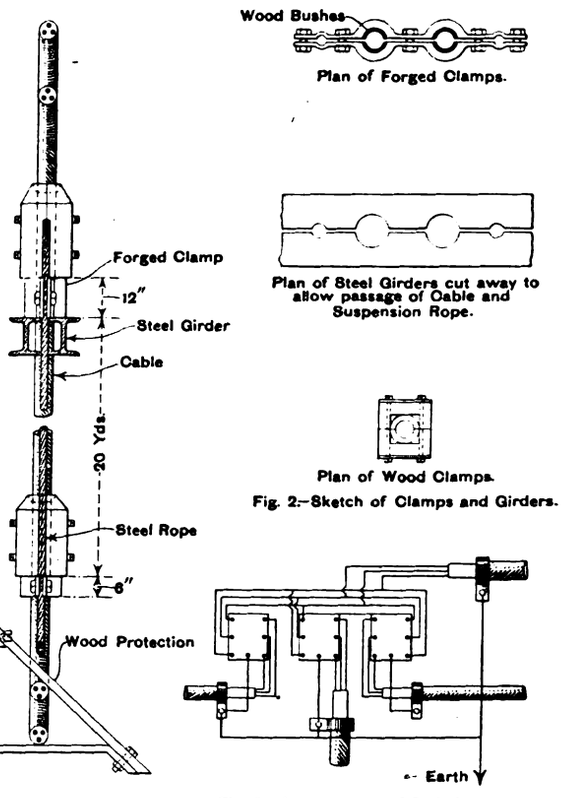

Fig. 2.—Sketch of Clamps and Girders.

Fig. 3.—Arrangement of Switches on a 3-Phase System.

In cases where junction-boxes are used, great care should be taken to make the armouring electrically continuous by stout copper bonding the armouring to the box, or by connecting the armouring at each end of the box.

It is the writer's opinion that it is not the best method to use junction-boxes underground, especially at a feeding centre; he recommends the use of switches instead. To give an instance, the writer once saw an installation where there were three haulages in one seam, and the feeder from the distribution-house (which was in another seam) connected into a four-way joint-box, from which the three haulages were fed. Now,

Digitized by Google

suppose any one of these haulage cables broke down, it meant that the current would have to be switched off the feeder from the distribution-house, thus shutting down that seam until the fault was repaired, or the faulty cable disconnected from the box. If switches had been used at this feeding-point the faulty cable alone could be switched off, and, therefore, not interfere with the other two haulages. Fig. 3 shows the arrangement for a three-phase system with armoured cables. Of course, these switches would have to be kept locked up so that no unauthorised person could interfere with them.

The fixing of cables in main haulage ways is an important point; they should never be fixed with metallic fastenings, unless it is in the motor-house, or through an arch or curve which is brick built. Where the cables have to be suspended from the props, or baulks, it must be done with rope or leather slings, so that if a fall occurred, or the baulks broke, the cable would be borne to the ground by the sling breaking, which would minimise the danger.

Where concentric cables are used, the outer conductor should always be kept at earth's potential, thus allowing it to be handled without risk of shock. For high-tension work, the writer thinks that there is nothing to beat vulcanised bitumen cables, especially in wet places. He has had three-core cables, double-wire armoured, working in such places for over two years, and their insulation resistance is as good to-day as it was the day they were laid down. In places where the floor does not move, the cables can be laid underground in good troughs, or even on the solid system; the writer has laid cables in this manner with good results, but prefers them in view for pit work.

Perhaps a word of advice on "feeder protection" would not be out of place in this article. I refer to the "Merz-Price" system of feeder protection. If I may say so, it is a long-felt want supplied, and is just the thing required in mines. The idea is, should any out of balance occur in any phase (due to earths or shorts), or, in other words, should one phase be supplying more current than the other, the relay operates, which closes an independent circuit supplied by a direct current from a battery in series with the trip coil of the switch, and the switch operates. These relays will act before a feeder has time to arc at all, so that there is no danger of a spark from the cable causing any trouble.

ELECTRIC POWER AT THE LOFTUS IRONSTONE MINES

AN electrical installation with a number of interesting features has been put down in the Loftus ironstone mines of Messrs. Pease and Partners, by Messrs. Ernest Scott & Mountain (Gateshead-on-Tyne). These mines are situated about four miles from Saltburn on the Yorkshire coast, at some distance from the Durham coalfield, so that the saving in fuel effected by the adoption of electrical driving is of some importance. The mine consists of two drifts running into the face of the hillside on the east of the deep valley dividing Loftus from Carlin How. With the north drift nothing in the way of electrification has yet been attempted, as the ironstone is easily brought to the in-bye end of the main haulage plane, from which sets of ten tubs at a time are pulled out to the surface by a steam-driven hauling engine. The other (south) drift, tending in a south-easterly direction, is also operated by means of a steam hauling engine at the surface, and serves to bring stone from three different districts, namely, Whitecliffe Mine, lying underneath part of the township of Loftus; Loftus Mine proper, further to the north; and Grinkle Mine, some two miles distant. In arranging the electrical underground haulage, the lead of the ropes was kept as straight as possible, and it was arranged that either engine could relieve the other in the case of a breakdown. The in-bye haulage roads meet at the bottom of the drift from the surface, and at this point the ropes from the two haulage gears cross.

Owing to the intermittent nature of the load on these haulages, it was decided to obtain the electric current from the Cleveland and Durham Electric Power Co., through a sub-station at the mine. For the endless-rope haulage at Whitecliffe, for the centrifugal pumps, drainage pumps, and the electric drills at the face, also for the electric lighting at the surface and underground, and motors of various sizes on the surface, current is provided from the power station at the mine, which is equipped with three four-cylinder vertical gas engines by the Campbell Gas Engine Co. (Halifax), each coupled direct to a 230 kw. 550 volt continuous-current generator. Gas is furnished by three Campbell suction-type producers. One of the haulage gears was originally worked by a horizontal steam engine, which was displaced by a continuous-current motor of 250 h.p., running at a normal speed of 375 r.p.m., regulated by means of a metallic controller of the tramway type with iron grid resistances, and supplied from the power station. This motor ran for about two years, and the only difficulty was due to the unavoidably intermittent nature of the load, which occasionally led to irregular working in the power station. In view of this, and the steady increase in constant running machines underground and on the surface, which provided sufficient load for the power station, it was decided to replace the motor by one of the three-phase type, to take its supply from the power company's mains. The present motor is of 250 to 300 h.p., running at a speed of 343 r.p.m., and wound for a voltage of 2,750, at 40 cycles per second.

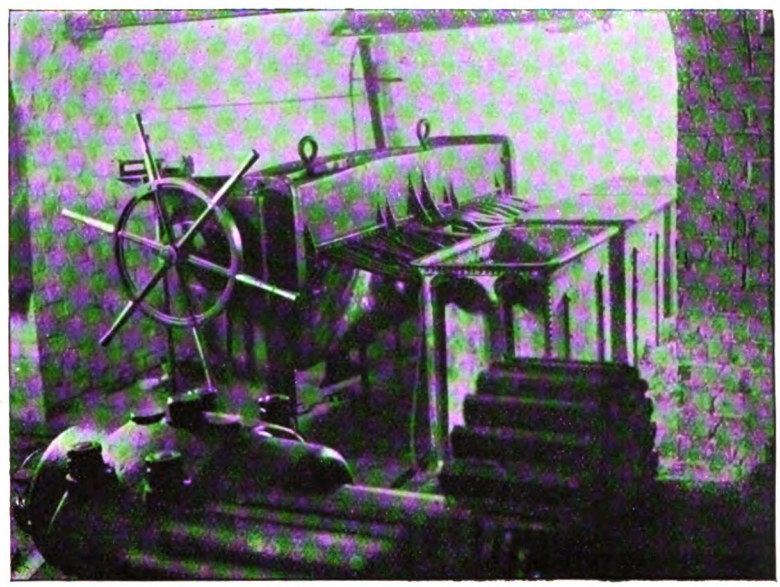

FIG. 1.—HAULAGE CONTROLLER IN POSITION.

Behind the motor, in a specially constructed archway, is fixed a metallic controller, which is a very massive instrument specially designed and supplied by Engineering Instruments, Ltd. (Darlington), for this work, and containing several unique features. The controller is divided into three sections, *i.e.*, one for each phase, each with 15 stops. Each stop in the controller consists of a quick-break switch with positive action, and, in addition, a spring break so arranged that in the event of the spring failing the switch will still be effective. Each stop is connected to an elaborate series of resistances carried in three galvanised iron tanks beside the controller. These tanks are filled with oil, and fitted with heavy copper circulating pipes, through which cooling water is forced by means of a centrifugal pump driven from the shaft of the motor. The controller body is mounted upon heavy cast-iron end supports, and raised clear of the ground, and is so arranged that the oil-filled tanks in which the switches operate can be readily lowered to provide for inspection and renewals. The controller is worked by means of a substantial handwheel fixed at the end of a long steel rod carrying it up to the operating platform. Beneath the pedestal carrying this handwheel is also fixed the oil-filled high-tension reversing switch, the handle of which is interlocked with the main wheel, so that the connections cannot be reversed until the wheel is in the "off" position. Still further back in the archway behind the motor will be found the water-filled resistance tanks to supplement the metallic resistances already described. These water tanks are very large, constructed of elm planks 1½ in. thick, and each holding

Digitized by Google

approximately 190 gallons. Their duty is to absorb a very large proportion of the energy at starting, so as to give a very gradual acceleration when picking up a set of tubs. These liquid tanks are coupled to the first three stops of the controller only, and are then relieved of further work, any regulation beyond this point being carried out by the water-cooled metallic resistances alone. A steady speed of from one to two

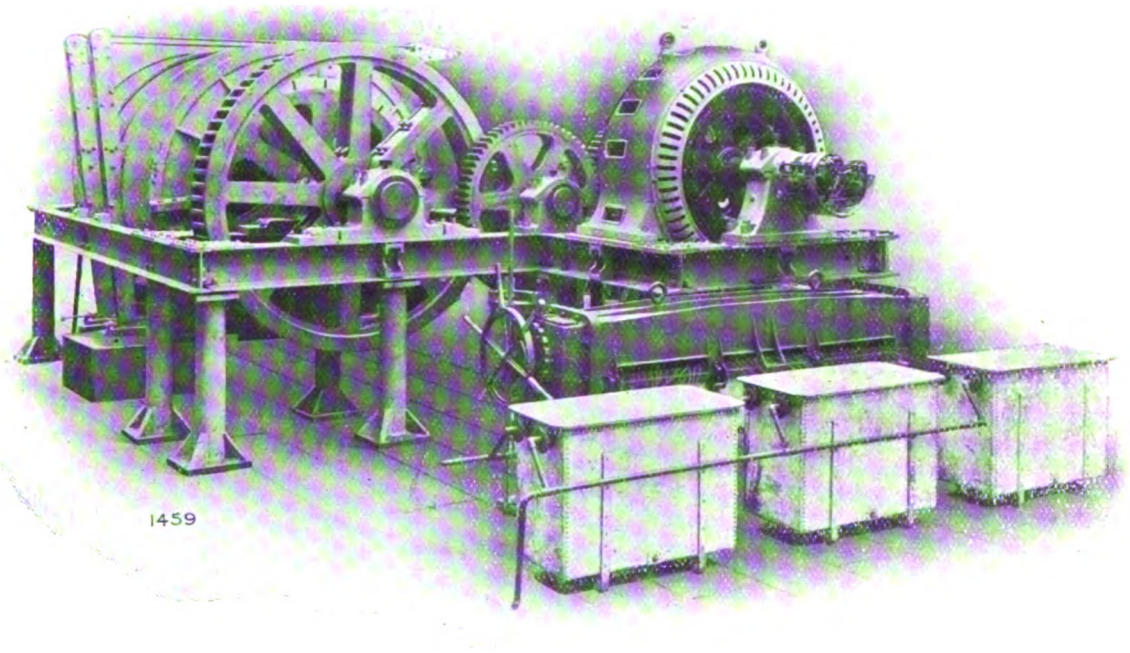

FIG. 2.—350-H.P. HAULAGE GEAR BEFORE ERECTION.

miles per hour can be maintained with the water tanks in circuit for purposes of adjusting the length of the rope, or for allowing the slack between tubs to be taken up gently. The work done by this haulage is to bring sets of from 30 to 50 tubs at a time over the somewhat uneven road from Loftus or Grinkle; in the latter case the run is 2,500 yards in length, and occupies from start to finish approximately 10½ minutes, from which it will be seen that the average speed is 8¼ miles per hour.

The other haulage gear is driven by a 300-h.p. motor, and is entirely new. The controlling arrangements are similar to those already described. A view of the controller in position is shown in Fig. 1, while the whole gear assembled prior to erection is seen in Fig. 2. There are two drums, each 6 ft. diameter on the barrel, and 2 ft. 8 in. wide, the shield boards being 8 ft. 6 in. diameter overall. Each of the two drums is fitted with "Hall" type of friction clutch, consisting of a very heavy cast-iron centre keyed to the main shaft and revolving with it. Outside this centre is an all-round brake strap 6 in. wide, fitted with elm blocks and operated by means of rods and levers inside the haulage drum, and connected to a sliding sleeve between the drums. The position of this sleeve is regulated by means of a hand-wheel with double-threaded screw, and is so arranged that either drum may be put into motion or stopped at will. The motor is capable of giving up to 450 h.p., and runs at 325 r.p.m., the voltage being 2,750. Owing to the frequent starting and stopping which is required, the motor is fitted with a wound rotor with very massive slip rings outside the end bearing protected by a sheet metal cover.

The continuous-current equipment at the surface comprises motors for operating the picking belt, tippler, and small motor generator for providing the lighting current for arc and incandescent lamps.

The continuous-current distribution board at Whitecliffe consists of a heavy cast-iron casing mounted on brick pillars and carrying double-pole switches mounted on slate base. The circuits in the board are five in number, and provide for the centrifugal pump room adjoining, the endless-rope haulage some 200 yards further in-bye, the drainage pumps placed at various points nearer the face, and the electric drills, which are in turn run from separate circuits leading out of a special distribution room at the side of the travelling road.

The centrifugal pumps are two in number. Each pump is constructed to deliver 600 gallons per minute against a head of 300 ft. and is driven by an 85-h.p. motor. These pumps deliver the water to the surface, and are run alternately, as the mine is fortunate in having large standage accommodation, which enables the pumps to be worked economically under the present strict regulations as to hours.

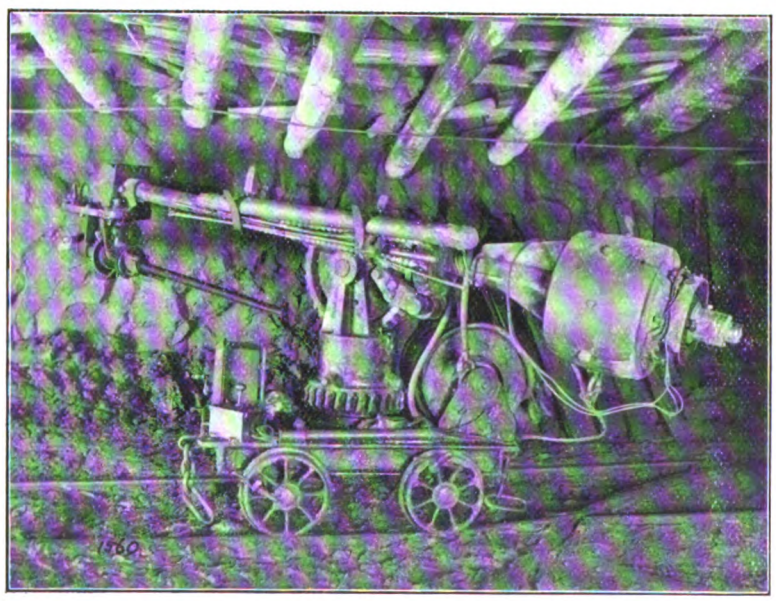

FIG. 3.—5-H.P. D.-C. MOTOR DRIVING ROCK DRILL.

Each pump set is provided with a switch column consisting of double-pole switch with circuit breaker and ammeter, the whole being ironclad and fireproof. The motors are started by means of "Esco" liquid switches.

Leaving the pump room, we proceed further in-bye to the endless-rope haulage, which operates two loads leading in-bye

Digitized by Google

to the face, and brings the tubs out to the assembling points, where they are picked up by the main rope haulage already mentioned.

This gear is driven by a 100-h.p. induction motor running at 525 r.p.m., and controlled by a liquid switch.

The next features of interest in the mine are the drainage pumps, which are of the ram type, and deliver their water to the sump, which supplies the two centrifugals already referred to. These pumps are of the portable type with direct-geared motors. There are two sizes in use, one suitable for 50 gallons per minute, and the other for 90. The switchgear for the motors is also mounted on the pump framework, so that the whole set is readily removed as circumstances require.

At the face of the mine useful work is done by a large number of electric drills, one of which is shown in Fig. 3. These drills are of exceptionally massive design, on account of the hard nature of the ironstone in which they have to work. Each drill is capable of boring 30 holes, 1½ in. diameter, and 3 ft. to 4 ft. long, in an hour, and does this work regularly while in ordinary use. It will be seen from the illustration that each drill carries its own supply of trailing cable on a special drum fitted with sliding contacts, the starting switch and regulator being also fitted on the drill carriage.

The whole of the installation has been carried out under the general direction of the manager of the mine, Mr. W. Moore; the under-manager, Mr. F. Seymour; and the active superintendence of Mr. T. Scott and Mr. W. Robson, the mechanical and electrical engineers.

A THREE-PHASE WINDING PLANT

A GOOD example of an electric winding plant of moderate size, in which the magnitude of the peaks of the load in relation to the capacity of the generating plant available is not sufficient to justify the capital cost of a flywheel equaliser system, is presented by an electrically-operated winder installed by the British Westinghouse Co. at the Tredegar Iron and Coal Co.'s Maclaren Pit, Abertysswg. The plant was operating at the commencement of sinking, and received power from an electric power station about 3,000 yards away at Ty Trist, the transmission line being led over the hills and terminating in high-tension lowering transformers. The winder was designed to raise rock, &c., during the process of sinking the shaft. Only one drum was used during sinking operations, the maximum unbalanced load being: rope, 22 cwt.; cage and chains, 26 cwt.; burden, 40 cwt.; total, 88 cwt. The maximum speed of hoisting was 600 feet per minute. On the completion of sinking the

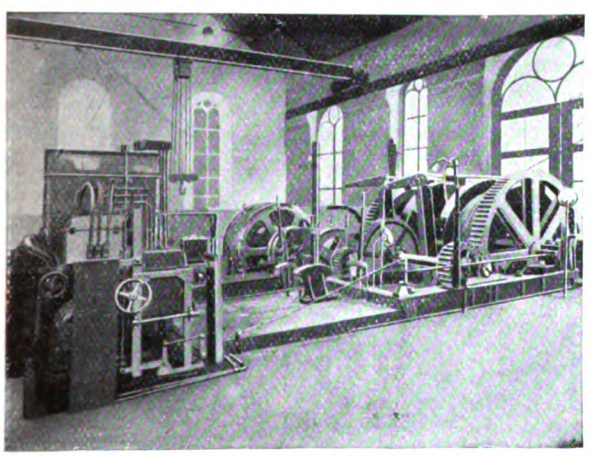

FIG. 1.—THREE-PHASE WESTINGHOUSE WINDING PLANT AT TREDEGAR COLLIERY.

winder was to be used for winding 500 tons of coal per day of nine hours, from a depth of 380 yards to a level of 300 yards from the bank—that is, 80 yards—for which purpose it is now employed. Two drums are used, and the cages, &c., are balanced.

The total load is 1 ton 14 cwt. 3 qrs., made up of 1½ ton of coal, and the 80 yards of rope of the cycle of operation occupies 45 sec., of which 30 sec. is actual winding. A view of the equipment is given in Fig. 1.

The drums are 6 ft. in diameter over the treads, and 2 ft. in width between the cheeks, one cheek of each drum being formed by a spur wheel and the other by the brake wheel. The drums are keyed to separate shafts, and can be operated either singly or together, in a similar manner to a main-and-tail haulage. The motor has a normal capacity of 250 h.p. at 380 r.p.m., and is of the Westinghouse standard three-phase induction type. Its working pressure is 500 volts at 40 cycles.

The control gear employs a liquid resistance consisting of two tanks mounted one above the other, a small motor and circulating pump, an oil-immersed main reversing switch, and also a main emergency switch. The upper tank contains three stationary electrodes and a movable sluice-gate, the electrodes being connected to the slip-rings of the main motor. The lower tank holds a supply of resistance liquid, and is fitted with cooling coils, through which cooling water is circulated. The resistance liquid is pumped into the upper tank by means of the small motor-driven circulating pump, and returns to the lower tank over the sluice-gate, which is in its lowest position when the driver's operating lever is at "off." The movement of this operating lever first throws the reversing switch in the primary circuit of the main motor in one direction or the other (according to the required direction of rotation), and then raises the sluice-gate. The latter operation causes the level of the liquid in the upper tank to rise, and consequently decreases the resistance between the slip rings.

The sluice-gate may be stopped in any position, or it may be immediately thrown to its highest position, this depending on how the driver manipulates the operating lever. As, however, the liquid cannot follow the raised sluice-gate faster than the pump can pump the liquid into the upper tank, a certain maximum acceleration of the motor (which is due to the rate

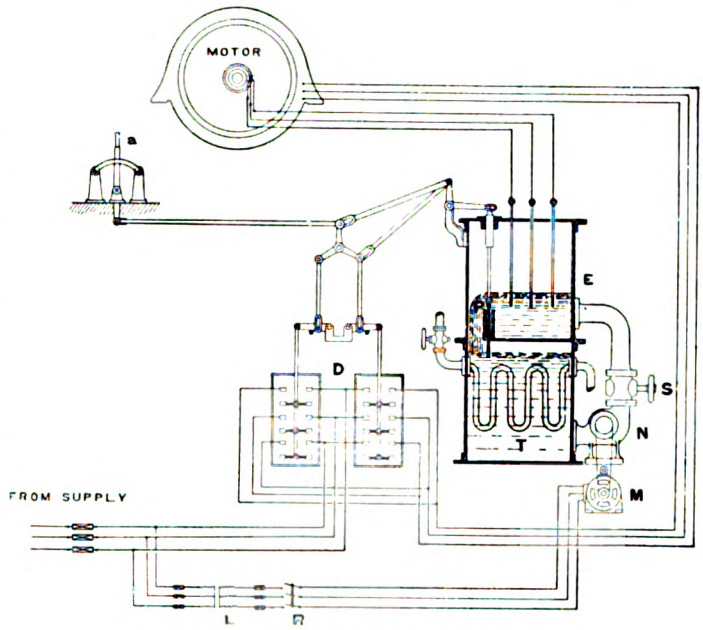

FIG. 2.—DIAGRAM OF CONNECTIONS.

of decrease of resistance in its rotor circuit) cannot be exceeded, although any less acceleration may be obtained. This maximum acceleration is adjustable by means of a stop valve in the delivery pipe of the pump.

The primary reversing-switch and sluice-gate are operated directly from the driver's lever, as shown in Fig. 2, where *a* is the driver's lever, *D* the main reversing switch, *E* the liquid-resistance tank, *P* the sluice-gate, *T* = the resistance-liquid reservoir with cooling coil, *N* the circulating pump driven by the motor *M*, and *S* the regulating valve.

The Harris Safety Shot Firing Apparatus.—A brief description of this apparatus, which has been designed to provide for the insertion of electric detonators in bore holes, was given on page xviii. of the last Mining Supplement, ELECTRICAL ENGINEERING, December 2nd, 1909. Mr. R. D. Harris has drawn our attention to the fact that our description was somewhat misleading. The copper rod is inserted into the last cartridge of the explosive *before* it is placed in the bore hole, and after the rod is inserted the hole must be well rammed with clay to prevent the flame from escaping. Finally, the detonator is placed in the end of the metal tube, with the firing wires *outside*, and the whole is inserted in the channel left by the copper rod. The detonator is then inserted into the hole made by the rod in the last cartridge by means of a fine rod in the tube. After withdrawing the tube, the hole is plugged, and the shot is ready for firing. Mr. Harris informs us that this apparatus is being used with complete success at the Dulais Colliery, Onllwyn, Glamorganshire, and that, between November 22nd and December 4th last, over 700 shots were fired with it, three misfires being dealt with without any danger or difficulty.

THE MINERS' ASSOCIATION AND ELECTRICAL WORKING

THE November issue of the *Monthly Circular* of the Northumberland Miners' Mutual Confident Association contains a section written by Mr. Thomas Burt, M.P., who has on previous occasions offered suggestions for minimising the dangers arising out of the use of electrical appliances in mines by stricter supervision, better inspection, and the appointment of properly trained men. He includes the following extract from correspondence from a colliery expert in practice in the northern counties. In criticising the manner in which some colliery installations have been carried out, his correspondent writes:—

"I feel strongly on the question of having certificates given to the mechanical engineers of collieries who are in charge of the electrical plant, and who are more or less responsible to the colliery manager and to the owners. Unfortunately, however, the colliery manager is the man responsible to law, and as a rule it is he who takes up the purchase of the installation with the contractors, and many contracts have been let at ridiculous prices to electrical companies, who were anxious to get in touch with mining work, but who had no experience of the operation of colliery electrical machinery, and who, to save making a bad bargain, put in the cheapest kind of machinery and plant to do the work. The colliery manager and the colliery engineer, in many cases, had little or no knowledge of electricity, and consequently were quite unable to supervise the work, and even now, although many colliery engineers have a good knowledge of electricity, there are very many collieries indeed where the electrician has only a very inadequate knowledge of electricity, and is certainly not competent to design or superintend the installation of electrical plant of any consequence. In some cases, consulting engineers have been employed, but again, the man appointed has usually been an electrical expert pure and simple, and he has had to gain his mining experience at the expense of the owners, and sometimes at the expense of the workmen. With regard to inspectors, I would like to point out that it is useless to appoint electrical inspectors who are purely electrical engineers. He may have every qualification as an electrical engineer, but unless he has had a very considerable experience in actual colliery work, he cannot carry out the duties efficiently.

"The only other point which I should like to mention is the suggestion that I made to you *re* the Miners' Association appointing their own electrical expert. The point raised is this: So far, the owners of collieries have installed, through their colliery managers, electrical plant, of which the latter has very little, if any, knowledge, and so far as the men themselves are concerned, their interests were not sufficiently considered; but in going through the whole of the accidents that have occurred due to 'Electricity in Mines' it is the men who have been the sufferers, and they have suffered in the majority of cases simply because the installation had not been fitted as it ought to have been by the electrical contractors.

"The suggestion I have to make is this: That the miners themselves appoint their engineer to attend inquests, and make a report on every fatal accident, and to make suggestions for their prevention, and such a record would not only be valuable to the miners themselves, but would be of material assistance to the owners when installing electrical plant, and would thus do very much to remove the present feeling against the use of 'Electricity in Mines,' which can do much to improve the conditions of the men underground if properly installed and used."

ELECTRIC PUMPING EQUIPMENT AT THE NEW ZEALAND CROWN MINES

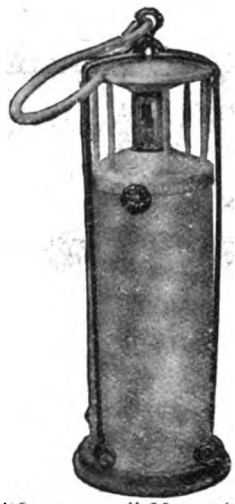
AN important electrical pumping equipment will shortly be completed at the Crown Mines at Karangahake, New Zealand. This pumping plant was necessary in order to extend the workings below the No. 5 level in the mine. Six hundred gallons of water per minute have to be raised a vertical height of 380 ft., and as further sinking is carried out this quantity will increase, until it is estimated that 1,135 gallons of water will have to be pumped a total height of 750 ft. This will be done in two stages by means of electrically-driven ram pumps.

The generating station is situated about 6,000 ft. from the mine, where a water supply is available from the Ohinemuri River. The power station equipment consists of a 720 b.h.p. water turbine direct coupled to a 550 kw. generator and a 500 b.h.p. steam engine direct coupled to the opposite end of the same generator, and the coupling between each is arranged so that the generator may be driven by one, the other, or both of the prime movers. The whole of the work will be done by the water turbine for the greater part of the year, and when the supply of water falls off the turbine will be assisted by the engine, and for a short period in the year it will be necessary for the bulk of the load to be taken by the engine. The turbine was supplied by Messrs. Escher, Wyss & Co., of Zurich, Switzerland, and is of the radial flow type, designed to run at 300 r.p.m. It is supplied with water under a net head of 80 ft., and the water is conducted to the turbine by a pipe line 6 ft. in diameter, the draught tubes extending from the turbine to the tail race 21 ft. below. The generator was manufactured by the Electric Construction Company, of Wolverhampton, and is of the three-phase revolving field type, generating at 2,200 volts and 25 cycles per second. The engine is of the high-speed, vertical, three-crank, triple-expansion pattern, manufactured by Messrs. Belliss & Morcom, of Birmingham. It is supplied with steam at 150 lbs. pressure, and exhausts to a rectangular tubular surface condenser supplied by the Worthington Pump Company. The steam is supplied by two Babcock & Wilcox watertube boilers, each capable of normally raising 6,000 lbs. of steam per hour superheated 50 degrees. Feed water heaters and purifiers are provided, and the generating station generally is equipped with the most modern appliances and accessories for both the hydraulic and steam side.

Current is transmitted from the generating station to the mine by means of bare overhead stranded copper conductors upon poles planted at suitable intervals through the Ohinemuri Gorge and the Waitawhita Gorge. From the terminal pole at the mine end a three-core cable is taken to a distributing board placed in a convenient position at the mine mouth, and from this board circuits are provided for the two pump motors, and a transformer is supplied for lighting and general supply.

The two double-acting duplex ram pumps are driven through double-reduction cast-steel spur gears by 250 b.h.p. induction motors, each pump and motor being mounted upon a frame provided with runners. The main incline shaft is provided with rails upon which the pumps are placed, so that they are in position to follow up the workings or be hauled out in emergency. The pumps were supplied by the Worthington Pump Company, of Newark, and the motors by the Electric Construction Company, of Wolverhampton.

The mine cables throughout are of the three-core type, paper-insulated, lead-covered served with jute, armoured with steel wires, and taped outside the armouring. There are no exposed terminal contacts or conductors of any kind inside the mine, no fuses are used, and all contacts are made and broken in oil contained in cast-iron cases properly sealed. The cables, both bare and insulated, were supplied by Messrs. Johnson & Phillips, and the switchboards, instruments, and all electrical equipment by the Electric Construction Company.



The whole of the apparatus was submitted to rigorous testing, as near as possible under actual working conditions, before being despatched, the boilers, engine, generator, motors, and switchgear being assembled at the works of Messrs. Belliss & Morcom for the purpose. The installation was arranged by Mr. H. F. Parshall, of Salisbury House, London Wall, who was also responsible for the testing of materials and apparatus, and the supervision of the design and manufacture of the equipment. The erection of the complete equipment was carried out by the New Zealand Crown Mines Company, under the direction of Mr. F. R. W. Daw, the company's mine manager, who also furnished the data upon which the installation was designed.

Electrical Mining Equipments.—A pamphlet of considerable interest to mining electrical engineers has just been issued by Messrs. Crompton & Co. (Salisbury House, London Wall, E.C.), and contains about 50 illustrations of plant, &c., typical of the methods used in the supply and utilisation of electricity in mines, a subject to which, as shown by the long list of mines where Crompton machinery is in use, the company have given a great deal of attention. Steam- and gas-driven power station plant is exemplified, and further illustrations show electrical driving of auxiliaries. Converting as well as generating plant is represented, and illustrations are given showing the detailed arrangement of power station main switchboards, and enclosed distributing switchboxes for underground use. A main shaft winding system, employing batteries in conjunction with boosters for load equalisation, is explained with diagrams, and illustrations are given of a number of patterns of electrically-driven haulage gears. Special controllers, both of the oil immersed pattern with metallic resistances, and also with liquid resistances, have been designed. Pumping, air compressing, and ventilating plants are dealt with, and an illustration of a special form of enclosed motor ventilated through pipes is given. Various applications of electric power for surface purposes are also illustrated, including electric capstans, machine tools, &c., and in speaking of lighting, the application of the auto-converter (see ELECTRICAL ENGINEERING, July 8th, 1909, page 629), for reducing the pressure of 500 volt circuits to a value convenient for lighting is explained.

MINERS' ACCUMULATOR SAFETY LAMP

THE accompanying illustration shows the general design of a new unspillable accumulator safety lamp, which is manufactured by Messrs. Longstreth's, Ltd. (190 Queen's Road, Battersea, London, S.W.) This lamp is suitable for use in mines, gas-works, sewers, and other places where the presence of inflammable gases is possible. It weighs under 3½ lb., and gives a light of two candle-power for twelve hours on one charge. The case is of aluminium, and the wire loops attached to the base are brought together over the top of the lamp chamber and clamped. A padlock can be inserted to lock the lamp if necessary. The whole lamp is easily taken apart and put together. An explosion-proof switch with internal contacts is provided. The accumulators are of the well-known "Lithanode" patent unspillable pattern, in which an auxiliary vent chamber with means for returning the acid sprayed or leaking from the main cell, is provided. This chamber prevents any likelihood of acid spraying out of the cell, and renders it possible to invert the cell without any acid escaping.

"LITHANODE" MINERS' SAFETY LAMP.

SOME NEW MINING PLANTS

WE recently had an opportunity of inspecting some mining machinery in course of completion at Messrs. Ernest Scott & Mountain's works. Among the most interesting pieces of plant shown us were some portable haulage gears for small main rope, and main and tail haulage, which have been specially designed for getting the coal from the working face to the main haulages. There is no doubt that when the eight hours Act comes into force, provision will have to be made in most collieries for getting the coal away from the working face quicker than is at present done, and where electricity is installed these portable haulages are by far the handiest thing that can be used. The main rope haulages are made in three sizes: 5 to 10 h.p. with a drum 15 in. dia. by 12 in. wide; 10 to 20 h.p. with a drum 18 in. dia. by 10 in. wide; 20 to 30 h.p. with a drum 21 in. dia. by 12 in. wide. The rope speed is generally about four miles per hour, but this can be arranged to suit purchasers' requirements. Where the gradient is not sufficient to enable the tubs to self-act (2 in. to the yard is generally found sufficient for this purpose), an endless rope drum is substituted for the main drum, or a portable main and tail haulage can be used.

A jaw clutch is provided for throwing the drum out of gear, so that the empty sets can be lowered on the brake with the motor standing. The bed is built up of steel plates, stiffened with angles and bolted together, so that it can be very easily taken apart, and is intended to carry either a three-phase or continuous-current motor which drives through machine-cut gearing, the motor being provided either with a raw-hide pinion, or, if it has to work in a damp situation, a forged-steel pinion. The whole of the gear can, if required, be mounted on trolley wheels. The bearings are gun-metal bushed, and, by withdrawing a few bolts, can be quickly withdrawn.

A portable main and tail haulage shown us was for the Carlton Iron Co., and is driven by a 20-h.p. three-phase slip-ring motor through a Hans Renold chain. One drum is raised slightly above the other so that the haulage ropes clear, and the gear is arranged for a speed of five miles per hour. The general design of this gear is very similar to the portable main rope, and it is designed to meet the requirements for a portable haulage where the gradient is not sufficient to enable the tubs to self-act the whole way.

Two haulage gears for the James Ross & Co.'s shale mines were also on view. The larger of these haulages, which is of 300 h.p., is for dealing with tubs on a gradient of 29 in. to the yard, or an angle of 53°, and is practically a winding engine. Two drums are used, one for the ascending, and one for the descending cages, one of the drums being provided with a jaw clutch, so that the position of the cages in the shafts can be adjusted on the incline. The maximum rope speed is 12 miles per hour, and the complete winding is calculated to take about 60 seconds. The load is 7 tons, which is raised through a total vertical lift of 773 ft. on an incline 960 ft. long. The motor, which runs at 465 r.p.m., is mounted at the side of the winder on separate slide rails, and drives through machine-cut helical gear. An automatic overwinding device is provided, which in case of an overwind cuts off all current to the motor and applies the post brakes by tripping a dead weight. This overwinding device is fitted to the depth indicator. A platform is provided about the level of the drum shaft on which the driver's seat is arranged, and this platform is extended all round the gear so as to give access to all parts, and is provided with stairs. Below the platform the space is partly bricked in and partly enclosed with flat mesh work, so as to enclose the winding engine and prevent access by unauthorised persons.

The smaller 100-h.p. haulage is for dealing with tubs on a gradient of 9 in. to the yard, 320 yards long, rising to 773 ft. vertical. The greatest load is 2 tons, and the maximum speed of rope 600 ft. per minute; time of a wind is about 120 seconds. The same arrangement of platform, overwinding gear, &c., is provided in this case.

Two electrically-driven ram pumps were also in course of construction for the Consett Iron Co. Each pump is designed to deliver 650 gallons per minute against a head of 470 ft., and is driven by a 120 h.p. motor through helical gear. A pump driven by a 40-h.p. motor was also in hand for the Wemyss Coal Co. This contract comprises in addition ironclad switchgear, and starter for controlling the motor, together with a special arrangement of bye-pass and relief valve, which enables the pump to be started, delivering the water back to the sump and the head applied gradually. Another speciality of the firm is a portable pumping set, which is made in a variety of sizes.

ELECTRICAL MINING PATENTS IN DECEMBER

THERE were only two patents published during December which can be said to be connected particularly with the applications of electricity in mines. The first of these is No. 21,693 of 1908, published on Dec. 9th. This was taken out by R. Rutherford, of Ferryhill, Durham, and describes a system of signalling in connection with haulage or winding plant. The apparatus consists of a number of electrically illuminated indicators, which are operated from different points by means of multiple-way switches. These switches are connected in series so that a signal cannot be given unless all are in the same position. The indicators are divided into compartments; thus six illuminated panes may be used, carrying the inscriptions, "Shaft work," "Coal work," "Men Riding," "Stop," "Change decks," and "Ready." The circuits of the lamps in the first four compartments, indicating the nature of the operation being or to be performed, are closed when the various switches are put in the corresponding positions. The remaining two circuits are each controlled by a switch provided with an electromagnetic device to hold it in the closed position until the work has been performed, when a device worked from a moving part of the winding engine closes the circuit of the magnet, opens the switch and extinguishes the lamps, showing that the work has been done. A bell-signalling system is used in conjunction with this visual signalling apparatus.

The other patent, also published on Dec. 9th, is by D. Lewis, of Gwaun-cae-gurwen, Glamorganshire, and describes an electrical apparatus for igniting miners' lamps. This comprises a box with lower and upper compartments. The lower compartment contains accumulators and an induction coil, and the upper compartment is divided into two parts. In one is the switch handle for closing the battery circuit, and the other is a gas-tight compartment for the lamp. A sliding door is so arranged that the switch cannot be closed unless the gas-tight compartment containing the lamp is completely closed.

Dispute re South Wales Colliery Plant.—As mentioned in our issue for December 16th, the Electrical Co., Ltd., are taking an action against Oliver H. Thomas Son & Co., proprietors of the Llynvi Valley Colliery, near Maesteg, for the recovery of £2,707 for electrical plant delivered at the colliery. A counter-claim has been entered by the defendants for £30,100. The proceedings originated before Mr. E. J. Pollock, official referee, at the Swansea Town Hall, but were subsequently transferred to London, and were continued down to the Christmas recess at the Royal Courts of Justice. The facts of the case are as follows:—The Electrical Co. contracted to supply certain electrically-driven pumps for unwatering of the Llynvi Valley Colliery, which the proprietors allege were unsuitable and defective. The terms as regards payment were that 60 per cent. was to be paid on delivery, 30 per cent. on starting, and 10 per cent. in three months later. The amount of the claim, namely, £2,707, was balance of account. The counter-claim is on account of the alleged inability of the defendants to enter certain workings owing to obstruction by the machinery installed, and also for unreasonable delay in supplying one of the centrifugal pumps. Mr. Abel Thomas, K.C., M.P., and Mr. John Sankey, K.C., appeared for the plaintiffs, and Mr. B. F. Williams, K.C., and Mr. Meager appeared for the defendants. Mr. J. Stottner, formerly manager to the Electrical Company, gave evidence to the effect that the plant was working satisfactorily on the occasions upon which he inspected it after erection, and that if it got out of order at any time it was due to the inexperience of the colliery officials in charge of it. Special care was taken with the construction of this plant, owing to the desire of the firm to supply a number of other mines in South Wales with similar plant. The conduct of the case has consisted to a large extent of the reading of the voluminous correspondence which has taken place between the plaintiffs and the defendants, this occupying several days. A further hearing of the case will be continued when the Courts resume their sittings.

MANUFACTURE OF TUNGSTEN FILAMENTS

The B.T.-H. Co. claim the Master Patent for Filaments drawn from Ductile Tungsten Alloys

ON August 19th, 1908, the Siemens & Halske Akt.-Ges. of Berlin applied for a British patent to cover a process for manufacturing bodies of tungsten, or of alloys of tungsten and nickel. The application is numbered 17,438, of 1908, and the date claimed for the patent, under the International Convention, is September 26th, 1907, which is the date of the application in Germany. The German patent is in the name of the Siemens & Halske Akt.-Ges., and is numbered 312,701. The complete British specification was accepted, and was published on April 22nd, 1909, and an abstract appeared in ELECTRICAL ENGINEERING, April 29th, 1909. On June 7th following, opposition to the grant of the patent was entered by the British Thomson-Houston Co., of Rugby, on the ground of anticipation by the British patent No. 23,335, of 1906. They also affirm that the invention is not sufficiently or fairly described in the complete specification. The Comptroller decided to grant the patent, with certain amendments to the specification, but this decision has been appealed against.

The specification in question, No. 17,438, of 1908, is a translation, by the Patent Agent, from the corresponding German specification, and gives the following particulars of the process:—

According to the present invention, objects of tungsten and nickel are made by intimately mixing the two metals and sintering them together by heating below the melting point of tungsten. There is thus produced a ductile mass which can be further worked by drawing, rolling, or hammering. As compared with directly melting together tungsten and nickel, this process has the advantage that the difficulties of fusion are avoided and that vaporisation of the nickel, generally unavoidable when the tungsten is fused, is obviated. When the nickel amounts to 10 to 12 per cent., the alloy is nearly insensitive towards chemical reagents, possesses surprising elasticity and great hardness, and can be easily hammered, rolled, or drawn. If objects of pure tungsten are to be made, the nickel can be expelled by heating in a vacuum. In the case of lamp filaments, the heating is advantageously effected by passage of a current through the rolled wire. If less than 60 per cent. of tungsten is present, the removal of the nickel by a current in a vacuum is not possible without melting the alloy. If less than 1 per cent. of nickel is present, the ductility of the alloy is not sufficient. Even with 4½ per cent. of nickel the ductility is still very low, and only with some 5 per cent. and more is an alloy obtained which fulfils all the requirements. A most suitable alloy consists of a mixture of about 85–95 per cent. of tungsten and 15–5 per cent. of nickel, more especially 90 per cent. of tungsten and 10 per cent. of nickel.

In order to obtain an intimate combination, the metals are mixed in the form of easily reducible chemical compounds; for example, tungsten powder may be mixed with nickel oxide, or tungstic acid with nickel oxide, or colloidal tungsten compounds with nickel powder. The reduced tungsten, being finely divided, unites with the nickel intimately and sinters with it to a very ductile mass.

A colloidal solution of a tungsten compound forms a most suitable medium to bind together the materials, and a rod is formed from the mixture. This rod may be about 20 to 30 cm. in length and of about 1–2 mm. in diameter. The rod dries very easily, and is then placed in an electrically-heated tube made of carbon reinforced with quartz. A stream of hydrogen is passed through the tube and the temperature gradually increased until the reduction is completed. When this condition has been attained the temperature is cautiously raised until it is about 1,510° C., and after heating at this temperature for some 50 seconds, a ductile rod is obtained.

The three claims attached to this specification are:—

1. The herein described manufacture of objects of an alloy of nickel and tungsten, by uniting the tungsten with the nickel by sintering the metals together at a temperature below the melting point of the tungsten to form a ductile mass, and then fashioning this mass by mechanical working such as rolling or drawing.

2. The modification in which, after the fashioning operation the nickel added to the tungsten is partially or completely expelled by strongly heating in a vacuum, substantially as described.

3. The modification wherein one of the metals to be combined is used in the form of a reducible compound in order to obtain by the reduction an intimate mixture of the constituents and to facilitate the sintering, substantially as described.

The Patent, No. 23,335, of 1906, put forward by the British Thomson-Houston Co., as an anticipation of the above invention, was granted to W. C. Arsem, of Schenectady, U.S.A., and was assigned by him to the British Thomson-Houston Co. The complete specification describes the process as follows:—

This process is applicable in the treatment of refractory metals such as tungsten, thorium, and molybdenum. The powdered refractory metal is mixed with a less refractory metal, and the mixture is heated to such a temperature that the less refractory metal fuses. An alloy is thereby formed, even though the temperature of fusion is very much lower than the melting point of the more refractory component. Alloys so produced are in some instances ductile, and can be rolled and worked into filaments. The more volatile metal may then be driven off by heat or may be otherwise removed. Although the invention is described in the following with regard to molybdenum, it is applicable to tungsten and other metals. Powdered molybdenum is mixed with an equal part of a ductile metal, such as copper, and the mixture is compressed into a solid lump. This lump is then heated to such a temperature that the ductile metal fuses. The alloy formed is then rolled, or drawn through a die, to produce wires of the proper cross section for lamp filaments, and these are heated in a vacuum or in an inert atmosphere to drive out the copper or other foreign metal. The molybdenum is not left porous by the vaporisation of the copper, but seems to solidify into a dense product. To effect the vaporisation of the copper, a current may be passed through the filaments or they may be heated in a furnace. The temperature of this treatment is somewhat above the vaporising point of copper. The ductile metal serves as a means to draw together the fine particles of the molybdenum or other powder, and subsequently passes off as vapour and leaves these particles cemented together into a strong homogeneous malleable product.

There are four claims to this specification:—

1. The process of manufacturing an electric conductor of refractory metal which consists in mixing the metal with less refractory metal, heating the mixture to fuse the less refractory metal and then treating the mixture to remove the less refractory metal and leave a coherent body of refractory metal.

2. The process of manufacturing an electric conductor of refractory metal which consists in forming an alloy of the metal with a metal having a lower vaporising point, shaping the alloy into wires, or the like, and then heating the wires in a vacuum or inert atmosphere to remove the lower vaporising metal and leave a coherent conductor of refractory metal.

3. In the manufacture of electric conductors as hereinbefore claimed the employment of an alloy or compound of refractory metal and copper.

4. Incandescent electric lamp filaments or conductors of refractory metal manufactured substantially as hereinbefore described and claimed.

At the hearing before the Acting Comptroller, Mr. A. Cliff, both parties were represented by their patent agents; Mr. Bloxam appeared for the applicants, and Mr. J. Gray for the opponents. Declarations were filed by Dr. M. S. von Pirani on behalf of the applicants, and by Mr. H. H. Needham and Mr. Gray on behalf of the opponents. Mr. Gray asserted that the B.T.-H. Co.'s patent, No. 23,335 of 1906, was a master patent for "a process of forming electric conductors by incorporating tungsten with a less refractory and more readily vaporisable metal to form a ductile alloy or mixture which is then shaped into conductors and subsequently treated to remove the vaporisable metal and leave a coherent conductor of tungsten." Mr. Bloxam admitted that the process covered by the applicants' claims 1 and 2 differs from the B.T.-H. process only in the selection of nickel, and Mr. Cliff does not consider that this constitutes a sufficient difference to support a patent, as it was admittedly known at the date of the opponents' patent that nickel alloys with tungsten. Mr. Bloxam denied, however, that the B.T.-H. patent was a master patent requiring a specific reference, and in support of this referred to seven earlier patents; but Mr. Gray argued that none of these disclosed a process for producing a coherent body of pure tungsten as set forth in his declaration as to a master patent. On the second ground of opposition, it was argued that the known B.T.-H. process is not sufficiently covered by the existing disclaimers in the specification, and that the alleged invention as distinguished from that covered by the B.T.-H. patent is not fairly indicated by claims 1 and 2.

Digitized by Google

After referring to the above arguments, Mr. Cliff, in his written decision, concluded that the insertion of a specific reference to the B.T.-H. Arsem patent is necessary, and that claims 1 and 2 must be deleted, as the process they claim is substantially the same as the B.T.-H. process. He suggested the additional amendment of the specification by deletion of the words "According to . . . is obviated" at the beginning, and an amendment to the remaining claim which would have made it read as follows:—"The manufacture of objects of tungsten or of an alloy of nickel and tungsten by the process described, wherein one or both of the metals to be combined is used in the form of a reducible compound in order to obtain by the reduction an intimate mixture of the constituents and to facilitate the sintering, substantially as described." This decision was dated October 15th, 1909. The applicants were, however, given the option of retaining claims 1 and 2 if they were restricted by the addition of the specific proportions of the materials described in the specification.

A supplementary decision, dated November 26th, 1909, states that this option has been exercised, and that the specification is to be amended as follows:—(1) The insertion of "*containing not less than* 60 *and not more than* 95 *per cent. of tungsten*" before "by uniting" in claim 1. (2) The insertion of "*of the process claimed in claim* 1" after "modification" in claim 2. (3) The insertion of "*or both*" after "one" in claim 3. The deletion of the paragraph referred to in the earlier decision and the insertion of the specific reference to the B.T.-H. Arsem patent are also required.

Notice of appeal to the Law Officer from these decisions of the Acting Comptroller-General was entered on December 17th, 1909, by the Siemens & Halske Akt.-Ges., but as there is a long list of cases to be heard before this one, it may be some months before the result will be known. The hearing will take place in the Law Officer's Room at the Law Courts, and will be private.

REVIEWS OF BOOKS

Proceedings of Thirty-second Convention (1909) of the National Electric Light Association. Three volumes. 9¼ in. by 6¼ in. (New York: The Association.)

THE proceedings of the Convention of the American National Electric Light Association, which was held at Atlantic City last June, have been issued complete in the form of three handsomely bound volumes. The reports of a number of committees appointed by the Association to investigate various subjects are included, and about 50 Papers, which were read, together with the discussions thereon. A useful feature is the provision of a collection of short abstracts of the Papers and reports, arranged alphabetically according to author, which forms a summary of the contents of the whole three volumes. For the sake of convenience, this is repeated in each volume, and is placed at the beginning. The subjects of the Papers are very diverse, and cover practically the whole range of the electric lighting industry, including not only engineering matters relating to supply and utilisation of electric current for illumination, but also details of the no less important business side of such undertakings. Electric supply for power purposes is also dealt with to a certain extent. The first volume contains reports, Papers, and discussion before the Association in general session, while the second volume forms the proceedings of the technical and commercial sections, and the last volume is devoted to the accounting and executive and public policy committees.

"Practical Engineer" Electrical Pocket Book and Diary, 1910. 566 pp. 5½ ins. by 3½ ins. (London and Manchester: Technical Publishing Co.) 1s.

THERE are evidences of a good deal of revision of this pocket book since the last edition, including some bringing up to date of the section on dynamo design, &c., which is again in the hands of Mr. C. C. Hawkins. Additions are to be found also in the following sections:—Storage batteries, motor-starters, the International candle, transformers, wiring systems, and lamps, though the last-mentioned is not as up-to-date as it might be. The obsolete Osmium lamp, for example, is spoken of as not yet in the commercial stage. The range of sizes of some metal filament lamps is also not quite complete.

The Practical Electrician's Pocket Book and Diary for 1910. 349 pp. 5 in. by 4 in. With illustrations (London: S. Rentell & Co., Ltd.) 1s.

IN revising this pocket book for the 1910 issue, Mr. H. T. Crewe, the editor, has found a certain amount of bringing up to date necessary, especially in the sections relating to gas, oil, and petrol engines, rope driving, polyphase machinery, metal filament lamps, time switches, &c., whilst additional matter treats of cheap wiring systems, auto-transformers, instructions to chargemen, and other subjects. In addition to over 300 pages of useful information a diary is included, as well as a collection of estimating forms for wiremen and others.

"Practical Engineer" Pocket Book and Diary, 1910. 670 pp. 5½ in. by 3½ in. (London and Manchester: Technical Publishing Co.) 1s.

A CERTAIN amount of new matter has been introduced into this year's edition of this pocket book, and additional information has been embodied in the revision of the older sections. The principal subjects which it has been found necessary to bring up-to-date are fuel testing, condensers, friction of air and water in pipes, alloys, pyrometry, suction-gas producers, emery grinding, &c. No attempt is made to exceed the limits of the real pocket book of reference, with the result that space has been found for an amount of really useful data, which compares very well with that in similar publications at a much higher price.

Who's Who, 1910. 2162 pp. **Who's Who Yearbook, 1910.** 162 pp. **Englishwoman's Yearbook, 1910.** 382 pp. **Writers' and Artists' Yearbook, 1910.** 127 pp. 7½ in. by 5 in. (London: A. & C. Black.) 10s., 1s., 3s. 6d., 1s.

MESSRS. BLACK'S Who's Who needs no commendation from us. The fact that it now reaches 2162 pages is sufficient evidence that a biographical notice is given to everybody who is anybody. The Who's Who Yearbook consists of the tables which were formerly such a popular feature in Who's Who itself, and they include many original tables not to be found elsewhere. The two books—the small one being a key to the larger one—seem to have made themselves indispensable in every section of life. The Englishwoman's Yearbook deals with all subjects specially appealing to ladies in matters of education, professions, philanthropy, sport, &c. The Writers' and Artists' Yearbook is a directory for writers, artists, and photographers, and should do much to solve the difficulty of knowing where to place articles, &c.

Hazell's Annual, 1910. 608 pp. 7½ in. by 5 in. (London: Hazell, Watson & Viney, Ltd.) 3s. 6d.

THE twenty-fifth edition of this annual contains a number of new features. In the first place, the contents of the volume have been rearranged in order to bring together articles upon closely related subjects. Another new feature is the introduction of signed articles upon some of the larger topics of the day, including one by Sir Oliver Lodge on the new physics. Brief reviews are also given relating to electrical supply, traction, motors, and omnibuses.

CORRESPONDENCE

THE T.A.C. TRAIN LIGHTING SYSTEM.

[TRANSLATION.]

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Being a subscriber to your journal, I have read in the issue of December 9th, 1909, a description under the title "The T.A.C. Train-lighting System" of a so-called new system of train lighting of the Tudor Accumulator Co., Ltd. (119 Victoria Street, S.W.). The system there described is in all its details without exception a rigorous copy (*copie servile*) of a system which I invented, patented, and worked in 1898, and has hitherto been described under my name in all publications dealing with the matter.

I may add that my system is worked in Russia by the Cie. Russe des Accumulateurs Tudor, with a single battery and iron-wire resistances. The English Tudor Company, in bringing out their servile copy of this arrangement, might at least have had the good taste not to describe as new a system which, as I am in a position to prove absolutely, is entirely my property.

I must ask you to be so good as to publish this letter in your next issue in the interests of the truth.

Yours, &c.,

C. VICARINO

(Director *Cie. Generale Electrique, Nancy.*)

Nancy, 29th Dec., 1909.

[We have sent a copy of this letter to the Tudor Accumulator Co., who will reply in our next issue.—ED. E. E.]

Royal Society of Arts—Among the lectures to be given this session are "The Japan-British Exhibition," by Count Hirokichi Mutsu, January 19th, and "An Improved Method of Electroplating," by A. Rosenberg, February 2nd.

Engineering and Machinery Exhibition, Manchester.—We have received some further particulars of the arrangements for the forthcoming Engineering and Machinery Exhibition at Manchester in October next, which is being organised by the proprietors of the *Engineering Review*. Space is to be charged for at rates from 3s. to 4s. per square foot, according to position, and exhibitors desiring electricity for power will be charged net rate fixed by the Manchester Corporation, which will not exceed 1½d. per unit. The voltage for 3 h.p. and over is 400. Electricity for this purpose is 200 volts, and will be charged at net rate, but the management will, if desired, supply exhibitors with 16-c.p. lamps at 10s. 6d. per lamp (including cost of electricity) for the period of the exhibition.

THE CLAPHAM FIRE

CAUSED THROUGH BREAKAGE OF A LAMP

THE inquest upon the victims of the disastrous fire on December 20th, at the premises of Messrs. Arding & Hobbs, drapers, and general furnishers, Lavender Hill, London, was continued by the Coroner for the South-Western District (Mr. J. Troutbeck), on Thursday last, and was concluded on Tuesday. The number of persons who lost their lives has now been fixed at eight, including two bodies which are unrecognisable, and one which has not been discovered. The premises are at the junction of Lavender Hill and St. John's Road, and the fire involved the total destruction of a long row of shops in both thoroughfares, and also considerable damage to adjacent property.

The fact that the fire was said to have been caused by the electrical installation in one of the windows lent additional public interest to the inquest, which occupied three long sittings. The fire originated in a shop window, which was, until early in December, lighted by gas, but in connection with a scheme of decoration for Christmas, two gas pendants were removed and electric lighting installed instead. The work of carrying out this installation was entrusted to Messrs. Holmes & Cooper, 160 The Grove, Wandsworth, who had been employed by Messrs. Arding & Hobbs for some years. Verbal instructions were given to do the work in the best possible manner, no limitation as to price being made. The scheme of decoration and lighting decided upon for this particular window was to have two shelves joined together by a sloping board surmounted by a vertical board, nine inches high, the total height at the back of the window being 2 ft. 6 in. All these shelves and boards were covered with cotton-wool (as shown in the sketch, Fig. 1), and upon this

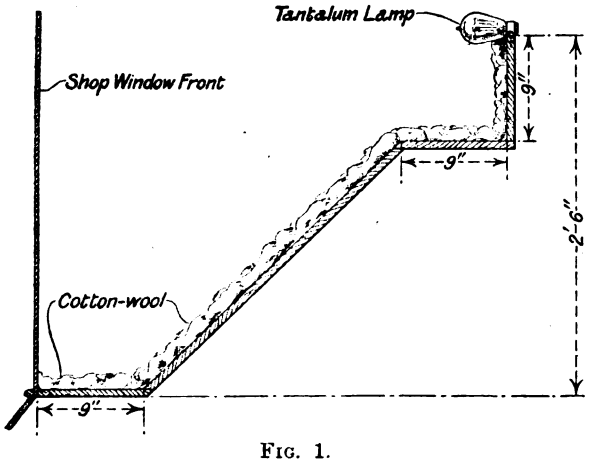

FIG. 1.

were displayed about 100 celluloid combs, a large number of tortoiseshell combs, jewellery, &c. On the top of the vertical nine-inch board were clamped lamp-holders, arranged so that the lamps would be at right angles to the board, and projecting over it into the window. Where the lamps projected the cotton-wool was cut away in a circle. There were in all 20 16-c.p. tantalum lamps, arranged two in series on a 240-volt circuit, the wiring being by means of 24/40 flexible. The length of the window was about 25 ft., so that the lamps must have been at about 1 ft. 3 in. centres. All the previous work carried out by this firm of contractors in the buildings had been in accordance with the Phœnix Fire Office rules, but on this occasion these had not been adhered to strictly, as one of their rules is that flexible cord conductors must not be used for shop-window lighting where there are inflammable goods, except in efficient flame-proof covering, and this was not done. It may also be mentioned that no notice was given to the electric supply authority, *i.e.*, the Battersea Borough Council, that these extra lights were being added, apparently through a misunderstanding on the part of the contractors, who were under the impression that one of the partners would do this, as he had done on a previous occasion. Connection was made with the existing meter, which was a 50-ampere meter, the load thereon being 34·3 amperes, and the increase, owing to new lights, being 9 amperes. There was no suggestion that, as far as the actual work of installation was concerned, this was not efficiently carried out.

These, then, were the circumstances on the day of the fire. About 4.30 p.m. an assistant went to this window and reached into it with the object of obtaining a necklace, when, according to his account—and also to the accounts of others in the vicinity—he heard an explosion or loud noise, and immediately the cotton-wool was on fire. He attempted to beat it out with his hands, but the celluloid combs also caught fire, and in a very few seconds the whole window was ablaze. Beyond these very indefinite statements no other information was available as to what actually happened. The assistant who reached into the window in the present case was positive that he did not break a lamp by coming into contact with it in leaning over the board upon which they were placed. The wiring contractor suggested that the assistant, when leaning over into the window, had knocked a lamp and broken it, or leaned on to it and pushed it downwards. The result would be a short circuit of the filament of the lamp, and the full voltage would be transferred to the other lamp with which it was in series. This might have the effect of blowing out the filament of the second lamp, and he believed it was possible for a lamp to break from such a cause. The Coroner pointed out that this would have meant two explosions or noises, but there was no evidence to this effect. So far as the present installation was concerned, witness had an idea of the nature of the goods which were to be placed in the window, and warned the firm not to place them near the lamps. He felt that the installation was quite safe, after it was completed. It was possible that the heat from the lamps might be sufficient to set celluloid combs alight. On the question of giving notice, witness admitted, in cross-examination, that it was usual for the contractor to notify the electric supply authority when new work was added to the mains.

In order to assist in elucidating the point as to the breaking of lamps, Mr. S. G. Castle Russell, electrical adviser to the Phœnix Assurance Co., was called on behalf of Messrs. Arding & Hobbs. It appears that, so far as the fire insurance goes, Messrs. Arding & Hobbs had permission to add temporary lighting for Christmas, and until 1908 Mr. Russell had, in his private capacity, inspected all such additions. Last Christmas, however, Mr. Russell was not called in, forgetfulness being given as the reason. Mr. Russell stated that previous work in the buildings had been carried out in a perfectly satisfactory manner, the wires being run in screwed steel barrel, and all apparatus enclosed in cast-iron cases. No expense was spared to ensure security from fire. With regard to the cause of the fire in the present instance, Mr. Russell said that in his opinion it was very probably caused by the breaking of an electric lamp. It was quite possible for a globe to break due to atmospheric pressure. Another cause was that the filament would sag to such an extent as to touch the globe, and then it would in all probability break. On the question of

Digitized by Google

a broken filament setting fire to cotton-wool, he had made some experiments since the previous sitting with tantalum lamps, although the voltage was not quite the same as at Battersea. The tests were made at the General Electric Co.'s offices in Queen Victoria Street. In the first experiment, a tantalum lamp was suspended over dried cotton-wool at a distance of about three inches, and the globe broken with a hammer. The broken filament instantly set fire to the cotton-wool. No cut-outs or fuses went. In a second experiment the cotton-wool had not been dried, and was in the state in which it would be purchased. In this case, the cotton-wool did not catch fire, but it was very badly burned. The fuses on this occasion went. In a third experiment, a tantalum lamp was again suspended over cotton-wool at a distance of three inches. The cotton-wool was thinned out, and underneath the lamp was placed a celluloid telephone mouthpiece. On breaking the lamp, both the wool and the celluloid immediately caught fire.

In answer to questions by the Coroner, Mr. Russell said the danger of broken incandescent electric lamps was well known. They were forbidden in mines except in strong glass cases, and were also forbidden in gunpowder factories. He did not think that working engineers or wiring contractors gave sufficient thought to such questions. In cases of temporary wiring, such as this, he agreed that a consulting engineer should be called in. He was afraid that similar installations under similar circumstances were put in all over London. He regarded them as so dangerous as to recommend his company not to accept the insurance risk, and this had frequently been done. He understood that in the present case no lamps were nearer to the cotton-wool than nine inches, but his experiments were dangerous up to four inches, and undoubtedly the danger would be there at nine inches.

On this point we would refer our readers to the sketch Fig. 2. We have shown the lamps at 1 ft. 3 in. centres.

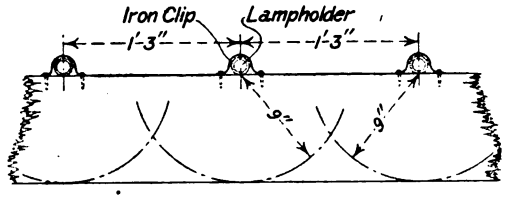

FIG. 2.

The upright board on which they were placed (see Fig. 1) was 9 in. high, and it was stated that the cotton-wool covered this, and was brought up to the top except for a space of 9 ins. around each lamp, where it was cut away. From Fig. 2. in which 9-in. circles are struck from each lamp, it is seen that there is a discrepancy in this, and that as the cotton-wool was brought to the top of the board between the lamps, it must have been considerably nearer to them than nine inches. One or two facts in regard to the occurrence may be of interest. It appears that the walls and ceilings of the buildings were made of match-boarding, and this, no doubt, accounted for the rapidity with which the flames spread, in conjunction with a strong wind blowing into the windows. It is also a fact that although the electricity was cut off at the main switch, the gas supply was not cut off.

In the course of his summing up, the Coroner said that undoubtedly electric light had great advantages compared with other illuminants, but no one would deny that there were fire risks in connection with it. It did not seem that the actual installation work was at fault, although it was surprising that no notice was given to the supply authority. The work also ought to have been supervised by a consulting engineer. He could not see that any blame was to be attached to Messrs. Arding & Hobbs for having used the lamps under such circumstances, but anyone doing so, in spite of the knowledge which had been gained as a result of that inquest, would involve themselves in very grave legal responsibilities.

The jury returned a verdict to the effect that the fire was due to the breaking of an electric lamp in one of the windows, and that the deaths of the eight victims were caused thereby. They regarded such window dressing as extremely dangerous.

After the circumstances of a disaster such as this have been fully investigated, it is our duty to consider whether they point to any modification in existing practice being necessary. We are, of course, not concerned with the question of fire drill and the effective arrangement of the fire appliances, but only with the actual cause of the fire, and the precautions that should be taken to render a repetition of the circumstances impossible. It is undeniable that of late the great safety and convenience of electric light have led to growing carelessness with regard to the surroundings of the lamps. No sane person would place highly inflammable materials, such as cotton wool and celluloid, in large quantities close to any other form of lamp. Yet the electric lamps employed in lighting the shop window in question were placed only nine inches above these materials, which had naturally become so thoroughly dried by the heat within the enclosed window that the merest spark or a single speck of glowing metal would have been sufficient to ignite them. We hesitate to accept the theory that a lamp broke of its own accord; but there is always a possibility of a lamp being smashed, and, in any case, the public should remember that even electric lamps are hot, and that the filaments within them retain their high temperature momentarily after the glass is broken. Neither in the illumination of shop windows nor in the lighting of ordinary rooms should inflammable materials be placed within a few inches of electric lamps, nor in such positions that they can come in contact with them. In fact, no other departure from present methods is needed than the exercise of ordinary common sense in the disposition of the lamps and their surroundings.

NEW PORTABLE SUCTION CLEANER

AN interesting development in electrical domestic apparatus is the "Arnold" portable suction cleaner, which is being placed on the market by Messrs. Drake & Gorham, Ltd. (66 Victoria Street, Westminster, London, S.W.). Contrary to some patterns of so-called "vacuum cleaners," this device is entirely self-contained. It comprises a small centrifugal blower, to the inlet of which is attached the fan-shaped mouth or suction nozzle. The blower is driven by a small high-speed motor. Nozzle, blower, and motor are built up together in a compact form, and are attached to the end of a pole, the whole having the appearance of an awkward-looking broom. Fitted over the exhaust pipe of the blower is the neck of a large cloth bag, the opposite end of which is attached to the pole. The dust is drawn up with the air by the blower, and the bag, which is always distended, allows the air to be blown through it, but acts as a filter and retains the dust, which can be removed afterwards. There is a ball-and-socket joint between the pole and the device proper, so that the cleaner can be adjusted to the convenience of the operator. A braided cable connects the motor to the wall-plug, and there is a switch on the motor case. The apparatus can be obtained with motors for any pressures from 100 to 250 volts, and the 200-volt pattern takes only 0·5 amp., or 100 watts. Thus, with a power rate of 2d. per unit, the cost of working would be only ½d. per hour, and only ¼d. per hour if run off the lighting circuit with a rate of 5d. per unit.

Telephone-Letters in London on Sunday.—Arrangements have been made whereby, in the absence of a Sunday delivery of letters in London, a combination of postal and telephone services will be inaugurated on Sunday next. This will enable country residents to post to London on Saturday afternoon letters the contents of which will be delivered by telephone on Sunday morning. In addition to the ordinary postage on the latter, a fee of 3d. per message of thirty words, and 3d. for each additional thirty words, has to be paid.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

CONTINUOUS CURRENT MOTORS.—No. E.E. 3 of the Phœnix Bulletin, issued by the Phœnix Dynamo Manufacturing Co., Ltd. (Thornbury Works, Bradford), contains very complete particulars of the company's series of continuous current motors. Not only is there a full description with excellent illustrations showing the detailed construction of the machines, but there is a good deal of information which, together with the views of motors applied to the driving of very diverse classes of machinery, will be found of use to those drawing up schemes for electric driving of works, &c. Particular attention should be drawn to the completeness of the lists of variable speed motors. A variation of as much as 6 to 1 (or in special cases even more) is obtainable by shunt regulation alone in consequence of the perfection of design of the auxiliary poles, in the application of which the company were pioneers. The company will be glad to send a copy of this issue of their bulletin to anyone interested.

METAL FILAMENT LAMPS AND FITTINGS.—A new catalogue from the Armorduct Manufacturing Co. gives particulars of a long range of sizes of "Gral" metal filament lamps for high and low voltages, together with accessories and fittings, including auto-transformers, series adapters, shock absorbers, cluster fittings, interior and exterior shop lighting, and other fittings of great variety and holophane, and other reflectors, globes, &c. Several new fittings are illustrated which make their appearance for the first time.

LINE MATERIAL.—A comprehensive new catalogue from British Insulated & Helsby Cables, Ltd., gives particulars of a great variety of poles, fittings, and tools for the erection of overhead telegraph and telephone lines. Both wood and iron poles are included, with suitable arms, brackets, supports, and other fittings, and a great deal of useful information regarding their use is given. The tool section is also very complete, and the utility of the list is enhanced by an alphabetical index.

ELECTRICITY SUPPLY.—A booklet entitled "The Electricity Consumer's Guide" is being issued by the Grimsby Corporation Electricity Department, with the object of providing would-be consumers with information of assistance in wiring and fitting up their premises for electric lighting and heating. The hints given are of a thoroughly practical nature, and the section on the choice of lamps is particularly useful.

THE I.C.S. STUDENT.—The January number of the Magazine of International Correspondence Schools, Ltd., contains, besides news of the doings of those connected with the Schools in various parts of the world, several articles of engineering interest, including a description of the new King's Dock, Swansea.

ARC LAMPS.—An illustrated leaflet is to hand from the Foster Arc Lamp & Engineering Co., Ltd. (Warple Road, Wimbledon, London, S.W.), giving particulars and prices of the "Q" type flame arc lamp. This lamp is fully described on another page of this issue.

ELECTRICITY IN LAUNDRY WORK.—The South Park Laundry (South Park Road, Wimbledon) have sent us postcards illustrating their stand at the Wimbledon Electrical Exhibiton of November last. Girls are shown manipulating electrically-heated flat irons of Messrs. Eastman & Warne's make, and an electric heater for goffering irons can also be seen.

ALLGEMEINE ELEKTRICITATS-GES.—A pamphlet is to hand from the Allgemeine Elektricitäts-Ges., of Berlin, containing a reprint (in German) of an article by Conrad Matschoss giving the history of the development of that company during the first twenty-five years of its existence.

AUTO-TRANSFORMERS.—A leaflet from the M. & C. Manufacturing Co. (Conduit Place, Paddington, W.) gives prices and particulars of auto-transformers for use with low-voltage metal filament lamps.

H.-T. SWITCHGEAR.—A folder from the British Thomson-Houston Co. illustrates and gives prices of oil switches and oil-switch panels for colliery and other work, either with slate panels or with the whole structure of iron plate.

TUBULAR FUSES.—The latest leaflet from Messrs. A. Reyrolle & Co. (Hebburn-on-Tyne) gives full particulars of the company's well-known tubular low-tension fuses, with a new list of code words and accurate drilling dimensions.

CALENDARS, &c.—An ingenious date-card, with the last two figures of 1910 in red, is being sent out by the Morgan Reeve Co. (12 Newgate Street, E.C.), who are well known in connection with advertising schemes. The card, which will be supplied to anyone on application, will be of special use during the first few weeks of the new year, as a reminder in dating letters, &c.

The same firm also issue a telephone card and a large sheet calendar for 1910, with particularly distinct figures. The company will be pleased to supply copies to firms who have not already received them on application.

A neat pocket calendar, diary, and engagement book accompanies the season's compliments from Messrs. Johnson & Phillips, Ltd., Victoria Works, Charlton, Kent.

The D.P. Battery Co.'s calendar is always attractive, and this year is decorated with a coloured view of Lumford Pack Horse Bridge, built in the fifteenth century, with the D.P. works (Bakewell, Derbyshire) in the background.

Messrs. S. Davis & Co. are issuing, at the price of half-a-crown, a bulky electrical engineer's diary, interleaved with blotting paper bearing advertisements of electrical plant and apparatus, and containing a quantity of useful information and tables relating to electric light and power, list of supply authorities, and tables showing in which London streets the different companies and borough councils have mains.

We have received a set of refill cards for their calendar of last year from Messrs. Venner & Co. (6 Old Queen Street, Westminster, S.W.). The company will be glad to send these to any possessor of last year's calendar who has not received them.

The pocket-book and diary issued by the British Electrical Trade Supply & Bitumen Co. is handsomely got up, and contains a well-chosen series of unit tables and a well-arranged collection of useful information. The company inform us that they will be very pleased to send copies of their pamphlet entitled "What is Bitumen?" (*see* ELECTRICAL ENGINEERING, December 9th, page 1044) to anyone who has not already received it.

WIRELESS TELEGRAPHY

Arrangements have been concluded by the Marconi Wireless Telegraph Co. for the equipment of the Donaldson Line steamers *Athenia, Cassandra,* and *Saturnia.*

At a conference of representatives of the Australian Admiralty, the Commonwealth, New Zealand, and Fiji, which recently met at Melbourne to consider the question of wireless telegraphy in the Pacific, the establishment of high-power stations at Sydney, Doubtless Bay (N.Z.), Suva, and Ocean Island, and medium-power stations in the New Hebrides and Solomon Island was recommended. All the stations will be under Government control.

The Electrical World of New York states that Representative Roberts, of Massachusetts, has introduced a resolution in the House at Washington providing for the creation of a Wireless Telegraph Board. The duties of the Board, according to the resolution, shall be "to prepare a comprehensive system of regulations to govern the operation of all wireless plants afloat and ashore which come under the cognisance of the United States, with due regard for Government and commercial interests." It is provided that within thirty days of the appointment of the Board a report, with recommendations, shall be submitted to Congress. The Board is to consist of seven members, consisting of "one expert each from the War, Navy, and Treasury Departments, three experts representing commercial wireless telegraph and wireless telephone interests, and one scientist well versed in the art of electric-wave telegraphy and telephony.

Railways and Tramways Competition.—In consequence of the competition of the electric tramways in North Greenwich, Poplar, Canning Town, and Cheshunt, the Great Eastern Railway Co. have decided to make further reductions in their fares.

Fire at an Underground Sub-station in Shoreditch.—On December 30th last a fire broke out in an underground sub-station in Clifton Street, Finsbury, belonging to the Shoreditch Borough Council. The sub-station contains some motor-generators, but these were not damaged. It appears that the cables in a trench under the floor caught fire, but the origin of the outbreak is unknown. The damage was confined to the cables, and fortunately the fire occurred in the morning, so that there was ample time to repair the damage before the night load came on. We understand that everything was in working order six hours after the outbreak, and that the supply was only slightly disturbed.

The Constantinople Telephone Contract.—In a letter to the *Times* on Friday, Mr. H. Laws Webb states briefly the facts relating to the agreement for the future telephone service of Constantinople. As already stated in our columns, this contract has been placed in the hands of a syndicate consisting of the National Telephone Co., Ltd., British Insulated & Helsby Cables, Ltd., Western Electric Co. (Chicago), and the French Thomson-Houston Co., Ltd. Mr. Webb states that the contract for which proposals were invited is the construction and operation of a telephone system to serve the whole of Constantinople. The original conditions consisted of 47 articles, and the Committee appointed by the Minister of Finance was composed of technical officers of the postal, telegraph, and public works departments, and was presided over by the Under-Secretary of Finance, an official of well-known uprightness. The Committee spent five weeks adjudicating upon the offers sent in, with the result that the proposals of the syndicate mentioned above were accepted. According to the rating of the Committee, there was over 100 per cent. difference between this tender and the tender placed second. It is proposed to form the Telephone Company of Constantinople to carry out the scheme.

ELECTRICITY IN LAUNDRY WORK. The South Park Laundry (South Park Road, Wimbledon) have sent us postcards illustrating their stand at the Wimbledon Electrical Exhibiton of November last. Girls are shown manipulating electrically-heated flat irons of Messrs. Eastman & Warne's make, and an electric heater for goffering irons can also be seen.

ALLGEMEINE ELEKTRICITATS-GES. A pamphlet is to hand from the Allgemeine Elektricitats Ges., of Berlin, containing a reprint (in German) of an article by Conrad Matschoss giving the history of the development of that company during the first twenty-five years of its existence.

AUTO-TRANSFORMERS. A leaflet from the M. & C. Manufacturing Co. (Conduit Place, Paddington, W.) gives prices and particulars of auto-transformers for use with low-voltage metal filament lamps.

H.-T. SWITCHGEAR.—A folder from the British Thomson-Houston Co. illustrates and gives prices of oil switches and oil-switch panels for colliery and other work, either with slate panels or with the whole structure of iron plate.

TUBULAR FUSES.—The latest leaflet from Messrs. A. Reyrolle & Co. (Hebburn-on-Tyne) gives full particulars of the company's well-known tubular low-tension fuses, with a new list of code words and accurate drilling dimensions.

CALENDARS, &c.—An ingenious date-card, with the last two figures of 1910 in red, is being sent out by the Morgan Reeve Co. (12 Newgate Street, E.C.), who are well known in connection with advertising schemes. The card, which will be supplied to anyone on application, will be of special use during the first few weeks of the new year, as a reminder in dating letters, &c.

The same firm also issue a telephone card and a large sheet calendar for 1910, with particularly distinct figures. The company will be pleased to supply copies to firms who have not already received them on application.

A neat pocket calendar, diary, and engagement book accompanies the season's compliments from Messrs. Johnson & Phillips, Ltd., Victoria Works, Charlton, Kent.

The D.P. Battery Co.'s calendar is always attractive, and this year is decorated with a coloured view of Lumford Pack Horse Bridge, built in the fifteenth century, with the D.P. works (Bakewell, Derbyshire) in the background.

Messrs. S. Davis & Co. are issuing, at the price of half-a-crown, a bulky electrical engineer's diary, interleaved with blotting paper bearing advertisements of electrical plant and apparatus, and containing a quantity of useful information and tables relating to electric light and power, list of supply authorities, and tables showing in which London streets the different companies and borough councils have mains.

We have received a set of refill cards for their calendar of last year from Messrs. Venner & Co. (6 Old Queen Street, Westminster, S.W.). The company will be glad to send these to any possessor of last year's calendar who has not received them.

The pocket-book and diary issued by the British Electrical Trade Supply & Bitumen Co. is handsomely got up, and contains a well-chosen series of unit tables and a well-arranged collection of useful information. The company inform us that they will be very pleased to send copies of their pamphlet entitled "What is Bitumen?" (*see* ELECTRICAL ENGINEERING, December 9th, page 1044) to anyone who has not already received it.

WIRELESS TELEGRAPHY

Arrangements have been concluded by the Marconi Wireless Telegraph Co. for the equipment of the Donaldson Line steamers *Athenia, Cassandra,* and *Saturnia.*

At a conference of representatives of the Australian Admiralty, the Commonwealth, New Zealand, and Fiji, which recently met at Melbourne to consider the question of wireless telegraphy in the Pacific, the establishment of high-power stations at Sydney, Doubtless Bay (N.Z.), Suva, and Ocean Island, and medium-power stations in the New Hebrides and Solomon Island was recommended. All the stations will be under Government control.

The Electrical World of New York states that Representative Roberts, of Massachusetts, has introduced a resolution in the House at Washington providing for the creation of a Wireless Telegraph Board. The duties of the Board, according to the resolution, shall be "to prepare a comprehensive system of regulations to govern the operation of all wireless plants afloat and ashore which come under the cognisance of the United States, with due regard for Government and commercial interests." It is provided that within thirty days of the appointment of the Board a report, with recommendations, shall be submitted to Congress. The Board is to consist of seven members, consisting of "one expert each from the War, Navy, and Treasury Departments, three experts representing commercial wireless telegraph and wireless telephone interests, and one scientist well versed in the art of electric-wave telegraphy and telephony.

Railways and Tramways Competition.—In consequence of the competition of the electric tramways in North Greenwich, Poplar, Canning Town, and Cheshunt, the Great Eastern Railway Co. have decided to make further reductions in their fares.

Fire at an Underground Sub-station in Shoreditch.—On December 30th last a fire broke out in an underground sub-station in Clifton Street, Finsbury, belonging to the Shoreditch Borough Council. The sub-station contains some motor-generators, but these were not damaged. It appears that the cables in a trench under the floor caught fire, but the origin of the outbreak is unknown. The damage was confined to the cables, and fortunately the fire occurred in the morning, so that there was ample time to repair the damage before the night load came on. We understand that everything was in working order six hours after the outbreak, and that the supply was only slightly disturbed.

The Constantinople Telephone Contract.—In a letter to the *Times* on Friday, Mr. H. Laws Webb states briefly the facts relating to the agreement for the future telephone service of Constantinople. As already stated in our columns, this contract has been placed in the hands of a syndicate consisting of the National Telephone Co., Ltd., British Insulated & Helsby Cables, Ltd., Western Electric Co. (Chicago), and the French Thomson-Houston Co., Ltd. Mr. Webb states that the contract for which proposals were invited is the construction and operation of a telephone system to serve the whole of Constantinople. The original conditions consisted of 47 articles, and the Committee appointed by the Minister of Finance was composed of technical officers of the postal, telegraph, and public works departments, and was presided over by the Under-Secretary of Finance, an official of well known uprightness. The Committee spent five weeks adjudicating upon the offers sent in, with the result that the proposals of the syndicate mentioned above were accepted. According to the rating of the Committee, there was over 100 per cent. difference between this tender and the tender placed second. It is proposed to form the Telephone Company of Constantinople to carry out the scheme.

LOCAL NOTES

ABERDEEN: *Supply to Tramways Co.*—The Electricity Committee have once again discussed the situation arising out of the refusal of the Aberdeen Suburban District Tramways Co. to accept the award of Mr. W. H. Patchell regarding the price which they shall pay the Corporation for electrical energy. It was stated that counsel's opinion had been received as to the ways in which the award might be enforced, and it has been decided to remit the whole matter to the Town Council.

BARTON-UPON-IRWELL: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1906.

BECKENHAM: *Mechanical Stokers.*—Messrs. Kincaid, Manville & Dawson, consulting engineers to the Council, have written stating that the two mechanical stokers recently installed have satisfactorily passed the prescribed tests, and recommend authority being given to fit a mechanical stoker to an additional boiler.

BRADFORD: *Removal of Electricity Department Offices.*—The offices of the Corporation Electricity Department have been removed from temporary premises at Whitaker Buildings, Victoria Square, to the newly completed extensions at the Town Hall. A small showroom has been fitted up adjacent to the inquiry office, and two installations of the Moore vacuum tube light—one yellow, for general office lighting, and another white, to demonstrate colour matching—are to be erected.

DUBLIN: *Proposed Increase in the Electricity Charges.*—A report has been prepared by the Electric Lighting Committee setting out the position of the electrical undertaking. It is pointed out that metal filament lamps have resulted in a saving to consumers of at least £15,000 during the past year, and, in view of the fact that the undertaking is being worked at a loss, the Committee think it not unreasonable that they should receive some benefit from the new lamp. They accordingly recommend that the rate for lighting purposes should be increased by 10 per cent. In a letter from the City Treasurer, which is appended to the report, it is stated that the bank overdraft now amounts to over £43,000, and that no provision is being made for renewals or depreciation. The City Treasurer states that if the Committee cannot induce the Council to approve of the readjustment of the lighting charges, he will be forced, for his own safety, to refuse to allow the Committee to avail themselves of existing credit balances of other accounts as a means of carrying on the undertaking. At the meeting of the Corporation on Monday, it was decided to increase the electric lighting charges by 10 per cent. as proposed, for one year.

GRANGEMOUTH: *Electric Lighting.*—Negotiations have been taking place between the Council and the Scottish Central Electric Power Co. for the company to take over the Council's Electric Lighting Order. The agreement between the parties is now practically completed.

INDIA: *Bombay: Tramway Fares.*—The Bombay Electric Supply and Tramways Co. have placed certain proposals before the Corporation with regard to a revision of the existing tramway fares. They state that there is nothing in the conditions governing the working expenses of tramways in Bombay to justify the existing unreasonably low fares. At present the average fare is one anna per passenger, a return which they claim is not commensurate either with the cost of operation or with the character of the company's service. They now ask for sanction to increase some of the long-distance fares.

Madras: Condition of the Tramway Track.—In consequence of complaints received as to the condition of the permanent way and rolling stock of the Madras Electric Tramways Co., the Madras Government have requested the Madras Corporation to instruct its Engineer to make periodical inspections.

LEYLAND: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1902.

LIVERPOOL: *Electric Supply Charges.*—Mr. A. B. Holmes, the Corporation's consulting electrical engineer, has prepared a report upon the charges for electric lighting and power. With regard to the present maximum charge of 3½d. per unit for lighting to the ordinary consumer, and the minimum charge of 1½d. per unit for lighting, and ½d. per unit for power to exceptionally large consumers, Mr. Holmes does not consider these unreasonable, and is unable to recommend any alterations. He calls attention, however, to the system of charging a fixed sum per annum on the rateable value of houses in use at Norwich, and recommends a trial of this system for twelve months for houses of a rateable value of not less than £20. He recommends a fixed quarterly charge of 3 per cent. on the rateable value of the house, plus 1d. per unit for all energy consumed.

LONDON: *Camberwell: Tube Railway to the Crystal Palace.*—The Upper Norwood Ratepayers' Association have forwarded a resolution to the Council approving of the proposed tube railway to the Crystal Palace. It may be remembered that the Syndicate promoting this undertaking decided a short time ago not to proceed with it until the result of the General Election was known. No Bill has been deposited for the next session of Parliament.

Shoreditch.—The Electricity Department have reduced the charge for electricity used for lighting arc lamps and signs outside shops, &c., to a flat rate of 2½d. per unit from the December meter readings. A meter rate of 1s. per quarter will also be charged.

MORECAMBE: *Electricity Supply.*—A recommendation to supply a local firm named Messrs. T. W. Ward, Ltd., with electricity at 1½d. per unit, the firm guaranteeing to use 1,000 units per week, has been rejected by the Council by fourteen votes to seven, on the ground that an expenditure of £2,500 would be involved. The Consulting Engineer to the Council recommended the acceptance of the offer and the expenditure of the capital named on the ground that extensions will in any case be necessary in the near future.

OLDHAM: *Electricity Supply.*—The Royton District Council have agreed to grant the application of the Corporation to supply electricity in Royton upon the same terms as in Oldham on condition that all damage to roads in laying cables is made good. The question of shutting down Rhodes Bank generating station was discussed at the last meeting of the Corporation. It was suggested that the station should only be used for the peak load. It was also mentioned that an additional 5,000 kw. of plant could be installed at the Greenhill station without new buildings. No decision was come to.

ROTHERHAM: *New Power Station.*—The Corporation's new power station at Wincobank has been running experimentally during the past few weeks. With regard to the application of the Sheffield Corporation for an electric lighting provisional order for the parish of Tinsley, the Electricity Committee have been instructed to take any necessary steps to safeguard the interests of the Corporation in the matter.

UXBRIDGE: *Electric Supply.*—The official receiver-in-charge as liquidator of the Uxbridge & District Electric Supply Co., Ltd., is endeavouring to make arrangements for its being taken over as a going concern. At the present time the Metropolitan Electric Supply Co., Ltd., hold most of the debentures, and certain proposals are coming from them with a view to the property being released in favour of the debenture holders in satisfaction of the charge, and it is possible that they may offer some inducement, so that such will represent a dividend to the creditors. The Council has been informed of the position of affairs in case they should contemplate taking over the undertaking.

WORCESTER: "*Sales Engineer.*"—Mr. Shaw, the Borough Electrical Engineer, recommends the appointment of a "Sales Engineer," on the basis of salary and commission. A sub-committee is to prepare a statement of the duties of the proposed canvasser.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The Tramways and Electricity Committee invite tenders for two water-tube boilers, superheaters, mechanical stokers, economisers, &c., and pipe work. Tenders to the Town Clerk by January 31st. (See an advertisement on another page.)

BIRMINGHAM.—The Tramways Committee invite tenders for stores, including electrical sundries and insulating materials. Particulars from the General Manager, and tenders by Feb. 1st.

CANADA.—An application has been made by the Burrard Power Co., Ltd., for powers to work a dam at the lower end of Lillooet River, British Columbia, and for the construction of an electric power station in connection therewith.

LAUNCESTON (TASMANIA).—Tenders are invited for the supply of about 1,100 tons of steel tramway rails and fastenings. Particulars from Messrs. John Barry & Co., 7 Great Winchester Street, London, to whom tenders by Feb. 11th.

LONDON: *Stepney.*—The Electricity Supply Committee require (*a*) boilers and accessories; (*b*) turbo-generator and accessories, converting plant, switchgear, &c. Particulars from the Borough Electrical Engineer, and tenders by January 24th. (See an advertisement on another page.)

Miscellaneous

AUSTRALIA.—It is stated that the Australian Postmaster-General's Department will shortly invite tenders for 2,356 knots of submarine cable at an estimated cost of £3,500.

BRADFORD.—The city electrical engineer will be glad to receive particulars of new apparatus for introduction to consumers.

BRAZIL.—The plans submitted by the Rio Janeiro Tramway,

Digitized by Google

Light & Power Co. for the electrification of the Corcovado Railway have been approved.

CANADA.—It is stated that a scheme has been prepared for the construction of 3¾ miles of subway tramway, and 18 miles of surface tramway in Toronto. The estimated cost is about £1,000,000.

CHILE.—The Chile Telephone Co., Ltd., have obtained a concession to extend their Concepcion and Talcahuano telephone service to San Rosendo, Yumbel, Los Angeles, Santa Fe, Renaico, Angol, Mulchen, Sauces, Collipulli, Traiguen, and Victoria.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

BIRMINGHAM.—Business premises. E. Harper, Ruskin Chambers, Corporation Street, Birmingham.

BRIGHTON.—Day training college, Richmond Terrace (£7,000). Surveyors, T. Simpson & Son, 16 Ship Street, Brighton.

EXETER.—Church. Architect, A. J. Dunn, 1 Waterloo Street, Birmingham.

Additions to Blind Asylum and school (£2,000). Architect, J. Jerman, Bedford Circus, Exeter.

KING'S HEATH (Birmingham).—Church. Architect, H. Harper, Long Row, Nottingham.

LIVERPOOL.—Schools, Fladwys Street (£10,000). Architects, Sproat & Warwick, 25 Lord Street, Liverpool.

MACCLESFIELD.—Bakehouse at Workhouse (£1,300). Builders, Gorton & Wilson, Macclesfield.

MERTHYR TYDFIL.—Dormitories at Workhouse (£1,350). Architect, T. Roderick, Clifton Street, Aberdare.

NORTH BERWICK.—High school (£3,000). Architect, T. S. Robinson, North Berwick.

NORTHFLEET.—Fire station. Builders, W. Archer & Son, Northfleet.

NORTHAMPTON.—Proposed public elementary school, Victoria Park; also additions (£3,000) Town and County school. S. Beattie, Secretary, Northampton Education Committee.

READING.—Workhouse buildings. Architect, W. Howell, Blagrave Street, Reading.

RICHMOND-ON-THAMES.—Alterations at Holy Trinity School, Lower Mortlake Road; also alterations to County School for Boys. H. Sagar, Secretary, Richmond Education Committee.

STANLEY.—Council offices (£4,000). Architect, J. Wilson, 3 Coleshill Street, Sutton Coldfield.

TOTTENHAM.—Clothing factory. Architect, Clifford Tee, 50 Moorgate Street, E.C.

WOOD GREEN.—Public baths (£8,000). Architect, H. Burgess, 51 Dunloe Avenue, West Green.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The Western Electric Co. have received a tender for the erection of a glow lamp magneto telephone switchboard at Edgecliffe, a suburb of Sydney.

BELFAST.—The following tenders have been accepted:—Messrs. Stewarts & Lloyds, Ltd., tramway poles; Messrs. George Webb & Co., brackets and scrolls; Messrs. W. Boydell & Sons, Ltd., bases, collars, and finials.

BRISTOL.—The tender of Messrs. Henley's Telegraph Works Co., Ltd., has been accepted for the supply of joint and junction boxes at £233.

CLECKHEATON.—An order has been placed with Messrs. Siemens Bros. & Co., Ltd., for cable.

ECCLES.—The Council have accepted the tender of the British Westinghouse Co., for the annual supply of electricity meters.

LONDON: *Woolwich.*—The Council received the following tenders for two miles of service cable: W. T. Henley's Telegraph Works Co., Ltd., £330; Siemens Bros. & Co., Ltd., £334; W. T. Glover & Co., Ltd., £335; British Insulated & Helsby Cables, Ltd., £341.

SALFORD.—The following tenders have been accepted by the Town Council:—J. Collier & Co. (Manchester), £65, for the installation of electric light and bells at Gardner Street Fire Station; General Electric Co., Ltd., 15 dozen 16-c.p. Robertson carbon filament lamps, 220 volts, 6s. 9d. per dozen: 5 dozen 50-c.p. Osram lamps, 220 volts, 2 dozen 50-c.p. ditto, 110 volts, and 1 dozen 50-c.p. ditto, 75 volts, 4s. 3d. each, less 20 per cent., and 10 per cent.; Smith, Major & Stevens, Ltd. (Salford), £85 15s., for supplying and fixing new single lift and motor, together with the necessary gearing, switches, and cable, at Pendleton Town Hall.

SOUTH AFRICA: *Johannesburg.*—The Council have accepted the tender of Messrs. Reunert & Lenz for a 3,000-kw. turbo-alternator, including condensing plant and exhaust pipes with foundations erected, complete with all necessary switchgear and cable connections, at £15,365.

The tender of the United States Steel Products Co. has been accepted for the supply of 3,900 flexible copper bonds at £223, and 1,500 solid copper bonds at £161. Delivery to be made in 18 weeks from receipt of order.

TODMORDEN.—An order has been placed with the British Westinghouse Co., Ltd., for a Leblanc condenser.

The BARROW-IN-FURNESS Council have placed an order with the D.P. Battery Co., Ltd., for the renewal of one of their storage batteries, and its maintenance for a term of ten years. The same firm's tender has also been accepted for the renewal of the batteries of the Urban Electric Supply Co., Ltd., at Dartmouth and Newton Abbot, and their maintenance for ten years.

The Skinningrove Iron & Steel Co., of Carlin How, have placed another order with Messrs. Ehrhardt & Sehmer for a further 1,650-h.p. gas engine to be direct-coupled to an electric generator. This is the third repeat order received from this company during the current year.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £63 to £63 10s. per ton (last week, £62 5s. to £62 15s.).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The last day for receiving proofs in the bankruptcy of E. Goodman, electrical engineer, 30 Hertford Street, Coventry, is January 17th. Mr. C. J. Band, 8 High Street, Coventry, is Official Receiver.

A petition has been presented by Joseph Langley, of 51 Fairbank Street, St. Luke's, London, E.C., for the compulsory winding-up of the London Electrobus Co., Ltd. The petition will be heard before Mr. Justice Neville on Tuesday.

ANDERSTON FOUNDRY CO.'S LONDON OFFICE.—Owing to increased inquiries for the vertical, high-speed, multi-cylinder gas engines which the Anderston Foundry Co., Ltd., have recently put on the market, an office has been opened in London at Queen Anne's Chambers, Westminster. Mr. Frank Adcock, who has been associated with the development of this engine since its inception, is in charge of this office.

PROPOSED NEW WORKS.—The rapid development of the demand for the new lubricants "Oildag" and "Aquadag" has led to sending an expert from the parent works at Niagara Falls to England to confer with the British agents, Messrs. Crosier, Stephens & Co., Newcastle-on-Tyne, and make arrangements for the establishment of works in England.

CANADIAN AGENCIES WANTED.—A Manchester firm manufacturing electric light and power machinery, main switches, and switchboards, &c., desires to appoint a reliable Canadian agent.

A Toronto firm wishes to obtain agencies of United Kingdom manufacturers of electrical apparatus.

Further particulars of the above may be obtained from the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

BRAULIK ENGINEERING CO.—Owing to the large increase in the engineering department of the business of Mr. G. Braulik, 8 Lambeth Hill, London, he has decided to separate this from his ordinary supply business. He has commenced a new department under the name of the Braulik Engineering Co., 8 Lambeth Hill, London, which will be in charge of Mr. E. Eugene Brown. This department will deal with generating machinery, switchgear, instruments, cranes, lifts, telephone and telegraphic apparatus, &c.

FIRE AT EDISON & SWAN CO.'S PREMISES.—The Edison & Swan United Electric Light Co., Ltd., inform us that the fire which broke out in their premises in Queen Street, London, E.C., on Monday morning, was confined entirely to the test room and basement, and will in no way interfere with business.

AGENCY.—Messrs. Wallach Bros., Ltd. (Royal London House, Finsbury Square, E.C.), inform us that they have been appointed sole agents for the Turner Oil Filter Co., and request that all inquiries for these filters may be addressed to them.

Embezzlement.—At Bow Street, on Friday, Vincent Edward Moir was again charged with embezzling money belonging to the National Society of Telephone Employees. The society was formed in 1905 by telephone employees for the protection of their interests, and prisoner was appointed secretary. It is now alleged that the total defalcations in 1906 were £50, in 1907 £254, and in 1908 £200. The prisoner was again remanded.

University College, London.—In addition to the postgraduate course of lectures by Professor J. A. Fleming on "The Theory of the Propagation of Electric Currents in Telegraph and Telephone Cables and in Electric Conductors," already announced, two other postgraduate courses have been arranged, namely, "The Ideal Arch, Metal and Masonry, Theory and Design," by Professor Karl Pearson, beginning on January 21st, and "Steam Turbines," by Mr. W. J. Goudie and Mr. E. G. Izzard (of Messrs. Willans & Robinson, Ltd.), beginning on January 21st.

NEW COMPANIES

ALUMINIUM CORPORATION, 34 Old Broad Street, London. Capital, £450,000, in 5,000 participating shares of 1s. each, and 149,750 preferred, and 300,000 ordinary shares of £1 each. To acquire the business of the Aluminium Corporation, Ltd., incorporated in 1907. The first directors are:—S. G. Bibby, Dashwood House, New Broad Street, E.C.; K. M. Clark, Sudbourne Hall, Orford, Suffolk; E. Manville, St. Stephen's House, Victoria Embankment, S.W.; W. C. Stennett, 116 Victoria Street, S.W.; and W. Williamson-Wylie, Vulcan Works, Johnstone, N.B.

SUTER'S PATENTS.—Registered by H. A. Scott, 53 Chancery Lane, London. Capital, £1,000. To carry on business of general electrical engineers. Subscribers: F. Suter, 16 Percy Street, London, electrical engineer; and J. W. Stephen, of the same address.

LUMINATOR WATER CO., registered by Messrs. Mayo, Elder & Co., 10 Drapers Gardens, London. Capital, £25,000. Electricians, engineers, &c.

BROUGHTON MACHINERY CO., 291 Bury New Road, Broughton. Capital, £1,000. To acquire the electrical and mechanical engineering business of M. E. Mercier at the above address.

ELECTRO SCRIP SIGN CO., 16 Holborn Viaduct, London. Capital, £1,000. To manufacture and deal in "Electro scrip" in the united Kingdom and the British Colonies.

BIRMINGHAM GUILD, 45 Great Charles Street, Birmingham. Capital, £12,500. To acquire the business now carried on as the Birmingham Guild of Handicraft, which includes the supply of electrical fittings, &c.

HILO IGNITION, LTD.—17 Fenchurch Street, London. Capital, £50,000. To acquire the "Hilo" system of ignition, and to carry on the manufacture of electrical appliances, &c.

COMPAGNIE GENERALE ELECTRIQUE DE LA CHAMPAGNE, LTD.—1 Broad Street Place, London. Capital, £80,000 in £4 shares. To distribute electric power in the Valley of Geippe, Rheims, and in Aisne, Ardennes, and Marne.

FIXED PRICE LIGHT CO.—Caxton House, Westminster, London. Capital, £10,0000 in £1 shares (100 deferred shares). Electricians and mechanical engineers and suppliers of electricity for all purposes. The subscribers are Mr. G. von Chauvin, 356 Caxton House, Westminster, London, S.W., telegraph engineer; Mr. W. Wheeler, 356 Caxton House, Westminster, S.W., accountant; Mr. J. S. Huddleston, 356 Caxton House, Westminster, S.W., electrical engineer. Mr. G. von Chauvin and Mr Huddleston are first directors.

PEEL-CONNER TELEPHONE WORKS, 31 Copthall Avenue, London, E.C.—Capital, £124,000 in 120,000 preference shares of £1 each, and 80,000 ordinary shares of 1s. each. To adopt agreements with the General Electric Co., Ltd., and M. S. Conner, and to take over the business formerly carried on by the General Electric Co. at Peel Works, Salford, Manchester. The subscribers are G. Byng, 71 Queen Victoria Street, London; H. Hirst, 71 Queen Victoria Street, London; M. S. Conner, Peel Works, Adelphi, Salford; J. Fraser, 31 Copthall Avenue, London; E. C. Byng, 71 Queen Victoria Street, London; and F. Samuelson, 46 Queen Victoria Street, London. The first directors are G. Byng, H. Hirst, and M. S. Conner.

SCOTTISH POWER CO.—Capital, £160,000 in 75,000 preference shares, 75,000 ordinary "A" shares, and 10,000 ordinary "B" shares. To acquire the share capital of the Scottish Central Electric Power Co., and to construct tramways, supply electrical energy, &c. The subscribers include Mr. A. W. Tait, chartered accountant, and Mr. George Balfour, M.I.E.E.

GYROSTATE TURBINES.—Registered by Ashurst, Morris, Crisp & Co., 17 Throgmorton Avenue, London. Capital, £10,000 in 8,280 "A" shares of £1 each, and 3,440 "B" shares of 1s. each. To adopt agreement with T. H. Holroyd and B. L. Barrow, and to carry on the business of electrical and general engineers.

G. WESTON & SONS, 153 Fenchurch Street, London.—Capital, £5,000, including 3,000 preference shares. To adopt an agreement with G. Weston, A. P. Stone, and H. Hill, and to acquire the business carried on at 153 Fenchurch Street, London, and also at Sheen and Finchley, as electric light contractors.

CHAPMAN & STEPHENSON.—Registered by Jordan & Sons, 116 Chancery Lane, London. Capital, £3,000. To acquire patents of an improved photometer invented by H. Chapman. The subscribers are H. Chapman, Ryecroft Villas, Meersbrook Road, Sheffield, electrical engineer; and A. Stephenson, Graystone House, Adwalton, near Bradford, electrical engineer.

Dr. Ludwig Mond's Will.—The will of the late Dr. Ludwig Mond bequeaths the sum of £50,000 to the Royal Society of London for the endowment of research in natural science, more particularly in chemistry and physics. A further sum of £50,000 is bequeathed to the University of Heidelberg for similar objects.

Central Technical College Old Students' Association.—The annual dinner will be held on February 12th, and not February 19th, as stated in the December "Central."

APPOINTMENTS AND PERSONAL NOTES

Eccles Town Council has appointed Mr. Harold F. Barnes, of Portsmouth, as switchboard attendant, in place of Mr. W. P. Hooper (resigned).

Mr. John Kerr, the Chairman of Messrs. Dick, Kerr & Co., Ltd., has joined the Board of the London Bank of Mexico and South America.

Mr. Hemming, Assistant Electrical Engineer to the Leek Council, has tendered his resignation. A successor is to be advertised for at a salary of £100 per annum.

Mr. John Grahame, Manager of the Brisbane Electric Light Co., has been appointed Manager of the Rockhampton (Queensland) Tramways.

Mr. Arthur P. Haslam, M.I.E.E., has commenced business and opened an office at Suffolk House, Laurence Pountney Hill, Cannon Street, E.C., where he is prepared to act as representative for two or three manufacturers of electrical or engineering specialities.

NEW PUBLICATIONS

The Writers' and Artists' Year-book, 1910. (London: A. & C. Black.) 1s.

Who's Who Year-book, 1910. (London: A. & C. Black.) 1s.

"Practical Engineer" Pocket-Book for 1910. (London: Technical Publishing Co., Ltd.) 1s.

Handbook for Wireless Telegraph Operators Working Installations Licensed by H.M. Postmaster-General. Revised Edition. (London: Eyre and Spottiswoode, Ltd.) 3d.

The Practical Electrician's Pocket-Book and Diary, 1910. Edited by H. T. Crewe. (London: S. Rentell & Co.) 1s.

MISCELLANEOUS CITY NOTES

MELBOURNE TRAMWAY & OMNIBUS CO.—A dividend at the rate of 15 per cent. per annum has been declared upon the ordinary shares for the quarter to December 31st.

HALIFAX & BERMUDAS CABLE CO.—An interim dividend of 5 per cent. per annum has been declared on the ordinary shares for the past half-year.

A New South African Engineering Institution.—According to *South Africa*, the first annual meeting of the South African Institute of Electrical Engineers was held recently under the chairmanship of Mr. J. R. Bradley. Applications for membership have been received from 158 persons, of which 71 have been elected members, 65 associate members, 14 associates, and 8 students. The question of amalgamation with other local engineering societies has been considered by the Provisional Committee, but it was not possible to lay any details before the meeting. Mr. C. M. R. Campbell was elected President, and Mr. W. Eldson-Dew and Mr. M. Rohman were elected Vice-presidents.

Telegraph Traffic.—On the 28th ulto. the cable between Obok and Djiboriti was restored, while the landlines between Alexandrette and Beyruth and between the latter place and Alep were interrupted.—On the 29th ulto. there still existed delay to Dando and Malange in Angola, but the cable between Reunion and Mauritius was put through again successfully on that day.—The Bagdad-Bassorah line ceased working on the 29th ulto., and on the 31st the Indo-European Telegraph Company was able to place the Lowestoft-Emden cable on the active list.—The first day of the New Year saw the repair of the Saigon-Tonkin cable and of the line between Medan—Kotarodga. - On the 2nd inst. the Russian landlines were repaired, and on the following day the cable between Bathurst and Bissao was again in order. On the same day direct communication between Saigon and Bangkok was down for a short while, and telegrams were sent via Paksé—Abone, subject to some delay.—We find, also, that the Lagos—Kotonow cable was awaiting repair on the 3rd inst.—Statements appeared recently in the daily press that the islands of St. Vincent and Jamaica were cut off from telegraphic communication. These statements were unfounded.—With reference to our recent notice on the question of the purchase of controlling interests by the Mackay Companies from the Western Union Telegraph Co. in certain telephone companies of New York, it is interesting to note that at the last quarterly meeting of the Western Union Telegraph Co. Messrs. J. N. Vail, president, E. J. Hall, H. B. Thayer, vice-presidents, and H. S. Howe, director of the American Telephone & Telegraph Co., were appointed directors.—The Postmaster of Jamaica, in his Report for 1908-9, states that £2,839 12s. 4d. was collected for foreign telegrams at out-stations, and was paid to the Direct West India Cable Company, Ltd., while the payment to the West India & Panama Telegraph Company, Ltd., on the same account was only £148 19s. 5d.

ELECTRICAL BILLS IN THE NEXT SESSION OF PARLIAMENT

[*This Summary is compiled by our own Editorial Staff, and is strictly copyright.*]

IN our issues for November 25th and December 2nd, we gave some particulars of the electrical Bills which were to be deposited for the next session of Parliament. We are now able to supplement these by full information taken from the actual Bills themselves, the statutory period for their deposit having expired. As usual, a certain number of proposals, of which notices had been given, are not to be proceeded with, but none of these can be regarded as of first importance. New constructional works, apart from tramway extensions, are entirely absent. There are, however, several points of interest to be noted in the electrical Bills, although they do not affect matters of important principle.

Probably the most ambitious scheme, although it is mainly financial, is the proposed amalgamation of the Great Northern, Piccadilly and Brompton, the Charing Cross, Euston, and Hampstead, and the Baker Street and Waterloo Railways, and their future working as one undertaking, to be known as the London Electric Railways Co., with a capital of £12,000,000. A physical connection is to be made between the Charing Cross, Euston and Hampstead Railway at Charing Cross station, and the Baker Street and Waterloo Railway Co. at the Embankment station, and also the Charing Cross station of the District Railway Co. This arrangement should render possible great economies in the working and administration of the railways, and it also serves to emphasise the very great extent to which underground communication in London has been carried on by means of comparatively small and isolated undertakings. Apparently the Great Northern and City Railway Co. do not intend to proceed with their application for an extension of time for the construction of their railway from Moorgate Street to the Bank, as no Bill has been deposited, and the extension of the line is therefore not being proceeded with.

The Bill of the Yorkshire Electric Power Co. is of interest, in that it asks for powers to invest capital in industrial and municipal concerns who take a supply of electrical energy from them. A similar proposal was made last session by the County of Durham Electric Power Co., but the Unopposed Committee of the House of Commons decided that such an application of funds was rather beyond the functions of an electric power company. On this occasion Mr. E. Moon, K.C., Speaker's Counsel, reminded Mr. C. H. Merz of the north-country saying that the "Cobbler should stick to his last."

It will be noticed that the Leeds Corporation are applying for powers to use the "trolley omnibus." Hastings Corporation have agreed to avoid the opposition of the Electrical Contractors' Association, by inserting in the clause in their Bill relating to wiring and fitting of premises for electric supply the words, "through a contractor but not otherwise." Several other Corporations, however, including Middlesbrough, Warrington, and Middleton, have not, so far, come into line with the views of the Association as to the wording of this clause, and are presumably prepared to meet with opposition.

The amalgamation of the Baker Street & Waterloo Railway Co. and the Charing Cross, Euston & Hampstead Railway Co. with the Great Northern, Piccadilly & Brompton Railway Co. is proposed, and a new company is to be incorporated bearing the title of the London Electric Railways Co. The Bill contains very detailed financial proposals for the carrying out of this scheme, and provides for the increase of the combined capitals of the three companies concerned by £7,195,000, making £12,600,000 in all. Of the new capital £9,450,000 will be in £10, ordinary shares, and the remainder in 4 per cent. preference stock. When the amalgamation is carried out the guarantee by the Underground Electric Railways Co. of London of the interest on the Great Northern, Piccadilly & Brompton Railway Co.'s preference and debenture stock will cease to exist.

In the Bill promoted by the Baker Street & Waterloo Railway Co., it is proposed, among other things, to construct a subway under Oxford Street from their Oxford Street station joining up with Regent Street. Powers are also taken to enable the Central London Railway Co. and the Great Northern, Piccadilly & Brompton Railway Co. to subscribe towards the construction of this subway.

The Charing Cross, Euston & Hampstead Railway Co. propose the construction of an extension line at Charing Cross to make a physical junction with the Baker Street & Waterloo Railway at their Embankment station, and the Metropolitan District Railway at their Charing Cross station. A period of five years is asked for for completion. Powers are also taken to raise £400,000 new capital. Another clause stipulates that £175,000 of the company's ordinary capital may, by permission of the ordinary shareholders, be converted into preference shares, to be known as Charing Cross, Euston & Hampstead Railway 4 per cent. preference stock.

Metropolitan District Railway Co. seek to raise £187,500 additional 4 per cent. guaranteed stock. The Bill also provides for the extinction of the arrears of guaranteed stock dividends by distributing new guaranteed stock to the extent of £184,375. The construction of certain new lines is also proposed.

Metropolitan Railway Co. ask for an extension of time by four years granted by the Act of 1902 for the enlargement and improvement of Baker Street Station. The construction of small additional lines is proposed as well as a subway in connection with their Edgware Road Station. Subways are also proposed at Moorgate Street, to be jointly constructed by the Metropolitan District Railway Co., the City & South London Railway Co., and the Great Northern & City Railway Co.

Middleton Corporation seek authority to supply and fix electrical fittings, and to supply electrical energy in Chadderton, Royton, and Prestwich. Other clauses relate to the supply of electrical energy in bulk outside the borough; to accept transfers of electric lighting undertakings; and to purchase electricity in bulk.

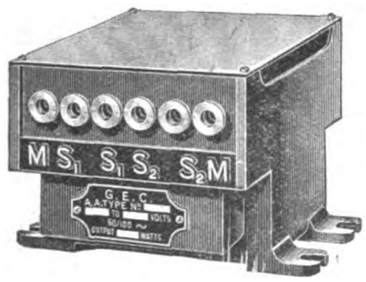
The incorporation of the North and South Shields Electric Railway Co. is proposed, and the revival of the powers granted to the company in 1902 for the construction of an electric railway under the River Tyne.

An extension of time is asked for by the North-east London Railway Co. for two years for the purchase of land, and a similar period for the construction of the railway. An extension is also asked for in which the capital of the company is to be raised. In the company's original Act of 1905, a period of twelve months was inserted for this purpose, but it has been extended annually since. The promoters now asked for a period of six years to be inserted in the Bill. Another clause authorises agreements with the Metropolitan District Railway Co.

Nottingham Corporation propose the construction of new tramways, for which borrowing powers are sought of £24,000, for construction, repayable in thirty years, and £9,250 for electrical equipment repayable in twenty years. An extension of time is also asked for the construction of tramways authorised in 1905.

Yorkshire Electric Power Co. asks for power to issue new capital in the form of preference shares, and to invest capital not exceeding £100,000 in industrial or municipal undertakings to which the Company supplies electrical energy.

An extension of time until 1913 is asked for by the London United Tramways, Ltd., for tramways in Kew authorised in 1902. It is also proposed to vary section 31 of the Company's Act of 1902, which relates to the protection of the Richmond Corporation. This variation is by agreement. Another clause provides for an extension of time until 1913 for the construction of light railways in Middlesex and Surrey authorised in 1908.



Powers are sought by the Leeds Corporation to use trolley omnibuses on a route from the City Square along Wellington Street, Aire Street, Whitehall Road, and terminating at the boundary of the city at Drighlington, the undertaking to form part of the tramways undertaking of the Corporation. Borrowing powers are sought to the extent of £5,000, repayable in ten years, for the provision of omnibuses, and £9,000, repayable in twenty years, for electrical equipment.

The Bishops Stortford Urban District Council are asking for a two years' extension of time for putting into force the Electric Lighting Order which they obtained in 1905.

The Southampton Corporation propose the construction of new tramways, and ask for powers to borrow £10,440, repayable in thirty years, for construction, and £1,540, repayable in twenty years, for electrical equipment.

The Bradford Corporation propose to construct new tramways and to supply electricity in bulk to districts outside the borough boundaries. Powers are taken to borrow £81,632 for the construction of the tramways specified in the Bill, to be repaid in thirty years, and £42,748 for other tramway purposes. It is

also proposed to borrow £22,800, repayable in twenty years, for feeder cables, switchboard plant, and apparatus for tramway purposes. Among the other clauses in the Bill is one providing for the erroneous registration of electricity meters. When any error is detected, this is to be taken as having commenced from the preceding quarter unless the error is proved to have arisen during the current quarter.

A Bill proposes the amalgamation of the Bishops Stortford & District Gas Co., Sawbridgworth Gas Co., Epping Gas Co., Newport (Essex) Gas Co., Ongar Gas Co., Much Hadham Gas Co., and the Dunmow Gas Co., and for powers to supply electricity and gas in Bishops Stortford and the districts of the various companies amalgamated by the Bill.

The Devonport & District Tramways Co. propose considerable amendments of their agreement with the Devonport Corporation. Instead of the fixed annual rents provided for by the agreement under the Act of 1898 in respect of the lines leased from the Corporation, the company suggest that the Corporation should be paid the net revenue from these lines. It is further provided that the price for electrical energy paid to the Corporation should be cost price (this to be determined by arbitration) plus 5 per cent. It is also proposed to extend the period for working the lines, which is stipulated in the Act of 1898 as for twenty-one years from that date, to twenty-eight years.

The incorporation of the Farnham Gas & Electricity Co. is proposed for the supply of electricity in Farnham, Surrey. The capital is £60,000 in £10 shares, of which £1,000 is to be in £10 preference shares.

The Handsworth Urban District Council ask for powers to construct thirteen sections of new tramways, and also to make waiting-rooms and shelters. It is proposed to borrow £15,000, repayable in sixty years, for the necessary street widenings, and £77,500, repayable in thirty years, for the construction of the tramways.

The incorporation of the Havant Gas & Electricity Co. is proposed, with a capital of £23,500, to supply electricity in the parishes of Havant, Bedhampton, and Harblington, in the county of Southampton.

Hastings Corporation seek to compulsorily acquire the land upon which their existing generating station stands. They also ask for powers to undertake the wiring and fitting of consumers' premises for electric lighting "through a contractor, but not otherwise." The accounts of this department, when it is inaugurated, are to be kept separately.

The Reading & District Electric Supply Co. seek an extension of area to include Caversham, Goring, and Bradfield. Powers are also taken to supply electrical energy in bulk to authorised distributors in Wokingham, Bradfield, Walford, and Henley. Authority to supply and fix electrical fittings is also asked for. Another clause seeks to compulsorily acquire the land upon which the present generating station stands.

Rhondda Urban District Council propose the erection of new tramways, which are to be leased, and for which borrowing powers are sought for £29,000 for construction, repayable in thirty years, and £5,000 for electrical equipment.

The incorporation of the Wimbledon & Sutton Electric Railway Co. is proposed, with a capital of £350.000. The first directors are Sir H. G. Smallman, Mr. H. D. Searl Wood, Mr. W. E. R. Innes, Mr. F. Wellstead, Mr. H. G. Hoare, and Mr. E. K. Burstal. Five years are taken in which to complete the line, and interest may be paid out of capital during construction at the rate of 4 per cent.

In an Omnibus Bill by the Warrington Corporation powers are taken to supply and fix electrical fittings, &c.

Mersey Railway Co. ask for an extension of time in which to pay out of capital the interest on the debenture stock authorised in 1900 and 1906 in connection with the electrical equipment of their railway.

Middlesbrough Corporation, in an Omnibus Bill, ask for powers to supply and fix electrical fittings. Powers are also taken to build sub-stations under streets. The stand-by clause is also included.

The Tramways Bill of the London County Council deals with the tramways in various parts of London, details of which have already been given in our columns. Authority is taken to spend £1,595.000 upon capital account up to and including the year 1911. An extension of time is asked for for three years in respect of certain tramways authorised in 1903. Powers are also taken to construct pedestrian subways under Victoria Embankment at Charing Cross.

The Cavehill and Whitehill Tramways Co. are asking for compulsory running powers over certain lines of the Belfast Corporation, and offer reciprocal running powers over their lines.

The incorporation of the Chipping Norton Gas & Electricity Co. is proposed for the supply of electricity in Chipping Norton. The company takes powers to supply and fix electrical fittings and apparatus. The capital of the proposed undertaking is £12.C00 in £5 shares.

Below is the complete list of applications for electric lighting provisional orders for next session. Where the name of the promoter is not given, it is the municipality. Ardrossan, Saltcoats, and District (George Balfour); Ballyclare; Rural District of Bath; Brixham and a portion of the Rural District of Totnes (R. A. Lister & Co., Ltd.); Brumby and Frodingham; Portion of the Special Lighting District of Cambuslang, Lanark; Borough of Hemel Hempstead and the Parishes of Bovingdon and Kings Langley in the Rural District of Hemel Hempstead (Chesham Electric Light & Power Co., Ltd.); Church; Clevedon; Cowdenbeath and Lochgelly, &c. (George Balfour); Dawlish [Amendment] Order (Electric Supply Corporation, Ltd.); Derby [Extension]; Frimley; Gorseinon (Gorseinon Electric Light Co., Ltd.; Huddersfield [Extension to South Crosland]; Navan; Ormskirk [Amendment]; Radcliffe (Lancashire Electric Power Co.); Runcorn and Weston (Castner-Kellner Alkali Company, Ltd.); Runcorn Urban and Runcorn Rural (Messrs. George Henry Cox and Herman John Falk); Skelmorlie and Wemyss Bay (Messrs. William Cornfoot Philip and Reginald Vandezee Farnham); Smethwick [Transfer] Order (Birmingham & Midland Tramways, Ltd.); Swinford; Templemore; Widnes [Amendment].

Carbons for Flame Arc Lamps.—A patent specification, No. 23,171 of 1909, by the firm of Gebr. Siemens & Co., of Berlin, covers the incorporation in flame carbons of phosphoboric acid (BPO_4) obtained by the action of boric acid on phosphoric acid. It is said to act like borates in producing steady burning, but is practically infusible. Unlike phosphoric acid, it has no tendency to solidify water-glass, and is therefore suitable as an addition to core materials made up with water-glass. It is further stated that whereas with carbons containing borates, the arc ruptures with alternating current at 35 volts, with phosphoboric acid, and the usual illuminating salts, potentials of 45 or 50 volts can be reached with either continuous or alternating current without rupture of the arc.

Fire at the Edison & Swan Co.'s Premises.—Shortly before eight o'clock on Monday morning, a fire broke out in the test-room at the premises of the Edison & Swan United Electric Light Co., 36 Queen Street, London, E.C. It appears that the firemen had some considerable difficulty in locating and suppressing the outbreak, but we understand from the Edison & Swan Co. that though the test-room has suffered considerably, the only other damage is that done by the water in the basement, and that the fire will in no way interfere with business. As yet, the cause of the outbreak has not been ascertained.

Push-button Control of Motor Starters.—When a motor starter is controlled from one or more distant points, as, for example, in printing-press driving, difficulty has been experienced in providing simple means for de-energising the no-voltage release magnet without interrupting the field circuit. A patent specification (No. 2,217 of 1909) by the Adams Manufacturing Co., Ltd., and others, published last month, describes an arrangement in which an alternative circuit to the release magnet coil is provided, and a two-way push-button is so interposed that both circuits cannot be broken at the same time. Normally the field circuit passes through the release coil and through a closed contact of the push-button switch. If the push-button is pressed, it first short-circuits the release coil by closing the alternative circuit through a second contact, and a further movement breaks the first contact, so that the arm of the main switch flies back to the off position. The field circuit is thus not broken at the push-button, and a closed path is left for the field to discharge itself through in the ordinary way. Push-button can be fitted at several points and without any alteration to an existing starter. Series motors can be provided with a similar arrangement with a series hold-on coil, and the invention is applicable to both D.-C. and A.-C. motors.

Electric Lighting in Churches.—The December issue of the *A.-E.-G. Zeitung* contains among other things an illustrated article on the applications of electricity in churches in Germany. Arc lamps only are used in a church at Neuburg, while in some churches, as in the new Berlin Cathedral, an arrangement of arc and glow lamps combined is used. Indirect lighting with arc lamps is employed with good effects in some old churches, and Nernst lamps are also used. Candle lamps for altar lighting are extensively employed, and in the Hildesheim Cathedral there is a large circular candelabra with electric candle lamps. The Protestant church of Bad Elster is lighted exclusively with 122 candle lamps. Most of the new churches are fitted with ordinary glow lamps on suitable pendants and brackets. Miniature glow lamps are used with striking effects for the illumination and decoration of the altars and pictures in some of the Catholic churches. Some particulars of the electric driving of organ blowing equipments and of the belfry mechanism are also given. Thus in a new church at Bitterfeld, four bells weighing 5·5, 1·8, 1·0, and 0·6 tons respectively are swung by means of suitable automatic gear from a main shaft driven by a 5 h.p. motor. For manual working, eight men would be required, and the running costs would, it is stated, be about three times as much as those with electrical working, including the cost of current.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Dec. 30th, 1909

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

1,414–5/09. **Heating and Cooking Apparatus.** A. F. BERRY (London). These two patents cover methods of connecting the low-pressure thick wire heating windings of A.-C. hot-plates to auto-transformers. The arrangement described in the first consists in connecting one end of each of several hot-plate windings to the transformer winding at symmetrical points, and connecting the ends to multiple-way switches affording connection to various intermediate points on the transformer winding. In this way the load is distributed along the winding at all loads, and undue heating of certain parts avoided. Three claims, three figures. In the second arrangement the temperature of each hot-plate is varied by altering the length of the low-pressure heating winding connected to the auto-transformer or by connecting its parts in series or parallel. Switches for effecting this and a combination of both methods of control are described. Three claims, two figures.

6,809/09. **Cable Armouring.** E. A. CLAREMONT and J. STRATTON (Manchester). In cables armoured with steel tape wound spirally in two overlapping layers, the turns are liable to coincide and thus expose the cable. To prevent this, the inner tape is given a longitudinal corrugation or rib at its centre, and the outer turns are kept in position by the ribs of the two adjacent inner turns. One claim, two figures.

16,328/09. **Manufacture of Tungsten Filaments.** C. H. WEBER (Berlin). Tungsten powder in a state of fine division is subjected to the action of pyridine or quinoline. This is done by mixing, for instance, pyridine (C_5H_5N) with alcohol, and causing the mixture to trickle slowly through the tungsten powder. The powder takes up the solution, and a certain amount of chemical action takes place. The product oxidises less readily than pure tungsten, and requires the addition of only a small amount of a binding agent for squirting. The binding agent is removed from the filaments by heating in a vacuum at 800° C., and the filaments are sintered in an inert atmosphere at 3,000° C. Three claims.

17,342/09. **Furnace for Electric Smelting of Iron.** AKTIEBOLAGET ELEKTROMETALL (Stockholm). This comprises a smelting chamber into which project three electrodes, and a vertical shaft above it with a gradually decreasing section towards the smelting chamber end. Part of the pressure of the ore is therefore taken up by the conical walls of the shaft, so that the ore is not forced up into the free spaces round the electrodes. The brickwork is thus protected from contact with the ores and the introduction of gases rendered possible. Two claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MÜLLER [Supply system with gas-engine driven generators] 7,595/09.

Dynamos, Motors, and Transformers: JACOBY [A.-C. commutator motors] 27,967/08; PUNGA [Single-phase series motor] 133/09; BOECKEL, GRUNBERG, KOUKOVSKI, and LUXEMBOURG [Machines] 1,327/09; CARTER [Machines] 3,352/09; MARKS (*Allmanna Svenska Elektriska Aktiebolaget*) [Polyphase commutator machines] 12,782/09.

Electric Ignition: ROBERT BOSCH [Sparking-plugs] 15,985/09.

Electrometallurgy and Electrochemistry: SKELTON [Ozonisers] 27,107/08; TUCKER [High-potential primary cell] 6,443/09; AKTIEBOLAGET SWEDISH NITRIC SYNDICATE [Concentrating acid] 10,591/09.

Incandescent Lamps: FRÉNOT, 7,073/09; LEWY [Pocket lamps] 22,032/09.

Instruments and Meters: NORTH [Meters] 3,300/09; YOUNG and R. LAIDLAW & SON, LTD. [Prepayment meters] 10,141/09; O'KEENAN [Shunt arrangement for power measurement] 15,298/09; COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIAL D'USINES À GAZ [Meters indicating maximum demand] 17,138/09, and [Induction motor meters] 19,277/09.

Storage Batteries: NYA ACKUMULATOR AKTIEBOLAGET JUNGNER, ESTELLE and EVERS [Negative plates for alkaline cells] 7,338/09.

Switchgear, Fuses, and Fittings: BAKER [Switch] 27,168/08; MARSHALL [Switch mechanism] 27,244/08; SIEMENS BROS. DYNAMO WORKS, LTD., and SCHUPP [Motor-starters] 2,464/09; PARSONS (Detachable Couplings) 7,345/09; BRAMPTON and OSBORNE [Conduit fittings] 8,601/09; BELEUCHTUNG SYSTEM FORTUNY-GES. [Reflectors] 11,556/09.

Telephony and Telegraphy: CLEMENT [Telephone Exchange] 27,139/08; COOPER, and BRITISH INSULATED & HELSBY CABLES, LTD. [Alarm fuses for telephone exchanges] 3,573/09; FESSENDEN [Wireless signalling] 14,826/09; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Order signalling] 19,684/09; CLEMENT [Telephone exchanges] 24,615-6/09; SIEMENS & HALSKE AKT.-GES. [Telegraphic signalling] 28,169/09.

Traction: GOULD [Automatically stopping trains] 27,151/08; HOLDSWORTH [Trolley collectors] 27,852/08; KAY [Apparatus for grooving trolley wire] 2,052/09; HEILMANN [Brakes] 7,324/09; FIORIO [Rail-joints] 14,026/09; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Track signalling] 14,120/09; BAXTER [Anchoring rails] 15,163/09.

Miscellaneous: STELJES [Electric dial movement] 25,577/08; POWELL [Magnetic separators] 27,020/08; KELVIN & JAMES WHITE, LTD., and CLARK [Mariners' compass] 7,021/09; EASTWOOD [Lifting magnets] 10,283/09; KEITH [Fans] 12,289/09; KING, KING, and HAMER [Electromagnetic coupling] 19,431/09; DOBBIE [Mariners' compass] 20,563/09; DICK, KERR, & CO. (*Braun*) [Electromagnetic friction brakes] 20,845/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: BINET and GUENNE [Casings] 28,849/09.

Electrochemistry: EYCKEN, LE ROY, and MORITZ [Electrolytic production of oxygen and hydrogen] 24,716/09.

Storage Batteries: SOC. INDUSTRIELLE DE L'ACCU MIXTE L'EMERGEQUE [Plates] 29,228/09.

Telephony: SIEMENS & HALSKE AKT.-GES. [Exchanges] 28,825/09.

Miscellaneous: ROBERT BOSCH [Insulation of windings] 22,479/09.

Opposition to Grant of Patents

16,260/08. **Utilisation of Exhaust Steam.** J. HOWDEN & CO., LTD., and W. H. OWEN. The grant of this patent has been allowed in spite of opposition. It covers the admittance of live steam into the low-pressure reservoir by means of an automatic valve when the supply of exhaust steam fails.

17,438/08. **Tungsten-Nickel Alloy.** SIEMENS & HALSKE AKT.-GES. This patent was granted in November last in spite of opposition, but an appeal has just been lodged against the Comptroller's decision. Full particulars will be found on another page of this issue.

3,604/09. **Depositing Metal on Metal.** A. SANG. Opposition has been entered to the grant of this patent. The specification describes a process in which the wire or object to be covered with a metallic film is immersed in a powder of the metal or of an oxide of the metal to be deposited, and a current is passed through the wire or object to heat it. If an oxide is used, a reducing agent must be introduced.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

870 of Jan. 13th, 1896. **Pumps.** J. G. MERRYWEATHER and G. HARRIS. A pump suitable for driving by a high-speed motor comprises three cylinders arranged radially and symmetrically about the crank-shaft centre.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Magnetite flame electrodes] 18,484/05.

Dynamos, &c.: W. E. BURNAND [Transformers] 21,410/97; W. R. MARSHALL [Sub-divided pole-shoes] 18,530/01; SIEMENS BROS. & CO. (*Siemens Schuckertwerke-Ges.*) [Inter-pole turbo-generator] 18,401/05; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Traction motor control] 18,846/05.

Electrometallurgy and Electrochemistry: J. HARGREAVES [Alkali manufacture] 21,178/97.

Incandescent Lamps: J. R. QUAIN [Multiple filament "turn-down" lamp] 18,569/01.

Storage Batteries: J. VON POPENBURG [Plates] 16,408/00; C. B. ASKEW [Plates] 18,381/05.

Switchgear, &c.: J. H. TUCKER [Tumbler switch] 20,217/96; BRITISH THOMSON-HOUSTON CO. (*E. F. Case, U.S.A.*) [Resistances for traction controllers] 18,332/01; J. W. CLARKE (*J. B. Foote*) [Automatic pressure regulator] 18,597/01; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Mercury motor-starter] 18,447/05; H. HIRST and J. H. COLLINGS [Ball-and-socket joint for lamp fittings] 18,646/05.

ELECTRICAL ENGINEERING

No. 159 [Vol. VI., No. 2] THURSDAY, JANUARY 13, 1910. [Price One Penny.
All rights reserved. *Registered as a Newspaper.*

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

PUBLISHED EVERY THURSDAY. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.

Canada. 8s. 8d. per Annum.

Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for SITUATIONS VACANT AND WANTED, ARTICLES FOR SALE AND WANTED, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

OFFICIAL NOTICES and TECHNICAL COLLEGE ANNOUNCEMENTS are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving

Letters for Insertion, *Tuesday first post.*

Small Advertisements and Official Announcements, *Wednesday first post.*

Displayed Advertisements, *Tuesday first post.*

Corrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 203-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, London." Telephone No.: 5509 Holborn.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON AND WESTMINSTER BANK (Temple Bar Branch).

A Supplement "Electrical Engineering in Mines" is included (gratis) in "Electrical Engineering" on the first Thursday of every month.

BINDING "ELECTRICAL ENGINEERING." — Vol. V. of "Electrical Engineering" (Jan.—Dec. 1909) closed with our issue of Dec. 30. An index for the volume is now ready, and copies may be ordered from any newsagent or bookseller at the price of 1d. each (or post free, 1½d.). Binding Cases, including index, are also ready, price 2s. each, post free 2s. 4d. (Abroad 2s. 6d.) Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to us, carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad.

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

IN an article by a special correspondent, the ingenious methods are described by which the electrical effects in the Drury Lane pantomime now running are produced, and some interesting figures of the amounts of cable, &c., used are given. (Page 19.)

AN Order in Council has been made confirming the Board of Trade Electrical Standards except as regards the ohm, in regard to which a slight alteration of the temperature of the observation has been made in order to bring it into line with the International Standards proposed by the Conference of 1908. (Page 20.)

ON Tuesday evening Mr. Hugo Hirst, Managing Director of the General Electric Co., addressed a meeting of some 300 of the London employees of that company, on the subject of Tariff Reform, with particular reference to the business of the General Electric Co. Some interesting particulars were given as to the arrangements for the manufacture of Osram lamps. Mr. Hirst also said that two or three large German firms had intimated that they wished to erect works in this country in conjunction with the company should Tariff Reform be introduced. (Page 20.)

IN a Paper read before the Institution of Mechanical Engineers on Friday last, Mr. C. W. Jordan described the generating station of the Ontario Power Co., which is situated at the base of the Horseshoe Fall, Niagara. When completed, the total capacity of the plant will be over 200,000 h.p. Current is supplied at 12,000 volts from 12,000-h.p. three-phase generators coupled to horizontal Francis-type turbines, to a distributing station at the top of the cliff, where it is transformed up to 62,000 volts, and transmitted in various directions. The turbine valves, generators, and switchgear are all controlled electrically from the distributing station. Aluminium cables are almost exclusively employed for the overhead lines. At present, the maximum distance of transmission is 160 miles, namely, from Niagara to Syracuse. (Page 21.)

THE general arrangements and lighting of the new offices and stores of the supplies department of Messrs. Siemens Bros. Dynamo Works, Ltd., are described. Lamps are stored in portable boxes, which are stacked up on the Unit system. A showroom has been provided particularly for the benefit of the trade. (Page 23.)

IN order to check careless driving, and so affect a saving in current consumption, the Interborough Rapid Transit Co. have equipped some coaches on the Manhattan Elevated Railway with devices which record

Digitized by Google

the total time during which the car is coasting. (Page 24.)

A SHORT article describes the meter-testing plant of Simplex Conduits, Ltd. (Page 24.)

WE give particulars of the principal electrical law-suits which are down for hearing during the Hilary sittings. There are a number of important appeals, including British Westinghouse Co., Ltd., *v.* Braulik, and Holmes *v.* Associated Newspapers, Ltd. In the Chancery Court, actions are down concerning the multiple-unit system of train control, electrical winding, and metal filament lamps. There are also a few Kings Bench Division cases of some interest. (Page 25.)

AT a meeting of the South Wales Section of the Institution of Mining Electrical Engineers, a General Purposes Committee was elected. A Paper on "Shocks" will be discussed at the next meeting at Cardiff on January 29th. (Page 26.)

SOME modifications have been made in the conditions under which tenders were invited by the Australian Commonwealth for wireless telegraph stations. We give some of the details of the specification. Attempts are being made, both in America and Canada, to make the carrying of wireless telegraph apparatus on ships compulsory. (Page 26.)

THE Tudor Accumulator Co. reply to Mr. Vicarino's letter in our last issue. A well-known firm of contractors call our attention to a fire which has been wrongly ascribed to electrical causes. (Page 26.)

THE second report of the London Traffic Branch of the Board of Trade expresses a very decided opinion that in the future motor omnibuses will be a serious factor in locomotion in London, and will tend to supersede electric tramways, especially in narrow streets. Mention is made of the fact that an application by the London County Council for permission to use trailer cars for passenger service is under consideration by the Board of Trade. Good progress is being made with the construction of the Euston-Watford Electric Railway. The report discusses at considerable length the advantages and drawbacks of electric traction for suburban railway service. (Page 27.)

THE Paper by Messrs. Lepine and Stelling on the German electrical industry has been further discussed by the Birmingham Section of the Institution of Electrical Engineers. It was agreed by several speakers that the greater prosperity of the German industry was largely due to the financial conditions, and it was clearly brought out that there has been some exaggeration of the differences in organisation of British and German firms in the Paper. (Page 28.)

ANOTHER new solder for aluminium and its alloys has been introduced. No flux is required, and the softest grade can be used with an ordinary bit. (Page 28.)

THE following books are reviewed in this issue:—"Chats on Electricity," by F. Broadbent; "Heat for Engineers," by C. R. Darling. (Page 29.)

THE claims upon the Bournemouth Corporation in respect of the tramway accident in May, 1908, amount to £8,508.—A recommendation of the Estates and Finance Committee of the Dublin Corporation to go to law with the Dublin Tramways Co. concerning tramway wayleaves has been rejected.—Winchester Corporation propose to purchase the local electric supply company.—The Anglo-Argentine Tramway Co. is providing 125 new tramcars and 80 additional trailers.—A large scheme of subway tramways is to be carried out in Buenos Aires.—An offer has been made to the Aberdeen Corporation by the local tramway company with regard to the dispute concerning the supply of electricity. (Page 29.)

BELFAST Corporation require water-tube boilers, superheaters, &c., and the Stepney Borough Council a turbo-generator, converting plant, and switchgear.—Transformers, arc lamp carbons, &c., are required at Plymouth, and stores at Rochdale and Acton.—Messrs. Harrison, Ainslie & Co. proposed to increase their electrical pumping plant at an estimated cost of £18,000.—A loan of £3,200 has been granted at Rhyl.—Loans of £3,500 and £1,500 respectively are required by the Sutton Coldfield and Worksop Councils. (Page 30.)

A COMBINED lighting and power meter has been introduced, having an additional "power" terminal connected to a tapping on the series coil, so that the current taken by the power or heating circuit flows through only a portion of this coil. The meter thus registers the units consumed for lighting, and, in addition, that proportion of the power consumption which, charged for at the lighting rate, equals the total power consumption charged for at the power rate. (Page 33.)

AMONG the specifications published by the Patent Office on Thursday last was one by T. Holdsworth for a device for attaching to trolley arms to protect the head from injury when it leaves the trolley wire and strikes a cross-wire.—A. Boeckel describes an improved form of the continuous-current generator, in which the field is rotated electrically in a direction opposite to that of the armature; the field winding is supplied with three-phase current from the armature.—An apparatus for grooving trolley wire when already strung up is covered by B. Kay; this comprises a bar clamped to the wire, and a reciprocating frame with two horizontal cutting discs.—F. W. Carter describes a means of improving commutation by providing the trailing edge of the brush with projections, which rapidly reduce the area of contact between the brush and the segment during the last moments of commutation.—A patent for a dry cell with vertical air-passages through the depolariser, has been granted to H. Hunte, in spite of opposition. (Page 34.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 13TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. Second Kelvin Lecture, "Lord Kelvin's Work in Telegraphy and Navigation," by Prof. J. A. Ewing, F.R.S.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science.

SATURDAY, JANUARY 15TH.

Birmingham and District Electric Club.

7 p.m. At Colonnade Hotel, New Street. Presidential Address by G. O. Donovan.

TUESDAY, JANUARY 18TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology. "The High Tension Spark Discharge in Air," by P. Kemp and W. A. Stephens.

Faraday Society.

8 p.m. At Institution of Electrical Engineers, 92 Victoria Street, London. (1) "The Conditions which Determine the Composition of Electrodeposited Alloys," by Samuel Field; (2) "Studies in the Electrodeposition of Metals," by Dr. F. M. Perkin and W. E. Hughes.

WEDNESDAY, JANUARY 19TH.

Royal Society of Arts.

8 p.m. At St. John Street, Adelphi, London. "The Japan-British Exhibition, 1910," by Count Hirokichi Mutsu.

Institution of Civil Engineers.

Students' visit to the new Horseferry Road station of the Westminster Electric Supply Corporation.

FRIDAY, JANUARY 21ST.

Physical Society.

5 p.m. At Imperial College of Science. (1) "The Polarisation of Dielectrics in a Steady Field of Force," by Prof. W. M. Thornton; (2) "On the Use of Mutual Inductometers," by A. Campbell.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "The Choice of Prime Movers for Power Stations," by E. T. Driver.

SATURDAY, JANUARY 22ND.

Junior Institution of Engineers.

3 p.m. Visit to the new generating station of the Westminster Electric Supply Corporation, Horseferry Road, Westminster.

ELECTRICAL EFFECTS AT THE DRURY LANE PANTOMIME

(By Our Special Correspondent)

WHILE it would perhaps be scarcely correct to liken a Drury Lane pantomime produced without the aid of electricity to the play of *Hamlet* without the Prince of Denmark, it is permissible to say that the performance would be shorn of a considerable amount of its beauty if electricity were an unknown factor. Certain it is that similar effects could be produced with no other form of illuminant, while the use of naked flames would be attended with considerable risk in any case. The authorities at Drury Lane were among the earliest, if not the very first, to appreciate the value of electric lighting for what are technically known as "stage effects," and, having gained more and more experience as the years have gone by, they have now attained to a degree of perfection which can hardly be realised even by those who watch the gorgeous spectacles from the auditorium. The thing is an art in itself, and can only be properly carried out by a person who has an intimate knowledge of theatre technique as well as a wide acquaintance with the rules and regulations affecting ordinary lighting. Moreover, the scale of illumination is gigantic, as may be realised from the fact that on certain occasions electrical energy is being consumed on Drury Lane stage at a rate equal to that in an entire town of several thousand inhabitants, while the weekly wages bill for the electrical staff runs well into three figures.

In *Aladdin*, which is now running at Drury Lane, the first feature of electrical interest occurs in Part I., when the Princess (Miss Ida René) and her ladies bathe in the sea. The scene consists mainly of a cloth painted to represent rolling waves, but immediately the stage lights are extinguished this is drawn up, leaving a plain cloth through which several holes are pierced. Through these holes the ladies place their heads and shoulders and go through graceful motions to imitate swimming. At the same time a cinematograph in the first circle is brought into action, and throws upon the screen a remarkably good reproduction of a moving seascape; so quickly is the change brought about that the illusion is complete. It may be mentioned that this cinematograph picture is the largest which has ever been shown, the screen measuring no less than 38 ft. square, whereas the usual size is about 25 ft. square. The film was taken specially for the purpose, and the machine itself is of an extra powerful type. It is housed in a fireproof box and takes normally about sixty amperes. For purposes of supply a special pair of 19/14 cables have been run to it from the stage intake.

Earlier in the play, Abanazar (Mr. Geo. Graves) makes his entry in an aeroplane fitted with a ½ h.p. motor, which serves the double purpose of driving the propeller and playing the "Merry Widow" waltz on a small barrel organ. Needless to say, other means are also provided for preventing the aeroplane and its occupant from reaching the stage in a too precipitate manner.

In the scenes which conclude Part I. the most interesting electrical effects are produced; here Aladdin (Miss Marie George) enters the mystic cave, his apparent descent being effected by raising a semi-transparent curtain, through which he can just be seen. While this is in progress, two "effect" curtains are lowered at the back of the stage, this operation being invisible to the audience. Each of these curtains carries 100 lamps of different colours wired by flexibles to forty plugs, which are all brought to a special iron platform situated on the prompt side, and some 30 ft. above the stage. When required, these plugs are quickly inserted into sockets permanently connected to spring contact-makers, which bear upon a wooden cylinder. Wound in the form of a spiral on the cylinder are two parallel brass strips, which thus serve to effect connection with the contact-makers as the cylinder is rotated. The cylinder and contact-makers somewhat resemble the familiar cylinder and comb of the musical box, with the exception that the little steel spikes on the cylinder are replaced by the spiral brass strips. Hence, when the cylinder is slowly rotated by hand, each lamp lights up when the first brass strip touches its contact-breaker, goes out, and lights up again for the second brass strip. The two strips are placed close together, so that the ultimate effect is that of a double flash succeeded by a definite period of inaction. When seen at a distance the result is particularly charming, and gives the impression of a vast number of twinkling coloured lights. The voltage employed is 100, and each lamp is provided with a small wire guard to avoid breakage during the process of raising and lowering. Some idea of the labour involved by this "effect" may be gained when it is realised that no less than three miles of flexible cord were necessary in wiring the curtains.

Following close on the cave scene is that depicting "The Garden of Light," which exhibits a most delightful scheme of colouring. In this scene no fewer than 1,000 "effect" lamps are employed. At the same time there are used twelve battens, each carrying 260 lamps, twenty-six portable battens, each carrying thirty lamps, and thirty-six stage arc lamps. That is to say, exclusive of stage arcs, practically 5,000 lamps, most of which are of 32 c.p., are in use at the same time. The wiring for this scene involved no less than one and a-half miles of fitting wire.

Scene 4 in Part II. represents the gardens of Aladdin's Palace, and is responsible for a considerable expenditure of electrical energy. The palace is outlined with coloured lamps to the number of about 1,200, for connecting up which some two and a-half miles of fitting wire were required. These lamps are fed from stage plugs, the leads consisting of twin flexibles whose aggregate length is 1,500 ft. Each conductor is composed of 130 strands of No. 40 S.W.G., the whole being insulated with vulcanised rubber and covered with a special compounded braiding. The leads are extremely flexible and are admirably suited to withstand the severe usage to which they are subjected. They were manufactured by the Liverpool Cable Co., and were supplied by Messrs. Baxter & Caunter, who also supplied 1,000 ft. of 300/40 constructed in a similar fashion. In addition to the 1,200 "effect" lamps, a large number of battens and arcs are employed in this scene. On the magic lamp being rubbed the palace is caused to float away in full view of the audience, and this is effected in an extremely ingenious manner. After the scene had been designed and set it was photographed, and a properly coloured lantern slide was made of it. The palace itself is an elaborate structure built up on one of the electric bridges, which can be raised or lowered at will, and immediately before it is caused to disappear a dense cloud of steam is projected upwards in front of it, thus cutting it off from the view of the audience. Under cover of this cloud, the structure is lowered and a plain sky cloth takes its place. Behind this cloth is a travelling telescopic ladder, something similar to those used for repairing overhead trolley wires, on the top of which is fixed a projection lantern. This lantern throws an image of the above-mentioned slide on to the sky

Digitized by Google

cloth, and this is what is now seen by the audience when the steam has cleared away. It is then a simple matter to push the ladder and lantern diagonally across the stage so that the picture travels across the cloth, gradually getting smaller and smaller, until it finally disappears. The effect of perspective is remarkable, and the illusion a very clever one, as the lantern is raised simultaneously with the traversing motion, so that the palace not only appears to be moving further away but also to be ascending.

In addition to the "effects" described above there are also others of minor character, such as the production of arcs between carbons held in the hands, the lighting up of long vacuum tubes by high-frequency currents, and similar examples of theatrical "magic." There are also the extremely pretty spectacles produced by the aid of portable accumulators, of which about 100 are in daily use. These accumulators are carried by girls and are used for lighting up miniature lamps hidden among flowers, &c. It is interesting to note that a special charging room for these small cells has been built at Drury Lane, and that every facility exists for dealing with this work efficiently and economically. Also, it may be observed that a separate switchboard is employed for all "effect" lamps. This is of the usual slate type, with twenty-four quick break switches and fuses, each capable of dealing with 25 amps. Some 2,000 metal filament lamps are used on the battens.

In concluding this article, we wish to express our indebtedness to the management of Drury Lane Theatre for their kindness in permitting our representative to examine the work, and to the theatre electrician, Mr. H. Mather, who so courteously devoted his time to explanations.

IMPERIAL ELECTRICAL STANDARDS

AN Order in Council has been made and is published in the *London Gazette* relating to the adoption of the units and standards recommended by the International Conference of Electrical Units and Standards, 1908. The question of agreement between the standards as defined by the Conference and the existing Board of Trade standards is gone into, and it is stated that they agree within the limits of accuracy obtainable, as already defined, except that in the case of the ohm the temperature should be 16·4° C., in place of 15·4° C., as specified in the original Order in Council relating to these Board of Trade standards. The new Order approves the denominations of the standards as set out in the following schedule:—

Standard of Electrical Resistance.—A standard of electrical resistance denominated one Ohm agreeing in value within the limits of accuracy aforesaid with that of the International Ohm, and being the resistance between the copper terminals of the instrument marked "Board of Trade Ohm Standard Verified. 1894 and 1909," to the passage of an unvarying electrical current when the coil of insulated wire forming part of the aforesaid instrument and connected to the aforesaid terminals, is in all parts at a temperature of 16·4° C.

Standard of Electrical Current.—A standard of electrical current denominated one Ampere, agreeing in value within the limits of accuracy aforesaid with that of the International Ampere, and being the current which is passing in and through the coils of wire forming part of the instrument marked "Board of Trade Ampere Standard Verified, 1894 and 1909," when on reversing the current in the fixed coils the change in the forces acting upon the suspended coil in its sighted position is exactly balanced by the force exerted by gravity in Westminster upon the iridioplatinum weight marked A, and forming part of the said instrument.

Standard of Electrical Pressure.—A standard of electrical pressure denominated one Volt, agreeing in value within the limits of accuracy aforesaid with that of the International Volt, and being one-hundredth part of the pressure which, when applied between the terminals forming part of the instrument marked "Board of Trade Volt Standard Verified, 1894 and 1909," causes that rotation of the suspended portion of the instrument which is exactly measured by the coincidence of the sighting wire with the image of the fiducial mark A before and after application of the pressure, and with that of the fiducial mark B during the application of the pressure, these images being produced by the suspended mirror, and observed by means of the eyepiece.

In the use of the above standards the limits of accuracy attainable are as follows:—For the Ohm, within one-hundredth part of one per cent. For the Ampere, within one-tenth part of one per cent. For the Volt, within one-tenth part of one per cent.

THE GENERAL ELECTRIC CO., TARIFF REFORM, AND OSRAM LAMSP

AT the request of some members of the staff of the General Electric Co., Mr. Hugo Hirst, managing director, addressed a meeting of some three hundred employees of the London offices of the company on the subject of Tariff Reform, with particular reference to the business of the General Electric Co. The meeting was held on Tuesday evening, at the Mansion House Restaurant, London. Tariff Reform was, said Mr. Hirst, a business and not a political question, but competent business men had not been consulted in the matter by the Government. Tariff Reform could be considered as a means of getting security of work, and continuity of employment. When foreign competitors were busy at home, they left us our own market, but we could not be sure of the work, and so were unable to organise properly in order to be always prepared for it. The profits of the company were not so large as was sometimes thought. He had gone into the matter, and the auditors would bear him out when he said that if the wages of the employees were increased 20 per cent. all round, there would be nothing left to pay the debenture interest.

With regard to the Osram lamp business, the lamps were originally wholly imported from Germany, but the directors, partly due to the protection offered by the 1907 Patents Act, partly because they saw a different kind of protection coming, and partly because they wished to make the Osram lamp business a manufacturing business, had decided to erect works for the manufacture of these lamps in this country. The erection of these new works at Hammersmith increased the value of the land there, benefited the building trade, and secured labour for 700 people. In a few months' time the number would be increased to 1,100. Specimens of the machines used in making the lamps had been brought from Germany, and the rest made here; men skilled in the processes employed had been brought here to instruct the workers. The sum paid in wages to the employees of the new Osram lamp works at Hammersmith would soon be £1,000 per week. Was it not better that this should go to Hammersmith and not to Berlin? They need not think that the staff employed in the import trade would suffer, as the increase in the manufacturing business would provide more than enough work for them. They hoped to manufacture Osram lamps for the Colonies as well as for home consumption.

Two or three German firms with which the company had business relations had intimated that they would erect works in England in conjunction with the G.E.C. if Tariff Reform were introduced. This would mean employing a large additional amount of labour, and it was to be remembered that he was only speaking of one firm in an industry which was a very small proportion of the industry of the whole country. Even if Tariff Reform were to make food dearer, a living wage would be given, as the labour would be required. As another example, Mr. Hirst mentioned the Robertson Works, which turned out, he said, five million carbon filament lamps a year. This country imported as well some 10 million lamps, and if a duty were imposed on these imported lamps, the output of the Robertson Works might be increased by, say, two million. The increased manufacture would lower the cost of production, and enable them to sell them even cheaper than before, and thus a duty would effect a reduction in price.

The Witton carbon works were another example. When these started work, the price of carbons in this country dropped immediately, but remained the same in other countries. Were they to stop manufacturing, the price would rise again at once. These works were being run at a loss. In the case of a tender for Hackney, they lost the contract by only £1, although their carbons were the only ones of British manufacture. At Woolwich they only obtained a £190 contract at much below cost price, and this they did only by working it as nineteen orders of £10 each, to evade certain clauses in the general conditions attached to the larger contracts, which would have increased the cost of manufacture still more.

Mr. Hirst, in reply to a question as to whether labour was sweated in protected countries, referred to the reports of the various committees which had recently investigated the matter in Germany and America. They had not found any sweating going on, but had reported most favourable conditions of the working classes.

Electric Railway between Denmark and Sweden.—A definite proposal has been put forward for the construction of a tunnel between Denmark and Sweden, starting at Copenhagen, and connecting up with Malmoe. Connection would be made on the way with the small islands of Amager and Saltholm, and the electric trains which it is proposed to run through the tunnel would run on the surface on these islands in order to reduce the underground journey as much as possible. If the scheme is carried out, it is estimated that the trip could be made in 1½ hours.

ONTARIO POWER PLANT AT NIAGARA FALLS

ON Friday last, a Paper describing the plant of the Ontario Power Co. at the Niagara Falls, was read by Mr. C. W. Jordan, before the Institution of Mechanical Engineers. This company's development comprises the taking of water from the Upper Niagara River above the Horseshoe Fall, leading it through pipes and penstocks to turbines in a station below the Fall, and there generating electric power, which is transmitted to a second station on the hill above, and thence distributed. There is a fall in level of 55 feet in the rapids above the Fall, and to take advantage of this the headgates are placed just above the rapids. From the headgates three steel and concrete tunnels will, when complete, convey nearly 12,000 cubic feet of water per second to the top of the cliff above the power-house, and just beyond the Fall. Thence it will pass through twenty-two steel penstocks in shafts and tunnels down and out through the cliff to an equal number of horizontal shaft turbines in the power-house at the foot of the Fall. From the generators, the cables pass through tunnels to the distribution station on the hill above, and thence to the transmission lines beyond. The total capacity of the whole installation, when complete, will be over 200,000 h.p. The intake, which is nearly 600 ft. long, stretches across the inlet at Dufferin Island almost parallel with the current in the river. Throughout its whole length, a concrete curtain wall extends down 9 ft. into the water, which is 15 ft. deep at this spot, so that the gate openings beneath admit only deep water, and this at right angles to the swift exterior surface flow, which, sweeping the full length of the curtain wall, carries the floating ice past to the rapids beyond. The intake is divided into twenty-five bays, through which the water is admitted at a velocity of 5 ft. per second. The main conduits are of 0·5-in. riveted and reinforced steel imbedded in concrete, 18 ft. and 20 ft. in diameter, and 6,500 ft. long, sunk beneath the surface. The water flows through them at an approximate velocity of 15 ft. per second. Riveted to the bottom of each main conduit are tapered steel-castings leading to the valves and penstocks below, each supplying water at 10 ft. per second to a single horizontal shaft turbine. Each valve is operated by a 30-h.p. induction motor controlled either locally or from the switchboard in the generating station, and may be fully opened or closed in three minutes.

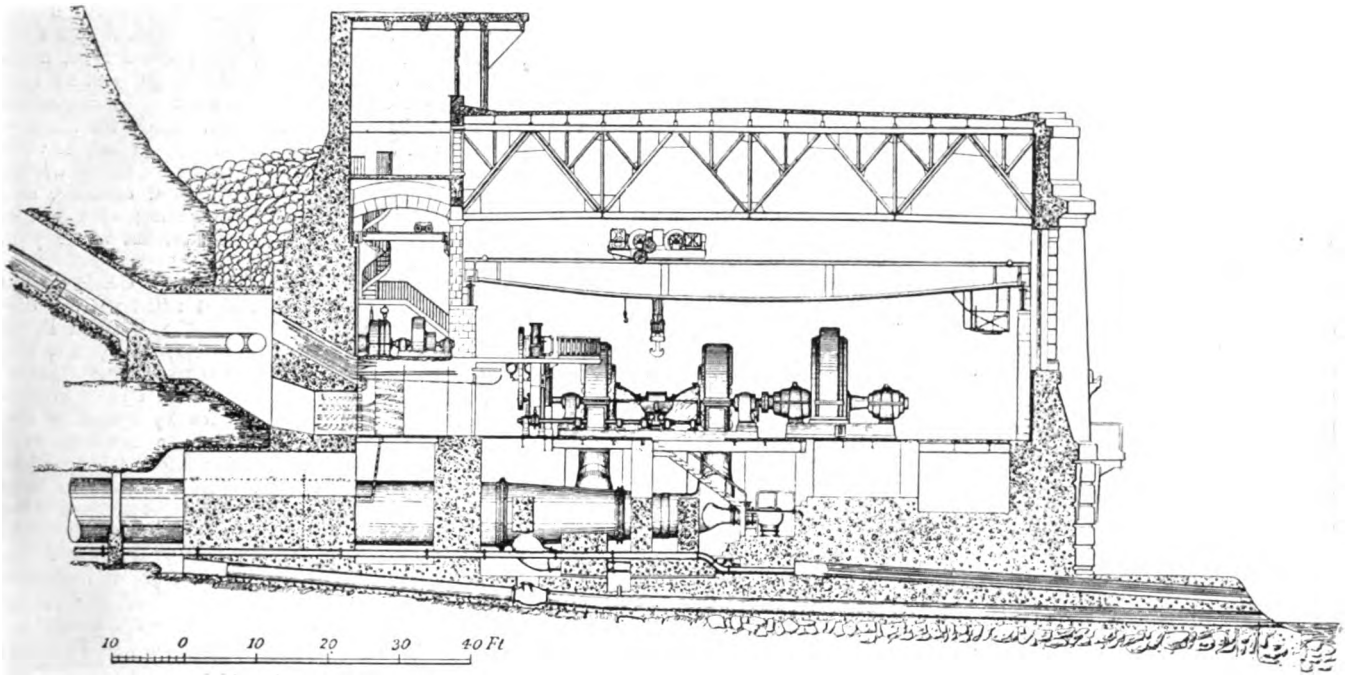

FIG. 1.—CROSS SECTION THROUGH THE NIAGARA GENERATING STATION OF THE ONTARIO POWER CO.

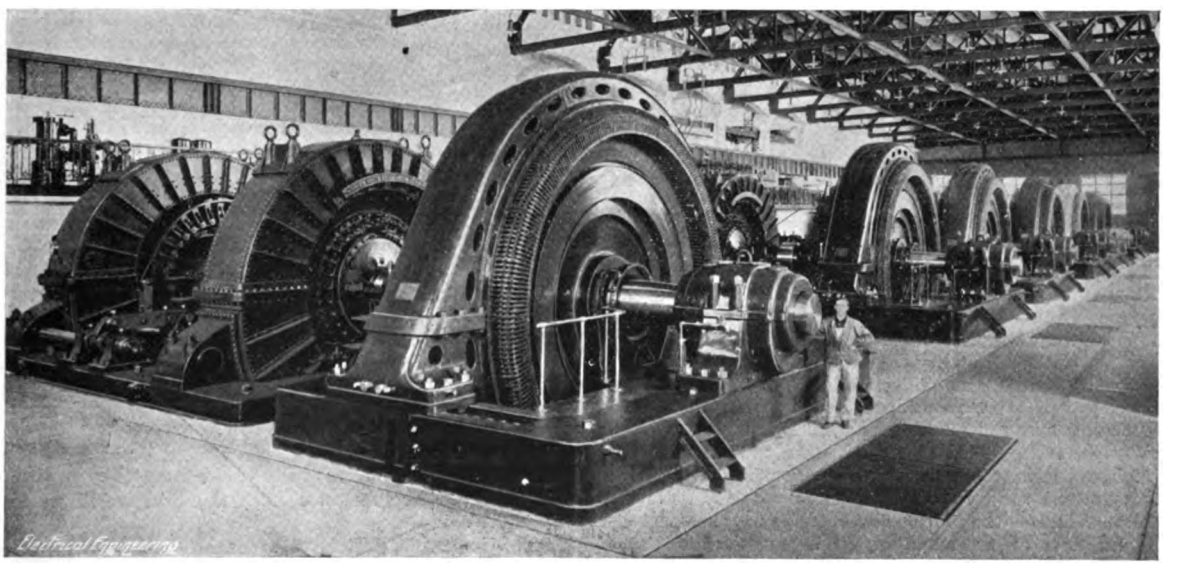

FIG. 2.—INTERIOR VIEW OF POWER STATION, SHOWING SIX 12,000-H.P. TURBINE UNITS.

The illustration of Fig. 3 shows the position of the power-house in relation to the Falls, and is especially interesting as showing the ice jam which occurred on March 5th, 1906.

Digitized by Google

Fig. 2 is an interior view of the station, and Fig. 1 is a cross-section to show the general arrangement of the plant. Each generating unit consists of a horizontal double turbine direct coupled to a generator. The latter machines are wound for three-phase, 12,000 volts, 25 cycles, and run at 187 r.p.m. The total weight of each generator is 231 tons, and each was entirely assembled on the spot, including the building up of the laminated iron rotor, and the winding and insulating of the armature. The exciters are 375 kw., 300 r.p.m., 250 volt machines, direct coupled to turbines on the gallery overlooking the turbine floor, and supplied with water through 30-in. penstocks that connect with the main conduit through the cable tunnel. Each exciter can supply the fields of six generators. The turbines are of the Francis or inward-flow type, double, central discharge or balanced twin turbines, and are designed to deliver

FIG. 3.—VIEW OF POWER STATION, SHOWING HORSESHOE FALLS AND 1906 ICE JAM.

12,000 h.p. at 175 ft. head. Their shafts are 24 in. maximum diameter, and each carries two 78-in. cast-steel runners. Immediately above the cable tunnel entrance are mounted the main generator switches, and on one side the two turbine-driven exciters and their governors, and on the other the motor-actuated main field rheostats. In front of the switches are a few panels carrying exciter rheostats and switches, and the gear for actuating the penstock valves. To avoid dampness from spray from the adjacent fall, and to ensure the generators keeping cool in hot weather, a cold-air supply is led to each generator from a sub-floor chamber, communicating with external shafts, and the heated air is released through large roof ventilators.

The cables from the generators are single conductors, insulated with treated cambric. These cables are mounted on porcelain insulators in separate compartments, built up of thin shelves of reinforced concrete fastened to the concrete substructure of the power-house, and closed by asbestos doors readily removable for inspection. At no place are the cables of more than three generators brought near one another. Field circuits, exciter leads, and control wires are carried in iron conduits. The switchgear already outlined is controlled from the distribution-station on the hill above the power-house, and ordinarily the engineer in the latter has merely to attend to the supply of exciting current, but in case of serious trouble, the control of the first generator oil-switch, and of the field-switch is at his command. All communications, and orders from the distribution-station to the power-house, and *vice versa*, are effected by means of a "telautograph," thus ensuring a written confirmation of every order given. The outgoing generator-cables from the oil-switches go to cable heads supported directly under the gallery. Here they branch into three-core cables, two being required for each generator. These are paper insulated and lead covered, with steel armouring, covered with jute. These cables are taken to the distribution-house through a tunnel approximately 9ft. square with arched roof cut through the solid rock. This tunnel starts on a level with the main floor of the power-house, extends through the rear wall, and rises at an angle of 30 degrees until it has passed under the main water-conduits. For this portion of the distance it accommodates the two 30-in. diameter penstocks for the exciter turbines. After passing under the main conduits it rises at an angle of 60 degrees, and opens in a manhole half-way up the hill at the distributing station. The control cables for the operation of the governors, field-switches, and penstock valves are carried in iron conduits secured to the roof of the tunnel by hangers. At intervals a space is left in the conduit, and a wooden clamp holds the cable, and bears against the end of the conduit

The generating and distributing stations are nearly 600 feet apart with a difference of 260 feet in elevation. The distributing-station is divided into three longitudinal bays. The front bay contains the switches, bus-bars, &c., at generator pressure; the rear bay contains those at transmission pressure. Between, is the main bay, divided into two long transformer-rooms. Each generating unit has its individual cables, switches, and switchboard, section of bus-bars, transformers, interrupters, and high-pressure switches complete to the transmission lines, enabling independent operation. The low-pressure bay contains on the main floor the 12,000-volt automatic oil circuit breakers. In the transformer-rooms, the transformers stand in pits 6 feet below floor-level. Each transformer is fitted with a recording thermometer, and is of the oil-insulated, water-cooled type, three to a unit, connected in delta on the low voltage, and in star with earthed neutral on the high-voltage side. The secondary (line) voltage is approximately 62,000 volts. Each transformer has a normal capacity of 3,000 k.v.a., and weighs, complete with oil and case, approximately 50 tons. The high-voltage wiring from the transformers is insulated with treated cambric, and further protected by a braided fireproof covering of asbestos. It is supported on large porcelain insulators in the upper part of the transformer pits.

The area of distribution of the Ontario Power Co. is shown in the map of Fig. 4. Two 60,000-volt lines run from the distributing station for 6 miles to a point on the Niagara River near the town of Queenstown, where they cross the gorge, and connect with the lines of the Niagara, Lockport, and Ontario Power Company, delivering power for use in the United States. These lines consist of aluminium conductors 1⅛ inches in diameter, carried on steel towers 55 feet high to the top wire, with an average span of 500 feet. The insulators for this line are of porcelain, and weigh 35 lb. each. The cables are brought across the river in three spans, from steel cantilevers at the top of the cliff to steel towers at the water's edge on the other side. The Niagara, Lockport, & Ontario Power Co. is a transmission company only, and buys the power from the Ontario Power Co. From the Niagara River to Lockport, a distance of 16 miles, there are two lines, each capable of transmitting 30,000 h.p. From Lockport to Mortimer, a distance of 57 miles, there is a line having a capacity of 20,000 h.p., and from Mortimer East to Syracuse, a distance of 81 miles, there is a line having a capacity of 10,000 h.p. From Lockport to a point about 11 miles east, and then south to the West Shore, thence on the West Shore to Pittsford is a line having a capacity of 20,000 h.p. From Pittsford on the West Shore right-of-way east to Syracuse is a line having a capacity of 10,000 h.p. From Lockport south to a point south of Buffalo, there are two transmission lines, each having a capacity of 30,000 h.p. These two

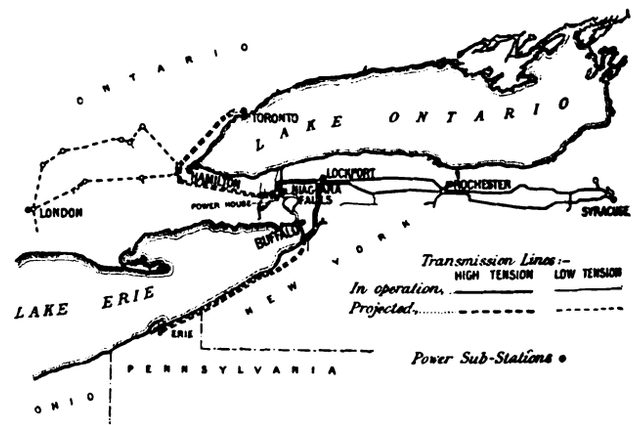

FIG. 4.—MAP SHOWING AREA SUPPLIED FROM THE ONTARIO POWER CO.'S NIAGARA STATION.

lines south will be eventualy extended through to the Niagara River, and so they are constructed for the full capacity of 30,000 h.p. The distance from the Niagara River to Syracuse is 154 miles.

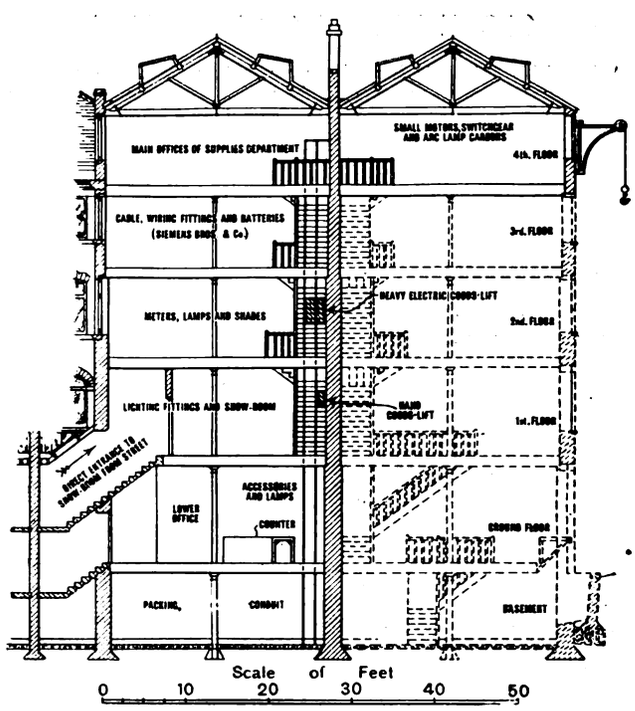
The main-line structures are nearly all steel towers, and the standard line span 550 feet. On some portions, however, much longer spans are used, the longest at present installed being 1,253 feet. In every case on the 60,000-volt lines, each line of towers carries only one three-phase circuit. The main-line conductors installed so far are all of aluminium cable, except on a portion of the line between Mortimer and Syracuse, where, because of the long spans employed, it is preferable to use copper. The first of the steel towers installed were of the tripod type, made of lap-welded pipe; but the later towers are of structural shapes and galvanised. The insulator used on all

Digitized by Google

the main-line construction consists of three shells cemented together by means of neat Portland cement, the whole insulator being cemented to a steel pin before attachment to the tower. The total height is 19 inches, and the diameter 14·5 inches.

The power generated by the Ontario Power Co. furnishes part or all of the public and private lighting in Niagara Falls, Welland, Stamford, and St. Catherines, Ontario; and Lockport, Depew, West Seneca, Hamburg, Batavia, Rochester, Canandaigua, Auburn, Baldwinsville, Phœnix, Fulton, and Syracuse, New York. Further, power is supplied to electric furnaces for the reduction of iron, copper, and other ores, and the manufacture of cement, calcium carbide, and lime nitrates in Port Colborne, Welland, Niagara Falls, and Thorold, Ontario, and Lewiston, Lockport, and Caledonia, New York. The railways and tramways supplied include the systems in Syracuse, Rochester, Canandaigua, Geneva, West Seneca, and Hamburg; and the interurban lines Syracuse, Lake Shore and Northern Syracuse and South Bay, Rochester and Geneva, Rochester and Mount Morris (Erie Railroad), Buffalo, Lockport and Rochester, Buffalo and Hamburg, and Buffalo and Dunkirk. Further, several large steel and other works requiring power are supplied.

In the early part of the year 1909 the Niagara River was partially frozen, and a large quantity of ice coming down from the lakes accumulated above the Falls, entirely blocking the American Fall, and partially blocking the Horseshoe Fall. This state of affairs did not in any way inconvenience the Ontario Power Company, who continued at work. Later, however, the lower river became blocked with ice, which piled up in the gorge and covered the Rapids, and finally even the Whirlpool (see ELECTRICAL ENGINEERING, April 29th, 1909, Vol. V., pp. 404 and 429). It appears that the water rose over forty feet above ordinary level and flooded the power-house. In April last, the company was still taking power in bulk from the Electrical Development Co., and the Canadian Niagara Co., whose power-houses, being situated on the Upper River, were not affected. The plant must have been submerged for some time, and it is anticipated that very considerable repairs and renewals will be required.



DISCUSSION.

Prof. W. C. UNWIN said that the development of 600,000 h.p. in the Niagara district in a comparatively short time, could be attributed to the financial, commercial, and engineering courage of the United States and Canada. The first installation had been dominated by the consideration that nothing was to be done to injure the beauty of the Falls. The generating station was placed two miles above the Falls, and the tail water was lead away by an underground tunnel, and discharged below the Horse Shoe Fall, nothing showing except a very unobtrusive tunnel mouth. That involved placing the turbines at the bottom of an excavation 200 ft. deep, and necessitated the use of vertical-shaft turbines. When the first installation, which now aggregated 200,000 h.p., was on the way, the United States engineers and financiers became a little disturbed at the prospect of competition from Canada, and obtained a concession on the Canadian side. That concession had now been developed by the Canadian Niagara Power Co., which had built a turbine house intended for 200,000 h.p., and a large part of this had already been installed. This power station had been modelled on the same principles as the original one, with vertical-shaft turbines placed at the bottom of a deep excavation, the tail water discharging through an underground tunnel in the same way. Another company proceeded on the same lines a little higher up the Niagara River, but as the ease of access for discharging the tail water below the Horse Shoe Fall was already occupied, this company made a tunnel for the tail water right under the Fall. Then the Ontario Power Co. came along, but found that they could not work on the same lines as the previous companies, and they carried their intake high up the river, and brought the water in underground pipes to a point a little below the Horse Shoe Fall, and then dropped it down to the generating station below the Fall. The Ontario Power Co. foresaw that the water in the lower river might flood their generating station, but they thought they were safe in placing the floor of the generating station about 20 ft. above the ordinary lower river level. This varied very little indeed in the ordinary way. Niagara River was supplied by an immense chain of lakes of an enormous area, and had an extraordinary constant supply of water all the year round. The only thing that changed the level of the river above or below the Falls were occasional winds which drove back the water in Lake Erie, and ice blocks which occurred in the lower river. As mentioned in the Paper, however, last winter there was an unprecedented ice block, and this provision proved to be insufficient. He believed they had had heaps of ice on the floor of the station, and had not yet started the works again. Probably the detail which had done most to make these hydraulic installations a success, and which had enabled the working of the large alternators in parallel, was the relay governor. This was very sensitive, and had no other function than just to open a small valve one way or the other, and so put in action a powerful hydraulic relay.

SIEMENS' LONDON STORES

THE extensive premises in Upper Thames Street, London, E.C., recently acquired by Messrs. Siemens Bros. Dynamo Works, Ltd., for offices and stores in connection with their Supplies Department, present several features of interest as regards both the general arrangements and the lighting. A few weeks ago we referred to the opening of these stores, and the equipment is now complete, and the business transferred from other premises in London is now in full swing.

As shown in the accompanying section, the main offices are situated on the top floor of the building, while the remaining four floors and the top floor of the adjacent building are devoted chiefly to stores. Packing is done in the basement, where there are also racks for wood casing and steel conduit. General sales, both to trade and the public, are conducted over the counter on the ground floor, where there is also a small office, an inquiry bureau, and the telephone exchange. In the large racks behind and to the side of the counter are tantalum lamps of the sizes most in demand, general wiring fittings, and accessories, arranged according to list numbers. The first floor is divided into two parts: one has been artistically decorated and fitted up as a showroom, and the other has racks and shelves for arc lamps and lighting fittings of all kinds. On the second floor are transformers, meters, tantalum and carbon-filament lamps, and holophane and other glass shades. The meters are arranged according to type and list number in open boxes, which slide out from the rack partitions like drawers and can be carried about if desired. The lamps are stored in deep wood boxes with metal-protected edges and hand-holes for carrying. All

SECTION THROUGH SIEMENS' UPPER THAMES STREET STORES BUILDING.

the boxes are of the same size, and each holds a definite number of lamps (in packing). These boxes are stacked on their sides so as to form partitioned shelves on the "Unit" system, each box bearing a label as to its contents, &c.

The third floor is devoted entirely to the manufactures of Messrs. Siemens Bros. & Co., and besides racks for cable, flexible and the metal-sheathed cable for the O.S. and other wiring systems, has a number of cupboards with sliding doors for the small fittings and accessories. Insulating tape, batteries, and the other products of the Woolwich Works are stored on this floor. The main offices of the Supplies Department are on the floor above, and adjacent to these is the stock of small motors, starters, fans, switch and fuse boxes, and arc-lamp carbons. Though only one floor is devoted to these commodities, there is a considerable stock of each, as the building is very much deeper than it is broad, and the available space has been utilised to the best advantage by the judicious placing of the racks.

The general lighting of all the floors, including the main offices and the basement, is by small "Economy" enclosed arc lamps taking 5 amps. and giving 24 burning hours. The counter on the ground floor and desks in corners and other places not well illuminated by the arcs have pendant tantalum lamps, while along each passage between the racks are hanging hand-lamps on the "Laurie" system. A steel wire is stretched along the

Digitized by Google

ceiling for the certain distance of the rack, and the cable from the ceiling-rose at one end is suspended from the wire in a series of loops by rings which can run easily along the wire. The hand-lamp is suspended by a piece of braided cable from the last ring, and can be readily brought to any partition.

Steam-heating has been adopted, and there are only one or two motors running in the building, but a power circuit has been provided for the heating apparatus, &c., in the showroom. The main wiring from floor to floor is in steel conduit, but all the rest is surface wiring on the O.S. system. The new "Z" cartridge-type fuses are used. A private telephone system affords communication between the counter and offices and the various store-rooms, and there are two lifts: a 1-ton Waygood electric goods lift with rope control, and a small hand-operated lift.

As indicated in the sketch, the showroom can be reached direct from the street without passing through the sales room, and contractors can take or send their customers to inspect or choose fittings. It is thus a trade showroom, and should prove of considerable use to contractors who have not room at their offices to stock a large selection of fittings and accessories.

The head of the Supplies Department is Mr. A. H. Bate, who has his office on the top floor. In the lower office will be found Mr. T. Gladdy, who is always ready to give valuable advice on installation matters to contractors. Mr. W. H. Hitchcock, who is assisting Mr. Gladdy, needs no introduction from us, as he is already well known among the contractors of the London district in connection with the Aldchurch Yard depôt, the business of which has been transferred to these new premises.

CLOCK METERS ON TRAMCARS

SEVERAL attempts have been made to reduce the excessive energy consumption of electric trains and tramcars due to careless driving. On the elevated railways in Chicago and Philadelphia signals were set up at certain points to remind the drivers when to start coasting, &c., but this system, though it had a good effect, does not give any comparative record of the methods of different drivers. Meters were tried in many places, but proved to be too delicate for the work. As stated in ELECTRICAL ENGINEERING, October 14th, 1909, page 898, clocks indicating the total time current is on have been used with considerable success in Berlin. A new method, which is giving much satisfaction on the Manhattan Elevated Railway of the Interborough Rapid Transit Co., of New York, is to connect a similar clock in such a manner that the total time during which the car is coasting is recorded. This system is described in a recent issue of the *Electric Railway Journal* (New York), and its chief advantage over the Berlin system is that it affords a check both on the efficiency of controller manipulation and braking.

The coasting clock consists of a time-recording apparatus electrically interlocked with the air brake and the electrical control. One circuit is made through a contactor of the multiple-unit control system, and another through the piston of the brake cylinder, which closes the circuit when the piston is in the off position. Both of these circuits must be closed to allow the clock to run. The device works, therefore, only during the period in which current is shut off from the motors and before the application of the brakes. An automatic record of the time during which the clock runs is printed on a strip of paper contained within the case of the clock. Each motorman is provided with a key of distinctive design. When this key is inserted in the clock case at the beginning of a run it stamps the paper record in the clock with the motorman's distinguishing number. At the end of the run the motorman removes the key inserted in the clock at the beginning of the run, and by so doing stamps the final time on the paper slip, together with his number. The record can then be detached by the motorman and handed in with his time card. The results obtained with some experimental sets in New York have been so satisfactory that a large number of cars are to be equipped with this apparatus.

Iron and Steel Institute.—The annual general meeting of the Iron and Steel Institute will be held at the Institution of Civil Engineers, Great George Street, on May 4th and 5th, and the annual dinner on May 4th. The autumn meeting will be held at Buxton on September 27th to 29th. Members of the Institute are specially invited to attend the International Congress of Mining, Metallurgy, Applied Mechanics, and Practical Geology which is to be held at Düsseldorf in June.

High-lift Centrifugal Pumps.—Messrs. Drysdale & Co. (Bon Accord Engine Works, Yoker, Glasgow) are making a special form of high-lift centrifugal pump, and we learn that they recently obtained an 83 per cent. efficiency on a small pump with only an 8-inch diameter over blades. Two of their 14-inch pumps have been in use at the Yoker generating station of the Clyde Valley Electrical Power Co. for some little time for handling the circulating water, and are giving good results.

SIMPLEX ELECTRICITY METERS

SINCE the establishment, some months ago, of a meter-testing department at 116 Charing Cross Road by Simplex Conduits, Ltd., this branch of the firm's business has rapidly developed, and we are informed that among the users of the meters which the company are supplying are some of the largest

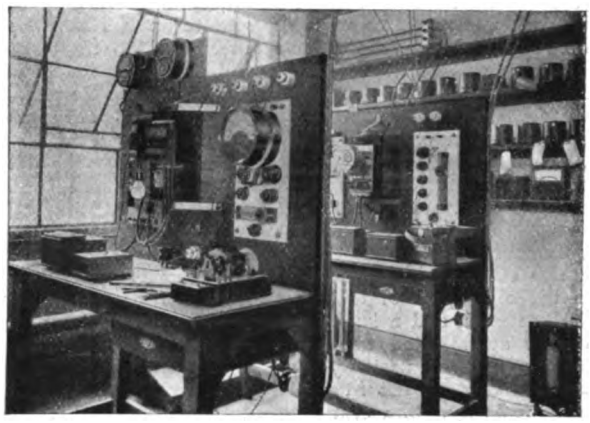


FIG. 1.—METER-TESTING BENCHES.

electricity corporations throughout the country. The new catalogue just issued gives particulars of a considerable range of patterns of both watt-hour and ampere-hour meter for continuous as well as for alternating currents, with diagrams of connections, and curves of accuracy at various loads. Time meters are also included, and two rate meters, with and without combined clock switch. A useful appliance listed is a portable check meter for testing house meters *in situ*. Considerable stocks of the most used types of meters are carried. We understand that some of these meters are being submitted to the Board of Trade for approval.

The meter-testing department, part of which is shown in Fig. 1, is equipped with extensive plant for carrying out complete tests on all types of electricity meters and for the calibrating thereof. Every meter is tested before being sent out,

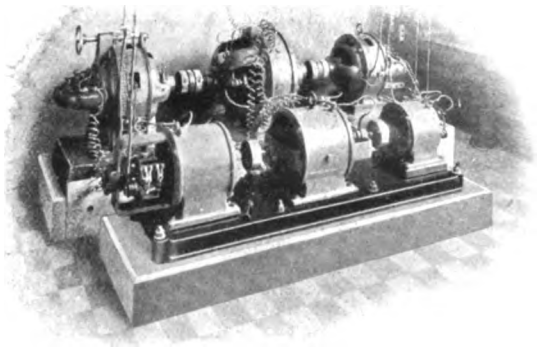

FIG. 2.—SPECIAL MOTOR-GENERATORS FOR METER TESTING.

in addition to being calibrated at the works. A special set of converting machinery (shown in Fig 2) is installed for changing the ordinary supply to give any phase displacement and frequency and all voltages up to 600. There are two separate motor-generators, one for continuous and one for alternating current, each comprising a motor driving two generators, one for the current circuit and one for the voltage circuit of the meter. In the case of the alternating set, the stator of the voltage machine can be shifted to give any phase displacement relatively to the current from 0 to 360°.

The Constantinople Telephone Contract.—The *Financial News* Constantinople correspondent states that a French company, jointly with the East European Cable Co., have lodged a protest in the Ottoman Chamber against the grant of the Constantinople telephone concession to the combined French, English, and American Syndicate. The French company asks for the contract to be cancelled, and has requested the intervention of the French Ambassador at Constantinople. It also announces its intention, if it does not obtain satisfaction in this direction, of bringing an action for 2,000,000f. damages.

Digitized by Google

PENDING ELECTRICAL LAWSUITS

(Compiled by our own Editorial Staff and Strictly Copyright.)

THE first "electrical" appeal case which will be heard during the Hilary sittings is that in which the British Westinghouse & Manufacturing Co. appeal against the decision of Mr. Justice Joyce in October last in the arc lamp infringement action brought by them against Mr. G. Braulik.

The judge's decision was that the patent in question (the Bremer flame arc lamp patent, No. 18,786 of 1902) was invalid for want of subject-matter, and that, consequently, there was no infringement. The arguments and evidence in the case and the decision were fully reported in ELECTRICAL ENGINEERING, Vol. V. (1909), pages 571, 617, and 909.

Another case on the list is the appeal of J. H. Holmes & Co. from the judgment of Mr. Justice Neville in October last, in the action brought by them against the Associated Newspapers, Ltd., for alleged infringement of the Clatworthy patent for the electric driving of printing presses.

The judge decided that the patent was invalid, as the invention claimed had been described in a previously published article on an American system. The facts of the case, evidence, and decision were given in ELECTRICAL ENGINEERING, Vol. V., pages 915, 936, 948.

The General Incandescent Co., Ltd., are appealing against the verdict in October of a special jury before Mr. Justice Ridley in the action brought against them by the Armorduct Manufacturing Co., Ltd.

The latter company obtained judgment for the repayment of monies due to them, and alleged to have been paid to the General Incandescence Co. by a former agent of the Armorduct Co. (See ELECTRICAL ENGINEERING, October 21st, 1909, Vol. V., page 917.)

"Dr." Bodie is appealing against the verdict of a common jury in November last, according to which he had to refund the sum of £1,000 paid him by Mr. C. H. Irving as a premium. (See ELECTRICAL ENGINEERING, Vol. V., pp. 953 and 970.)

Among the other cases which are down for hearing is an action brought by the British Thomson-Houston Co., Ltd., against the Midland Railway Co.

This will be heard with witnesses before Mr. Justice Parker in the Chancery Division. It was down for hearing before Mr. Justice Warrington last sittings, but did not come on. The British Thomson-Houston Co. allege that the Midland Railway Co. have infringed their patents covering the multiple unit control system for electric traction. The equipments in question were supplied by Siemens Bros. Dynamo Works, Ltd., in connection with the conversion to electric traction on the single-phase system of the Heysham-Morecambe section of the Midland Railway Co.'s system.

Another interesting and important action down for hearing before Mr. Justice Parker is that brought by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges., of Zabcze, Germany, against the Electric Construction Co., Ltd., for alleged infringement of the two Ilgner patents for the automatic control of electrical flywheel sets in connection with the driving of reversing rolling-mills.

The hearing of this case is announced for Wednesday next, January 19th, subject to anything part heard. In the same list, but some considerable way down, is the hearing of an appeal against the Comptroller's decision in a dispute between the same parties. This was with regard to the method of procedure and the submission of evidence in connection with an application made by the Electric Construction Co. that the patents in question should be revoked under Section 27 of the Patents Act, 1907, on the ground that the patented articles are manufactured mainly outside the United Kingdom. Abstracts of the two patents in question, together with the Comptroller's decision with regard to the submission of evidence, were given in ELECTRICAL ENGINEERING, Vol. V., page 305. In the event of the Donnersmarckhütte Ges. losing their case for infringement, doubtless the Electric Construction Co. will withdraw their application for the revocation of the two patents, which would then be of less importance to them.

Mr. Justice Parker will also hear an action brought by the "Z" Electric Lamp Syndicate against Marples, Leach & Co., Ltd. (now the Adnil Electric Co., Ltd.), for alleged infringement of their patent No. 21,654 of 1906, granted to Dr. Hollefreund & Co., of Berlin.

The patent is for the use of phospham or other similar compound in the manufacture of metal filaments for the purpose of removing the carbon remaining over from the organic material used for binding together the tungsten particles for squirting. The patent was given in full in ELECTRICAL ENGINEERING, July 29th, Vol. V., page 685. An application was made by the "Z" Lamp Co. for further particulars from the defendants in reply, but this was dismissed by Mr. Justice Warrington. An appeal against this decision before Lords Justices Cozens-Hardy, Fletcher Moulton, and Farwell in October last was unsuccessful, and so the original objections to the patent put forward by the defendants will stand.

The list of causes for trial before Mr. Justice Neville in the Chancery Division include one between the Chemische Fabrik Griesheim Elektron and the Badische Anilin- und Sodafabrik. The petitions by Messrs. Dick, Kerr & Co., Ltd., and Messrs. A. Schonfield & Co., for the winding up of the British Aluminium Co., Ltd., and a summons against the Amalgamated Radio-Telegraph Co., Ltd., to restrain the sale of shares, will also be heard before Mr. Justice Neville. The cases before Mr. Justice Eve include one between Lloyds Bank, Ltd., and the Aluminium Corporation, Ltd.

Among the chief King's Bench actions is one by the Gravesend & District Electric Tramways Co., Ltd., against the Gravesend Corporation.

The Corporation supply electrical energy to the Tramway Co., and there is a dispute with regard to the metering of the current supplied for this purpose. The action may involve a question of principle with regard to the certification of meters.

A special jury action is down for hearing, in which Messrs. Ganz & Co. are suing Messrs. Willans & Robinson in respect of plant supplied, as sub-contractors, to the South Wales Electrical Power Distribution Co.

Messrs. Willans & Robinson were not paid in full by the Power Co., and consequently did not pay their sub-contractors in full. Messrs. Ganz claim that under their agreement they are entitled to full payment.

Other actions are by Mr. J. H. Lukach against the British Westinghouse Co., the North-Eastern Steel Co., Ltd., against Messrs. R. W. Blackwell & Co., Ltd., and the Surbiton Council *v.* Callender's Cable & Construction Co. There are also a number of actions against the London County Council, the London United Tramways Co., and the London Electrobus Co., for personal injuries.

Telegraph Traffic and Movements of Cable Ships.—It is gratifying to be able to announce the restoration of the cable between Paramaribo and Cayenne, the *bête noir* of the Compagnie Française des Cables Télégraphiques. On the 3rd inst. direct communication between Saigon and Bangkok was interrupted, and telegrams had to be routed *viâ* Pakse and Obone. Restoration was effected on the 9th inst., on which day the El Arich route ceased working. The following day saw the Bagdad-Bassorah line again working as usual. Among the cables yet to be repaired are those between Perim-Assab, Dakar-Conakry, Saigon-Doson, Bathurst-Bissao, and between Tourane and Amoy. The cable steamer *Henry Holmes* repaired the Jamaica-Colon cable, which was disturbed by the recent hurricane, and the *Ponyer Quetier* is off French Guiana attending to another cable. The *Mackay-Bennett*, of the Commercial Cable Co., is in company with the *Colonia*, of the Telegraph Construction and Maintenance Co., attending to the diversion of another of the former company's cables to Newfoundland, the shore end of which has already been laid off Cuckold's Cove, near St. Johns. The *Colonia* will then lay another cable between St. Johns and New York, and thus, notwithstanding the great outcry in connection with the landing rights, &c., at Newfoundland, the Commercial Cable Co. will have a duplicate route. The Anglo-American Telegraph Co.'s ship *Minia*, returned to Halifax, Nova Scotia, after a repair, and left again for a fault near Cape Breton. The *Contre Amiral Coubet* was in dock idle. The *Cambria*, of the Telegraph Construction and Maintenance Co., is repairing the Western Union Cables. She has been off the Flemish Cap for close on three months, working in about two miles of water in bad weather, and it is believed that new cable has had to be laid in to the extent of about 50 miles. The cable steamer *Relay* left Jamaica after repairing the cable there, and is now at New York. The members of the Royal West Indian Commission have left for New York, *en route* to the West Indies, to inquire into the possibilities of Canadian—West Indian trade, and in particular the subject of telegraphic communication. The Commission will report in what manner the complicated telegraphic conditions in the Caribbean may be improved, and the possibilities of wireless in this connection will be studied.

THE INSTITUTION OF MINING ELECTRICAL ENGINEERS

A MEETING of the South Wales Section of the Institution of Mining Electrical Engineers was held at the Park Hotel, Cardiff, on Saturday, January 8th. Owing to the unavoidable absence, through a railway breakdown, of the President, Mr. Sydney F. Walker, the chair was taken by Mr. G. L. Stone (Mountain Ash). The meeting was well attended, not only by electrical engineers connected with collieries, but also by colliery managers and other engineers intimately connected with mining in general.

After the minutes of the last meeting had been read by the Secretary (Mr. E. Ivor Davies), the following gentlemen were elected to act on the General Purposes Committee:—Mr. J. A. Howell (Aberamman), Mr. James Phillips (Tredegar), Mr. W. J. Richards (Maesteg), Mr. C. G. Davies (Pontnewynydd), Mr. G. F. Soars (Swansea), Mr. C. Jones (Treorchy), Mr. L. Fokes (Treharris), Mr. G. L. Stone (Mountain Ash), Mr. T. G. Nelson (Pyle), Mr. A. Brodie (Tylorstown), and Mr. R. A. Gower (Ystradgynlais).

As will be noticed, the meeting endeavoured to elect a committee that would be, as far as possible, representative throughout the whole of South Wales. It was decided that the secretary should write to each member asking him if he is prepared to submit evidence in the inquiry which the Institution is making into electrical accidents in mines.

The membership is gradually creeping up, and no doubt before much time has elapsed, will be upwards of several hundreds.

The next meeting will be held at the Park Hotel, Cardiff, on January 29th, at 4 p.m., when Mr. Maurice's Paper on "Shocks" will be discussed. The Secretary, E. Ivor Davies, 96 Gt. Western Street, Moss Side, Manchester, will be pleased to send all information to prospective members.

WIRELESS TELEGRAPHY

CONSIDERABLE modifications have been made in the conditions under which the Australian Commonwealth are inviting tenders for the erection and equipment of wireless telegraph stations at Sydney and Fremantle (ELECTRICAL ENGINEERING, December 30th, p. 1107). Originally the tenders were to include alternative quotations for stations with a range of 500 miles and 1,000 miles. In accordance, however, with the opinions expressed at the recent wireless telegraph conference in New Zealand, firms are being requested to include quotations for stations having a range of 1,250 nautical miles, so as to assure continuous communication with New Zealand. Preference is also to be given to systems which will emit a definite musical note. The specification for these stations practically leaves all matters of detail to the tenderers. No tender will be considered in which is included any condition restricting the use of the apparatus to the purpose of communication with similar or specified apparatus only, it being the intention that, so far as the technical arrangements of the accepted installations will admit, the Government shall be at liberty to utilise the stations for communication without regard to the type of station communicated with. The stations are to be equipped so as to conform in every way to the requirements of the Radiotelegraphic Convention; and preference will be given to installations which are capable of rapid tuning on both sides of the normal wave-length. Either recorders or telephones may be used as receivers. Preference will also be given to a system in which waves equal in power but differing in length by more than a stated percentage, preferably not exceeding 3 per cent., may be rendered non-interfering at will. The system should also be capable of receiving damped or undamped waves. The stations shall have such a range as to enable them to exchange signals under the conditions of test at the guaranteed speed of working during day or night, and under any conditions as to temperature, or as to dryness or humidity of the atmosphere. The test includes communication with one of H.M. ships fitted with an Admiralty pattern of wireless equipment; or one of the R.M. steamships fitted with any standard system of wireless equipment; or any other steamship fitted with a system of wireless equipment approved for the purposes of the test by the Government and the contractor. The necessary buildings will be provided by the Government, but the tenders are to include prices for power plants as well as for the wireless installation itself.

Of 282 steamships that carried steerage passengers to and from the United States during the first half of 1909, says the *Electrical World* (New York), 143 were equipped with wireless telegraph apparatus. Of the 167 prominent coastwise vessels 97 are provided with wireless equipments. Secretary Nagel has recommended the passage of a Bill requiring wireless installations on passenger steamers carrying more than a certain number of passengers over more than a given distance.

The Stornoway cable broke down on Christmas Day, and has not yet been repaired, says the *Pall Mall Gazette*. All telegrams from and to Lewis, Harris, Uist, and Barra are being transmitted through the wireless stations at Lochboisdale and Tobermory, and their efficient handling is in striking contrast with the conditions which prevailed during previous breakdowns before the stations were established.

Arrangements have been made with the Natal Government by Marconi's Wireless Telegraph Co. for the erection of a wireless telegraph station at the Bluff, Durban, with a range of 350 miles.

It is announced that Dr. Lee De Forest has erected a wireless telephone apparatus on the top of the Metropolitan Opera House, New York, for the purpose of transmitting operas by means of wireless. He calculates that it will be possible for anyone within a radius of 50 miles to hear the opera by use of wireless receivers.

An American consular report states that a wireless telegraph and telephone station has been erected at Ebereswald, Germany, by the Telegraphenbau Anstalt C. Lorenz A.G., of Berlin. The system used is the Poulsen-Lorenz. The station has a range of 5,000 km.

A Bill has been read in the Canadian Parliament for the first time, the object of which is to compel all vessels over 1,000 tons leaving Canadian ports to have a wireless telegraph installation on board.

CORRESPONDENCE

THE T.A.C. TRAIN LIGHTING SYSTEM.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—We have read Mr. C. Vicarino's letter, and think that the system to which he refers was patented by him in this country in 1899 (No. 24,634). The system described in this patent has nothing whatever in common with ours, except the use of the differential dynamo, accumulators, and other devices common to most known systems, the method of automatic regulation being entirely different.

It may be interesting to note that some of the claims of Vicarino's patent are anticipated by Crompton's patent No. 5,168 of 1886. With regard to the use of iron-wire resistances for train lighting, which are an important feature of our system, this is due to Dr. Max Buttner, of the Gesellschaft fur Elektrische Zugbeleuchtung, Berlin.

It may be that Mr. Vicarino has supplied dynamos to the Russian Tudor Co., who hold from the Gesellschaft für Elektrische Zugebeleuchtung the rights for iron-wire resistances in Russia.

We think that any further comment is unnecessary.

Yours truly,
THE TUDOR ACCUMULATOR CO.,
Per L. R. Fraser.

119 Victoria Street, S.W., 5th Jan., 1910.

ELECTRIC FIRES.

To the Editor of ELECTRICAL ENGINEERING.

DEAR SIR,—As you have from time to time called attention to the absurd way in which fires are attributed to electricity, we send you herewith copy of a letter we have had to send to a number of papers, which had attributed a fire at Rockcliffe Park, near Darlington, to electricity, and as this report appeared in many London papers, and no doubt throughout the provinces, we should like you to give this letter publicity.

Yours faithfully,
COX-WALKERS, LTD.,
T. W. COX-WALKER, Secretary.

Darlington, Jan. 10th, 1910.

[COPY.]

ROCKCLIFFE PARK FIRE.

DEAR SIR,—In your issue giving an account of above, it is stated that the cause of this fire was supposed to be a fusion of electric wires, and as it is becoming a too common practice to ascribe unknown causes of fires to electric wiring, we should be glad if you will make it known that in this instance the fire has been clearly traced to a faulty chimney flue, and that so far from electric lighting being the cause of the fire, it was actually the means of giving the first intimation, through some lights going out, that something was wrong; and it was not until our men, who were engaged on other work in the building, went into the false roof to ascertain the cause that the fire was discovered, which had already been smouldering for many hours, if not days. In the interests of electric lighting generally we shall be glad if you will publish this letter.

Yours faithfully,
(Signed) COX-WALKERS, LTD.

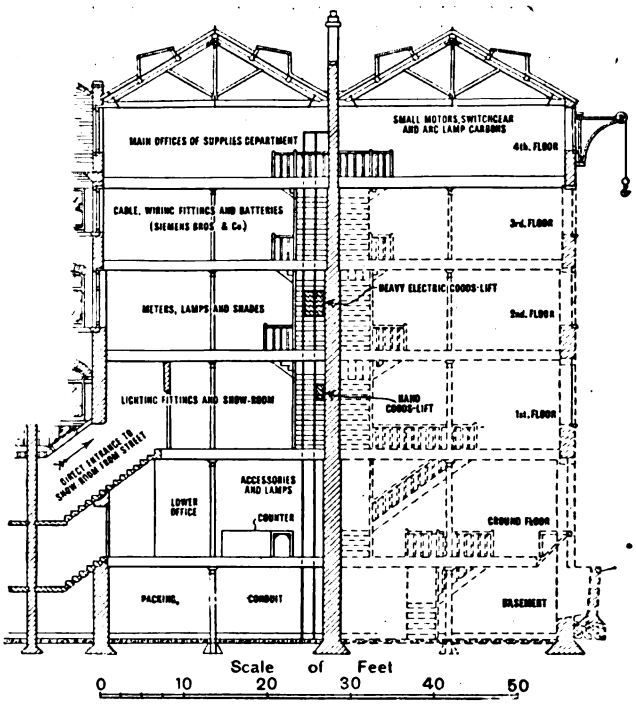
7th Jan., 1910.

Digitized by Google

the main-line construction consists of three shells cemented together by means of neat Portland cement, the whole insulator being cemented to a steel pin before attachment to the tower. The total height is 19 inches, and the diameter 14·5 inches.

The power generated by the Ontario Power Co. furnishes part or all of the public and private lighting in Niagara Falls, Welland, Stamford, and St. Catherines, Ontario; and Lockport, Depew, West Seneca, Hamburg, Batavia, Rochester, Canandaigua, Auburn, Baldwinsville, Phœnix, Fulton, and Syracuse, New York. Further, power is supplied to electric furnaces for the reduction of iron, copper, and other ores, and the manufacture of cement, calcium carbide, and lime nitrates in Port Colborne, Welland, Niagara Falls, and Thorold, Ontario, and Lewiston, Lockport, and Caledonia, New York. The railways and tramways supplied include the systems in Syracuse, Rochester, Canandaigua, Geneva, West Seneca, and Hamburg; and the interurban lines Syracuse, Lake Shore and Northern Syracuse and South Bay, Rochester and Geneva, Rochester and Mount Morris (Erie Railroad), Buffalo, Lockport and Rochester, Buffalo and Hamburg, and Buffalo and Dunkirk. Further, several large steel and other works requiring power are supplied.

In the early part of the year 1909 the Niagara River was partially frozen, and a large quantity of ice coming down from the lakes accumulated above the Falls, entirely blocking the American Fall, and partially blocking the Horseshoe Fall. This state of affairs did not in any way inconvenience the Ontario Power Company, who continued at work. Later, however, the lower river became blocked with ice, which piled up in the gorge and covered the Rapids, and finally even the Whirlpool (see ELECTRICAL ENGINEERING, April 29th, 1909, Vol. V., pp. 404 and 429). It appears that the water rose over forty feet above ordinary level and flooded the power-house. In April last, the company was still taking power in bulk from the Electrical Development Co., and the Canadian Niagara Co., whose power-houses, being situated on the Upper River, were not affected. The plant must have been submerged for some time, and it is anticipated that very considerable repairs and renewals will be required.



DISCUSSION.

Prof. W. C. UNWIN said that the development of 600,000 h.p. in the Niagara district in a comparatively short time, could be attributed to the financial, commercial, and engineering courage of the United States and Canada. The first installation had been dominated by the consideration that nothing was to be done to injure the beauty of the Falls. The generating station was placed two miles above the Falls, and the tail water was lead away by an underground tunnel, and discharged below the Horse Shoe Fall, nothing showing except a very unobtrusive tunnel mouth. That involved placing the turbines at the bottom of an excavation 200 ft. deep, and necessitated the use of vertical-shaft turbines. When the first installation, which now aggregated 200,000 h.p., was on the way, the United States engineers and financiers became a little disturbed at the prospect of competition from Canada, and obtained a concession on the Canadian side. That concession had now been developed by the Canadian Niagara Power Co., which had built a turbine house intended for 200,000 h.p., and a large part of this had already been installed. This power station had been modelled on the same principles as the original one, with vertical-shaft turbines placed at the bottom of a deep excavation, the tail water discharging through an underground tunnel in the same way. Another company proceeded on the same lines a little higher up the Niagara River, but as the ease of access for discharging the tail water below the Horse Shoe Fall was already occupied, this company made a tunnel for the tail water right under the Fall. Then the Ontario Power Co. came along, but found that they could not work on the same lines as the previous companies, and they carried their intake high up the river, and brought the water in underground pipes to a point a little below the Horse Shoe Fall, and then dropped it down to the generating station below the Fall. The Ontario Power Co. foresaw that the water in the lower river might flood their generating station, but they thought they were safe in placing the floor of the generating station about 20 ft. above the ordinary lower river level. This varied very little indeed in the ordinary way. Niagara River was supplied by an immense chain of lakes of an enormous area, and had an extraordinary constant supply of water all the year round. The only thing that changed the level of the river above or below the Falls were occasional winds which drove back the water in Lake Erie, and ice blocks which occurred in the lower river. As mentioned in the Paper, however, last winter there was an unprecedented ice block, and this provision proved to be insufficient. He believed they had had heaps of ice on the floor of the station, and had not yet started the works again. Probably the detail which had done most to make these hydraulic installations a success, and which had enabled the working of the large alternators in parallel, was the relay governor. This was very sensitive, and had no other function than just to open a small valve one way or the other, and so put in action a powerful hydraulic relay.

SIEMENS' LONDON STORES

THE extensive premises in Upper Thames Street, London, E.C., recently acquired by Messrs. Siemens Bros. Dynamo Works, Ltd., for offices and stores in connection with their Supplies Department, present several features of interest as regards both the general arrangements and the lighting. A few weeks ago we referred to the opening of these stores, and the equipment is now complete, and the business transferred from other premises in London is now in full swing.

As shown in the accompanying section, the main offices are situated on the top floor of the building, while the remaining four floors and the top floor of the adjacent building are devoted chiefly to stores. Packing is done in the basement, where there are also racks for wood casing and steel conduit. General sales, both to trade and the public, are conducted over the counter on the ground floor, where there is also a small office, an inquiry bureau, and the telephone exchange. In the large racks behind and to the side of the counter are tantalum lamps of the sizes most in demand, general wiring fittings, and accessories, arranged according to list numbers. The first floor is divided into two parts: one has been artistically decorated and fitted up as a showroom, and the other has racks and shelves for arc lamps and lighting fittings of all kinds. On the second floor are transformers, meters, tantalum and carbon-filament lamps, and holophane and other glass shades. The meters are arranged according to type and list number in open boxes, which slide out from the rack partitions like drawers and can be carried about if desired. The lamps are stored in deep wood boxes with metal-protected edges and hand-holes for carrying. All

SECTION THROUGH SIEMENS' UPPER THAMES STREET STORES BUILDING.

the boxes are of the same size, and each holds a definite number of lamps (in packing). These boxes are stacked on their sides so as to form partitioned shelves on the "Unit" system, each box bearing a label as to its contents, &c.

The third floor is devoted entirely to the manufactures of Messrs. Siemens Bros. & Co., and besides racks for cable, flexible and the metal-sheathed cable for the O.S. and other wiring systems, has a number of cupboards with sliding doors for the small fittings and accessories. Insulating tape, batteries, and the other products of the Woolwich Works are stored on this floor. The main offices of the Supplies Department are on the floor above, and adjacent to these is the stock of small motors, starters, fans, switch and fuse boxes, and arc-lamp carbons. Though only one floor is devoted to these commodities, there is a considerable stock of each, as the building is very much deeper than it is broad, and the available space has been utilised to the best advantage by the judicious placing of the racks.

The general lighting of all the floors, including the main offices and the basement, is by small "Economy" enclosed arc lamps taking 5 amps. and giving 24 burning hours. The counter on the ground floor and desks in corners and other places not well illuminated by the arcs have pendant tantalum lamps, while along each passage between the racks are hanging hand-lamps on the "Laurie" system. A steel wire is stretched along the

Digitized by Google

ceiling for the certain distance of the rack, and the cable from the ceiling-rose at one end is suspended from the wire in a series of loops by rings which can run easily along the wire. The hand-lamp is suspended by a piece of braided cable from the last ring, and can be readily brought to any partition.

Steam-heating has been adopted, and there are only one or two motors running in the building, but a power circuit has been provided for the heating apparatus, &c., in the showroom. The main wiring from floor to floor is in steel conduit, but all the rest is surface wiring on the O.S. system. The new "Z" cartridge-type fuses are used. A private telephone system affords communication between the counter and offices and the various store-rooms, and there are two lifts: a 1-ton Waygood electric goods lift with rope control, and a small hand-operated lift.

As indicated in the sketch, the showroom can be reached direct from the street without passing through the sales room, and contractors can take or send their customers to inspect or choose fittings. It is thus a trade showroom, and should prove of considerable use to contractors who have not room at their offices to stock a large selection of fittings and accessories.

The head of the Supplies Department is Mr. A. H. Bate, who has his office on the top floor. In the lower office will be found Mr. T. Gladdy, who is always ready to give valuable advice on installation matters to contractors. Mr. W. H. Hitchcock, who is assisting Mr. Gladdy, needs no introduction from us, as he is already well known among the contractors of the London district in connection with the Abchurch Yard depôt, the business of which has been transferred to these new premises.

CLOCK METERS ON TRAMCARS

SEVERAL attempts have been made to reduce the excessive energy consumption of electric trains and tramcars due to careless driving. On the elevated railways in Chicago and Philadelphia signals were set up at certain points to remind the drivers when to start coasting, &c., but this system, though it had a good effect, does not give any comparative record of the methods of different drivers. Meters were tried in many places, but proved to be too delicate for the work. As stated in ELECTRICAL ENGINEERING, October 14th, 1909, page 898, clocks indicating the total time current is on have been used with considerable success in Berlin. A new method, which is giving much satisfaction on the Manhattan Elevated Railway of the Interborough Rapid Transit Co., of New York, is to connect a similar clock in such a manner that the total time during which the car is coasting is recorded. This system is described in a recent issue of the *Electric Railway Journal* (New York), and its chief advantage over the Berlin system is that it affords a check both on the efficiency of controller manipulation and braking.

The coasting clock consists of a time-recording apparatus electrically interlocked with the air brake and the electrical control. One circuit is made through a contactor of the multiple-unit control system, and another through the piston of the brake cylinder, which closes the circuit when the piston is in the off position. Both of these circuits must be closed to allow the clock to run. The device works, therefore, only during the period in which current is shut off from the motors and before the application of the brakes. An automatic record of the time during which the clock runs is printed on a strip of paper contained within the case of the clock. Each motorman is provided with a key of distinctive design. When this key is inserted in the clock case at the beginning of a run it stamps the paper record in the clock with the motorman's distinguishing number. At the end of the run the motorman removes the key inserted in the clock at the beginning of the run, and by so doing stamps the final time on the paper slip, together with his number. The record can then be detached by the motorman and handed in with his time card. The results obtained with some experimental sets in New York have been so satisfactory that a large number of cars are to be equipped with this apparatus.

Iron and Steel Institute.—The annual general meeting of the Iron and Steel Institute will be held at the Institution of Civil Engineers, Great George Street, on May 4th and 5th, and the annual dinner on May 4th. The autumn meeting will be held at Buxton on September 27th to 29th. Members of the Institute are specially invited to attend the International Congress of Mining, Metallurgy, Applied Mechanics, and Practical Geology which is to be held at Düsseldorf in June.

High-lift Centrifugal Pumps.—Messrs. Drysdale & Co. (Bon Accord Engine Works, Yoker, Glasgow) are making a special form of high-lift centrifugal pump, and we learn that they recently obtained an 83 per cent. efficiency on a small pump with only an 8-inch diameter over blades. Two of their 14-inch pumps have been in use at the Yoker generating station of the Clyde Valley Electrical Power Co. for some little time for handling the circulating water, and are giving good results.

SIMPLEX ELECTRICITY METERS

SINCE the establishment, some months ago, of a meter-testing department at 116 Charing Cross Road by Simplex Conduits, Ltd., this branch of the firm's business has rapidly developed, and we are informed that among the users of the meters which the company are supplying are some of the largest

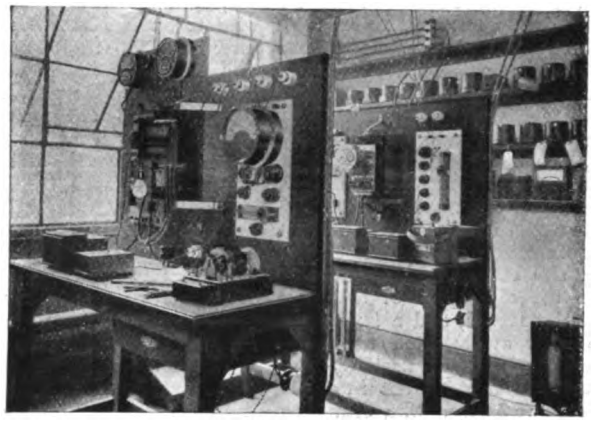


FIG. 1.—METER-TESTING BENCHES.

electricity corporations throughout the country. The new catalogue just issued gives particulars of a considerable range of patterns of both watt-hour and ampere-hour meter for continuous as well as for alternating currents, with diagrams of connections, and curves of accuracy at various loads. Time meters are also included, and two rate meters, with and without combined clock switch. A useful appliance listed is a portable check meter for testing house meters *in situ*. Considerable stocks of the most used types of meters are carried. We understand that some of these meters are being submitted to the Board of Trade for approval.

The meter-testing department, part of which is shown in Fig. 1, is equipped with extensive plant for carrying out complete tests on all types of electricity meters and for the calibrating thereof. Every meter is tested before being sent out,

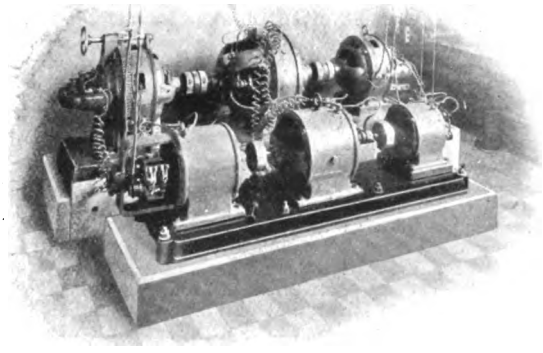

FIG. 2.—SPECIAL MOTOR-GENERATORS FOR METER TESTING.

in addition to being calibrated at the works. A special set of converting machinery (shown in Fig 2) is installed for changing the ordinary supply to give any phase displacement and frequency and all voltages up to 600. There are two separate motor-generators, one for continuous and one for alternating current, each comprising a motor driving two generators, one for the current circuit and one for the voltage circuit of the meter. In the case of the alternating set, the stator of the voltage machine can be shifted to give any phase displacement relatively to the current from 0 to 360°.

The Constantinople Telephone Contract.—The *Financial News* Constantinople correspondent states that a French company, jointly with the East European Cable Co., have lodged a protest in the Ottoman Chamber against the grant of the Constantinople telephone concession to the combined French, English, and American Syndicate. The French company asks for the contract to be cancelled, and has requested the intervention of the French Ambassador at Constantinople. It also announces its intention, if it does not obtain satisfaction in this direction, of bringing an action for 2,000,000f. damages.

PENDING ELECTRICAL LAWSUITS

(Compiled by our own Editorial Staff and Strictly Copyright.)

THE first "electrical" appeal case which will be heard during the Hilary sittings is that in which the British Westinghouse & Manufacturing Co. appeal against the decision of Mr. Justice Joyce in October last in the arc lamp infringement action brought by them against Mr. G. Braulik.

The judge's decision was that the patent in question (the Bremer flame arc lamp patent, No. 18,786 of 1902) was invalid for want of subject-matter, and that, consequently, there was no infringement. The arguments and evidence in the case and the decision were fully reported in ELECTRICAL ENGINEERING, Vol. V. (1909), pages 571, 617, and 909.

Another case on the list is the appeal of J. H. Holmes & Co. from the judgment of Mr. Justice Neville in October last, in the action brought by them against the Associated Newspapers, Ltd., for alleged infringement of the Clatworthy patent for the electric driving of printing presses.

The judge decided that the patent was invalid, as the invention claimed had been described in a previously published article on an American system. The facts of the case, evidence, and decision were given in ELECTRICAL ENGINEERING, Vol. V., pages 915, 936, 948.

The General Incandescent Co., Ltd., are appealing against the verdict in October of a special jury before Mr. Justice Ridley in the action brought against them by the Armorduct Manufacturing Co., Ltd.

The latter company obtained judgment for the repayment of monies due to them, and alleged to have been paid to the General Incandescence Co. by a former agent of the Armorduct Co. (See ELECTRICAL ENGINEERING, October 21st, 1909, Vol. V., page 917.)

"Dr." Bodie is appealing against the verdict of a common jury in November last, according to which he had to refund the sum of £1,000 paid him by Mr. C. H. Irving as a premium. (See ELECTRICAL ENGINEERING, Vol. V., pp. 953 and 970.)

Among the other cases which are down for hearing is an action brought by the British Thomson-Houston Co., Ltd., against the Midland Railway Co.

This will be heard with witnesses before Mr. Justice Parker in the Chancery Division. It was down for hearing before Mr. Justice Warrington last sittings, but did not come on. The British Thomson-Houston Co. allege that the Midland Railway Co. have infringed their patents covering the multiple unit control system for electric traction. The equipments in question were supplied by Siemens Bros. Dynamo Works, Ltd., in connection with the conversion to electric traction on the single-phase system of the Heysham-Morecambe section of the Midland Railway Co.'s system.

Another interesting and important action down for hearing before Mr. Justice Parker is that brought by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges., of Zabeze, Germany, against the Electric Construction Co., Ltd., for alleged infringement of the two Ilgner patents for the automatic control of electrical flywheel sets in connection with the driving of reversing rolling-mills.

The hearing of this case is announced for Wednesday next, January 19th, subject to anything part heard. In the same list, but some considerable way down, is the hearing of an appeal against the Comptroller's decision in a dispute between the same parties. This was with regard to the method of procedure and the submission of evidence in connection with an application made by the Electric Construction Co. that the patents in question should be revoked under Section 27 of the Patents Act, 1907, on the ground that the patented articles are manufactured mainly outside the United Kingdom. Abstracts of the two patents in question, together with the Comptroller's decision with regard to the submission of evidence, were given in ELECTRICAL ENGINEERING, Vol. V., page 305. In the event of the Donnersmarckhütte Ges. losing their case for infringement, doubtless the Electric Construction Co. will withdraw their application for the revocation of the two patents, which would then be of less importance to them.

Mr. Justice Parker will also hear an action brought by the "Z" Electric Lamp Syndicate against Marples, Leach & Co., Ltd. (now the Adnil Electric Co., Ltd.), for alleged infringement of their patent No. 21,654 of 1906, granted to Dr. Hollefreund & Co., of Berlin.

The patent is for the use of phospham or other similar compound in the manufacture of metal filaments for the purpose of removing the carbon remaining over from the organic material used for binding together the tungsten particles for squirting. The patent was given in full in ELECTRICAL ENGINEERING, July 29th, Vol. V., page 685. An application was made by the "Z" Lamp Co. for further particulars from the defendants in reply, but this was dismissed by Mr. Justice Warrington. An appeal against this decision before Lords Justices Cozens-Hardy, Fletcher Moulton, and Farwell in October last was unsuccessful, and so the original objections to the patent put forward by the defendants will stand.

The list of causes for trial before Mr. Justice Neville in the Chancery Division include one between the Chemische Fabrik Griesheim Elektron and the Badische Anilin- und Sodafabrik. The petitions by Messrs. Dick, Kerr & Co., Ltd., and Messrs. A. Schonfield & Co., for the winding up of the British Aluminium Co., Ltd., and a summons against the Amalgamated Radio-Telegraph Co., Ltd., to restrain the sale of shares, will also be heard before Mr. Justice Neville. The cases before Mr. Justice Eve include one between Lloyds Bank, Ltd., and the Aluminium Corporation, Ltd.

Among the chief King's Bench actions is one by the Gravesend & District Electric Tramways Co., Ltd., against the Gravesend Corporation.

The Corporation supply electrical energy to the Tramway Co., and there is a dispute with regard to the metering of the current supplied for this purpose. The action may involve a question of principle with regard to the certification of meters.

A special jury action is down for hearing, in which Messrs. Ganz & Co. are suing Messrs. Willans & Robinson in respect of plant supplied, as sub-contractors, to the South Wales Electrical Power Distribution Co.

Messrs. Willans & Robinson were not paid in full by the Power Co., and consequently did not pay their sub-contractors in full. Messrs. Ganz claim that under their agreement they are entitled to full payment.

Other actions are by Mr. J. H. Lukach against the British Westinghouse Co., the North-Eastern Steel Co., Ltd., against Messrs. R. W. Blackwell & Co., Ltd., and the Surbiton Council *v.* Callender's Cable & Construction Co. There are also a number of actions against the London County Council, the London United Tramways Co., and the London Electrobus Co., for personal injuries.

Telegraph Traffic and Movements of Cable Ships.—It is gratifying to be able to announce the restoration of the cable between Paramaribo and Cayenne, the *bête noir* of the Compagnie Française des Cables Télégraphiques. On the 3rd inst. direct communication between Saigon and Bangkok was interrupted, and telegrams had to be routed *viâ* Pakse and Obone. Restoration was effected on the 9th inst., on which day the El Arich route ceased working. The following day saw the Bagdad-Bassorah line again working as usual. Among the cables yet to be repaired are those between Perim-Assab, Dakar-Conakry, Saigon-Doson, Bathurst-Bissao, and between Tourane and Amoy. The cable steamer *Henry Holmes* repaired the Jamaica-Colon cable, which was disturbed by the recent hurricane, and the *Ponyer Quetier* is off French Guiana attending to another cable. The *Mackay-Bennett*, of the Commercial Cable Co., is in company with the *Colonia*, of the Telegraph Construction and Maintenance Co., attending to the diversion of another of the former company's cables to Newfoundland, the shore end of which has already been laid off Cuckold's Cove, near St. Johns. The *Colonia* will then lay another cable between St. Johns and New York, and thus, notwithstanding the great outcry in connection with the landing rights, &c., at Newfoundland, the Commercial Cable Co. will have a duplicate route. The Anglo-American Telegraph Co.'s ship *Minia*, returned to Halifax, Nova Scotia, after a repair, and left again for a fault near Cape Breton. The *Contre Amiral Coubet* was in dock idle. The *Cambria*, of the Telegraph Construction and Maintenance Co., is repairing the Western Union Cables. She has been off the Flemish Cap for close on three months, working in about two miles of water in bad weather, and it is believed that new cable has had to be laid in to the extent of about 50 miles. The cable steamer *Relay* left Jamaica after repairing the cable there, and is now at New York. The members of the Royal West Indian Commission have left for New York, *en route* to the West Indies, to inquire into the possibilities of Canadian—West Indian trade, and in particular the subject of telegraphic communication. The Commission will report in what manner the complicated telegraphic conditions in the Caribbean may be improved, and the possibilities of wireless in this connection will be studied.

Digitized by Google

existing circumstances, could not be worked by this means with commercial advantage.

In addition to the above extracts, the report reviews the progress of locomotion in London for the period mentioned in its widest aspect, including the housing problem, street improvements, regulation of street traffic, accidents on railways, fares, &c. There are also appendices to the report consisting of a comparison of locomotion and traffic conditions in London and in Paris; statistical information regarding railways, tramways, and street traffic; and a large amount of information concerning population and rents. There is also reprinted the evidence given on behalf of the London County Council before the Royal Commission on London traffic.

THE GERMAN ELECTRICAL INDUSTRY

Birmingham Discussion

THE Paper entitled, "Notes on Methods and Practice in the German Electrical Industry," by Messrs. L. J. Lepine and A. R. Stelling, which was read on Thursday, December 9th, before the Institution of Electrical Engineers in London, and was also discussed in Manchester on Tuesday, December 14th, was further discussed by the Birmingham Section of the Institution on January 5th. In the Paper, a long abstract of which was given in our issue of December 16th, Vol. V., page 1057, the authors compared the principal features of German and English manufacture and design of electrical machinery. They considered the following factors contributory to the success of German manufacture:—Commercial enterprise, good general management, close study given to schemes, large capital, and backing by banks. The two-shift system, cheap labour, and thorough specialisation, are also important factors in competition. In design, they said, England is in no way behind, in fact, in several cases the English designers are more far-seeing, and their designs are more practical than those of their German competitors.

Mr. R. K. MORCOM (Messrs. Belliss & Morcom), in opening the discussion, first referred at considerable length to the discussion on the Paper which had previously taken place in London, with special reference to the legitimacy or otherwise of discussing matters affecting electrical engineers generally. He considered that if the ruling of the President on that occasion was to be accepted as final, then it was hard to say what really was open to discussion. He held the view that any question affecting the well-being of the members of the Institution was open to discussion, and referred to clause 3 B. in the Memorandum of Association in support of his contention. Referring to the Paper, Mr. Morcom said that after a recent tour of inspection of German works he came to the conclusion that the shops were not generally so ship-shape as our own. Furthermore, the kw. output per man employed was not so great as in this country. He disagreed with the authors that foreign departments were peculiar to German works, and said that most large English firms had similar departments; in fact, his own firm had separate departments to deal with various portions of the globe.

Mr. R. ORSETTICH (General Electric Co.) was of the opinion that the German banks were strong because of the law which prohibited the issue of shares by any company of less value than £50. This was beneficial to the companies because the shares were held by the banks, being too costly for the average private investor, and therefore the credit of the company was the credit of the bank. He did not consider that double shifts were of great benefit as regards economical production, as he felt that there was considerable over-production in Germany, not only of goods, but also of qualified engineers. So much was this the case that men with high degrees were frequently to be found working as foremen and in charge of stores. Mr. Orsettich laid stress upon the great advantage which Germany obtains from the attention paid to scientific investigation. As an instance of this, he mentioned that during the great trade depression the only department in which expenses were not cut down was that for scientific investigation

Mr. F. J. MOFFETT (Messrs. Moffett & Rosher) considered that English manufacturing firms should take a leaf out of the German book and enter into working agreements "to prevent injurious competition," as was done by the amalgamated firms in Germany. The example had been set in this direction by the railway companies, the cable makers, and to a certain extent by meter manufacturers, and the financial results had quite justified the adoption of such agreements. In connection with the electro-trustee banks, there seemed scope for similar institutions in this country. He had been interested in a water-power scheme in Africa, the concession for which had been obtained from the Portuguese Government, who guaranteed a sufficient payment for the public lighting of the streets, Government offices, and residences, to pay a minimum dividend of 5 per cent. on the capital necessary; but it was not found possible, in spite of repeated efforts to induce any English manufacturing firm to finance the scheme. As regards the foreign departments, he was pleased to find on a visit to Germany that this, in the case of one of the largest firms, was almost entirely staffed by Englishmen. This went to show that it was not English engineers who were at fault, but that it was financial backing which was required. The system which prevailed in Germany of firms insisting on the acceptance of their own specification, tended to make the manufacturers very arbitrary in their methods. When testing some plant for South America at one of the German works, the hinges of the switches were found to be used for carrying current, in spite of the fact that it was specified that they were not to be so used, and great difficulty was experienced in getting this altered. In England, manufacturers had the benefit of the researches and advice of the Engineering Standards Committee, which represented all sections of the industry, including purchaser's engineers, as well as the makers. Consequently a less one-sided view was taken as to the requirements.

Mr. S. P. SMITH (Siemens Bros.' Dynamo Works, Ltd.) said that after the experience of some years in Germany as a research student, he had come to the conclusion that, speaking generally, the plants in that country were elaborate, and the reserves far too large; this also applied to Switzerland and Italy. He considered that the higher training of students and foremen was of no great value to them. In his experience, young engineers usually started at £4 per month instead of £6 5s., as stated by the authors. German designs of electrical machinery were, in his opinion, not so good as ours.

Dr. G. C. GARRARD (General Electric Co.) held that any superiority possessed by Germany was due to the scientific spirit of their engineers.

Mr. L. J. LEPINE, in reply, said that electrical firms could not afford to have representatives stationed abroad as advocated by Mr. Morcom, but suggested that several firms making dissimilar goods should combine and send abroad a representative and staff who could deal with complete schemes on the spot. He said that it would not be possible for English firms to combine as suggested by Mr. Orsettich, because no one could be found who would buy up all the competing firms. The rules of the Verband Deutsche Verein correspond to our Engineering Standards Committee, but the former were frequently not complied with. The author would not admit Mr. Smith's figures as to the salary of German engineers.

Dr. KAPP (Birmingham University), in proposing a vote of thanks to the author, said that he repeatedly received letters from his old students asking him to find them positions in England as they were crowded out in Germany.

[It had been intended that Mr. R. D. Gifford's Paper on "The Influence of various Cooling Media upon the rise in temperature of Soft Iron Stampings," should be read and discussed, but owing to the lateness of the hour it was postponed until the next meeting.]

ALUMINIUM SOLDER

ANOTHER new solder for aluminium and its alloys has just been introduced on the market. This is known as the "Premier" brand, and can be obtained from Charles Ruff & Co. (30 Kirby Street, Hatton Garden, London, E.C.). It is manufactured in three grades. The softest grade can be used with an ordinary copper bit, and is suitable for light work and small repairs; the other two grades are harder, and necessitate the use of a blow-pipe. No flux is required, and of course the ordinary fluxes must on no account be used, as they attack the metal. The parts to be soldered are first cleaned by scraping away the oxide from the surface, and are then uniformly heated with a blow-pipe until sufficiently hot to melt the stick of solder on. This temperature is slightly above that necessary for ordinary solders. After a flow of solder over the surface has been obtained, the molten solder is scratched through with a steel scraper or brush, so as to remove the oxide and cover the surface with a thin clean covering. The two parts are then sweated together with the blow-pipe and allowed to cool slowly. With regard to chemical action, a joint which was made nine months ago shows no sign of corrosion. The solder is an alloy of aluminium, and weighs about half as much as ordinary solder, so that about twice as many sticks go to the pound. The price of all three grades is 12s. per lb. Messrs. Charles Ruff & Co. will be pleased to repair any aluminium casting, such as a broken gear-case, free of charge for any firm desiring a proof of the efficacy of the new solder.

S.E. & C.R. Electrification.—It is stated that, owing to the success of the single-phase line of the London, Brighton & South Coast Railway Co. between London Bridge and Victoria, the directors of the South-Eastern & Chatham Railway Co. are considering the question of dealing with some of their suburban lines in a similar manner. We understand, however, that no detailed scheme has yet been prepared, although the matter has been under discussion.

REVIEWS OF BOOKS

Chats on Electricity. By Frank Broadbent. 196 pp. 7½ ins. by 5 ins. 25 illustrations. (London: T. Werner Laurie.) 3s. 6d.

WITH the ever-widening range of the applications of electricity in daily life, bringing practically everybody in contact with electrical phenomena, an increasing need arises for "non-technical" persons to have, at any rate, a bowing acquaintance with electrical principles. Mr. Broadbent addresses his remarks to this class, and, without skimming too lightly on the surface, or on the other hand diving too deep in the theoretical, he supplies in a suitable, chatty form enough to enable the average man to understand to some degree what he sees around him and reads about. The first three chapters deal with general principles, but in our opinion it would have been better to commence with the ideas underlying currents and circuits before treating of the less familiar electrostatic phenomena. The succeeding part is more practical, and treats in simple way of electric motive power and traction. A chapter follows entitled Electricity in the Office and at Home, and deals with bells, telephones, light, and heat, and this will probably be the most sought after part of the book. Telegraphy is next considered, and a striking illustration both of the utility and limitations of wireless telegraphy is provided by an extract from the log of the wireless station at Siasconset at the time of the disaster to the ss. *Republic*, showing how seriously the clashing of signals from various sources interfered with one another. The last chapter is entitled Practical Considerations, and gives useful information, causes of fuses blowing, bells refusing to ring, &c., as well as a clear exposition of the maximum demand system.

Heat for Engineers. By C. R. Darling. 430 pp. 8¾ ins. by 5½ ins. 110 illustrations. (London E. & F. Spon.) 12s. 6d.

THIS is a practical treatise on heat and its applications in the various branches of engineering, and is quite unique in the character and scope of its contents. It is not a text-book, neither is it a manual to aid students in preparing for any particular examination. The subjects dealt with are of an essentially practical nature, but in all cases the fundamental principles are clearly explained in order that a thorough grasp of the subject may be obtained. The author has been for some years lecturer in heat at the City and Guilds Technical College, Finsbury, and a number of original experimental methods and commercial tests are included in the book. A brief and lucid treatment of the nature of heat and the relation between heat and other energy units is followed by a useful chapter on the calorific value of fuels, which includes a description of the author's calorimeter for routine tests in central stations. Practical hints on combustion and smoke-prevention are given, and the chapter closes with some very brief references to electric resistance and arc furnaces and the "Thermit" welding process. A clear treatment of the phenomena of specific heat and expansion is followed by brief descriptions of the practical effects and applications of expansion. The precautions that have to be taken on account of the expansion of girders, rails, boiler plates, steam-pipes, and pistons, and the utilisation of expansion as exampled by thermo-regulators, fire alarms, compensated balance-wheels, steam-traps, &c., are described. Following this are chapters dealing with the more elementary side of the subject, including thermometric scales and the general properties of gases. But the next is a thoroughly practical and up-to-date chapter on pyrometry, and includes descriptions of various forms of platinum resistance and thermo-couple pyrometers, and recording instruments. The principles and construction of heat-radiation and optical pyrometers are also described. The laws of fusion are then explained, and the applications described include the Grinnell and other "sprinklers" for fire protection, boiler safety-plugs, freezing mixtures, &c. An interesting chapter on the liquefaction of gases is followed by illustrated descriptions of representative refrigerating plants on various systems, with worked numerical examples to illustrate the thermodynamic principles involved. In a useful section on heat-insulating materials are given particulars of an electrical method of testing steam-pipe lagging; and the remaining sections cover ventilation, draught of chimneys, and the efficiency of heat-engines, although only the first two laws of thermo-dynamics are discussed. In the chapter on radiation there is an interesting paragraph on the relation between temperature and luminosity, in which the cause of the high efficiency of tantalum and tungsten filaments as against carbon filaments is discussed. The book is illustrated with helpful diagrams and drawings, and should prove a useful work of reference for engineers of all classes.

LOCAL NOTES

ABERDEEN: *Supply to Tramway Co.*—The Council are still unable to come to an agreement with the Aberdeen Suburban Tramways Co. as to the price which the latter shall pay for electrical energy. The company have now made the following alternative offers:—(1) They will agree to pay 1.4d. per Board of Trade unit supplied to them for the period of three years from June, 1909, or (2) they are willing to pay for such longer period as the Corporation and they may agree on, a price calculated at 0·35 of a penny (over a third of a penny) per Board of Trade unit above the price per unit which the Corporation Tramways may be paying to the electricity department for their supply from time to time. Assuming that the Corporation Tramways are getting their supply at cost price, the latter offer would give the Corporation a clear annual profit of over £200 per annum on this company's account. This letter has been remitted to the Electricity Committee for consideration and report.

ARGENTINE: *Buenos Ayres: Tramways.*—At present, the Anglo-Argentine Tramways Co. have 1,200 electric cars in service, in addition to 600 trailers, but in order to meet the ever-increasing demand, they have on order, says the *Review of the River Plate*, a further 125 cars and 80 trailers. The returns for the first ten months of 1909 show that 231,000,000 passengers were carried, compared with 208,000,000 passengers in the corresponding period of the previous year.

Subway Tramways.—H.M. Consul at Buenos Aires reports that an *ad referendum* agreement has been made between the Mayor of that city and the Anglo-Argentine Tramway Company for the construction of a series of underground tramways, to run in various directions under the city of Buenos Aires, in connection with the present above-ground system. The following lines may be constructed, viz.:—(1) Between Plaza Mayo and Plaza Once de Septiembre, running underneath the Avenida de Mayo; (2) between Retiro and Plaza Constitución, running under Calle Maipú or Calle Florida and the continuations of these on the south side of the Avenida de Mayo; (3) between Plaza Mayo and Plaza Italia, Palermo. Each of these is to have a double line, and is to have direct connection with the above-ground lines. The first line is to be completed before June 1st, 1913; the second before December 31st, 1914; the construction of the third line depends upon whether the municipality finally carry out the project of making a diagonal avenue. A newspaper extract containing the text (in Spanish) of the most important clauses of the contract may be seen by British firms interested on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

BERLIN: *Transport Facilities.*—Particulars have been published of the receipts of the public transport companies in Berlin during 1909. These are as follows:—Berlin tramways, £1,888,500; Electric Railways (elevated and underground), £3,567,700; Berlin Omnibus Co., £459,300. The tramway receipts are slightly less than in the previous year, owing to competition by a new section of electric railway opened in 1908.

BOURNEMOUTH: *Tramway Accident Claims.*—The Tramways and Parliamentary Committee have presented a report upon the settlement of the claims in connection with the tramway accident in May, 1908. The total claims amounted to £26,450. The sum paid in compensation and costs in respect of those killed was £3,619, and in the other cases £7,705. After the amount payable by the insurance companies has been received, the net liability falling upon the Corporation is £8,508. In the accident in question seven persons were killed and 26 injured.

CHELTENHAM: *Electricity Accounts.*—The gross receipts from the electricity undertaking for the past year were £22.609 against £23,700 in the previous year. This decrease is attributed entirely to the use of metal filament lamps. The number of consumers increased during the year from 967 to 1,126.

DUBLIN: *Tramway Wayleaves Dispute.*—The Estates and Finance Committee recommend that the dispute between the Corporation and the Dublin United Tramways Co. as to wayleaves for the use of the streets should be taken to court, as the parties were unable to come to an agreement. Up to the year 1900, no question arose as to the amount of the annual payment, as the mileage being under twenty miles, the company were liable for the minimum of £10,000 as fixed in the agreement. By the construction in that year of the Ballybough extension, the mileage became in excess of twenty miles, and wayleave became chargeable thereon at £500 per street mile. Since then it appears that no additional payment has been made by the company, in consequence of a difference of opinion as to the meaning of the words "per street mile" in the agreement. The company states that the Corporation wish to charge double the mile rate in the case of crossings where there are four tracks, for instance, and argue that if this is the true construction of the agreement, then where there is

Digitized by Google

only single track half rate should be charged, and that therefore they have paid at too high a rate in the past. The Council claim a balance of £4,209 as due to them. The report of the Estates and Finance Committee was rejected, it being the general opinion that an amicable settlement should be possible, and so avoid law costs.

DUNDEE: *The New Electricity Works.*—Councillor Payton has given notice that at the next meeting of the Council he will move that a full report be prepared showing estimates and actual costs of the new electricity works, buildings, and equipment; the cause of the delay in the completion of the works, and what parties are responsible for the loss involved in claims, and otherwise.

EASTBOURNE: *Electricity Reserve Fund.*—At the last meeting of the Town Council it was stated that the Electricity Reserve Fund now amounts to £10,737, in addition to a contingency fund of £4,000.

FAREHAM: *The New Electricity Works.*—Messrs. May & Hawes, the Council's consulting electrical engineers, have reported that part of the town is now being supplied from the new works. The second portion of the new plant is practically ready for the change-over, which will be made very shortly. The arc-lamp posts are being erected, and the lamps will in all probability be ready in a few days. The report states that the running of the plant has been exceedingly satisfactory, and that the fuel-consumption tests are better than had been expected.

GRIMSBY: *Supply to Docks.*—Twelve months' notice has been received by the Town Clerk of the intention of the Grimsby Dock Company to terminate the agreement under which they receive electrical supply.

HENDON: *The Trolley Omnibus.*—The North Metropolitan Electric Power Supply Co. have asked the Council's permission to erect posts and wires in connection with the railless cars which the Metropolitan Electric Tramways, Ltd., propose to run between the Borroughs and Golders Green Tube Station. The consideration of the matter has been postponed in order that further particulars may be obtained.

IRELAND: *Monaghan: Electric Lighting.*—An offer has been made to the Council to provide public electric lighting, and at the next meeting a resolution is to be moved that the question of obtaining a loan for the purpose be considered.

LIVERPOOL: *Tramway Traffic.*—The receipts from the Corporation tramways from January 1st to December 31st, 1909, were £560,218, against £562,029 in 1908. The passengers carried in 1909 numbered 121,532,939, against 121,927,883 in 1908. The mileage in 1909 was 11,952,373, against 12,244,353. The decrease in receipts for 1909 would have amounted to only £253 but for the fact that 1908 was a leap year, and included an extra day's receipts.

LLANELLY: *Electric Lighting.*—As almost a year has expired since the Llanelly District Electric Light & Traction Co. entered into an agreement for the electric lighting of the town, the Town Clerk recently asked the company what steps they were taking to put this agrement into force. He has been assured by the company that they are proceeding with the matter, and will have the installation complete within the period agreed upon.

MERTHYR TYDVIL: *Overhead Wires.*—The Dowlais Chamber of Trade has passed a resolution against the use of overhead mains by the Merthyr Tydvil Corporation for the electric lighting of this district.

PARIS: *Underground Railway.*—The *Times* Paris correspondent states that an important new section of the underground railway was opened on Saturday. The line has a total length of 11½ km., and runs from the Porte de Clignan-court by the Gare du Nord to the Paris Central Markets, and crosses the Seine at the Châtelet, whence it turns westwards under the Place St. Michel, and runs by the Odéon and St. Sulpice under the Rue de Vaugirard to the Gare Montparnasse and to the Boulevard Raspail, passing thence in a fairly straight line to the Porte d'Orleans.

READING: *Political Meeting in Car-sheds.*—The recent meeting in the car-sheds of the Corporation, when Mr. Lloyd George spoke on behalf of the local candidate, Mr. Rufus Isaacs, K.C., was, we believe, the first occasion on which car-sheds have been used for large political meetings. Special arc lamps were installed for illumination purposes. Photographs were taken during the meeting, the flashlights being fired by electricity. The temporary flooring laid over the car-pits was removed a few minutes after the meeting closed, and the cars ran into the sheds as usual the same evening. The tramways undertaking benefited by a substantial sum paid as rent, and also by conveying several thousand persons to the meeting.

ST. HELENS: *Street Electric Lighting.*—Two metal filament lamps of 200 c.p. each, and two of 100 c.p. each are to be erected on tramway posts as an experiment.

SWEDEN: *Water-power Utilisation.*—The Stockholm correspondent of the *Financial News* states that the numerous waterfalls in Sweden are to be investigated and reported upon by a special Commission with a view to their utilisation for the generation of electricity. A proposal has been made to construct an electric power station on the Porjus Falls on the Lulea River at an estimated cost of 12,000,000 kroner.

WEST BROMWICH: *The "Fair" Fare System.*—A public meeting was held on Tuesday, at which protests were made against the introduction by the British Electric Traction Co. of the "fair" fare system, it being alleged that this has resulted in an increase of fares in many cases. A resolution was passed pledging the meeting to endeavour to compel the tramway company to revert to the old fares. A committee was appointed to deal with the matter.

WEST HAM: *Reversible Turbine Experiments.*—For some time past experiments have been carried out at the generating station with a patent reversible turbine. A syndicate has been formed to exploit the patents, and the Electrical Engineer had been asked to grant the necessary facilities and to supply steam, &c., for the experiments. The Committee have authorised the Engineer to enter into negotiations with the syndicate as suggested.

Electric Supply.—The Woolwich Council have been asked to receive a deputation to discuss the possibility of arriving at an arrangement in the matter of supplying North Woolwich, and so obviating an appeal to the Board of Trade.

WIMBLEDON: *The 1,000-kw. Howden Set.*—At the last meeting of the Town Council, the Electrical Engineer reported on a test of the 1,000 kw. turbo-alternator recently installed by Messrs. J. Howden & Co., Ltd. The actual steam consumptions were slightly in excess of the guarantees, but as they were very low he recommended that the set be finally accepted from the contractors, providing a few outstanding details are attended to by them. The set ran continuously from December 8th to December 14th, *i.e.*, 137 hours, and the temperature rise of the alternator was practically inappreciable. The recommendation was agreed to, and the balance of the 80 per cent. of the contract price, due to the contractors on completion, is to be paid.

WINCHESTER: *Purchase of Electric Supply Co.*—The Special Committee recently appointed to report as to the advisability of purchasing the undertaking of the Winchester Electric Light & Power Co., recommend the Council to immediately give the necessary twelvemonth's notice, under the agreement. The recommendation will be discussed at a special meeting of the Council.

YORK: *Tramways.*—Trial runs have been made over the reconstructed horse tramways.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The Tramways and Electricity Committee invite tenders for two water-tube boilers, superheaters, mechanical stokers, economisers, &c., and pipe work. Tenders to the Town Clerk by January 31st. (See advertisement last week.)

A Local Government Board inquiry was held last week into an application by the Corporation for a loan of £62,200 for electrical extensions. The present capacity of the electricity station is 4,000 kw., and the loan asked for has in view the increase of this to 5,500 kw. This latter is the estimated output at the end of the next two years. During the past year the number of units sold increased by 17½ per cent.

HARRISON, AINSLIE & CO.—The directors propose to create £200,000 of 6 per cent. preference shares, of which £18,000 are required to defray the cost of extending the use of electrical power throughout the very wide area which the company controls. In the working of one grinding mill alone it is estimated that a saving of £7,000 per annum would be made if it were driven electrically instead of by steam.

LONDON: *Stepney.*—The Electricity Supply Committee require (*a*) boilers and accessories: (*b*) turbo-generator and accessories, converting plant, switchgear, &c. Particulars from the Borough Electrical Engineer, and tenders by January 24th. (See advertisement last week.)

MANCHESTER.—The Electricity Committee invite tenders for a 300-kw. motor or rotary converter, or motor generator, and high- and low-tension switchgear. Particulars from the Secretary, Town Hall, and tenders to the Town Clerk, by January 19th.

RHYL.—The Local Government Board have sanctioned a loan of £3,000, and a supplementary loan of £1,000, for electrical extensions.

SOUTH AFRICA.—According to the *South African Mining Journal*, it is intended to equip electrically the Wankie mine, on the surface as well as underground, for both power and light. The present boilers and engines will be utilised, but electrical generators are to be installed.

SUTTON COLDFIELD.—A loan of £3,500 is to be applied for, in connection with extensions of mains.

TAVISTOCK.—It is proposed that a consulting engineer be appointed to advise the Council as to an electric lighting scheme. A capital expenditure of about £10,000 is contemplated.

TORQUAY.—The scheme for extending electrical mains to Chelston at an estimated cost of £1,335 is to be enlarged so as to include three other roads at an additional cost of £735.

Digitized by Google

WORKSOP.—An application has been made to the Local Government Board for sanction to a loan of £1,500 for electric lighting purposes.

Miscellaneous

ACTON.—The Electricity Committee invite tenders for one year's supply of cables, steel tubing, meter boards, and fuse boxes. Particulars from the Borough Electrical Engineer, and tenders by January 18th.

BIRMINGHAM.—The Tramways Committee invite tenders for stores during the year to March 31st, including electrical sundries, and insulating materials. Particulars from the General Manager, to whom tenders by February 1st.

CHELTENHAM.—Tenders are invited for the supply of general stores, including electric light fittings. Particulars from the Borough Surveyor, to whom tenders by January 29th.

HALIFAX.—The Highways and Tramways Departments require electrical accessories. Particulars from the Borough Engineer, and tenders by February 17th.

MEXICO.—A contract has been sealed between the Mexican Legislature and the Mexican Tramways Co. authorising the latter to construct a double line of tramway along the extension of Calle Gante, and also to double some of the existing lines.

PLYMOUTH.—The Corporation invite tenders for the supply of the following during the twelve months to March 31st, 1911:—Arc-lamp carbons, electricity meters, transformers, paper-insulated cables, oil, and waste. Particulars from Borough Electrical Engineer, to whom tenders by January 25th.

ROCHDALE.—The Tramways Committee invite tenders for (1) Poles, bracket arms, and accessories; (2) overhead line materials, trolley wire, section boxes, and accessories; (3) points and crossings. Particulars from the tramway manager, and tenders to the Town Clerk by January 17th.

STONE (Staffs).—An electric light and telephone installation is required at the new Isolation Hospital, Yarnfield, for the Stone Joint Hospital Board. Particulars from the Clerk, 21 High Street, Stone, and tenders by January 19th.

SWITZERLAND.—The *Board of Trade Journal* states that Mr. Arthur Bider, of Langenbruck, and Mr. E. Jenny, of Waldenbourg, have been granted concessions for eighty years, for the construction and working of an electric railway from Waldenbourg to Balsthal, with a branch from St. Wolfgang (Palsthal) to Mümliswil, the total length being 9½ miles. Messrs. Scharer and F. Luder, of Koppigen, have also been granted a concession for eighty years, for the construction and working of an electric railway from Herzogenbuchsee to Kirchberg *via* Koppigen, and from Koppigen to Lyss by way of Utzenstorf.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.—Alterations to Eastern Hospital, Homerton Grove. Builders, F. & G. Foster, South Norwood.

E.—School, Gainsborough Road, West Ham. Architect, Education Committee.

N.W.—Church Hall, Mill Hill (£2,300). Architect, J. S. Alder, Arundel Street, W.C.

Church, Central Square, Hampstead Garden Suburb, N.W. Architect, E. L. Lutyens, 29 Bloomsbury Square, W.C.

PROVINCES.

BIRMINGHAM.—Factory, Hockley Hill, for Messrs. Canning. Builders, Eloins & Sons, Maden Road, Soho, Birmingham.

Factory, Soho. Builder, E. Crowther, Farm Street, Birmingham.

BOLTON.—Labour Hall, St. George's Road (£5,000). Secs., Bolton Operative Spinners Association.

JARROW.—School (£15,700). Architect, F. Renoldson, 37 King Street, South Shields.

MANCHESTER.—Additions to works, Trafford Park, for Redpath, Brown & Co., Ltd.

Extension, Technical Institute. Architect, D. Bowden, c/o E. Warrall, surveyor, Stretford U.D.C.

NEWCASTLE-ON-TYNE.—Bakery and confectionery works. Architect, C. S. Errington, 21 Grainger Street West, Newcastle-on-Tyne.

Exhibition of Australian Telephone Apparatus.—In connection with the tenders that are from time to time invited by the Australian Postmaster-General's department for telephone and postal apparatus, it has been decided to have patterns of every class exhibited at the office of the Commonwealth in London, 72 Victoria Street, London. The specimens may be inspected by British manufacturers wishing to tender.

Paris-Vienna Telephone.—A Dalziel wire from Vienna states that direct telephonic communication will shortly be available between Vienna and Paris. The line, over which successful experiments have been made, will pass via Frankfort. Hitherto it has been necessary to telephone from Vienna to Berlin, and thence on to Paris.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The Australian Postmaster-General's Department has accepted the tender of the Western Electric Co. (Australia), Ltd., for telephone cable, silk and cotton insulated and light lead-covered, in 440-yard lengths at £399 per mile.

BRISTOL.—The tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., for the supply of joint and junction boxes during 1909-10 has been accepted at £233.

CARLISLE.—The tender of the British Insulated & Helsby Cables, Ltd., has been accepted for overhead cable at £799.

CHATHAM.—The tender of Messrs. Rayfield & Jenner, Chatham, has been accepted for the supply of "Osram" electric lamps at £17 2s. per gross.

ECCLES.—The tender of the British Westinghouse Co. has been accepted for the supply of meters during the coming year.

LONDON: *St. Pancras.*—The following tenders have been received for a new switchboard at the King's Road station:—British Thomson-Houston Co., Ltd., £87 15s.; Northcote, Heaver & Co. (accepted), £90 19s.; Bertram Thomas, £95 5s.; E. F. Moy, Ltd., £109; A. Seage & Co., £115.

WALSALL.—The Council have placed an order with the Electric Ordnance & Accessories Co., Ltd., for four arc lamps at £2 3s. 6d. each.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £63 5s. to £63 15s. per ton (last week, £63 to £63 10s.).

DISSOLUTION OF PARTNERSHIP.—The partnership between A. Bagshaw and W. J. Fox, electrical engineers, Bradford Road, Batley, Yorks, has been dissolved.

CANADIAN AGENCIES WANTED.—A Toronto firm reports that there is a very good market in Canada for aluminium wires, &c., and desires to obtain the agency of a United Kingdom manufacturer. Further particulars of this inquiry may be obtained at the office of the High Commissioner for Canada, 17 Victoria Street, London.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—At the adjourned public examination on Thursday of E. Smith, electrical engineer, Lincoln, a complaint was made by the Official Receiver that the debtor had not complied with an order to render a cash account, and to hand over a certain pocket-book. The matter has been reported to the Board of Trade. The examination was again adjourned to enable the debtor to comply with the order of the Court.

A meeting of Messrs. Easton & Anderson, Ltd., will be held at 25 Victoria Street, Westminster, London, on Tuesday, February 15th, at 11.30 a.m., to hear the liquidator's account of the winding up.

ELECTROMOTORS' NEW OFFICES.—Messrs. Electromotors, Ltd., have found it necessary to remove their London office to more commodious premises, and all communications for this office should be addressed to 49 Queen Victoria Street, E.C. The telegraphic address and telephone numbers remain as before.

ROBERTSON & OSRAM SOCIAL CLUB.—The first annual fancy dress ball was held at Hammersmith on Saturday last, when there was an attendance of 400.

Slight Interruption to Supply in East Ham.—Some exaggerated reports have appeared in the daily Press with regard to a slight disturbance to the electric supply in East Ham on Monday last. We understand from official sources that owing to a slight cable fault or some similar disturbance, both feeder and machine circuit-breakers at the generating station came out. They were replaced and came out again, but on replacing a second time the fault apparently healed itself, and the supply was maintained. The interruption lasted only a minute or two in each case.

The late Mr. F. H. Medhurst.—Creditors of the late Mr. F. H. Medhurst are requested to send particulars of their claims to Messrs. Bennett & Ferris, 68 Coleman Street, London, E.C., not later than February 18th.

Glare: Its Causes and Effects.—At a meeting of the Illuminating Engineering Society on Tuesday, a discussion took place upon "Glare: its Causes and Effects." Dr. S. P. Thompson, President of the Socicy, was in the chair. In order to encourage discussion, a series of eleven questions was sent around to members. Of these five were purely physiological questions, and it was decided to restrict the discussion to this side of the question. The engineering side will be discussed at the next meeting of the Society, which will be held on February 15th.

London-Madrid Telephone.—The question of communication between Paris and Madrid is occupying the attention of the French postal authorities, and an agreement has been signed for the laying of a line between these two cities. When this is completed, it is hoped to be able to telephone from London to Madrid.

Digitized by Google

MISCELLANEOUS CITY NOTES

R. WAYGOOD & CO.—The full dividend on the 6 per cent. preference shares has been announced for the six months to January 16th.

PRIMITIVA GAS & ELECTRIC LIGHTING CO.—Extraordinary general meetings of this company, the River Plate Gas Co., and the Buenos Aires (New) Gas Co. were held on Thursday to confirm resolutions providing for the amalgamation of the three undertakings.

DUBLIN UNITED TRAMWAYS CO.—The directors recommend the full dividend on the 6 per cent. preference shares for the half-year to December 31st, and 6 per cent. on the ordinary shares for the same period, after setting aside £15,000 to renewals of permanent way, and carrying forward £9,267. The amount at credit of net revenue account includes the sum of £8,150 in respect of income tax over-assessed during the past six years.

RIO DE JANEIRO TRAMWAY, LIGHT, & POWER CO.—A dividend of one per cent. has been declared upon the ordinary shares.

MEXICAN LIGHT & POWER CO.—A dividend of one per cent. has been declared upon the ordinary shares.

MADRAS ELECTRIC SUPPLY CORPORATION.—In accordance with the terms of the trust deed for the 5 per cent. construction debenture stock, the company give notice that it will require holders to accept forthwith one fully-paid £5 share for every £5 of construction stock.

CHILI TELEPHONE CO.—An interim dividend of 3s. per share, free of tax, has been declared for the past half-year.

DIRECT UNITED STATES CABLE CO.—An interim dividend of 4s. per share is declared for the December quarter. The sum of £7,500 has been added to reserve fund, and £6,859 carried forward.

COMPANIES' MEETINGS AND REPORTS

SUNDERLAND DISTRICT ELECTRIC TRAMWAYS CO.—At the meeting last week the report and accounts given in our last issue were adopted. The Chairman pointed out that but for the serious drop in the traffic receipts they would have shown a profit for the past year. The Board still considered that it would be a good thing for the public if they were allowed running powers into Sunderland, but although they continued to make efforts in this direction they had not been successful. The reorganisation of the company's capital would have to be dealt with soon, and had the past year been a normal one the Board would have brought forward a proposal at that meeting.

HARRISON, AINSLIE & CO.—At the annual meeting on Tuesday the question of installing new electrically-driven pumps, referred to in our "Tenders Invited" columns, was mentioned. It was stated that at the present moment an arbitration was pending between the makers of the original electrical plant and the syndicate with whom Messrs. Harrison, Ainslie & Co. contracted for the erection of the plant. The syndicate has, however, agreed that the result of the arbitration shall be binding as between the syndicate and the company, thus preventing the latter being involved in any litigation. The proposal to increase the capital by £200,000 preference shares of £1 each was adjourned until next Wednesday in order to give the shareholders time to thoroughly consider the matter.

APPOINTMENTS AND PERSONAL NOTES

Mr. F. A. Cortez-Leigh, of Messrs. Lacey, Sillar & Leigh, has been appointed chief electrical engineer to the London & North-Western Railway Co.

Bailie Maclay has resigned from the Glasgow Town Council, owing to pressure of business. Bailie Maclay was Convener of the Corporation Electricity Committee from November, 1896, to November, 1902.

Mr. Uffleman, having resigned his position in the Sales Department of West Ham undertaking, Mr. T. O. Wilton (formerly canvasser) has been appointed to fill the vacancy at £2 10s. per week and commission.

NEW COMPANIES

R. PAIN & SONS, High Street, Woking. Capital, £6,000. Electricians and engineers.

ALDOUS & CAMPBELL, 21 Lower Bland Street, Southwark, London. Capital £2,500 in £10 shares (50 preference shares). Electrical and general engineers.

SHEFFIELD ELECTRIC POWER CO., Chippinghouse Works, Lowfields, Sheffield. Capital, £2,000. To acquire the business of W. E. Burnand at above address. W. E. Burnand is managing director.

FRAME LIGHT.—Registerd by Messrs. Waterlow Bros. & Layton, Ltd., Birchin Lane, London. Capital, £1,500. Dealers in electric and other lamps.

C. S. CASELLA & CO., 11-15 Rochester Row, Westminster, London. Capital, £10,000. To acquire the busines of C. F. Casella & Co., scientific instrument makers, &c.

LONDON ELECTRIC TREATMENT INSTITUTE, 43-44 New Bond Street, London. Capital, £5,000. Electric light cure and Electro-therapeutic Institute.

COMBINED LIGHTING AND POWER METER

STATION engineers are all busy canvassing consumers with a view to their adopting appliances for heating and power in order that the loss of revenue caused by the extended use of metal filament lamps shall be counteracted by an increased consumption for power. A new meter, which should do much to encourage the use of electrical domestic appliances, has been introduced by the Adnil Electric Co., Ltd. (Adnil Building, Artillery Lane, London, E.C.). This comprises a standard lighting meter fitted with an additional terminal, which is connected inside the meter to the main current coils. The connection is made in such a manner that the current taken by the heating, cooking, or other appliance does not flow through all the turns of the main current coils, but only through a portion of them, dependent on the ratio of the power tariff to the lighting tariff. The current taken by the lamps in the installation flows through the meter coils in the ordinary way. The meter thus registers the units consumed for lighting, and, in addition, that proportion of the power consumption which, charged for at the lighting rate, equals the total power consumption charged for at the power rate. To deduce the total bill for lighting and power, the total units registered by the meter must therefore be multiplied by the lighting rate.

The method of connection for a D.-C. meter is illustrated diagrammatically in the accompanying figure, in which the

"ADNIL" COMBINED LIGHTING AND POWER METER.

special power terminal is shown connected to one-half of the series windings. In this case the ratio of the power and lighting rates is assumed to be 1 : 2—*e.g.*, threepence for power and sixpence for lighting; it will also be seen that it is only necessary to run one extra main back to the meter from the heating apparatus, &c., and connect it to the power terminal. Should the power rate be only one-third of the lighting rate, the power terminal is joined to a tapping on the main current coil, so that only one-third of the total number of turns is in series with the power circuit. Both A.-C. and D.-C. meters of this type can be obtained, and for any ratio of lighting and power rates, and as the prices are only slightly in excess of those for ordinary meters, they should be of considerable use where flat rates for both lighting and power are in vogue.

Fowler's Mechanical Engineer's Pocket Book for 1910. Edited by W. H. Fowler. (Manchester : Scientific Publishing Co., Ltd.) 1s. 6d.

Automatic Train Stops on a Berlin Electric Railway.—A recent issue of *Elektrische Kraftbetriebe und Bahnen* contains a description of an automatic arrangement for the purpose of stopping trains in the event of their passing a danger signal. An arm projecting over the track from the signal post swings in a vertical plane, and is so connected with the signal that when this is set to danger the arm is in the horizontal position, and when "clear," in the vertical position. On the roof of the motor-coach of the train is a device comprising a switch with a lever arm which tends to descend under the influence of a strong spring, but is prevented from so doing by a wooden support. The latter is knocked to one side by the arm on the signal post if the train passes it when it is in the horizontal position. The switch then opens the main circuit through a relay, and causes the brakes to be applied automatically. The fact that the device has operated is indicated in the driver's cabin, and a lever attached to the switch enables it to be used in cases of emergency.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

CALENDARS, &c.—Messrs. A. E. Mallandain, manufacturers of drawing instruments and drawing-office supplies (51 Cheapside) are sending out a convenient office wall calendar with a tear-off sheet for each month.

Messrs. Everett, Edgecumbe & Co. (87 Victoria Street, Westminster) are issuing a calendar for 1910, which consists of twelve monthly tear-off sheets, each having an original sketch by the well-known artist, Mr. John Hassall. These sketches give one an idea of how the various well-known names in common use, so far as electrical measuring instruments are concerned, appeal to the artist.

Premier Electric Control, Ltd. (Red Lion Street, Clerkenwell), have embodied a most ingenious idea in their calendar for 1910. Above the monthly tear-off sheet is a small window, through which appears a rotatable disc bearing the days of week. Above this window is a larger one, through which can be seen, under the leading resolution for 1910, the words, "Wipe out all inferior electrical controlling apparatus of every description." The rotation of the disc causes a hand holding a sponge to pass across the space and apparently to effect the wiping out advised. The firm will be pleased to forward a copy to any of their friends who have not yet received one.

A Christmas card from the Lea Recorder Co. (28 Deansgate, Manchester) is embellished with a border forming a diagrammatic representation of their well-known system of feed-water measurement.

A most useful combined blotting pad calendar and engagement book is being sent out by Messrs. Alfred Graham & Co. (St. Andrew's Works, Crofton Park, S.E.), makers of loud-speaking telephones.

TEXTILE MACHINERY DRIVING.—A pamphlet from the British Department of the Maschinenfabrik Oerlikon (Oswaldestre House, Norfolk Street, Strand) contains a reprint of an article on the use of variable-speed three-phase motors for the driving of machines for printing textiles.

TECHNICAL BOOKS.—A comprehensive catalogue of technical and scientific books, including a number of works on electricity and electrical engineering are to hand from Messrs. W. & G. Foyle, educational and other booksellers (135 Charing Cross Road, W.C.). Prices are given for new copies, but the firm are able to supply nearly all those mentioned second-hand at about half the published price.

TELEPHONES.—A new list from the Western Electric Co. devoted to telephone instruments describes a number of patterns of apparatus, including battery intercommunication instruments and accessories, and central battery sets in considerable variety. Particulars are given of a new automatic intercommunication system with a series of key buttons for calling. An automatic replacement intercommunication system is also described. Table and wall magneto sets are listed in numerous patterns, as well as magneto military portable telephone sets.

LANTERN SLIDES.—Messrs. Siemens Brothers' Dynamo Works, Ltd. (Caxton House, Westminster), have sent us a revised list of the large stock of lantern slides illustrating electrical plant and apparatus of every description which they are at all times willing to lend to lecturers, &c., free of charge. Many interesting additions have been made since last year's list.

METAL FILAMENT LAMPS.—A miniature list from the Brush Electrical Engineering Co. (108-112 Belvedere Road, S.E.) gives prices of "Metallum" lamps which they are putting on the market for voltages from 100 to 250, and in candle powers from 16 to 100.

ELECTRIC IGNITION FOR LARGE GAS ENGINES.—A pamphlet from the Lahmeyer Electrical Co. (109-111 New Oxford Street) contains a reprint of an article describing a low-tension electric ignition system for large gas engines. The break inside the cylinder is produced electromagnetically, and the commutator, which is a substantial piece of apparatus, is arranged to prevent all possibility of an accidental early spark by keeping the contacts short-circuited until the moment of ignition. The apparatus is made for pressures from 65 to 220 volts.

ELECTRIC SIGNS.—A striking post-card from Messrs. Venner & Co. (6 Old Queen Street, Westminster) gives a good idea of the effectiveness of their well-known signs, which are particularly recommended for electric supply advertising.

ELECTRIC IGNITION OF ACETYLENE LAMPS.—A leaflet from Messrs. Cox-Walkers, Ltd. (Darlington), describes an attachment for acetylene motor-car headlights for lighting them from the seat by a spark over the burner from the ordinary ignition apparatus on the car.

The Electrical Trades' Benevolent Institution.—The second festival dinner of this Institution will be held on February 23rd next. Dr. Gisbert Kapp has consented to preside.

The Electrical Standardising, Testing, and Training Institution.—Arrangements for the following special lectures to be delivered at Faraday House have been made :—"Electrical Measurements, by Mr. J. Rennie (of the Board of Trade Electrical Standards Laboratory), and "Accumulators," by Mr. W. R. Cooper.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 6th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,832/08. **Trolley-wheel Guard.** T. HOLDSWORTH (Birmingham). This comprises a curved metal arm pivoted just in front of the wheel at the top of the pole, and pointing downwards in the direction of movement. Should the wheel leave the trolley wire and a cross-wire be encountered, the latter comes under the metal arm and turns it about its pivot so that it reaches over the wheel. The wire thus slides over the underside of the arm and cannot catch in the wheel. After the cross-wire is passed, the arm is returned to its original position by a spring. Three claims, eight figures.

27,967/08. **Automatic Control of Single-phase Motors.** H. C. JACOBY (London). These are improvements in the method of control of an A.C. commutator motor, in which the brushes are rocked to vary the speed and to reverse. (See ELECTRICAL ENGINEERING, September 10th, 1908, Vol. IV., p. 383.) A V-shaped cam transmits the motion of the governor to the brush rocker, which moves into a position of less torque as the speed increases. Three claims, five figures.

133/09. **Single-phase Motor.** F. PUNGA (Liege). In series commutator motors, in which the compensating winding is in series with the auxiliary pole windings, and the compensating current is generated by induction, an auxiliary pressure is applied to this circuit from tappings off the main transformer in order to displace the current in phase, and thus completely neutralise the pressures induced in the short-circuited armature coils. Four claims, one figure.

1,327/09. **Continuous-current Generator.** A. BOECKEL, O. GRÜNBERG, J. K. KRUKOVSKI, and E. LUXEMBOURG (St. Petersburg). This is an improvement on the machine described in specification No. 72/09, abstracted in ELECTRICAL ENGINEERING, October 21st, 1909, Vol. V., p. 924. The armature and field rotate in opposite directions, while the brushes are stationary. A rotary field is produced by a stationary field system supplied with three-phase current from the armature. The latter has two commutators, one of usual construction, and one with twice the number of segments as there are turns in the armature. On the first are three brushes supplying the field current, and on the second are brushes for collecting continuous current. One claim, two figures.

2,052/09. **Apparatus for Grooving Trolley-wires.** B. KAY (Haslingden). Trolley-wires are grooved at intervals for securing to ears by a device comprising a longitudinally grooved bar with a reciprocating frame containing two horizontal cutting discs pressed inwards on each side of the wire by slide-pieces adjustable by means of hand screws. The bar is clamped to the wire, and the frame worked by hand or power. Five claims, four figures.

2,464/09. **Motor Starter.** SIEMENS BROS. DYNAMO WORKS, LTD., and E. SCHUPP (Stafford). Though this switch has only one operating arm, a double-pole break is secured, by connecting an automatic switch in the overload release circuit to one pole and the starter arm to the other. The overload release is independent of the short-circuiting of the no-voltage release magnet, and both devices can operate during the switch-in period. If either release operates, the starter-arm must be returned to the off position before switching on. The armatures of the two coils are mechanically interlocked. Four claims, one figure.

3,352/09. **Dynamo Brushes.** F. W. CARTER (B. T.-H. Co., Rugby). Brushes for high-speed machines are shaped at the trailing edge, so that the area of contact between brush and segment during the last moments of commutation decreases at a faster rate than that due to the movement of the segment when brushes with parallel sides are used. The brushes are fluted or corrugated on the trailing edge, so as to provide teeth with rounded edges, or rectangular brushes may be staggered with respect to the commutator to give the same effect. Two claims, six figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Arc Lamps: BENKÖ [Securing contacts to electrodes], 15,737/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MERZ and PRICE [A.-C. distributing system] 28,186/08.

Dynamos, Motors, and Transformers: FERGUSON [Machines] 28,040/08; BRITISH THOMSON-HOUSTON Co. and CLOUGH [Bearings] 7,334/09; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Speed-regulation of machines] 18,802/09; and [Regulation of A.-C. commutator machines] 20,005/09; AKT-GES. BROWN, BOVERI, ET CIE. [Excitation of commutator generators] 20,899/09; JACOBY [Control of motors] 23,619/09.

Electric Ignition: KEITH [Ignition of gas lamps] 7,827/09; MILTON [Magneto-ignition] 24,602/09.

Electrometallurgy and Electrochemistry: GREENWOOD [Electrolytic decomposition of alkaline salts] 25,208/08; COMPAGNIE GÉNÉRALE D'ELECTRO-CHIMIE DE BOZEL [Manufacture of silicides] 5,799/09;

Incandescent Lamps: HADDAN (*Bruno-Patente-Verwertungs-Ges.*) [Incandescent bodies] 12,467/09.

Switchgear, Fuses, and Fittings: VESSEY [Wall plugs] 9,402/09; JOHNSON [Switch for railway points, signals, &c.] 18,500/09.

Telephony and Telegraphy: MUIRHEAD [Telegraphy] 27,867/08; SHARMAN [Telegraphy and telephony by earth conduction] 2,169/09; CONNER [Party-line ringing key] 10,247/09; GRAHAM [Telephonic receivers] 25,112/09; CLOUGH [Telephone mouthpieces] 26,461/09; SIEMENS & HALSKE AKT.-GES. [Signalling apparatus] 26,465/09.

Traction: ARMSTRONG and RUSSELL [Automatic brakes] 27,941/08 and 27,447/09; DUDGEON and CROSS [Trolley head] 5,235/09; MUNRO and RAILLESS TRACTION Co. [Trolley head] 5,249/09; THOMPSON [Trolley head] 8,649/09; TETLOW [Trolley] 9,365/09; BLUHM [Trolley] 12,253/09; DICK, KERR & Co. [Electro-magnetic brakes] 19,098/09; S.P. (Suchostawer Patents) SYNDICATE, LTD., and SAYERS [Collectors] 20,115/09.

Miscellaneous: STOCKALL [Electric clocks and counters] 13,679/08; WALTON and BELL [Temperature alarm] 27,626/08; RUBINER [Therapeutic apparatus] 27,796/08; BOYD [Therapeutic apparatus] 1,987/09; STEINWEG [Soldering aluminium] 6,138/09; DUNOYER [Mariners' compasses] 18,615/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: SENFTNER [Manufacture of electrodes] 8,151/09.

Electric Ignition: WEISS [Ignition systems] 29,255/09; DAIMLER MOTOREN-GES. [Distributor] 29,615/09.

Incandescent Lamps: KUZEL [Metal filaments] 25,889/09.

Traction: AKT.-GES. BROWN, BOVERI ET CIE. [Electric driving of vehicles] 24,843/09.

Amended Specifications Published

The following amended Specifications can now be obtained.

25,175/08. **Fan.** ELECTRIC & ORDNANCE ACCESSORIES Co. and JACOBSEN. This specification was amended as the result of opposition, and describes a blade construction for centrifugal fans.

8,263/09. **Fuses.** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens & Halske Akt.-Ges.*) A disclaiming note has been added to this specification, which describes non-interchangeable cartridge fuses. See ELECTRICAL ENGINEERING, December 23rd, 1909, Vol. V., p. 1086.

Opposition to Grant of Patent

14,615/08. **Dry Cell.** H. HUNTE. This patent has been granted in spite of opposition. The specification describes a dry cell with vertical air passages through the depolariser open at top and bottom. Further particulars were given in an abstract in ELECTRICAL ENGINEERING, September 30th, 1909, Vol. V., p. 859.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, &c.: C. HESS [Insulating composition] 19,111/05.

Electrometallurgy and Electrochemistry: K. BIRKELAND and S. EYDE [Furnace with electromagnet to spread arc] 20,003/04; C. RUZICKA [Primary cell] 18,931/05.

Incandescent Lamps: A. W. HILL and SIR HIRAM MAXIM ELECTRICAL Co. [Straight-filament lamps] 19,259/05; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Vanadium-carbide filaments] 19,264/05.

Instruments and Meters: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Multiple-rate A.-C. meters] 19,036/05.

Switchgear, &c.: C. L. MENGES [Lamp-holder] 21,623/97; A. D. SMITH [Switch] 18,691/01; G. SMITH [Lamp-holder switch] 18,904/05.

Telephony and Telegraphy: J. E. BLANC [Ships' wireless course indicator] 12,994/04; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Vapour lamps in wireless systems] 19,034/05.

Traction: BRITISH THOMSON-HOUSTON Co. (*C. E. Barry, U.S.A.*) [Multiple-unit control] 16,705/00; A. J. BOULT (*N. A. Christensen, U.S.A.*) [Automatic switch for air-brakes] 19,028/01; R. HERMAN [Signalling] 19,086/01; R. SHEEHY [Signalling] 20,887/02; M. B. MOUNTAIN, G. M. GIBSON, and A. F. HEAD [Tramcar obstruction remover] 19,158/05; O. BÖHM [Train-lighting system] 19,201/05.

Miscellaneous: R. WAYGOOD & Co. and H. C. WALKER [Lift control] 20,613/04.

SUMMARY

A new pattern of explosion-proof motor, designed by the General Electric Co. to suit the special requirements of a gunpowder factory, is described. The carcase is gas-tight, and there are no means for ventilating but the heavy cast-iron covers are provided with corrugated iron centres, which, besides offering a large cooling surface, give a certain amount of elasticity. The flanges of the covers are recessed to take a packing of hemp rope dipped in tar. (Page 37.)

It seems highly improbable that the large fire in a retail shop in Kilburn last week was electrically caused, although in the first instance it was ascribed to the electrical installation. (Page 37.)

The 1910 edition of the Phœnix Wiring Rules, just issued, includes a stretching test for the rubber insulation of conductors, and also some very definite conditions with regard to the use of flexible and the wiring of shop-windows. (Page 38.)

Under Electrometallurgy and Electrochemistry, we give some notes on the electro-deposition of alloys of silver and copper. An electric furnace for the production of pig-iron is described; this is an arc furnace in which the electrodes are prevented from coming in contact with the incoming charge. (Page 38.)

A note about the London Electrobus Co. appears on page 38.

The "Fixed Price Light Co., Ltd." has been established to provide electric light for small houses at a fixed price of a few pence per lamp per week, which includes the hire of the wiring and fittings, as well as the supply of current. The company is affiliated to Messrs. Siemens Bros. & Co., Ltd., and the "Stannos" system of wiring is employed. (Page 39.)

A Paper read by Mr. R. M. Neilson last week before the Glasgow Local Section of the Institution of Electrical Engineers, contained an investigation of the most economical vacuum for making steam turbines. Assuming certain data for a hypothetical station, curves were given for different load factors, showing how capital and other costs were affected by the degree of vacuum for which the plant was designed. (Page 39.)

At last Thursday's meeting of the Institution of Electrical Engineers, the second "Kelvin" Lecture was delivered by Prof. J. A. Ewing, F.R.S., who chose as his subject the work of Lord Kelvin in telegraphy and navigation, and dwelt particularly on his connection with the early Atlantic cables and his improvements in the mariner's compass. (Page 41.)

We publish a description of the common battery exchange recently put into operation at Fremantle (Western Australia). An intermediate distributing frame of the vertical type is employed; alternate verticals are used for local and multiple connections. The line and cut-off relays are mounted on a frame forming part of the I.D.F. On the cord circuits repeating coils are dispensed with, and a similar arrangement is employed to that on the new Cardiff Exchange. Some of the subscribers' sets are fitted with a special party-line lock out device. (Page 43.)

Some particulars are given of four recent designs of heavy electric locomotives. The single-phase locomotive for the New York, New Haven & Hartford Railway has four pairs of driving wheels, coupled to four 350-h.p. motors through flexible gearing, and two pairs of guiding wheels. The motors are mounted rigid on the frame directly over the axles. Two three-phase locomotives are described. The first is one of those working in a tunnel of the American Great Northern Railway, and has four independent pairs of driving wheels only, each geared direct to a 375-h.p. motor. Speed variation is obtained by resistances in the rotor circuits. In the new Simplon Tunnel locomotives, the

Digitized by Google

four pairs of driving wheels are geared together and to two 700-h.p. motors with short-circuited rotors. Four economical running speeds are obtained by changing the effective number of poles. The last described is a new 4,000-h.p. continuous-current locomotive, one of 24 ordered for the New York terminus lines of the Pennsylvania Railway. This comprises two independent units each with two pairs of driving wheels coupled together and driven through coupling rods by a 2,000-h.p. interpole motor. (Page 44.)

SOME motor-boats with combined petrol and electric drive have been constructed in Germany. An accumulator battery is charged at low speeds by a dynamo which is driven as a motor to assist the engine at high speeds. A 17-ft. cruising boat of this type, displacing over nine tons, carries a 20-h.p. engine and motor-dynamo and an 80-cell battery with a capacity of 213 ampere-hours on the one-hour discharge rate. (Page 45.)

A PAPER on the testing of rubber was read by Prof. A. Schwartz before the Manchester Section of the Institution of Electrical Engineers on Tuesday, January 11th. The author pointed out how important a bearing the results of mechanical tests had on estimating the suitability of rubber for electrical purposes, and described methods by which these could be applied. He also made certain suggestions as to tests that might be specified by the Cable Makers' Association. (Page 46.)

SOME figures of the output of an electrically driven cogging mill at Middlesborough are given on page 47.

A RETURN has been issued, under the Census of Production Act, 1906, dealing with the electrical industry in 1907. The total value of the electrical machinery, apparatus, cables, &c., produced was £13,782,000. The imports were 14 per cent. of the electrical machinery, 26 per cent. of electrical goods and apparatus, 11 per cent. of telegraph and telephone cables, and 5 per cent. of wires and cables. (Page 48.)

THE Board of Trade Report by Major Pringle on the buffer stop collision in November last on the Metropolitan District Railway at Ealing attributes the accident to absence of pressure in the brake air-reservoir due to the valve connecting the main reservoir with the train pipe having been accidentally left closed, and makes certain recommendations to avoid recurrence of such an accident. (Page 48.)

A SHORT article gives a *résumé* of some of the most important work accomplished by the Electrical Manufacturers' Association during the past year. (Page 48.)

A PAPER on factory organisation was read by Mr. James Rider at a recent meeting of the Rugby Engineering Society. (Page 49.)

THE Gravesend & Northfleet Electric Tramways, Ltd., are taking action against the Gravesend Corporation in respect of the metering of the electrical energy supplied for the tramways. The allegation is that the meters are reading fast, and that the company have had registered against them since August, 1908, about 47,000 units in excess of the actual consumption. (Page 49.)

AMONG the specifications published by the Patent Office on Thursday last is one by T. Ferguson for a train-lighting dynamo with automatic shunt regulation. The increase in the driving torque as the speed and output increase is caused to displace a sleeve on the shaft, and this in turn works a rheostat arm.—C. H. Merz and B. Price describe a system of protection for simple A.C. circuits, in which any difference in the currents in the different conductors causes a core to be magnetised and a current to be generated in a winding connected to the tripping coil of the main switch.—A specification by Dick, Kerr & Co. describes a magnetic track brake consisting of several independent electromagnets linked together.—The S.P. Syndicate has covered a construction of skate or collector for traction systems; this comprises a length of metallic woven fabric drawn edgewise across the studs.—The decision of the Comptroller to grant a patent to H. Hunte for a dry cell with open-air passages through the depolariser has been appealed against.—The opposition to the patent by C. E. Gilbert for an arc lamp mechanism has been withdrawn.—A patent by R. Pearson for a device for indicating in a signal box when a semaphore arm moves expires on Saturday after the full life of fourteen years. (Page 50.)

WE have received a letter from Messrs. Simplex Conduits, Ltd., with reference to the combined lighting and power meter described in our issue of last week, stating that there is no reason why existing meters should not be utilised for the double rate purpose by suitable reconnection, and that no special type of meter is essential. (Page 51.)

THE Cardiff Finance Committee have reported that the tramway system is being maintained in such an efficient condition that the provision of a depreciation fund is unnecessary.—The New Carolina Port Electricity Works of the Dundee Corporation will shortly be formally opened.—Sir Alexander Kennedy is to report with regard to large extensions at Hampstead.—A power tariff of 1d. per unit, on the restricted hour system, has been adopted at Marylebone.—Mr. Peter Fisher, General Manager of the Dundee Tramways, has reported upon the unsatisfactory position of the Perth Tramways, which, he says, is overstaffed, in some departments, to the extent of 50 per cent.—Local authorities in the Potteries are to hold a conference regarding the new system of fares introduced by the British Electric Traction Co.—The first section of the reconstructed tramways at York has been officially inspected. (Page 52.)

AN expenditure of £54,000 is contemplated at Coventry. Loans have been sanctioned at Wolverhampton (£15,000) and Lowestoft (£2,500). Southampton Corporation propose to borrow £9,600 for new cars and meters. The Ashton-under-Lyne Corporation require generating plant and condensing plant. A system of electrically operated clocks is required at the new Institution of Electrical Engineers' building. Electrical stores are required at Newport, Islington, and by the Asylums Committee of the London County Council. (Page 52.)

THE Victoria Falls Power Co. are issuing £900,000 debentures in Berlin. (Page 54.)

ARRANGEMENTS FOR THE WEEK

FRIDAY, JANUARY 21ST.

Physical Society.

5 p.m. At Imperial College of Science. (1) "The Polarisation of Dielectrics in a Steady Field of Force." by Prof. W. M. Thornton; (2) "On the Use of Mutual Inductometers," by A. Campbell.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "The Choice of Prime Movers for Power Stations," by E. T. Driver.

SATURDAY, JANUARY 22ND.

Junior Institution of Engineers.

3 p.m. Visit to the new generating station of the Westminster Electric Supply Corporation, Horseferry Road, Westminster.

MONDAY, JANUARY 24TH.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. At Armstrong College. "On the Safety Devices in Coal-Cutters," by H. J. Fisher.

TUESDAY, JANUARY 25TH.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "Equitable Charges for Tramway Supply," by H. E. Yerbury.

WEDNESDAY, JANUARY 26TH.

Institution of Electrical Engineers: Leeds Section.

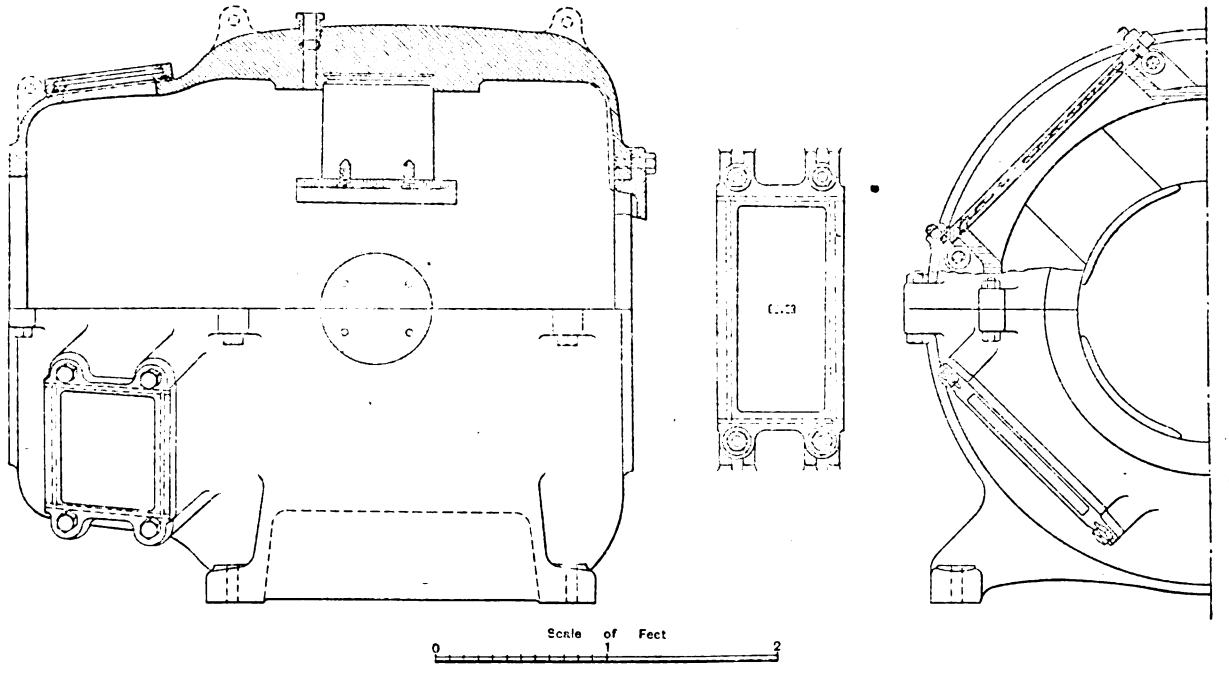
7.15 p.m. At the University. "Equitable Charges for Tramway Supply," by H. E. Yerbury.

Institution of Electrical Engineers: Students' Section.

7.30 p.m. Annual Dinner at the Trocadero.

THURSDAY, JANUARY 27TH.

Institution of Electrical Engineers.



8 p.m. At 25 Great George Street, London. "Equitable Charges for Tramway Supply," by H. E. Yerbury.

NEW DESIGN OF FLAME-PROOF MOTOR

THE accompanying illustration shows the mechanical details of a new pattern of flame- and explosion-proof motor designed by the General Electric Co. to suit the special requirements of a gunpowder factory where the presence of a certain amount of explosive dust in the air is unavoidable. For such work, the motor carcase must be capable of withstanding an explosion inside the motor, and there must be no possibility of hot gases escaping into the surrounding air. It will be noticed that all the openings are also machined, are recessed to take a packing of hemp rope dipped in tar. This packing is considered to be more efficient and much more durable than rubber, which would deteriorate at a temperature of 150° Fahr.

As the motors have to be gas-tight and explosion-proof, all the cables are brought into the casing through strong glands. One of these is shown in the drawing. Special packing has also been applied to all the bearings to prevent any hot gas produced by explosion inside the motor from escaping through the bearings. This has

G.E.C. FLAME- AND EXPLOSION-PROOF MOTOR FOR POWDER FACTORY.

provided with heavy covers consisting of cast-iron frames with galvanised corrugated iron centres cast in. This construction gives stiffness combined with a certain amount of elasticity. The corrugated iron offers a large cooling surface, and, being comparatively thin, is most effective in keeping the temperature of the inside of the machine within a low limit. There is no provision whatever for ventilating the inside of the motors, but they have been designed to withstand a 20-hours continuous run without exceeding the guaranteed maximum temperature rise of 80° Fahr. The edges of the openings are machined, and the flanges of the covers, also the advantage of preventing the blowing-off of the oil, which may take place if this protection is not applied, and bring with it as a consequence the overheating of the bearings. This would be most dangerous in the circumstances in which these motors are running.

The particular powder factory in question has been supplied with two 75-h.p., seven 30-h.p., four 10-h.p., and two 5-h.p. motors of this pattern. The pressure of the supply is 220 volts, D.C., and the motors are provided with slow-movement, totally enclosed, gas-proof starters. These have cast-iron boxes, and are fitted with glass doors.

ELECTRIC LIGHT AND FIRE RISK

FOLLOWING so shortly on the terrible fire at Clapham just before Christmas, a serious fire at Kilburn on Thursday last has attracted much attention and comment, owing to the fact that it was alleged to have been due to the electric light installation. Mr. B. B. Evans, the head of the firm B. B. Evans & Co., in whose drapery and furnishing shop the fire occurred, has suggested to an interviewer that the fire was electrically caused.

To ascertain the real facts, we have made a thorough investigation of the matter, and in the meantime Mr. G. H. Cottam, electrical engineer to the Hampstead Borough Council, has written to the *Times* to say that he can produce several witnesses—amongst whom is the man who rang the fire alarm—who noticed the fire at one of the first-floor windows, on which floor electric light was not installed, and that the interior of the building in which the fire originated was lighted with gas. Our investigations have revealed that there is a discrepancy in the statements of witnesses as to the part of the building in which the fire broke out. While an eye-witness states that before any alarm of fire had been called, he saw smoke and afterwards flames above an arc lamp in a shop window filled with blouses and underclothing, the man who rang the fire alarm states that the outbreak occurred in a different part of the building to this, several yards away. We need not consider the likelihood of the fire having originated in more than one place simultaneously, and it would appear most probable that the actual outbreak was in the position indicated by the latter witness, as it is this part of the building that has been wholly destroyed, whereas the front of the building and the floors above the shop window referred to are still standing, and the

Digitized by Google

window adjacent to it has practically only been damaged by water. Moreover, the condition of the wires which led current to the arc lamp in question would not lead one to infer that there had been any serious short-circuit or arc between them. A considerable length of these wires above the arc lamp had not been consumed, and although the insulation was, of course, burnt off, the wire itself had not been destroyed. It must be admitted that the management of the shop showed great carelessness in placing inflammable materials in a shop window within close distance of an arc lamp inside the window; yet there is certainly no proof that the fire was originated by the lamp or the wires connecting it.

A number of fires whose cause is unascertainable are constantly being put down to the "fusion of electric wires," and there is no doubt that the large majority of these, as in the present case, have not been caused by any defect in the electrical installation. The electric light is undoubtedly by far the safest of all methods of artificial illumination, and even with the worst-designed electrical installation the fire risk is probably considerably less than with the best gas lighting system.

NEW PHOENIX WIRING RULES

MR. S. G. CASTLE RUSSELL, Electrical Adviser to the Phœnix Assurance Co., Ltd., has sent us a copy of the 1910 edition of the Phœnix Fire Office Rules for electric light and power installations which are just being issued.

Among the alterations is the inclusion of a stretching test for the rubber insulation of conductors. Conductors must be insulated with pure and vulcanised rubber, or with other material that has been specially approved by the Fire Office, and the rubber insulation must comply with the following test:—The dielectric, after being stretched to three times its own length for twenty-four hours at normal temperature, shall return to within 15 per cent. of its original length within one hour.

If the rules with regard to flexible conductors and shop-window lighting are carefully followed in installations, such accidents as the one that produced the Clapham fire will be absolutely guarded against.

Flexible cords, except when used in connection with pendant lamps hung clear of material, must not be used in shop windows containing inflammable goods. In a rule relating to show-windows, which are included among "special risks," this regulation as to flexible cord is repeated. It is also laid down that all wiring must be fixed and of permanent character, and that all lamps must be fixed in positions well clear of goods, and so placed that there would be no possibility of inflammable material being set on fire through breaking of lamps.

In the rules for temporary installations, which have been amplified, it is stated that flexible cord must not be used, that all changes of section in wires must be protected with double fuses, and here again it is repeated that lamps must be kept at a safe distance from inflammable material.

Incorporated Municipal Electrical Association.—The 1910 conference of the I.M.E.A. will be held at Glasgow from June 13th to 17th next. Mr. W. W. Lackie, City Electrical Engineer at Glasgow, is President.

A Middlesex Tramway Rail Contract.—A case was down for hearing in the King's Bench Division, on Monday, before Mr. Justice Ridley, in which the North-Eastern Steel Co., Ltd. sued Messrs. R. W. Blackwell & Co., Ltd., on a contract for rails supplied in connection with the Middlesex County Council tramways. It was announced, however, that an arrangement had been come to whereby Messrs. Blackwell consented to judgment against them for the sum of £2,910 17s. 6d., to be reduced by £7 12s. 6d. for every ton of rails returned by Messrs. Blackwell up to 67 tons. In this way the judgment might be reduced by £510 17s. 6d. The details of the action, therefore, were discussed.

ELECTROMETALLURGY AND ELECTROCHEMISTRY

A MEETING of the Faraday Society was held on Tuesday, January 18th, when a Paper on the conditions which determine the composition of electrodeposited alloys was read by Mr. Samuel Field. The author had previously discussed the deposition of zinc and copper in the form of an alloy, and in this Paper he describes the simultaneous deposition of silver and copper from various solutions. It would appear that while copper and silver are apparently so close together on the electrochemical scale, yet the difference between them is very distinct. This fact is well known in the case of solutions of sulphates and nitrates of these metals, where even when there is a large excess of copper in the solution, it is possible to deposit out the silver, with moderate current densities, almost entirely free from copper. Similar conditions also obtain with copper and zinc sulphate or nitrate solutions. But while copper and zinc are most readily deposited together, *i.e.*, as an alloy, from solutions of their double cyanides, there are apparently very narrow limits in which the same laws apply to silver and copper. The simultaneous deposition in both cases, however, is much more difficult when an excess of cyanide is present.

The second Paper contained the results of studies made on the electrodeposition of metals by Dr. F. Mollwo Perkin and William E. Hughes. The authors describe various forms of anodes and cathodes which they have found satisfactory for depositing metals in rapid electrochemical analysis. Also the arrangements of the apparatus for potential measurements.

The electric production of pig iron in the electric furnace is dealt with by B. Neumann in *Stahl und Eisen*, 1909, **29**, 18 1. The furnace described was started in operation towards the end of 1908. It consists in the main of two parts, the lower or electric smelting region and an upper shaft, which is very similar in shape to the blast furnaces, and it is by means of this that the charge is supplied to the hearth. The smelting zone is made of a circular magnesite hearth which is enclosed or bound together by means of iron bands. It has a diameter of 11·5 ft., and is 7·9 ft. high. An arch which covers it serves for the introduction of the electrodes. The usual cup and cone surmount the shaft and serve for carrying away the furnace gases. This particular form of shaft has two advantages; in the first place the weight of it is taken by six pillars which support it, and not by the arch, and secondly any necessary repairs are more readily carried out.

The wide form of the hearth and the size of the arch opening enables the charge to be delivered to the hearth in the form of a conical heap, thus leaving a circular air space around it, and into this the waste gases are blown after passing through a dust chamber. The smelting area is thus cooled, and the charge descending the shaft is warmed. There are inspection holes through which the temperature of the arch can be watched and the circulation of the gas regulated accordingly. Double electrodes are used, and are fixed into position by means of wedges, which also make contact with copper plates. The arc is struck through the air space so that the electrodes do not directly go into the charge, and there is thus no electrode contamination. Four men and a foreman are required to work the furnace, which requires emptying every six hours. From figures given it would appear that very good results have been obtained.

The American Electrochemical Society have appointed a committee to deal with the standardisation of dry cells. The annual output in the United States is about 40,000,000 cells, and is continually increasing. The present usual methods for rating the cells by short-circuiting or by taking the dimensions, are to be replaced by some more sensible method of obtaining the energy output.

THE ELECTROBUS

IT is announced that the assets of the London Electrobus Co. have been sold to "The Reorganisation and Control Syndicate," with the debenture-holders' authority. Until further details are forthcoming, it is, of course, difficult to say exactly how this will affect the shareholders' interests, but in the meantime we should recommend all those who have a holding in the Electrobus Co. to bestir themselves, and to insist on an early general meeting of the company, and a full explanation of the manner in which the company's business is being carried on and has been conducted in the past. It would, in fact, be desirable for the company to go into liquidation forthwith, while there are still a few of the electric omnibuses running in London, so that there may be an impartial investigation as to whether the continuity of the service should be maintained. Although there may be further revelations of the methods of some of the individuals connected with the company when the action of Gould *v.* Lehwess comes up for re-trial, there is no reason to wait for this, and although this action is revealing Dr. Lehwess' peculiar activities in one direction, it will doubtless not disclose all that has been done during his direct or indirect connection with the London Electrobus Co.

CHEAP ELECTRIC LIGHT FOR THE SMALL CONSUMER

NOW that, thanks to metal filament lamps, electric light can be as cheap as or cheaper than gas, the only impediments in the way of its use being extended to the very smallest consumers are the capital expenditure on services and meters, the cost of wiring, and the objection of the small householder to meters and quarterly payments. The man who pays a small weekly or monthly rental for his house does not wish to run up a quarterly bill for his lighting; on the other hand, the management of the electricity works do not find it very remunerative to put in slot meters and separate services and fuses for 3- or 6-light consumers. Ever since the introduction of the metal filament lamp, we have advocated a simple contract system for small consumers—a fixed charge at the rate of so much per light per annum; this, combined with a rental for the wiring, and a system of employing one service for a group of terrace houses, meets most of the difficulties. It is evident, however, that for such an arrangement to be a success, it is necessary for the canvassing, the supply, the wiring, and the collection of accounts all to be under one control, and, as a rule, the companies and local authorities who have attempted the organisation and detailed work of such a business have either not found it a financial success, or have fallen foul of local prejudices. The operations of the "Fixed Price Light Co., Ltd." (Caxton House, Westminster, London, S.W.), which has been established for the supply of electric light to the tenants of small houses on the basis indicated above, will therefore be watched with considerable interest. For such a business to be a success, a cheap and at the same time reliable method of surface wiring is essential, and the company (which is intimately connected with Messrs. Siemens Bros. & Co., Ltd., and whose scheme of operations was suggested by Messrs. Handcock & Dykes) are employing the "Stannos" system in conjunction with low-voltage tantalum lamps. The company will have the consumer's house wired and fitted for him, and will charge a fixed price per lamp per week, which will include both the rent of the installation and the supply of electricity. The current is metered to the company by the supply authority, who are therefore relieved of all risk and of all the detailed work in connection with the scheme, their duty being simply to lay a service and to supply a meter for the company for each group of about three houses.

By arrangement with the London Electric Supply Corporation, Ltd., the Fixed Price Light Co. is starting operations in this supply company's district. Branch offices have been opened at 141 Rotherhithe New Road, and 19, Waterloo Road, S.E., and we were invited last week to inspect the former offices, which are in a small terrace house fitted as a specimen.

Current is taken from the supply company's low-tension A.-C. network, and is led into one of the houses of each group of two or three in the ordinary way through a meter and main fuses to a transformer. The transformer, meter, and fuses will be placed either in a suitable place in the house or in a watertight case on the outside wall. From the L.-T. terminals of the transformer, the pressure at which is 60 volts, current is led to the fuse in each house by a wire on the face of the building. As the number of lamps in each house is small, no other fuses or distributing boards are necessary. The wiring has been absolutely standardised on the "Stannos" system throughout, and the work will be let to wiring contractors. The "Stannos" system will be well known to the majority of our readers (see ELECTRICAL ENGINEERING, Vol. V., pp. 337 and 934), and need not be described here again in detail. The wire used is insulated with vulcanised rubber and protected with a tinned copper sheath which, in the case of these installations through transformers, will be used as the return conductor. Plain batten lamp-holders with "Langham" shades are fixed on wood blocks on the ceilings, and plain tumbler switches are employed. The wires are led into the switches and lamp-holders by means of the standard "continuity" back-plates and clamps. The size of lamp employed is chosen in accordance with the dimensions of the room; a rough test is that a woman should be able to see well enough to darn a black stocking. Twelve candle-power appears to be the ruling size.

An inclusive charge is made of 2½d. per light per week from April 1st to September 30th, and 3½d. per light per week from October 1st to March 30th. This includes the first supply of lamps, but the tenant has to buy his own renewals—an arrangement which will to some extent check waste of current. In order to prevent the tenant from replacing his lamps with lamps of higher candle-power, we understand that a system of special holders is to be employed, the details of which are not yet available for publication. It should be explained that the prices mentioned above are for ordinary dwelling-houses. In the case of shops and business premises, where the hours of lighting are longer, a higher rate per lamp is necessarily charged.

From the above notes, it will be seen that the whole scheme has been well thought out, and it should prove a source of satisfaction and profit to the supply authority, the small householder and the wiring contractor, and let us hope also to Messrs. Siemens Bros. & Co. and the Fixed Price Light Co.

THE MOST ECONOMICAL VACUUM FOR WORKING STEAM TURBINES

A PAPER entitled "An Investigation as to the Most Economical Vacuum in Electric Power Stations employing Steam Turbines and Cooling-Towers" was read by Mr. R. M. Neilson before the Glasgow Local Section of the Institution of Electrical Engineers on Tuesday, January 11th.

The effect of different degrees of vacuum on the capital cost of the boiler and condensing plant was considered, and also the annual charges due to the capital expenditure together with the cost of coal. Taking as an example a 9,000-kw. turbo-alternator station with three units working with a 10 per cent. load-factor, the curves in Fig. 1 for the boiler and condensing plant separately and together were given. Curves were also worked out showing the expenditure on coal for different vacua for four prices of coal per ton. The costs themselves were not given, but the curves show only the difference between the cost at any vacuum and a 27-in. vacuum (referred to a 30-in. barometer). Fig. 2 is obtained by combining these curves, and shows the aggregate variation in the items which vary with the vacuum. The most economical vacuum is seen to be at about 26¼ in. for coal at 6s. a ton, and at between 27 in. and 27¼ in. for coal at 18s., intermediate prices of coal giving intermediate best vacua.

Similar curves were worked out for a load-factor of 20 per cent. (Fig 3). The relative importance of low first cost is much less in this case than in the previous. The coal controls the final result to a greater extent in this case than in the other, and the best vacuum is seen to vary from about 26¾ in. with coal at 6s., to between 27¼ in. and 27½ in. with coal at 18s.

The Paper passes on to give curves for a 30 per cent. load-factor, but the final result is only slightly different from that for 20 per cent. In fact, each successive increase of 10 per cent. in load-factor makes a continually less difference. For very low load-factors new curves would have to be made. The best vacuum for a plant load-factor of 5 per cent. would lie between 25½ in. and 27 in., according to the price of coal. It may be said that, unless in very exceptional cases, the most economical vacuum for any plant load-factor and any price of coal will never fall below 25 in., and never rise as high as 27¾ in.

As regards the method adopted to obtain data for his curves, the plan involved assuming an initial cost for boiler plant and condensing plant, in both cases for 27-in. vacuum. An assumption was then made as to the variation in the steam consumption of the turbo-generators with varying vacuum, and thus, allowing for the varying power consumption of the condenser auxiliaries, and the varying hot-well temperature, the increase or decrease in the boiler-plant cost consistent with the varying aggregate of B.Th.U. required to be given to the water per B.T.U. of electricity delivered was obtained. The depreciation, repairs, and maintenance on the boiler plant have been taken at 10 per cent., and the same figure has been assumed as a mean on the condensing plant, including the cooling-tower. Seven per cent. additional has been added in each case for interest, rates, &c.,

Digitized by Google

so that the total annual charge on boiler and condensing plant is 17 per cent. of the initial cost, which includes cost of erection. Different coal consumptions per B.T.U. delivered have been assumed for the three plant load-factors, in each case for 27-in. vacuum, and the variation in the coal consumption with variation in vacuum has been worked out. Then, taking four different prices for coal, the difference in cost of coal per 1,000

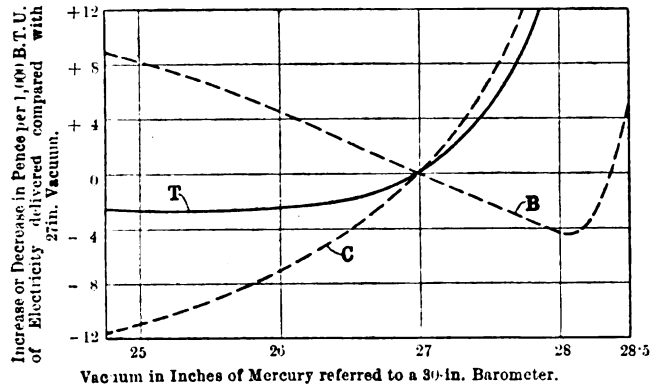

FIG. 1.—EFFECT OF VACUUM AS REGARDS INTEREST, DEPRECIATION, MAINTENANCE, RATES, TAXES, AND INSURANCE ON BOILER AND CONDENSING PLANT. PLANT LOAD FACTOR, 10 PER CENT.

B.T.U. of electricity delivered has been calculated. The coal has been reckoned as of a uniform calorific value of 13,000 B.Th.U., so that for coal of a greater or less calorific value a correction must be made. The cost of boiler plant was taken at £3·5 per kw. for a 27-in. vacuum, and that of the condensing plant at £1·4. per kw. Tables of other data upon which the curves were based are given in the Paper.

A few other items of cost are influenced to some extent by the vacuum. The oil consumption should be greater with high

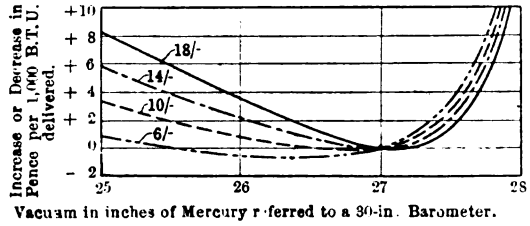

FIG. 2.—CURVES FOR A 10 PER CENT. LOAD FACTOR.

vacuum, owing to the greater size of the condenser auxiliaries. The annual amount of make-up condensing water required to balance the continual loss through evaporation and leakage, and for periodic discharge and renewal of the water, will be affected by the amount of water passed through the cooling-tower per hour—which is greater the higher the vacuum—but will also be affected by the condensing water discharge temperature—which is lower the higher the vacuum—these effects will partly counterbalance each other. Again, the higher the vacuum, the greater the aggregate size of the cooling-towers, and, therefore,

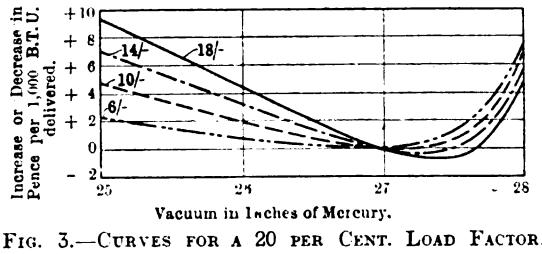

FIG. 3.—CURVES FOR A 20 PER CENT. LOAD FACTOR.

the greater the ground area required by them. On the other hand, high vacuum slightly reduces the ground area of the boiler house, and also reduces the cost of the house.

The present investigation is based, concludes the author, on a station containing three turbo-generators each of 5,000 kw., but a considerable variation could, the author considers, be made in the aggregate power of the station and in the number of units installed without greatly affecting the locality of the most economical vacuum for the different plant load-factors and prices of coal. The results may, however, be considerably different for stations not dependent on cooling-towers, but obtaining cold condensing water from a river, lake, canal, or from the sea.

DISCUSSION.

At the commencement of the discussion two communications were read. In one Mr. M. G. SWALLOW (Richardson, Westgarth & Co., Hartlepool), said that the steam economy resulting from high vacua was so tempting, that the high costs of obtaining the said vacua were often overlooked. He also asked several questions as to the assumptions made in preparing the Paper, drawing particular attention to the probability that in the case of low load-factor, the cost of "banking" losses would be so high as to have to be recognised.

The second communication from Mr. R. J. KAULA (London) was principally devoted to inquiries, which were dealt with by Mr. Neilson in his reply.

Mr. J. ROBERTSON (Burgh Electrical Engineer, Greenock), said that with turbine plants the condensing arrangements necessarily played a great part in the process of design, whereas in the old days, with reciprocating engines, it was often only a question of whether condensing or non-condensing was the more efficient. Mr. Robertson proceeded to give several figures illustrating the effect which the increase referred to would have on the total works costs under ordinary conditions, which had led him to the conclusion that the increased cost of obtaining the high vacua referred to was enormously in excess of the saving in steam consumption obtained. He thought that the standing charges allowed by the author were much too high. If these standing charges were corrected to, say, 4 per cent. for depreciation, 3 per cent. for interest, and 1 per cent. for repairs, and the curves revised accordingly, he thought the author would find that the most economical vacuum was in the region of 28-28¼ in. He did not agree with the author's method of arriving at the load-factor. Referring to the author's figures for price of condensing plant, he found that it was assumed that an increase of vacuum from 27 in. to 28·5 in. meant 157 per cent. increase in the cost of the plant. In an actual case which Mr. Robertson had in mind, the actual increase on the whole plant was only of the order of 15 per cent.

Mr. G. L. BLACK (Glasgow Corporation Electricity Department), took up the question of load-factor, referring to Mr. Lackie's address of last session on the subject. He apparently did not agree with all the result given as being probable in actual practice.

Mr. S. A. SIMON (Consulting Engineer to the A.E.G. Co., Glasgow), took up the cooling-tower side of the question. He drew attention to the fact that cooling-tower makers usually guaranteed to deal satisfactorily with a certain quantity of steam, giving certain definite results, with a certain hygroscopic state of the air at certain temperatures. The net result was that it was almost impossible to get a suitable test for cooling-towers, or the conditions specified may possibly be only obtained once in a year, or in several years; and there is no method of correcting the results for the other conditions obtaining in practice. It was obviously going to be uneconomical to strive for a high vacuum with a turbine which was designed to give its best results on a moderate vacuum, and *vice versâ*. He thought it was now generally accepted that the impulse type of turbine is better adapted for high vacua than the reaction type.

Mr. W. B. SAYERS (Consulting Engineer, Glasgow), made some inquiries *re* assumptions made by author.

Mr. NEILSON, in his reply to Mr. Swallow's remarks, said that jet condensers had not been considered. The jet condenser would cost less, but the working expenses would be higher, as more work is absorbed in removing the large quantity of air taken in with injection water. In reply to several queries, Mr. Neilson said he had not assumed the use of a Parson's vacuum augmentor. The application was a very interesting one, but he was not aware as to how the steam consumption varied between full load and fractional loads. The "banking" losses were allowed for. The figures were assumed on the basis of water-tube boilers, and were taken from test data supplied to him. Mr. Neilson did not think it would be possible to improve cooling-tower results very much in this country, but if it could be done, and the temperature of the outlet water reduced to, say, 72° instead of 82°, the increased margin would allow one to reduce the weight of circulating water to, say, 30 times the weight of steam dealt with, instead of 40 times, as in the normal case. Replying to Mr. J. Robertson, Mr. Neilson said that turbines were specially designed to take advantage of high vacua. The efficiency increased with the increase of vacua. Mr. Neilson did not quite follow Mr. Robertson's argument with regard to the standing charges. He claimed, however, that the standing charges of interest and depreciation on a cooling-tower were much in excess of those on any other part of a station plant. With regard to Mr. Robertson's contention that the condensing and vacuum plant should be arranged to suit the load-factor of the set instead of the whole station, Mr. Neilson pointed out that all the sets in his assumed station were of equal size, and were supposed to be run for equal periods. With regard to Mr. Simon's remarks, Mr. Neilson thought that the users of cooling-towers to blame in that they accepted any guarantees given. The manufacturers naturally prefer to give conditions which can hardly ever be obtainable. He hardly agreed with Mr. Simon that the makers of cooling towers usually allowed a good margin; he was afraid that the reverse was the case.

THE WORK OF LORD KELVIN IN TELEGRAPHY AND NAVIGATION

THE second Kelvin lecture was given at last Thursday's meeting of the Institution of Electrical Engineers by Prof. J. A. Ewing, F.R.S., who chose for his subject an account of the work of Lord Kelvin in telegraphy and navigation. At the commencement of his lecture he referred to several of the characteristics of the great man, and said that few who had only seen the venerable figure of his latter years could realise the tremendous force and the overwhelming vitality of mind and body that characterised him in his prime. "His nature," he said, "was one of transparent simplicity; he was one of the few great men whose greatness was not greater than their goodness." The lecturer then mentioned that it was just forty years ago since he himself first came under his spell, and related how in 1872 he was invited by Prof. Fleeming Jenkin, who, besides being Professor of Engineering at Edinburgh, was Sir William Thomson's partner in consulting work relating to submarine telegraphs, to become one of the firm's assistants, and how in this way began a personal connection with Kelvin, which lasted on that basis for several years, and continued on the wider basis of discipleship and friendship to the time of his death.

The first task of the Kelvin lecturer was, he said, one of selection. In his initial lecture, Prof. Silvanus P. Thompson gave an admirable general survey of Kelvin's life and work which he was glad to see would soon be followed by the publication of a biography in two volumes. To-night, however, he had selected two portions of Lord Kelvin's work as the most suitable to bring before his audience, namely, his work in submarine telegraphy and navigation, both practical matters which appealed to the members of the Institution of Electrical Engineers. There was an additional reason for this selection in the personal one that both in telegraphy and navigation it had been the lecturer's good fortune as one of his young assistants to see some of his inventions in the making.

Lord Kelvin's connection with telegraphy began when he was nearly thirty years of age, dating from 1854. To appreciate rightly the part he played then, it is necessary to go back as far as 1850, the year of the earliest submarine telegraph. It was in August, 1850, that a line consisting of a single copper wire, insulated with gutta percha, but with no sheath or protection of any sort, was laid from Dover to Calais. In a few hours it was cut by the anchor of a fisherman, but during its brief life it gave the operators much food for thought. Accustomed to the clear, sharp signals of land lines, they could make nothing of those got from the cables, and Mr. Willoughby Smith relates how at each end of the line it was regretfully concluded that the operator at the other end must have been lunching not wisely but too well. Prof. Ewing then passed on to explain the effects of the capacity of a submarine cable in causing the current which arrives at the distant end not to reach its full strength at once, and to die away slowly after the signal is sent, an effect previously unknown. A successful Dover-Calais cable properly covered with a protecting sheath was laid in 1851, and was soon followed by other short lines. The general character of the electrostatic charge in a cable was explained by Faraday, and it was experimented upon by Latimer Clark in a cable 110 miles long, laid to connect England with Holland, but no one knew then in what manner the retardation of signals to which it gave rise depended on the electrical characteristics. It was in 1854 that Thomson's attention was drawn to the subject by Stokes, and in this way began the connection with submarine telegraphy which was to prove of momentous import. Thomson attacked the problem with characteristic ardour, and in less than twelve days he sent a complete solution to Stokes, which was published by the Royal Society in May, 1855. In this Paper he formulated equations and drew up what is called the "curve of arrival," which shows in what manner the current gradually reaches its full value, and how it falls away when the cable is put to earth, and showed how the time constant varies practically as the product of the capacity of the cable and its resistance, and that the time taken by the current to reach any particular fraction of the full value varies as the square of the length. The result of the theory was of particular interest at the time, for the project was then beginning to be introduced of connecting England with America by wire. The "law of squares" which Thomson had formulated was challenged by Mr. Whitehouse, who was interested in the Atlantic project, and it appears to have been the controversial letters on this subject which led to Thomson taking a share in the earliest attempt to lay an Atlantic cable in 1857. In this connection he carried out investigations on the resistance of copper, which showed the importance of systematic testing, and insisting on the use of copper of the highest conductivity, and he took up the invention of a method of signalling adapted to the character of the curve of arrival. It was in December, 1856, that Thomson joined the Board of the Atlantic Telegraph Co., which had been formed in the October. Charles Bright was engineer-in-chief, and Whitehouse, who had misunderstood and disputed Thomson's electrical results, was electrician.

The lecturer then passed on to relate the story of the first attempts at laying an Atlantic cable, starting with the unsuccessful endeavours of 1857, and the further expedition of 1858, in which Thomson took part on board the *Agamemnon*. In the meantime he had been working out the theory of the forces concerned in the laying and lifting of deep sea cables, of which the lecturer gave an admirably clear *résumé*, showing how a cable paid out from a ship going at a uniform speed, takes the form as it sinks of a straight line at uniform slope on account of the resistance which the water opposes to its motion. In the early summer of 1858 the cable squadron was again ready to put to sea. New paying out brakes had been devised, and Thomson had succeeded with much difficulty in getting systematic tests of conductivity established during the manufacture of the additional 700 miles of cable. And, most important of all, he had invented a new signalling and testing instrument, which was to make Atlantic telegraphy commercially practicable. This is the mirror galvanometer, the first description of which is found in his patent of 1858. Prof. Ewing showed some examples of the instrument, and explained how in its simplest form it consists of a circular mirror no bigger than a threepenny piece, to the back of which are cemented two or three pieces of steel watch spring, flattened and hardened and permanently magnetised. Showing some lantern slides, giving the form of the current waves under various conditions, he showed the great advantages which this very sensitive instrument was able to attain in rapidity of signalling by working on the early part only of the curve of arrival.

Continuing the narrative of the laying of the cable, he described how, after further failures, success was at last obtained, and a cable completed on August 5th of that year. Scarcely, however, had the enthusiasm aroused by this great event begun to subside, when it was apparent that all was not well. The Irish end of the cable had been handed over to Mr. Whitehouse, who had attempted with little or no success to establish communication by means of his own signalling instruments. It was only when the galvanometer of Thomson was resorted to with a simple Daniell battery to send the current, that messages were transmitted. The Board, dissatisfied with Whitehouse's action, directed Thomson to take complete charge. Various important messages passed, but the tests showed that the insulation was breaking down, and in a few weeks the cable altogether ceased to speak. It was not until 1865 that an attempt was made to lay a new Atlantic cable, but by that time much had been accomplished. It was in the intervening years that the work of establishing standards for electrical measurement was undertaken by a Committee of the British Association. The Committee was appointed at the instance of Thomson, and he took a prominent part in this work. In 1865 the *Great Eastern* was available for laying the cable. Thomson along with Cromwell Varley, went as a consulting expert on behalf of the company. The first attempt was a failure, as the cable parted in deep water, but in 1866 the thing was done. An entirely new cable was laid with complete success, and later the lost end of the cable of 1865 was recovered in water over 2,000 fathoms deep. By this time it was generally recognised that the credit for Atlantic telegraphy regarded as an electrical achievement belonged to Thomson, although, in his characteristic manner, he would, in speaking of the subject, dwell on the parts played by others. Along with Mr. Canning, the engineer of the expedition, and Captain Anderson, he received the honour of knighthood.

For a time his mirror galvanometer remained the only instrument by which conversation could be carried on. He now proceeded to design a substitute for it in the well-known siphon recorder, which gives a permanent record of the successful electric impulses. Prof. Ewing explained that the action of this instrument, which is really the earliest example of the moving-coil type of galvanometer, is often called the D'Arsonval type by those who do not recognise its real origin. He was able to exhibit the second instrument of this kind which was made, owing to the kindness of the Eastern Telegraph Co., along with the modern form which the instrument now takes.

Thomson was now beginning to reap some reward for his

Digitized by Google

inventions. He had formed in 1865 a partnership for telegraph patents with Cromwell Varley and Fleeming Jenkin. Varley's chief contribution was a highly important device of signalling through condensers, and Jenkin was associated with Thomson in the invention of what is known as "curb sending," which is the method of sharpening the signal through a cable by following up each signal current with a reverse current of somewhat shorter duration. Besides this treble partnership in patents, there was a separate partnership between Thomson and Jenkin which lasted until Jenkin's death. Among the cables for which they acted were the Western and Brazilian line, which was laid in 1873 by the ss. *Hooper* (now known as the *Silvertown*), a ship specially built for cable laying, with what was for those days a phenomenally large capacity. Prof. Ewing recalled how on one occasion when he himself was on board, the *Hooper*, when in mid-ocean, dropped one of the two blades of her single screw, and completed the round trip to Rio de Janeiro and back, including the laying of the cable on a single blade. Sir W. Thomson went out on the *Hooper* on her first trip, and it was at Madeira, where there was some delay, that he met the lady who afterwards became his wife.

In those days the testing room of the cable factory was a better school in which to learn electricity than any laboratory. Practice, which owes so much to science, was just then giving back in that department of knowledge as much as she received or more. The electricity of the workshop had outstripped the electricity of the schools. It had become more scientific than the electricity of the lecture room and of the text-book. Members of the Institution have no need to be ashamed of the heritage that has come to them from the earlier associations from which this one sprang, the Society of Telegraph Engineers. To the telegraph engineer of the '60's and '70's is due most of the exact measurements and much of the exact thinking which supplies the foundation of the electrical engineering of to-day. Prof. Ewing then delighted his audience with some anecdotes throwing much light on the personal character of Lord Kelvin, partly extracted from reminiscences of Mrs. Fleeming Jenkin.

The second part of the lecture dealt with Lord Kelvin's work in navigation. In all that concerned the art of the navigator he took a keen interest, and with him that meant an impulse to improve the art. Taking the older aids to navigation, the compass and the sounding line, he revolutionised them both. He found the compass full of serious defects. Everyone knew it was very unsteady, and was liable to be set swinging through a large angle when the ship rolled. Under a mistaken idea of what would lead to steadiness, the card was usually made heavy and the needles long, and the long needles made it impossible to correct the compass properly for the magnetism of the ship. He recognised that for this purpose the needles must be short. Further, that for steadiness, what was wanted was a long period of horizontal oscillation. But to keep the frictional error down, the weight of the card, including the needles, should be small. So he made the card as light as he could get it; a mere aluminium rim tied by silk threads to a small central boss, and from the silk thread spokes he hung short pieces of magnetised knitting needles, to serve as the magnet. Magnets and all the card only weighed 180 grains, for a 10 in. size, and yet its period of oscillation is much longer than that of the old standard compass. A story is related of Lord Kelvin once showing it to a committee of admirals, who were disposed to say: "Too flimsy. Sure to be fragile." His reply was to throw it across the room. Another admirable feature of Kelvin's invention is his method of keeping the compass always level. He hung the bowl as usual from gimballs, but used knife-edges for their support, and to damp the swinging motion he partly filled the lower part with oil. Prof. Ewing then explained how the problem of the correction for the magnetism of the ship is solved. This magnetism springs from two causes. First, there is the more or less permanent part which the ship takes up when she is first built; then there is the induced part which changes with every change of course, a transient effect due to the induction of the earth's magnetic field. The permanent magnetism produces an effect when the ship is "swung," as if the compass were disturbed by a bar magnet turned slowly round a vertical axis. This error reaches a maximum twice in a revolution, hence it is called the semi-circular error. This magnetism has, of course, components fore and aft, thwart-ships and vertical, and the semi-circular error produced by them is corrected by putting suitable permanent magnets under the compass in the binnacle. One group of the correcting magnets faces fore and aft, and another faces thwart-ships. If the ship remains always on even keel these two sets would be sufficient, but when the ship rolls another kind of error, called the "heeling error," comes in, which arises from the fact that the ship's magnetism has a vertical component, which becomes inclined, with the result that a new force comes into play, hence Kelvin corrected this by putting in his binnacle an upright bar or bars of permanently magnetised steel directly under the centre of the compass card. Considering next the effects of induced magnetism, he explained how the error due to this was a maximum when the ship was lying N.E., S.E., S.W., or N.W., and for this reason is called the quadrantal error. It is corrected by balancing the fore and aft iron in the ship by two iron balls near the compass and on either side of it. The possibility of correcting the quadrantal error in this way had been pointed out by Airy as early as 1840, but with the old form of compass card and needles it could not be done because of the excessive length and large magnetic moment of the needles. A further cause of error is produced by the induced magnetism due to the vertical component of the earth's field, and this is corrected by a bar of soft iron in a vertical position at the back of the binnacle arranged so that the magnetism induced in it will act as a counter balance. This is called the Flinders bar, so called because its use was pointed out by Captain Flinders as early as 1801. Kelvin also devised an attachment to his compass in the Azimuth mirror, an apparatus which, standing on the top of the bowl allows bearings of distant objects to be readily taken by sighting. He also invented the deflector, an instrument for testing the adjustment of the various correcting magnets with a view to determining whether the effect of an external field is the same on the compass for all positions of the ship. The evolution of the Kelvin compass took about five years, but it was not until twelve years after the date of his patent, or eleven years after he had laid the invention formally before the First Lord of the Admiralty, that it was adopted in the Navy.

In the navigational sounding machine we have another invention of first-rate importance. Prof. Ewing explained the principal features of this machine, of which he was able to show an example. Another of Kelvin's services to navigation was his advocacy of what is called the position line in working out of a navigator's sights, in connection with which he published a set of very useful tables.

The lecturer then said a few words on Kelvin's work in the investigation of the tides and method of harmonic analysis introduced by him in this connection, culminating in the design of the mechanical tide predictor now largely in use.

"I have said nothing to-night," concluded Prof. Ewing, "of the lofty flights of scientific imagination which are perhaps his highest title to fame, but I have said enough to show that Kelvin was no mere philosopher with head in the clouds. He was quick to recognise a real need: quick also to see how the need should be met. He found material for invention in the most commonplace appliances, because his mental habit was in everything to seek for the how and the why, and to ask himself in what way the thing might be done better, and he had an infinite faculty of taking pains and adhering to a purpose until he secured its full accomplishment, and going on from improvement to improvement in pursuit of the same perfect result, and, with all this, a courage and hopefulness that no opposition could damp, that never accepted defeat. We may apply to him the words which he himself used of Cyrus Field: he possessed an admirable and unapproachable quality, an attribute of heroes; he never knew when to give in."

A vote of thanks to the lecturer was proposed by Mr. Alexander Siemens, and seconded by Prof. Silvanus P. Thompson, F.R.S., who paid particular tribute to the clearness of Prof. Ewing's explanation of the corrections of the compass, and was carried by acclamation.

Tests of Metal Filament Lamps.—We are informed that a series of life tests on 15 of the principal makes of tungsten-filament lamps has just been completed at the Westminster Testing Laboratory (York Mansion, York Street, Westminster). The following lamps were tested:—Pope, Simplex, Metalite (Bryant), Sunbeam, Auriga (Westinghouse), Welsbach, Leuconium (Stearn), B.T.-H., E.M.F., Cryselco, Efesca (Falk, Stadelmann), Metfil (Ediswan), Wultun (British Tungsten Lamp Co.), Osram (G.E.C.), and Metalik (Boddy). Four lamps of each make were tested. They were obtained direct from the makers, and purported to be for 200 volts, and of either 32 British or 32 Hefner candle-power. The lamps were run at 200 volts for 1,000 hours, and were tested for mean horizontal candle-power, watts and watts per C.P. at start, and after 200, 400, 600, 800, and 1,000 hours. The voltage during the run was maintained constant within ½ per cent. by an automatic regulator. The results of the tests have been printed in full and bound in one volume. In addition to giving the results for each lamp individually, this also gives the average of all of each make at each period, and the average for each make throughout the whole run. The subscription for a copy of the complete report is £2 2s. Additional copies may be obtained at £1 1s. each.

A NEW AUSTRALIAN TELEPHONE EXCHANGE

TO the order of the Commonwealth Post Office a complete telephone exchange equipment, manufactured and equipped by the British Insulated & Helsby Cables, Ltd. (of Prescot, Helsby, and Liverpool), has recently been put into operation at Fremantle, Western Australia. The new exchange is of the latest common battery type; the system, in fact, is very similar to that in use at the new exchange at Cardiff, described in ELECTRICAL ENGINEERING of December 3rd, 1908.

The Fremantle exchange has a main distributing frame with a capacity on the vertical side for 2,400 lines; the frame is fitted with carbon lightning arresters and heat coils, together with 5-ampere enclosed fuses for 1,200 lines. Its horizontal side has a capacity for 2, 880 lines, or 20 per cent. greater than that of the vertical side, in order to allow for spare wires in the street cables, and this side is equipped with tag connection strips for 1,400 lines.

In the same room an intermediate distributing frame is provided of the "vertical" type. Instead of there being horizontal and vertical sides, alternate verticals are used for multiple and local connections. The cables from the M.D.F., multiple jacks and line and cut-off relays, are joined to the multiple verticals, whilst the local jacks only are wired to the local verticals, the cross-connections being made by quadruple jumper wire. The scribers' multiple jacks, the outgoing junction jacks are also in strips of 20. Each strip has below it a designation strip, of similar dimensions to the jack strip, fitted with 20 removable labels, which are engraved with the names of the distant exchanges and the number of the lines thereto. The present equipment of subscribers' multiple jacks is 900, of the outgoing junctions 80, whilst the capacity of the jack panels is for 1,600 and 160 respectively per four panels.

The sections are constructed with iron frames, the woodwork visible from the front of the switchboard being polished mahogany, and at the rear ash and other suitable hard wood; all is lined with uralite. Electric light reflectors are fitted and provided with 16 c.p. lamps, whilst plug sockets are provided at the back of the sections for portable hand lamps. All apparatus used in connection with the subscribers' operators' cord circuits is mounted on the sections, but owing to the small size of the sections, part of the incoming junction apparatus is fitted on a special rack at the rear of the sections.

For traffic supervision a chief operator's desk is provided and equipped with observation circuits, in addition to other necessary circuits, and listening lines to the operators' telephone sets. The observation circuits have lamps which light and darken simultaneously with the line lamps of subscribers complaining of irregular service to whose lines the observation

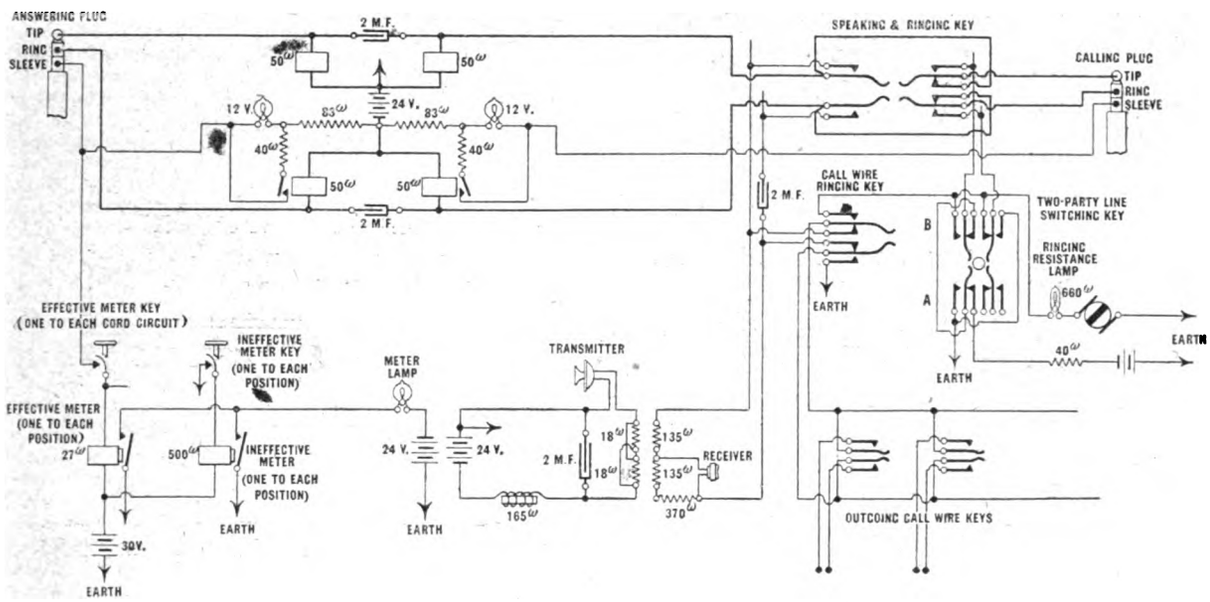

FIG. 1.—SUBSCRIBERS' OPERATORS' CORD CIRCUIT.

I.D.F. is single-sided, and is fixed to the wall of the apparatus room. Line and cut-off relays for 900 subscribers' lines, of 60 ohms and 30 ohms resistance respectively, are located in strips of 10 of each on a rack forming part of the same frame as the I.D.F., and in parallel with each cut-off relay is connected a subscriber's service meter. The meters are, of course, mounted on a separate rack.

The subscribers' sections, of which seven are supplied, are each arranged for one operator's position, and each section is equipped with 15 cord circuits similar to that in use at Cardiff and shown in Fig. 1, except that provision is made for party line ringing, suitable for the operation of selective and semi-selective lock-out 2- and 4-party lines. It will be noticed that the repeating coil is dispensed with, and that the battery is connected to the line through a supervisory relay and retardation coil on each side, each pair being separated by a condenser which allows the passage of the speaking currents. Each section has capacity for 200 calling lamps and answering jacks, whilst an equipment of from 100 to 180 subscribers' lines per operator is provided.

Two incoming junction sections, also for one operator's position, are provided, each fitted for 28 single-cord circuits. One section is wired for junction circuits incoming from other C.B. exchanges, and the other for circuits from magneto exchanges. Single lamp clearing is adopted for the former, and double lamp clearing and supervision for the latter.

The subscribers' multiple jacks are in strips of 20 at ½ in. centres; these strips are 11½ ins. in width and ½ in. in height. The multiple jacks are repeated every four panels, as are also the outgoing junction jacks. As in the case of the sub-circuits are connected; the chief operator can thus note the time taken to answer such subscribers' calls.

A testing officer's desk allows of the efficient testing and maintenance of the outside lines and plant. Special circuits are provided to facilitate testing from the multiple. These circuits end in plugs fitted on a dummy position on the switchboard, the ordinary engaged test click being supplemented by a "tone test," which intimates to operators requiring the lines into which these testing plugs have been inserted that such lines are out of order and under test.

The accumulators consist of two sets of 11 "J. 16" Tudor elements in type "J. 28" lead-lined wood boxes, and two sets of four "J. 2" Tudor elements in type "J. 4" glass boxes, the latter being put in series with the main batteries to raise the potential to 30 volts for the operation of the subscribers' meters in the ordinary manner.

A motor generator, consisting of a 12½ h.p. alternating-current motor coupled to a variable voltage generator, is provided for the charging of the above cells, and a choking coil is introduced into the charging circuit to enable the exchange to be run direct from the machine without the batteries, or to enable simultaneous charging and discharging. To obviate a breakdown, owing to only one charging machine being installed, a spare rotor and armature are supplied.

To supply the necessary ringing current, a 75-watt ringing motor generator and a 75-watt ringing dynamotor are provided, and each is fitted with the interrupter drums for giving the tone-test signals already mentioned, and for breaking up this tone into dots and dashes for the "busy-back" and "don't answer" signals, jacks for which are arranged on the switch sections.

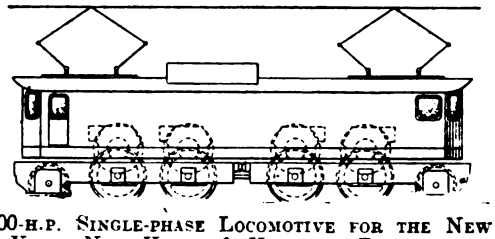
A slate power board is equipped for the control of the power

Digitized by Google

plant, and a slate fuse-board in an iron cabinet, fitted with the latest pattern patent alarm fuses, protects the power supply circuits to the switchboard and other apparatus. These fuses have a sleeve which rotates when the fuse wire is blown; this makes a contact, and lights a lamp to indicate on which bar a fuse has melted, and a bell is also rung to call the attendant's attention. At the same time the rotation of the sleeve discloses a coloured patch which indicates the individual fuse operated.

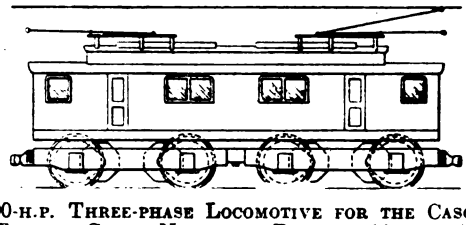
In addition to the foregoing exchange equipment over 800 subscribers' telephone sets were supplied, some being equipped with special lock-out party line apparatus. This lock-out device permits only one subscriber to speak on a party line at any one time unless another subscriber on the same line is required; in this latter event the second subscriber may be called by the operator, and the first subscriber, by depressing a key, cuts out of circuit a low resistance coil which normally prevents a second subscriber's mechanism from operating. The ordinary subscriber's telephones are wired up to the "bridge circuit," thus giving a very quiet line.

Sixty switchboards for private branch exchange working have been provided, the sizes varying from one exchange line and three extension lines, to four exchange and twenty extension lines. The smaller sizes are cordless, and all indicators fitted on these boards are of the drum type.



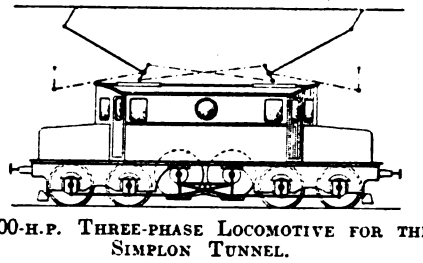
A large number of special extension switch sets for extension line working were included in the tender. These switches are operated by means of a key having four positions all operated by the same lever. A hand generator is fitted for calling the extension instrument, the main instrument being normally connected to the exchange, and a primary battery for energising the microphones when the main and extension instruments are connected. A drum indicator, only in circuit when the extension instrument is through to the exchange, is operated during the conversation, enabling the main instrument to know when to replace the key to its normal. By the addition of two short straps of bare wire the main instrument is enabled to come in parallel with the extension instrument when the latter is through to the exchange.

A porcelain base protector, fitted with carbon lightning arresters, heat coils, and fuses is provided for each instrument.

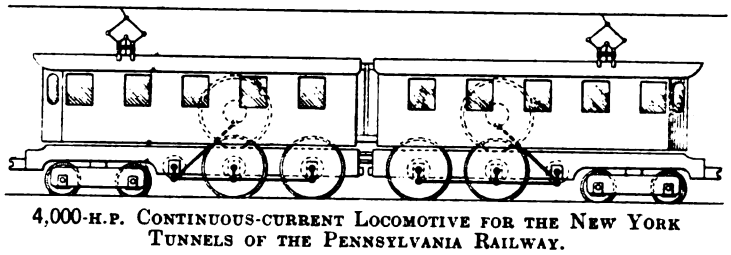


We are indebted to the British Insulated & Helsby Cables, Ltd., for the information given in this article.

A COMPARISON OF SOME RECENT ELECTRIC LOCOMOTIVES



WE have collected together, for the sake of comparison, the following particulars of four heavy electric locomotives of recent design, which illustrate some new departures in the methods of driving and of mounting the motors, and indicate some of the directions in which developments are taking place. All three systems of electric traction, namely, single-phase, three-phase, and continuous-current, are represented, and an interesting comparison of the equipments and design can be made.



1,400-H.P. SINGLE-PHASE LOCOMOTIVE FOR THE NEW YORK, NEW HAVEN & HARTFORD RAILWAY.

1,900-H.P. THREE-PHASE LOCOMOTIVE FOR THE CASCADE TUNNEL, GREAT NORTHERN RAILWAY (AMERICA).

1,400-H.P. THREE-PHASE LOCOMOTIVE FOR THE SIMPLON TUNNEL.

4,000-H.P. CONTINUOUS-CURRENT LOCOMOTIVE FOR THE NEW YORK TUNNELS OF THE PENNSYLVANIA RAILWAY.

OUTLINE DRAWINGS TO THE SAME SCALE OF FOUR LARGE ELECTRIC LOCOMOTIVES, SHOWING METHODS OF DRIVING.
[One inch = 20 feet.]

The first is the single-phase goods locomotive built by the Westinghouse Electric & Manufacturing Co. (America) for the New York, New Haven, and Hartford Railroad, and was described in ELECTRICAL ENGINEERING, December 9th, 1909, page 1041. This was designed for handling fast goods trains, but will also be used for hauling heavy passenger trains. The 2-4-4-2 wheel arrangement has been adopted. Each truck has two pairs of driving wheels and a single pair of leading wheels. The electrical equipment comprises four 350-h.p. single-phase geared motors, for operation on either 11,000-volt alternating-current or 600-volt direct-current. The motors are placed directly over the axles, and are mounted rigid on the truck frames. A special form of flexible drive, described in detail in the above-mentioned article, is employed, and this smoothes out the torque pulsations and allows vertical movement of the axles. The centre of gravity of the motors, as well as that of the entire locomotive, is high, avoiding the transmission of strains and shocks from the track and roadbed to the motors. The locomotive is capable of hauling a 1,500-ton train at a speed of 35 miles per hour. When used in passenger service 800-ton trains are hauled at a maximum speed of 45 miles per hour.

The first three-phase locomotive illustrated is one of those working on the Cascade Mountain tunnel section of the Great Northern Railway in Washington, U.S.A. This locomotive has no guiding wheels, the whole weight of 103 tons being on the driving wheels. There are two trucks connected by a coupling, each truck having two driving axles; a motor is connected to each axle by twin gears with a gear-ratio of 4·26. The diameter

of the driving wheels is 5 ft., and the synchronous speed of the motors 375 r.p.m., corresponding to a speed of 15 miles per hour on the load corresponding to the one-hour rating of 475 h.p. per motor. The motors are completely enclosed and cooled by forced ventilation. Each locomotive has two 400-kw. transformers weighing 4·6 tons each. The motors weigh 5·45 tons each exclusive of gears. A single locomotive is capable of hauling an 885-ton train at the normal speed, and of accelerating such a train up a 2·2 per cent. gradient. The control system of each motor is separate, and speed variation is obtained by means of resistance control in the rotor circuits.

The Simplon three-phase locomotive illustrated is the latest design on this railway and is known as F.4/4. It was constructed by the A.-G. Brown, Boveri & Cie., of Baden, Switzerland, for operation in the Simplon tunnel, and presents some new features in three-phase design. There are two 700-h.p. motors, with short-circuited rotors, and four economical running speeds are obtained by changing the stator connections so as to vary the number of poles. There are two separate windings on each stator; one winding will give either 6 or 12 poles and the other 8 or 16, corresponding to speeds of 71, 35, 53, and 26 km. per hour respectively. As shown in the figure, the two motors are coupled together and to the four driving axles by means of eccentrics and coupling-rods without the interposition of gearing. The motors are operated by means of a controller worked by compressed air, and the transformer permits of the pressure at the terminals being raised from 1,000 to 3,000 volts in ten steps of 200 volts each. On the last step the motors are supplied at the full line pressure. On account of the great difference between the temperature in the tunnel and outside, it has been found necessary to enclose the stators totally to avoid condensation on the windings, and to do without forced ventilation, both of which factors considerably reduce the output of the motors for their size.

The large continuous-current locomotive illustrated is for handling the Pennsylvania Railroad trains into the New York station and through to the yards on Long Island. Twenty-four of these locomotives have been ordered from the Westinghouse Electric & Manufacturing Co. of America. The motors are mounted upon the frame and side-connected to the driving wheels by a system of cranks and parallel connecting rods, similar to steam practice. This permits the mounting of the motors upon the frame, secures their spring support, and brings the centre of gravity to 79 in. above the rail, or approximately the same as in high-speed steam locomotives. This locomotive can start a train of 550 tons trailing load upon the tunnel grades under the river, which are approximately 2 per cent. The guaranteed tractive effort is 60,000 lb. The normal speed with load upon a level track is 60 miles per hour, but during some of the trial runs a speed of 72 miles per hour was attained. The locomotive is an articulated machine. Each half carries its own motor and has four driving wheels 68 in. in diameter and one four-wheel truck with 36-in. wheels. The motors are 600-volt 10-pole interpole machines, designed for forced ventilation, with a capacity of 2,000 h.p. each. At this output each motor takes 2,900 amperes direct from the third rail. For the relief of the driving mechanism from excessive strains in the event of short-circuit in the motors, an adjustable friction clutch is provided between the armature spider and the motor shaft.

Manchester Engineering Exhibition.—At a representative meeting of engineers held at the Midland Hotel, Manchester, on Wednesday, 12th inst., it was resolved that a General Engineering and Allied Trades Exhibition be held in the spring of 1911, under the management of a committee of exhibitors, and to be organised by the International Trade Exhibitions, Ltd., London. The building is now in course of erection in Old Hall Lane, Rusholme, and will have a ground floor area of 100,000 square feet.

Commutation Pole Traction Motors.—In connection with the order from the Hull Corporation for twenty 33 h.p. tramway motors and controllers received by Messrs. Siemens Brothers Dynamo Works, Ltd., it is interesting to note that the motors are fitted with commutation poles, and the controllers are arranged according to the new system recently worked out by them, in which the ordinary series parallel system is combined with control by shunting the fields. Particulars of these commutation-pole motors were given in ELECTRICAL ENGINEERING, Vol. V., page 842, and the company claim that the employment of commutation poles in traction motors, and the system of control which is rendered possible by their use, marks a distinct advance in the direction of economy and satisfactory working of tramways. We are informed that this order was placed after exhaustive comparative tests on the first set of equipments of this type already supplied to the Hull Corporation Tramways against motors run with the ordinary series parallel control, and others working on the regenerative principle.

PETROL-ELECTRIC MOTOR BOATS

A NUMBER of motor boats with combined petrol engine and electric drive similar to the Pieper "Auto-mixte" system have been constructed by Messrs. Siemens-Schuckertwerke, of Berlin, and some examples are described in a recent issue of *Elektrische Kraftbetriebe und Bahnen*. The petrol engine is connected to a machine which can act as either motor or dynamo by an electro-magnetic coupling, and a second similar coupling is inserted between this machine and the propeller shaft. An accumulator battery is connected in parallel with the motor-dynamo in circuit with a controller for starting, varying the speed, and reversing, while a second switch is provided for obtaining different conditions of drive. When this latter switch is in the off position, all the circuits are broken, and both electro-magnetic couplings are released. In the charging position the engine is coupled to the machine, which is started as a motor from the battery by working the controller. The machine then begins to generate and charges the battery. The next is the normal running position in which both couplings are closed. When the controller is moved to "start," both engine and propeller are started by the machine acting as motor, but the engine immediately picks up and drives both machine and propeller, the speed being varied by the controller. At low speeds the machine generates and charges the battery, as only a portion of the engine power is required by the propeller, but at high speeds the conditions are automatically reversed, and the battery supplies current to the machine, which then acts as a motor assisting the engine. For reversing, the machine only is used and takes current from the battery, and the switch is placed in the fourth position, in which the coupling between the engine and the machine is released. In the fifth position the battery is disconnected, and the propeller is driven by the engine only, and no charging takes place. The speed in this case is regulated by hand levers, which vary the petrol supply and the ignition. Lastly, there is a sixth position of the switch for driving the boat forwards independent of the engine.

A 17-ft. cruising boat equipped on this system has a 20-h.p. petrol engine and a motor-dynamo of about the same output. The total weight of the electrical equipment is 4·3 tons, of which 2·8 tons is the weight of the battery. The latter comprises 80 cells, with a total capacity of 213 amp.-hours on the one-hour discharge rate. The total displacement of the boat is 9·37 tons. With purely electric drive, a speed of 5·7 miles per hour is attained with an expenditure of 3·5 h.p., and a four or five hours' run can be made with the accumulators alone at a speed of 7·5 miles per hour. The electrical equipment of this boat includes an arc search-light, glow-lamp lighting of the cabins, and electric ventilating and cooking apparatus. A boat for sea-going purposes has a 35-h.p. petrol engine, but a motor-dynamo of only about 6 h.p. The battery also is very small, weighing only half a ton. With purely electric drive a distance of about 18 miles can be covered on one charge at a speed of about 6·2 miles per hour.

Embezzlement.—At the Central Criminal Court on Friday, Vincent Edward Moir was sentenced to six months' imprisonment in the second division, for embezzling about £500 whilst acting as secretary of the National Society of Telephone Employees.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Members: A. Anderson, Prof. L. A. Herdt, P. W. Sothman, R. E. Winkfield. Associate members: P. M. Baker, F. E. Bayley, W. Bent, W. H. D. Bostock, P. R. Boulton, G. Bowyer, W. C. Chappell, W. F. J. Cosser, W. S. Cunningham, D. S. Duff, T. M. Dutton, T. W. Ellis, R. F. Fry, W. A. Fullalove, G. G. Gale, H. Gobie, A. G. Grier, R. L. Griffin, A. B. Hart, A. H. Hull, J. H. Hull, H. H. Johnson, R. Johnson, C. G. Kirkus, H. Kitchen, S. C. Leggett, H. A. McInnes, D. McLennan, R. Murray, R. Nimmo, H. Ogilvie, P. J. Pybus, E. L. Ransome, J. W. Ray, O. L. Record, Major G. B. Roberts, R.E., J. W. Saaler, R. Sherley-Price, M. G. F. Temple, H. G. Townsend, P. W. THE TESTING OF RUBBER

A PAPER entitled "The Testing of Rubber for Electrical Work" was read by Prof. A. Schwartz on Jan. 11th, before the Manchester Section of the Institution of Electrical Engineers. The author pointed out that purely electrical tests did not afford satisfactory indications as to the permanence of those qualities of the rubber upon which its power of insulation depends. For information on this head we must turn, he said, to physical and chemical tests, and he considered in detail methods by which the various mechanical and other tests which he recommended might be carried out.

After a consideration of the various ways in which tensile tests may be applied, he discussed the best form for the test pieces, their preparation and mounting, and described the hysteresis machine he had devised.

The object of this machine is to effect the extension of the rubber by means of a load which is increased at a given rate until either a given load or a given extension is attained. When this point is reached the load is diminished at the given rate and the rubber is allowed to retract, the relation between load and elongation being recorded automatically throughout the test. The hysteresis loop furnishes a graphical record of extension of the rubber test-piece as the load is increased from zero to a given maximum and then decreased again to zero. The physical quantities which may be obtained from a hysteresis diagram drawn between limits of load or extension are set out as follows in connection with the accompanying figure. The

TYPICAL HYSTERESIS CURVE OF RUBBER.

rate of extension with load is given at any point on the extension curve *O B* by the inclination of the tangent at that point. The rate of retraction in a similar way may be obtained from the retraction curve *B D*; the work done in extension is given by the area *O B C' O*; the work done by the rubber in retracting is given by the area *D C' B D*; the work expended in the rubber itself is given by the area of the loop *O D B* O; and the sub-permanent set remaining after a given extension: this is measured by the length of the line *O D*.

With a normally vulcanised standard specimen of high-grade rubber stressed nearly to its breaking-point, the extension curve may be divided into three distinct portions in which the relation between load and extension differs considerably. Considering the extension curve *O B*, we see that in the first portion (stage 1) the increase in extension per unit of load is small, and that for the middle portion of the curve between (stage 2) it becomes much larger, and is practically constant, falling again on the last portion of the curve (stage 3). With high-grade rubbers which are correctly vulcanised and with rubbers which are under-vulcanised or contain a small proportion of substitute, stages 1 and 3 are small, while stage 2 is large. With hard rubbers which are over-vulcanised or contain a large proportion of mineral matters, stages 2 and 3 are small or suppressed, and stage 1 is large.

The following procedure is suggested for reducing the salient features of a number of hysteresis loops of various rubbers to a common basis for purposes of comparison:—(1) The designation of the form of extension curve as convex, linear, &c. (2) The determination by means of a planimeter or area scale of the areas representing the work done in extending the rubber. (3) The determination of the work done by the rubber retracting. (4) The reduction of the areas in (2) and (3) to their equivalent triangles on a given base.

With homogeneous material, the loops obtained with the hysteresis machine are identical for any number of standard specimens of a given material, and are, therefore, characteristic of the material. It must, however, be borne in mind in this connection that freshly vulcanised rubber improves with keeping, and takes some time to settle down to a constant state, so that if comparative tests are to be made on a number of samples which are newly manufacured care should be taken that they are all of the same age.

Experiments were made on the effects of variation of temperature, from the results of which it did not appear that variations in the test-room temperature were likely to present any serious difficulty. Variations in speed of working were also found not to be of great consequence in commercial testing.

The author's researches confirm Stevart's law that for a given extension the load is directly proportional to the cross-sectional area of the specimen, and show that the work done in extension, retraction, and in the rubber itself is also proportional to the cross-sectional area of the specimens. Further experiments showed that for a compound containing 88 per cent. Para and a 200 per cent. extension, the work done in extension, retraction, and in the rubber itself is directly proportional to the length of the specimen. A further series of experiments with 88 per cent. Para mixing rolled into sheets which were vulcanised for different times showed that the work done in extension, retraction, and in the rubber itself, was for a 200 per cent. extension approximately proportional to the length of the specimen multiplied by a coefficient which was proportional to the time of vulcanisation. On the completion of the first cycle of extension and retraction the specimen may be retained in the machine and subjected to a series of similar cycles, the limits of which may be set either by a given maximum extension or a given maximum load. This successive cycle test may be applied to discriminate between mixings containing various percentages of rubber. The proportion of rubber in the mixing exercises a considerable influence on the areas of the loops for the first cycles, and also on the increments of extension due to the subsequent cycles.

In another method of testing the specimens were given a constant elongation by being stretched between two fixed points, arrangements being made to measure the decrease in tension at definite time intervals with a view to ascertaining the relative durability of specimens made from the same compound, but vulcanised at a given temperature for different lengths of time. Tests of this nature were made at various temperatures, and it was found that the decrease in tension for the under-vulcanised and for the over-vulcanised specimens was in each case greater than that for the correctly vulcanised ones. Some of the observations made by this method, however, were inconclusive.

Further experiments were directed to the measurement of the slow stretch of rubber under constant load. This test may be used to discriminate between mixings, in which the rubber contents are varied, and also the degree of vulcanisation of a given mixing. Investigations were also made on the influence of small percentages of substitutes and on the various known qualities of rubber. The author has found, however, in cases in which he has known the actual order of merit of the samples from a knowledge of their composition, that the results of the maximum extensions per cycle have placed the specimens in their correct order, whereas the results for the sub-permanent set have not done so. Further, the maximum extensions are far easier to measure than the sub-permanent set, as the quantities are larger and the specimen is under a constant tension at the time the quantity is recorded.

In this country, continued the author, owing to the initiative of the Cable Makers' Association, we are fortunate in possessing a partial system of standardisation for rubber cable coverings. The standardisation, however, only extends to certain particulars, thus for each size of cable the minimum thickness of dielectric is fixed, and certain grades or quantities are established, the minimum insulation per mile being fixed for each of these grades. The individual manufacturers have a free hand as to the ingredients they employ in the compounds, provided that the finished article complies with the above conditions. It is suggested that a further standardisation, based on the physical properties of the rubber, may prove advantageous in discriminating between C.M.A. material and other material on the market which is sold as being "equal to C.M.A." Such a test would also enable the manufacturers to secure uniformity in the degree of vulcanisation, in the quality of the rubber employed, and in the amount of mineral filling used.

The author conducted a series of tests with samples of C.M.A. and non-Association cables. When first submitted to him, and therefore probably freshly manufactured, the 2,500-megohm grade samples all extended over 300 per cent. before breaking, while for the 600-megohm C.M.A. grade the extensions at break-

Digitized by Google

ing lay between 200 per cent. and 300 per cent., with the exception of one sample, which extended 305 per cent. before rupture. The non-Association cables, with one exception, broke with extensions of from 80 per cent. to 200 per cent.

These samples were exposed to the air for three months, and as the rubber covering was stripped from the core, both the inside and outside were exposed, and the samples deteriorated to some extent; and to allow for this the extension limits decided upon for the tests were 200 per cent. for the 2,500-megohm grade, and 150 per cent. for the 600-megohm grade. All the 600-megohm C.M.A. coverings broke before reaching the 200 per cent. extension, with the exception of two, and the hysteresis loops for these two specimens were larger than those for the 2,500-megohm grade. It is evident, therefore, considers the author, that the existing C.M.A. conditions have already brought about results which allow of the two grades of cable coverings being broadly distinguished from one another by means of their physical properties.

The points which a satisfactory physical test should ensure would seem to be the following :—The employment in the mixing of a given percentage of rubber of a quality that shall not fall below a given standard; the restriction of the employment of recovered rubber and substitute within limits as to both quantity and quality; the degree of vulcanisation imparted; the character of the mineral filling used.

It would appear hopeless to expect any one test to fill all the above requirements, but the author thinks that possibly the necessary tests might be carried out with the hysteresis machine on the following lines :—(1) The hysteresis loop for a given grade of covering to lie within certain limits as to load, extension, and area. (2) The hysteresis loop after the specimen has been heated under specified conditions as to time and temperature should not vary from the loop under (1) by more than a specified amount. (3) The increments of extension for successive cycles to fall within specified limits.

DISCUSSION.

THE discussion was opened by Mr. A. WHALLEY, who pointed out that but little 88 per cent. mixture was employed in cable work. One reason that a lower percentage of rubber was necessary for uniformity of electrical results at a reasonable cost was that it was difficult on mixing rolls to get a really homogeneous mixture with much above 50 per cent. of rubber. To produce a more homogeneous mixture with the higher percentages, the two mixing-mills were driven at different speeds, but the increased friction caused partial vulcanisation on the rolls when the sulphur had been added. Even when the electrical results were better with the higher percentages of rubber—and in some directions they might be worse—they were not often proportional to the increased cost. He asked some questions as to the interpretation of the experiments, and was inclined to think that the constant load tests tended to imperfect results. The author's new testing-machine should be valuable in certain directions. The assumption, however, that it was a law that the smaller the area of the mechanical hysteresis loop the better is the cable, or the longer its life, needs most careful examination before acceptance.

Mr. C. BEAVER (Messrs. W. T. Glover & Co.) was not prepared to admit that physical tests could displace other usual cable tests, but thought that the author's development of the machine and researches in connection with it have rendered it quite ready for its application or dovetailing into existing tests used in connection with rubber cable work. From the cable-maker's point of view, therefore, the ideal conditions would be to standardise a hysteresis loop for a given grade of insulation, which would coincide with the maximum combined efficiency of electrical and vulcanisation results. He would then have his correct electrical standard, his corresponding maximum of chemical stability, and the corresponding physical test. When these were properly proportioned to one another for any given class of work, the author's machine would be applied to its greatest advantage, and would be of equal service to manufacturer and purchaser. He protested against the author's disparaging remarks as to 600 megohms grade C.M.A. cable, and said that the section of the Paper relating to substitute had practically no connection with cable work—at least, so far as cables made in this country were concerned. Even foreign cables did not often contain more than 10 per cent.

Mr. J. H. C. BROOKING (St. Helen Cable Co.) considered that tests of the effect of heat upon cable were important, and agreed that for ordinary purposes the stretch test, as shown by Prof. Schwartz, should be of considerable interest to those concerned.

Mr. W. CRAMP (Manchester Municipal School of Technology) did not understand why diagrams which were called hysteresis loops were plotted with the loads as ordinates. In electrical work they were accustomed to plot the magnetising force (which in this case corresponds to the load) horizontally, and, turning the curve round, gave it a curious and unfamiliar look. He failed to find in the Paper any experimental confirmation of Prof. Schwartz's law that with constant cross-section the area of the hysteresis loop for a given load was proportional to the length of the specimen. If confirmed, it would follow that two mechanical characteristics of rubber might be expressed in the form of ergs. per cubic centimetre per cycle, exactly as in the case with iron hysteresis. By testing a number of specimens, different hysteretic constants might be deduced to be adopted as standards in specifications. If a distinct connection could be shown between the hysteresis loop and the dielectric strength, the testing-machine would be of still greater use to electrical engineers.

Mr. T. URMSTON spoke from experience of the excellent working of the machine and

Mr. H. CAMPBELL CORMACK suggested that more consistent results might be obtained if, instead of a longitudinal section, an entire tubular length of the insulation of the cable or wire could be taken. Samples from different sizes of cables would be of varying lengths, but the ratio of length to diameter could be kept constant. Such samples would not be similar, inasmuch as the ratio of thickness of envelope to diameter would not be the same for all sizes.

Prof. E. W. MARCHANT (Liverpool University) asked Prof. Schwartz whether he had ever made any tests on the rate at which the electric current, through rubber, diminished when a steady P.D. is applied, and whether that has any relation with the hysteresis loops which we have seen. He was inclined to think that although these extension tests might be very useful, they were not adequate to determine the true quality of rubber for electrical purposes.

Mr. C. F. SMITH (Manchester Municipal School of Technology) thought that the great alteration in rubber on exposure to air would introduce difficulties. If the mechanical property could be taken as a sort of standard indication of the physical nature of the rubber, it would be of great value from the mechanical test alone to find the relation between this mechanical standard, and the various other properties of the rubber, such as its insulation, dielectric strength, and what ought to be closely analogous to it, the dielectric hysteresis constant when rubber is used in an alternating cable.

Mr. A. S. L. BARNES and Mr. C. C. ATCHISON (Borough Electrical Engineer, Rochdale) spoke briefly, and Mr. S. J. WATSON (Borough Electrical Engineer, Bury) made a few remarks from the chair, but the author, owing to the lateness of the hour, was only able to reply briefly.

ELECTRICAL EQUIPMENT OF ROLLING MILLS

THE electrically operated 28-in. cogging mill equipment recently installed by Messrs. Dorman Long & Co., Britannia Works, Middlesbrough, has fully justified the courage and enterprise of the firm in being one of the first to realise the advantages of the electrical operation of this class of machinery.

The mill is a 28-in. cogging mill, and on the 26th November last, during a night shift of 12 hours, it cogged 92 ingots 14 in. by 12 in. down to both 6-in. and 5-in. billets as required in 4 hours 41 minutes actual cogging time, the total weight cogged being 105 tons. The mill, which was built by Taylor & Farley, of West Bromwich, and the electrical equipment, which was designed and built by the British Thomson-Houston Co., Ltd., of Rugby, gave no indication that they were then at their limits.

The output for which the mill and equipment was originally designed was 15 tons per hour, with a possibility of dealing with 22½ tons per hour for two hours continuously if required. It will be noted that during the shift referred to the output of the mill was 22 tons per hour, for 4¾ hours continuously. In this mill an ingot of from 22 to 25 cwt. 14 in. by 12 in. can be cogged down to a 5-in. billet in 2¼ minutes.

We understand that this is the fastest running cogging plant in the North. It reflects great credit, not only on the users for the manner in which the mill is operated to obtain these results, but on the designers and builders of the mill and its equipment.

Glasgow Technical College Scientific Society.—The first part of Vol. VI. of the transactions of this society has just been issued and contains a short address by the President, Mr. A. G. Strathern, on the importance of thoroughness in engineering work. The paper by Mr. A. G. Collis, of Messrs. Ferranti, Ltd., on "High-tension Switchgear," and the discussions on it, are also included in this volume, together with a large number of plates and diagrams. An abstract of this paper appeared in ELECTRICAL ENGINEERING, Nov. 11th, 1909, Vol. V., p. 973.

Electric Traction on the Prussian State Railways.—According to the *A.E.G. Zeitung*, the Allgemeine Elektricitats Ges. of Berlin has received an order for a 3,000-kw. 900 r.p.m. turbo-alternator with turbine-driven auxiliaries for the new generating station which is to be erected to supply the Dessau-Bitterfeld section of the Prussian main-line railways. An order has also been received for a 62-ton single-phase locomotive for this line. This will have one 900-h.p. motor connected to the two driving axles by coupling rods. The contact-line pressure is to be 10,000 volts, and the frequency 15 cycles per second.

PRODUCTION OF ELECTRICAL MACHINERY IN 1907

A BLUE-BOOK has been issued which summarises the results of the returns received under the Census of Production Act, 1906. This deals with a number of industries, including electrical engineering, and gives tables relating generally to the year 1907. The following particulars show, as far as can be at present determined, the value of the finished products of the electrical industry, the values returned being values at works, and not the selling prices :—

Electrical machinery and parts thereof :—Direct- and alternating-current generators, £851,000; direct- and alternating-current motors, £1,592,000; motor-generators, converters, and transformers, £494,000; switches, rheostats, £511,000; switchboards, £678,000; other descriptions, £30,000; making a total of £4,156,000.

Electrical instruments of all kinds, £484,000; primary batteries, £109,000; secondary batteries, £434,000.

Lamps and parts thereof (except carbons) :—Glow lamps, £235,000; arc lamps and search-lights, £226,000; making a total of £461,000.

Telegraph and telephone cables :—Submarine, £1,102,000; land, £809,000; making a total of £1,911,000.

Electric power and lighting cables :—Paper and bitumen insulation, £1,322,000; rubber insulation, £1,300,000; other and unclassified insulation, £729,000; making a total of £3,351,000.

Transmission apparatus and plant, £539,000; telegraph and telephone accessories, £307,000; electrical accessories, £392,000.

Contract work in the United Kingdom (exclusive of materials) :—Telegraphic or telephonic lines or works, £47,000; electric power or lighting works, £1,200,000; making a total of £1,247,000.

Repair and maintenance work for customers, £391,000.

The total for electrical engineering amounts to £13,782,000.

The exports during 1907 were as follows :—Electrical machinery and parts thereof, £996,000; electrical goods and apparatus, including telegraph and telegraph apparatus, £668,000; telegraph and telephone cables, £1,301,000; electric wires and cables, insulated, £501,000. The figures for the net imports under the above headings, *i.e.*, imports less re-exports, were as follows :—£570,000; £716,000; £207,000; £158,000.

The value of the imports of electrical machinery is nearly 14 per cent. of the value of the home manufacture as returned above; of electrical goods and apparatus, 26 per cent.; of telegraph and telephone cables, 11 per cent.; and of electrical wires and cables, 5 per cent.

In comparing these figures it must be borne in mind, as has already been pointed out, that the values returned to the Census of Production are values at works, while those declared by exporters are the values of goods free on board at port of shipment, and those declared by importers are the values of goods at port of landing.

Wireless Telegraphy.—The first of the Donaldson line steamers to be equipped with a wireless telegraph outfit is the *Athenia*, and it is stated that the *Cassandra*, of the same line, is also being fitted.

The Compagnie Générale Transatlantique have commissioned the Marconi International Marine Communication Co. to equip the s.s. *Guadeloupe* and *Perou*, which trade between Havre and Colon, with wireless telegraph apparatus.

It is stated that a Government Bill is to be introduced in Canada, having for its object the control of wireless telegraph companies doing business in the Dominion.

Telegraphic Traffic and Movements of Cable Ships.—The c.s. *Restorer* has been engaged in the laying of a telephone cable for the British Columbia Telephone Co. from Telegraph Bay to the island of San Juan, the old one having been broken during recent storms.—Telegraph cables have behaved fairly well during the past week. There were interruptions between Bagdad and Bassorah on the 11th and 13th insts, and on the 13th communication between Tangier and Mogador failed, but was repaired on the same day. Telegrams for the latter place were despatched from Casablanca at the same rates, and it was not necessary to give a fuller address.—On the same day also direct connection between Saigon and Bangkok failed, and telegrams are routed *via* Pakse Obome subject to delay.—The condition of communication in Central and South America is still far from satisfactory, owing to censorship and senders' risk. Telegrams to Novo Dondo and Bailundo in Angola are also subject to delay.—American telegraph companies have of recent years been rather active in West Indian waters, and it is known that the American Government also is desirous of extending telegraphs in that part. As soon as the concession of the International & Ocean Telegraph Co. expired, a direct cable was laid from New York to Havana, and as the concessions of the Cuba Submarine Telegraph Co. in Cuba, and of the West India & Panama Telegraph Co. in Puerto Rico, expire in 1910, it is quite possible an extension of American lines to these islands may take place. In fact, schemes considered by Congress included cable connection between Puerto Rico and the Isthmus of Panama.

THE BUFFER STOP COLLISION AT EALING

MAJOR PRINGLE'S Board of Trade Report on the fatal buffer stop collision which occurred at Ealing Broadway Station of the Metropolitan District Railway, in circumstances already reported in ELECTRICAL ENGINEERING (Vol. V., p. 1033), on November 18th, 1909, has now been issued. After briefly describing the accident, which happened to a train coming straight from the depôt in the morning, Major Pringle reviews the evidence, which, in his opinion, proves beyond dispute that the cause of the collision was failure of the brakes to act on account of there having been no air pressure in the train pipe or auxiliary reservoirs at the time of the accident. This appears to have been due to the isolating valve on the main reservoir pipe under the driver's brake valve having been left closed when the train started out, contrary to instructions. When this valve is closed, no air can pass from the main reservoir line into either the driver's brake valve, the auxiliary reservoirs and train pipe line, or the pressure gauge. The reading of both needles in the gauge will then be negative, and any application of the continuous brake either by the driver or conductor will have no effect.

It appears that ineffective attempts were made by the driver to pull the train up by putting over the reversing switch, with the result of causing the section circuit breaker to come out.

The report goes into the regulations for preparing a train for service, and investigates the irregularities which occurred in the procedure that morning. Finally, the attention of the company is called to the following points :—

1. The desirability of enforcing invariable obedience to the regulations for testing the continuous brake. Where trains stand for the night at a station and commence passenger service without any preliminary journey, the station inspector or other officer should be instructed personally to see the brake tested, and to sign the conductor's return that he has seen it tested, and that it was in working condition.

2. It is not clear that motormen and conductors are sufficiently exercised in the proper method of dealing with an emergency such as the failure of the continuous brake, more especially as regards the use of the reverse, and hand brakes. Some action to ensure that the men's practical knowledge is maintained in this respect seems to be desirable.

3. The conductor's test of the continuous brake, as now prescribed in the company's instructions, is insufficient. It is possible to make a full application by the emergency valve, and, even with so ineffective a pressure as 12 or 15 lb. in the train pipe, to be misled, by the rush of air escaping and by the sound of the blocks striking the wheels, into thinking that the brake is in working condition. It is necessary to observe on the gauge that the correct pressure (62 lb.) is available before making the test, and is recovered when the valve is closed.

THE NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION

WE have received from this association a short review of the results of their activity during the past year. In regard to railway and shipping rates, a conference with railway company officials has resulted in a new classification for metal filament lamps, which in practice amounts to a reduction of 15 per cent. off the former rates. The cost of carriage of recording ammeters by rail has also been reduced, owing to the efforts of the association, and a reduction in the freight of electric lamp shades to South Africa has been obtained. In Parliamentary matters the association was successful in influencing the retention of a clause in the Electric Lighting Acts Amendment Bill relating to hire apparatus whereby machinery which is now let out on hire by electric supply authorities to users cannot be distrained on.

The association has entered into an agreement with the British Traders' Association whereby, through its status bureau, members now receive information very definitely and promptly. In addition to this, members now have their debts collected free of cost in England and Wales, and can consult the solicitor of the British Traders' Association free of expense.

Useful help has been given in legal cases, and the association has established a trade custom regarding cash discount, of which cash discount can only be allowed subject to the following conditions : "All goods supplied during any calendar month are due for settlement on or before the last day of the following month, unless shorter terms have been arranged."

Meetings of different classes of manufacturers have been arranged for the discussion of various questions, and matters relating to exhibitions have been dealt with. The association has nominated members of the Engineering Standards Committee and of the Institution of Electrical Engineers Committee for the revision of the "Model Conditions of Contracts," and has also forwarded the interests of the Benevolent Trades Institution which was founded by it in 1906.

Extension of Central London Railway.—It is stated that the extension of the Central London Railway from the Bank to Liverpool Street will shortly be commenced. It is anticipated that the extension will be completed in twelve months.

FACTORY ORGANISATION

A PAPER on the above subject by Mr. James Rider (Middlesbrough) was read on Thursday last before the Rugby Engineering Society. In discussing first of all the lay-out of works, the author emphasised the importance of each separate productive operation automatically bringing the article at each stage of manufacture to the point where it was most convenient to handle it, either for loading and despatch as a semi-finished product, or for the next succeeding process. He also spoke of the advisability of having plenty of margin of power in lifting and transport machinery, and adequate shop lighting. Again, the position of the stores had considerable influence on economy. Too often the store building is detached from the main factory, or is in one corner. It is desirable, if possible, to make this building run along the end of, and at right angles to the various shops of the main factory, making its internal arrangements correspond as far as practicable with each shop, and so secure that the needs of each section are served with a minimum cost of time and labour.

With regard to the administration of the factory, this should be divided into two distinct sections, the operating and the commercial. The whole attention of the operating staff, from the works manager down, should be devoted to production, and should not be taken up with details of stores and cost-keeping, which properly belong to the commercial department of the administration.

The author considered that the most important factor in works or factory organisation is that of cost of production, including the method of obtaining accurate information upon it. He favoured the cost office being part of the accountant's department. There are, he said, many systems of time recording, but few which surpass or equal that of the job card, with one card to each job done by the workman, and this worked well, with a certain number of shop clerks patrolling the shops, checking the men's cards, and changing them when required. The foreman appointed the man his work, giving him a ticket, which contained (as far as possible printed on a standard form) his instructions. The shop clerk saw that this corresponded with the work the man had in hand, and checked the time of commencement and completion.

The procedure with regard to material would be rather different. Assuming an order was given out for one or a group of standard machines, such order, emanating from the drawing office, should be accompanied with a complete list of all the parts required for each machine, the drawing or print showing the operations required to finish each part. This order would be sent to the works manager's office, from whence requisitions would be forwarded to the stores for all material required.

A careful organised store or stock-keeping system is essential. Just as in commercial book-keeping, he continued, it is necessary to have separate accounts for each individual customer, however small, so it is equally necessary to have separate records of each article which is of sufficient importance to require keeping in stock. By the judicious use of card ledgers, analysis sheets, and similar appliances for making up the accounts, it is possible to always keep the factory well and fully supplied without carrying an excessive stock, and to keep a constant check on stocks. Many directors and managers are frightened at the sight of black-coated clerks, and carelessly (and really ignorantly) class them as unproductive, and necessary evils, but the accountant's department of a factory, with its cost and stock records, if not a money making, is, or might and ought to be, a money saving department.

One of the weakest parts of factory organisation is that relating to fulfilment of delivery promises. One reason why there is so much default on this point is, that it is very rarely the business of any one department or person to follow up orders in each stage. There is frequently serious delay in getting drawings and instructions into the shops.

In conclusion, the Paper dealt shortly with indirect factory expenses which, if not carefully watched, are liable to become excessive; on the other hand, machinery requires attention, and in this connection it is much cheaper, whenever possible, to anticipate breakdown and prevent its occurrence.

Naval and General Engineering Exhibition.—A Naval, Mercantile, Marine, and Engineering Exhibition will be held at Olympia from August 31st to September 24th, 1910, inclusive. The organising manager is Mr. F. W. Bridges, 119 Finsbury Pavement, London, E.C. The patrons and Hon. Advisory Council include a number of persons well known in the electrical industry, including Dr. Gisbert Kapp, Sir John Gavey, C.B., Sir A. B. W. Kennedy, Sir W. H. Preece, K.C.B., Mr. G. K. B. Elphinstone, Mr. W. B. Esson, Dr. R. T. Glazebrook, Mr. W. H. Patchell, Mr. Charles Bright, Mr. H. V. Kramer, Mr. W. C. Mountain, Mr. J. H. Rosenthal, and Captain H. R. Sankey.

METER DISPUTE AT GRAVESEND

AN action is being heard in the King's Bench Division before Mr. Justice Hamilton, in which the Gravesend and Northfleet Electric Tramways, Ltd., ask for an injunction ordering the Gravesend Corporation to remove three meters from their power station, which are used for the purpose of measuring the electrical energy supplied to the tramways. The facts of the case are as follows:—Under an agreement dated February 11th, 1902, the Gravesend Corporation undertook to supply electrical energy to the company, and in clause 4 the amount of energy supplied was to be ascertained by the average reading of three wattmeters, which were supplied and calibrated by the Corporation and fitted in their power-house. In August, 1907, the company alleged that the meters were registering inaccurately, and that in consequence they had paid a larger sum to the Corporation than that represented by the amount of energy actually supplied. The difference to August, 1907, was settled, but without any admission on the part of the Corporation that the meters were inaccurate. As a consequence of this, the clause of the original agreement was altered so as to read that the amount of energy supplied should be ascertained by the average reading of three wattmeters to be supplied by and remain the property of the Corporation, but that such meters were to be calibrated and fixed in the Corporation's power-house and connected in a manner to be reasonably approved by the company.

The statement of claim is to the effect that from August 7th, 1907, to August 7th, 1908, the meters recorded a supply of about 40,627 units in excess of what the actual supply was, and that the meters are still recording wrongly, and that from August 7th, 1908, till the commencement of the action the meters recorded about 47,000 units too much. The company have refused to pay for the amount actually registered, and also allege that the Corporation have never asked for their reasonable approval of the connection of the meters provided for in the supplementary agreement. The Corporation deny all these allegations, and counterclaim for the sum of £233 16s. 4d., which has been deducted by the company from the account delivered for the year ending August 7th, 1908, for electrical energy supplied, and also 4 per cent. interest from that date till payment. The Corporation also claim that the company have approved the connection of the meters, inasmuch as they have not objected to such connection since it was made. The meters in question are of the B.T.-H. Co.'s motor type of integrating wattmeter.

The case for the company is that a complete investigation of their cars and equipment has not revealed any such defects as to account for the excessive consumption per car-mile, which is greater at Gravesend than upon any of the other lines of the British Electric Traction Co. Evidence was called to show that since September, 1907, the consumption per car-mile had continued to increase, and this was demonstrated by the following figures:—1907, 1·2 units per car-mile; 1908, 1·4 units per car-mile; 1909, 1·49 units per car-mile. In the opinion of the witnesses for the company, the variation in the number of cars in service, the fact that top-covered cars might be used, or the fact that chilled wheels or steel tyres were employed, did not account for the difference. They therefore came to the conclusion that the meters must be recording inaccurately. It was admitted, however, in cross-examination, that on one occasion when the meters were tested one was found to be correct and the other two were reading slow. One of the witnesses went so far as to assert that the B.T.-H. motor-meter was incapable of measuring accurately a fluctuating load such as a tramway load, and that the only meter likely to do this without fear of inaccuracy was the Aron meter. It was pointed out that the test mentioned above was made on a uniform load and not on a fluctuating load. It was further contended, on behalf of the company, that the meters had been installed in 1902, and that the weakening of the brake-magnets had made them read fast. Such meters, it was said, were also liable to be affected by stray fields, and it was suggested that they were not properly shielded.

On the point that this type of meter was regarded as unfit for the particular class of work, Mr. Justice Hamilton remarked that apparently the company had not held this view up to August, 1907, and that under the agreement there was nothing to compel the Corporation to install a different type of meter, even if an admittedly better one was known to exist. Both parties had apparently agreed that the meters installed were satisfactory up to a certain date, and now one of the company's witnesses alleged that this class of meter was not suitable for the work in question. What was the remedy of the company under the agreement if the Corporation did not put in a proper meter in a proper manner?

Mr. WALTER, K.C., who appears for the Company, said it seemed to him that there was no liability on the part of the company to pay.

Mr. Justice HAMILTON said that that was how the agreement struck him, and he did not understand why the company need have brought this action.

In the course of further discussion, Mr. Bousfield, K.C., who appears for the Corporation, said that two of the meters read within 2 per cent. of each other, and the third read within 5 per cent. of the other two.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 13th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

28,040/08. **Train-lighting Dynamo.** T. FERGUSON. In a previous patent, No. 17,311 of 1908, a train-lighting dynamo was described, in which the armature was caused to slide along its shaft away from the field system by the action of the increase in driving-torque due to the higher output at high speeds. According to this invention, the increase in torque is utilised to produce the displacement, not of the armature, but of a sleeve on the shaft which is connected to a pivoted arm. The latter cuts in resistance into the shunt field-circuit, and thus reduces the voltage and output. Five claims, six figures.

28,186/08. **Balanced Protection Systems.** C. H. MERZ and B. PRICE. A protective arrangement for simple A.-C. circuits comprises an iron ring surrounding the two- or three-core cable and a winding on the ring connected to the tripping gear of the main switch. Should there be leakage to earth, the currents in the cores will be unbalanced, the ring will be magnetised, and the current generated in the winding will trip the switch. Instead of placing the winding round the cable, three current transformers with the secondaries connected in parallel or series to the tripping coil may be used. Other similar arrangements are described. Six claims, eleven figures.

5,235/09. **Trolley Head.** H. DUDGEON and H. CROSS. This head is so constructed that it is free to swivel when in contact with the trolley wire, but is brought forcibly into alignment with the pole when the hand rope is pulled, to enable easy replacement on the wire. This is effected by attaching the rope to a short lever pivoted on the fixed part of the pole head in such a manner that it presses on projecting pieces on the swivelling part and brings it into alignment. Three claims, four figures.

6,138/09. **Aluminium Solder.** C. E. STEINWEG. A solder for aluminium comprises an alloy of aluminium and 5 per cent. cadmium. The sticks are tubular and are filled with a flux consisting of 60 per cent. chloride of lithium, 30 per cent. fluoride of potassium, and 10 per cent. cryolite. Five claims.

19,098/09. **Magnetic Track Brakes.** DICK, KERR & Co., LTD. (*R. Braun*). A number of electromagnets are connected together by links so that the brake takes the form of a chain which can adjust itself to irregularities in the rail. The units are excited separately, so that the failure of one does not affect the others. The units are interchangeable, and the number per brake can be varied to suit the conditions. Two claims, one figure.

20,005/09. **Single-phase Commutator Motor.** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*). To improve the speed characteristic of a single-phase shunt or separately excited commutator motor, an auxiliary winding is provided on the stator. This winding replaces the ordinary compensation winding, and is supplied from an auto-transformer with an E.M.F. of such magnitude and phase that the E.M.F. of self-induction in the armature winding is neutralised by transformer action. Four claims, three figures.

20,115/09. **Collector for Surface-contact Traction System.** THE S.P. (SUCHOSTAWER PATENTS) SYNDICATE, LTD., and H. M. SAYERS. This is a collector or skate formed of one or more lengths of metallic woven fabric carried edgewise under the car, with the width of the strips of which the fabric is composed at right-angles to the direction of motion so that they scrape across the contact studs or third rail. Devices for keeping such a skate in tension and for magnetically drawing it down on to the studs are described. Six claims, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MORRIS and LISTER [Pressure regulation on A.-C. systems] 416/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Insulating material] 2,128/09; WITZENMANN [Method of armouring cables] 4,957/09.

Dynamos, Motors, and Transformers: SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Polyphase commutator machines] 21,542/09; ALLGEMEINE ELEKTRICITÄTS GES. [Machines] 26,146/09.

Electric Ignition: BROWN and VANDERVELL [Commutator] 20,897/08; TROIKE [Magneto-generator] 14,153/09; GIBAUD [Ignition mechanism] 20,241/09.

Electrometallurgy and Electrochemistry: JOHNSON (*Badische Anilin und Soda Fabrik*) [Manufacture of calcium nitrite] 11,275/09.

Incandescent Lamps: COOLIDGE [Metal filaments] 282/09.

Instruments and Meters: FRICKER and MORDEY [A.C. meters] 129/09; PRALON, FRANÇON and FOURNIER [Meters] 10,456/09.

Storage Batteries: FENNELL and PERRY [Charging and discharging arrangements] 6,773/09.

Switchgear, Fuses, and Fittings: REASON MANUFACTURING CO. [Time-switches] 353/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Motor controllers] 551/09; TANNAHILL [Controllers] 3560/09; SIEMENS BROS. & Co., LAUCKERT and NEBEL (partly *Siemens & Halske Akt.-Ges.*) [Switch] 10,550/09.

Telephony and Telegraphy: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Telephone exchanges] 13,749/09, and 25,882/09; STRAGIOTTI [Telephone systems] 17,473/09, and [Telephone relays] 17,542/09.

Traction: GROB [Lighting and heating of vehicles] 28,120/08; MUNRO and RAILLESS ELECTRIC TRACTION CO. [Trolley-arm] 764/09. and [Collector] 11,947/09; KOHLER [Collectors, 26,808/09; GROB [Control of vehicle lighting] 27,937/09.

Miscellaneous: FAGERLUND [Electrically operated valves] 2,740/09; SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Thermo-electric temperature indicator for steam locomotives] 24,389/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Telephony, &c.: VON LEPEL and BURSTYN [Oscillation generator] 30,030/09.

Traction: BOIRAULT [Automatic brakes] 30,088/09.

Miscellaneous: CLEIREN [Electro-mechanical power transmission] 29,995/09; ANDERSON [Transmitting pictures to a distance] 30,188/09; JONES [Alarms] 30,305/09.

Opposition to Grant of Patents

14,615/08. **Dry Cell.** H. HUNTE. An appeal has been lodged against the decision of the Comptroller to grant this patent. The specification describes a dry cell with vertical air passages through the depolariser open at top and bottom. Further particulars were given in ELECTRICAL ENGINEERING, Sept. 30th, 1909, Vol. V., p. 859.

27,303/08. **Arc Lamp Mechanism.** C. E. G. GILBERT. The opposition to this patent by H. P. Bleckley, of the Abbey Electric Co., has been withdrawn. Full particulars of the patent and of the grounds of opposition were given in ELECTRICAL ENGINEERING, December 30th, 1909, p. 1101.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

1,563 of Jan. 22nd, 1896. **Railway Signal.** R. PEARSON. To indicate that the signal has worked, the semaphore arm carries a curved glass tube containing a globule of mercury immersed in oil. There are two contacts at either end, and when the arm moves up or down, one circuit is momentarily closed by the mercury and an indicator in the signal box operated.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: A. BLONDEL [Supplying current through friction shoes to burning ends of flame carbons] 19,712/05; M. V. ELY and E. R. GROTE [Reflectors] 19,719/05.

Dynamos, &c.: H. CHITTY [Magnetic bridge-pieces for placing between pole-shoes] 20,820/03; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Prevention of field distortion in single-phase rotary converters] 21,045/04.

Electric Ignition: D. B. ADAMS [Automatic stopping of overheated combustion engines] 21,354/02; J. PORTER [Switch for ignition circuit] 21,093/03; H. HILL [Ignition of acetylene carriage lamps] 19,570/05.

Electrometallurgy, &c.: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Vacuum resistance furnace] 20,809/04; A. F. BOSQUET [Electro-deposition] 20,896/04; G. SCHAULI [Primary cell] 19,616–6A/05.

Instruments and Meters: BRITISH THOMSON-HOUSTON CO. (*E. Thomson, U.S.A.*) [Dynamometer type voltmeter] 22,218/97.

Switchgear, &c.: R. W. H. HOFSTEDE-CRULL [Switchboard construction] 21,008/03; E. DU BOIS [Time switch] 19,551/05; CROMPTON & Co. and R. C. HARRIS [Automatic circuit-breaker] 19,603/05.

Telegraphy, &c.: E. OLDENBOURG [Multiple tube electro-capillary relay] 19,425/05; F. OPRENDEK [Telephone relay] 19,819/05.

Traction: H. BRAMHALL and J. B. PEAT [Station indicator] 21,069/03; W. PROKOV and M. RICHTER [Track signalling] 20,941/04; A. L. PRENTISS [Pneumatic control of trolley poles] 19,504/05; F. B. HOLT and A. WALLIS [Electrically worked signal] 19,568/05; F. HEWER [Trolley head and wheel] 19,746/05; J. HAYDOCK and T. S. JONES [Trolley wire supports] 19,753/05.

Miscellaneous: K. W. HEDGES [Joints and connections of lightning conductors] 19,678/99; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Electromagnetic gearing] 21,142/04.

Digitized by Google

Mr. WALTER pointed out that when tested against a Chamberlain & Hookham meter, the three B.T.-H. meters were fast to the following extent:—8·3 per cent., 14·1 per cent., and 13 per cent. Continuing, he said that the agreement provided for three meters to be fixed by the Corporation in their power-house, in a manner to be reasonably approved by the company. The Corporation had never asked for the approval of the company with regard to the mode of connection, and this raised the question of stray fields. It might be that all the meters were registering fast, and surely it could not be contended that the company should pay?

Mr. Justice HAMILTON replied that if it were true that the B.T.-H. meter was largely used for a similar purpose, this would be material evidence, and it was not for him to say how much they should register fast in order to condemn them as unsuitable meters, having in view the terms of the contract. The question of their construction in relation to meters of different types was another matter, and did not arise on this action, it seemed to him.

Mr. WALTER contended that with a 3 per cent. variation, it could reasonably be said that an instrument did not read accurately.

The hearing was adjourned. Among the witnesses yet to be heard in the case are Mr. A. P. Trotter, Mr. J. Rennie (who have been subpœnaed on opposite sides), Mr. H. M. Sayers, Mr. A. H. Preece, and Mr. S. H. Holden.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[READERS APPLYING TO ANY OF THE UNDER-MENTIONED FIRMS FOR COPIES OF THE CATALOGUES OR PAMPHLETS REFERRED TO ARE REQUESTED TO MENTION "ELECTRICAL ENGINEERING."]

CALENDARS.—One of the most artistic of the wall calendars that we have received is that of the British Westinghouse Electric and Manufacturing Co., which presents a striking example of effective colour printing, showing a damsel driving home a flock of geese, illumined by the rays of the setting sun.

Messrs. Evershed & Vignoles' desk blotting bad is combined with an abridged catalogue of their electrical instruments, a monthly calendar, and an engagement pad with weekly tear-off sheets.

STEAM PIPE COUPLING.—A pamphlet from the Westinghouse Brake Co. (82 York Road, N.), describes a flexible steam pipe coupling for railway steam heating pipes, which entirely does away with rubber packing.

ENAMEL INSULATION.—A booklet from Messrs. Connolly Brothers, Ltd. (Blackley, Manchester), deals with the properties of wires coated with the firm's patent enamel insulation, and gives various results of comparative tests to show its superiority over other classes of insulation for a great variety of electrical purposes. It is stated to be quite non-inflammable, to resist acids and electrolytic effects, to withstand high temperatures, and to possess high insulation resistance, combined with flexibility and durability.

THE ENGINEERING DIARY.—This is a publication which is being issued from the offices of the *Electric Journal*, at one penny monthly, and contains, besides a diary for the month of January, some useful curves and data on engineering matters.

HEATING AND COOKING APPLIANCES.—The newest catalogue of radiators and electric cooking apparatus of the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.) contains a number of new and attractive designs of lamp radiators, connectors, and other heaters, and a considerable range of cooking and heating appliances on the Phœnix, Prometheus, and other systems.

ELECTRIC LOCKS.—A series of electric locks which the Sun Electric Co. have on the market is described in a leaflet just to hand. These locks are made in several forms, and are intended for unlocking a door electromagnetically from a distance by means of a push-button contact. The reclosing of the door automatically locks it, and resets the electrical release. They should be of considerable use to shopkeepers and others who desire to control their doors from behind the counter, and for garden gates and similar purposes.

TELEGRAPHIC APPARATUS.—An illustrated pamphlet from Messrs. Siemens Bros. & Co., Ltd. (Caxton House, Westminster, London, S.W.), describes the electric driving of telegraph instruments on the Mulligan system, in which both transmitting and receiving instruments are provided with motor drive. The system is applicable to any type of weight- or spring-driven apparatus, and the motors can be worked from a section of the battery supplying the telegraph circuit. By means of an ingenious device, the receiver starts and stops under the control of the transmitter at the distant end of the circuit. The system is in use by the G.P.O. at the Central Telegraph Office, London, where it is said to be giving every satisfaction. A number of photographs illustrating the comparative space taken up by weight and electric motor driven receivers are given.

ELECTRIC DRIVING OF PRINTING PRESSES.—We have received from Messrs. Kohler Bros. (56 Ludgate Hill, E.C.) an illustrated pamphlet describing briefly their well-known push-button system of driving printing presses, and containing a number of testimonials as well as a list of the newspaper and other printing offices using the system. The Kohler equipment at the *Times* London Offices was described in ELECTRICAL ENGINEERING, June 3rd, 1909, p. 506.

CORRESPONDENCE

To the Editor of ELECTRICAL ENGINEERING.

COMBINED LIGHTING AND POWER METER.

SIR,—We are much interested by a description that appeared in your last issue (January 13th, p. 33) of a combined lighting and power meter which has been put upon the market, with the purpose of encouraging the use of electrical domestic appliances without introducing two separate meters.

We would like to point out that the system described is somewhat of an old friend, and a glance at the connections which appear in diagram accompanying your description leaves no doubt whatsoever that the system described is nothing more or less than a very old friend, generally known as the three-wire connection, with split neutral, and in use for three-wire ampere-hour meters. (Fig. 1.) The principle can be applied

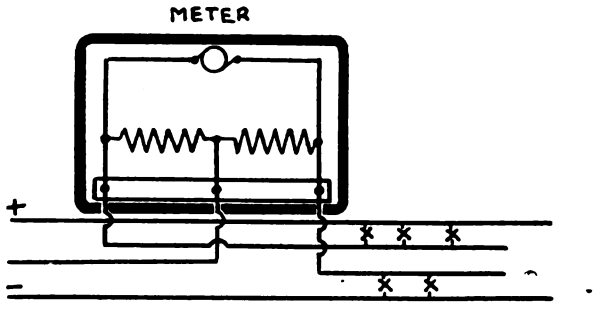

FIG. 1.

to any type of watt-hour meter, and does not call for any special instrument, such as your article leads us to believe to be the case. There are several drawbacks in connection with this method of obviating the use of double meters, principally the difficulty with which the meter can be adjusted should the ratio of the lighting and power rate differ from 2:1. Supposing, however, this latter condition to be the case, there is absolutely no reason why existing meters should not be utilised for the double rate purpose under consideration, and in this connection we may point out that shunted ampere-hour meters lend themselves most readily to the application of this system of connection. (Fig. 2.) In this case variation be-

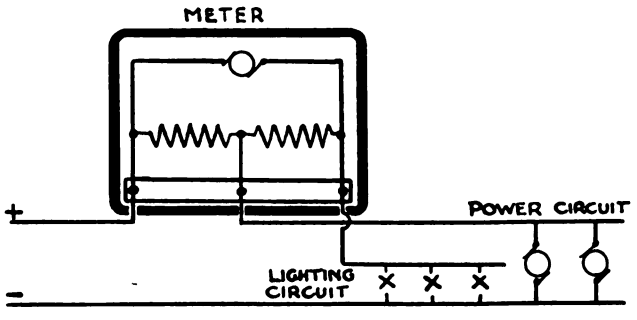

FIG. 2.

tween the ratio of lighting and power charges can be adjusted for by tapping the series shunt in the proper place.

As this type of meter is used to a very large extent, and has the additional advantage of being inexpensive, the principle might be adopted with advantage in the case of the smaller class of consumer, to whom it must be looked to make up for the decrease in revenue due to the widespread adoption of higher efficiency lamps. Our object in writing is to point out the fact that no special type of meter is essential, such as the notice we have referred to will lead central station engineers to believe to be the case.

Yours, &c.,
SIMPLEX CONDUITS, LTD.
London, January 18th, 1910. (Meter Dept.)

LOCAL NOTES

ACTON: *Electricity Accounts.*—The report of the Assistant District Auditor says that the gross revenue of the electricity undertaking for the past financial year amounted to £9,004, and the expenditure to £9,175, leaving a deficiency of £171. After providing for repayment of loans, £2,377, and interest, £2,390, there was a total deficiency of £4,943 for the year's working.

BIRMINGHAM: *Concert.*—On Tuesday, January 11th, the Corporation Electrical Engineers and the leading manufacturers entertained the high-tension consumers and others, including their lady friends, to a Bohemian concert at the Grand Hotel. The chair was taken by Mr. Bertram Moore, and an excellent variety programme was enjoyed by all.

BURMAH: *Mandalay: Electricity Supply.*—Under the Indian Electricity Act a licence has been granted to the Burmah Electric Tramways & Lighting Co., Ltd., Mandalay, for general supply and for the supply of energy to particular consumers under special agreements, but not for traction, in respect of the area comprised within the limits of the Mandalay Cantonments.

CARDIFF: *Tramway Depreciation Fund.*—The Joint Finance and Electric Lighting and Tramways Committee report that they are of the opinion that the tramway system and its equipment is being maintained in a good and efficient condition, and that it is not, therefore, necessary at present to provide a depreciation fund other than the present sinking fund.

CLYDEBANK: *Tramways over Canals.*—At the last monthly meeting of the Town Council, Councillor Young asked if there was any further information to give as to the erection of the bridges over the Forth and Clyde Canal by the Glasgow Corporation. Were the Tramways Committee still pushing on these plans? The Provost pointed out that plans had recently been prepared and estimates taken, but they had been rejected by the railway company. He had information from an outside source that certain engineers of the Glasgow Corporation were at present preparing plans. They had made a request to the Corporation to have a meeting. Of course they were under an obligation to pay Glasgow £700 when the two bridges were built, but they would not pay a penny until then. They had still two years to go before the powers expired.

CROYDON: *Water Supply.*—At the last meeting of the Council, the provision of an artesian well at the generating station was proposed, at an estimated cost of £1,150. It was calculated that the Electricity Committee would save about £325 per annum. After some discussion it was decided to take the recommendation back in order that the matter might be considered by the Water Committee.

DUNDEE: *The New Electricity Works.*—A formal opening ceremony is to be held in connection with the new electricity works at Carolina Port. The Electricity Committee hope that they will be able to arrange with a well-known electrical engineer to perform the opening ceremony. The request of Councillor Paton for full information concerning the estimates of the new power-house, and the reasons for the delay in its completion, has been ruled out of order, as all this information has been given from time to time.

GILLINGHAM: *Electric Wiring.*—Mr. E. E. Hoadley, Borough Electrical Engineer, Maidstone, has communicated with the Council regarding a proposed Bill for conferring wiring powers on municipalities. Mr. Hoadley is to be asked to furnish a list of those boroughs which have promised financial support and the amounts promised.

ISLE OF WIGHT: *Newport: Street Lighting.*—The Council have complained to the Isle of Wight Electric Light & Power Co. that they are not fulfilling the terms of their contract, and supplying 1,000-candle-power lamps in the streets. At the last meeting of the Council it was stated that the candle-power given by the lamps was not more than 250.

LONDON: *Hampstead: Electricity Undertaking.*—At their meeting on January 13th, the Borough Council decided to engage Sir Alexander Kennedy to report, at a fee of 400 guineas, on the future working of the electricity undertaking. The report is required in consequence of the probability of large additions to the plant at the generating station being required in the near future.

Marylebone: Power Supply.—The General Manager's recommendation of a tariff for power at 1d. per unit on the restricted hour system has been adopted by the Electricity Committee.

PERTH: *Tramway Undertaking.*—Mr. Peter Fisher, General Manager of the Dundee Corporation tramways, was recently called in to investigate the Perth tramway system, and has now submitted his report. Mr. Fisher says that one reason for the unsatisfactory results at Perth can be attributed to overstaffing, in some respects to the extent of 50 per cent. He recommends running the cars on Sundays, but disapproves of half-penny fares and the granting of season tickets, except to heads of municipal departments and Corporation employees. The report also deals with certain extensions

POTTERIES: *Tramway Fares.*—A conference of local authorities in the Potteries District is to be held to consider the new system of fares recently inaugurated by the British Electric Traction Co., Ltd.

SIAM: *Electricity Supply.*—According to a Consular report, the electricity works at Bangkok are owned by the Siam Electricity Co. (Limited), a Danish company. Its equipment consists of Babcock & Wilcox boilers, Brush compound triple expansion engines, Curtis turbine, and others; Morley, G.E.C., Short, and other dynamos; Terrarie, Thompson, G.E.C., and other motors. The pressure at the consumers terminals is 100 volts, 100 cycle, single phase. The company began operations in September, 1890, and is the only electric-supply company in Siam. It furnishes the electric power and light for the city of Bangkok, both public and private, and also supplies the electric power for the 25-mile single-track overhead-trolley system of tramways.

Telephones.—The Government owns and operates the telephones. A new installation was finished this year. It is of the central-battery system, for 1,500 subscribers. The electric power, obtained from the Siam Electricity Co., is 100 volts, 100 cycle, single phase, and two sets of motor generators. The contractors for this work were a Stockholm firm.

WIDNES: *Electricity Supply.*—By the agreement with the Salt Union for the supply of electricity within the borough, the maximum charge for lighting to small consumers is to be 4d. per unit, to small consumers for power purposes, 2d. per unit; large consumers, primarily for power purposes, 1½d., where the consumption is not less than 300,000 units per annum; maximum price to be charged to the Corporation for traction purposes, 1d. per unit, and for all in excess of 500,000, ½d. Energy for public lighting will be supplied at 2d. per unit. A Provisional Electric Lighting Order is being applied for this session.

WIGAN: *Tramway Deficit.*—At the last meeting of the Corporation it was stated that the revenue for the tramway undertaking to date was £5,000 less than for the same period of the previous year. A long discussion took place, in which various suggestions were put forward for improving the position, but nothing definite was done.

WOKINGHAM: *Electric Supply.*—The Rural District Council have referred the Reading and District Electric Supply Bill to the Highways Committee for consideration and report. The Bill only affects Wokingham in relation to the roads, and the Rural Council wish to be certain that they are protected so far as reinstatement is concerned.

YORK: *Completion of Tramways.*—Lieut.-Col. von Donop made an official inspection, on Thursday, on behalf of the Board of Trade, of the tramways from Fulford to Nessgate.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ASHTON-UNDER-LYNE.—Tenders are invited for (1) a counter current jet condensing plant, (2) natural draught cooling-tower, (3) exhaust turbine and 400-kw. direct-current generator, and (4) balancer. Particulars from the electrical engineer, and tenders by February 19th. (See an advertisement on another page.)

COVENTRY.—In consequence of the increased demand for electrical energy, the Electricity Committee recommend an expenditure of £54,000.

INDIA. The Secretary of State for India invites tenders for electric power plants. Particulars from the Director-General of Stores, India Office, Whitehall, to whom tenders by January 27th.

LOWESTOFT.—The Local Government Board is to be asked sanction a loan of £1,500 for meters, and £1,000 for public lighting. A fresh set of air-pumps for the condensers are to be obtained, and the Local Government Board is to be asked to sanction the borrowing of £350 for same. The Local Government Board have sanctioned the borrowing of £1,822 for the provision of a new 250-kw. set and mechanical stokers.

MONAGHAN (IRELAND).—Messrs. Miller, Wilson & Pegg have submitted an electric lighting scheme to the Council. The estimated cost is £4,000. The matter is to be discussed at the next monthly meeting.

NETHERLANDS. The communal authorities of Leeuwarden, says the *Board of Trade Journal*, have decided on the erection of an electric generating station, the cost of which is estimated at £21,666. The burgomasters of Harmelen and Vleuten are endeavouring to arrange for the installation of electric lighting in all the communal districts to the south-west of the Province of Utrecht, the central station to be erected at Harmelen.

SHEFFIELD.—Mains are to be extended at an estimated cost of £528.

SOUTHAMPTON.—Application is to be made to the Local Government Board for sanction to borrow £660 for meters. Application is to be made to the Local Government Board for sanction to borrow £9,000, the estimated cost of fourteen new

Digitized by Google

cars. The General Manager is to proceed with the preparation of the specifications, drawings, and bills of quantities in connection with the construction of tramways from the Clock Tower to the Northam Toll Bridge.

WOLVERHAMPTON.—The Local Government Board have sanctioned a loan of £15,000 for electricity mains, repayable in twenty-five years.

Miscellaneous

BRITISH COLUMBIA.—It is stated that the British Columbia Electric Railway Co. contemplate an expenditure of £100,000 upon new rolling stock, &c. Four electric locomotives, 100 passenger cars, and 100 freight cars are to be provided.

CANADA.—An application is to be made to the Parliament of Canada by a company for permission to construct an electric railway, about 50 miles long, from Niagara Falls Town to Dunnville. The company has a capital of about £102,750. The name of one of the directors of the company, to whom inquiries regarding the proposed railway might be addressed, may be obtained by British firms interested on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

ECUADOR.—A Bill providing for the construction of an electric railway about 106 miles long, between Quito and Ibarra, has been presented to the National Congress. The maximum cost per kilom. is fixed at £2,000, and the maximum total cost of rolling stock, &c., £180,000. The line is to be completed within three years.

HELSINGFORS (FINLAND.)—Tenders are invited by the Administration Supérieure des Routes et Travaux Hydrauliques, Helsingfors, for the supply of an electric crane. Tenders by March 1st.

LONDON: *London County Council.*—Tenders are invited by the Asylums Committee for various stores for the year commencing April 1st, 1910, including electrical sundries and electric lamps. Particulars, &c., from the Asylums Committee Office, 6 Waterloo Place, London, S.W., and tenders by February 4th.

London County Council.—Tenders are invited for the roadwork and platelaying for the tramways from Brockley Station to Forest Hill. Particulars from the Chief Engineer, and tenders by February 1st.

Institution of Electrical Engineers.—The Council invite tenders for a complete system of electrically-operated clocks at their new premises on the Victoria Embankment. Particulars from the Consulting Engineers, Messrs. Handcock & Dykes, 1 Victoria Street, London, S.W., and tenders to the Secretary of the Institution, 92 Victoria Street, London, by February 4th.

Islington.—The Council invite tenders for electrical and engineers' stores for the year commencing on April 1st, including arc lamp carbons and globes, transformers and accessories, meters and prepayment meters, cables, electrical sundries, cable terminal, service, and network boxes and tapes. Tenders to the Town Clerk by February 4th.

NEWCASTLE-UPON-TYNE.—The Corporation invite tenders for an electric crane for the quayside. Particulars from the City Engineer, and tenders by January 29th.

NEWPORT (MON.).—Tenders are invited for stores, including electrical accessories, dry batteries, fuse wire, insulating tapes, and enamelled steel tubing. Particulars from the Borough Electrical Engineer, and tenders by January 24th.

OLDHAM.—The question of extending the tramways to Grains Bar at an estimated cost of £12,000 is under consideration.

SWANSEA.—A number of additional streets are to be lighted electrically, at an annual cost of £215.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

ALLOA, N.B.—Extensions to Ludgate School (£2,000). Architects, Wilson & Tait, Lumley Street, Grangemouth.

AYR.—House, St. Leonards Road (£15,000). Architect, J. Drinnan, 30 Wallace Street, Ayr.

House, Arran Terrace (£1,200). Architect, A. C. Thomson, Wellington Chambers, Ayr.

BARRY.—School, Weston Hill (£8,000). Architect, G. A. Birkenhead, 104 St. Mary Street, Cardiff.

BRISTOL.—Extensions to Casual Wards (£1,800). Builder, S. Lovell, Bristol.

BRISTOL.—The Docks Committee of the Corporation invite tenders for the electric lighting of the passenger station of the Royal Edward Dock, and the maintenance of the work for twelve months after completion. Particulars from W. W. Squire, Engineer's Office, Cumberland Road, Bristol, and tenders to the Secretary, Docks Office, 19 Queen Square, Bristol, by January 31st.

BRITON FERRY.—Public hall and institute (£5,000). Architect, H. A. Clarke, Briton Ferry.

EXETER.—Additions to St. John's Hospital School. Architects, C. E. Ware & Son, Bedford Circus, Exeter.

FIFE.—Additions to I.D. Hospital (£15,000). Architect, E. Simpson, 16 King Street, Stirling.

HALIFAX.—Business premises, Harrison Road (£1,800). Architects, J. T. Dalton, Victoria Street, Halifax.

Mackintosh's confectionery works (£2,500). Architect, Medley Hall, 1 Harrison Road, Halifax.

HORNSEY.—The Borough Electrical Engineer has been instructed to prepare a specification for the installation of electric light in Stroud Green School.

JARROW.—Secondary school (£15,000). Architect, F. Rennoldson, Union Chambers, South Shields. Builder, T. Lumsden, Albert Road, Jarrow.

LIVERPOOL.—St. James' Schools (Cathedral) (£7,000). Architects, G. Bradbury & Son, Cook Street, Liverpool.

OXFORD.—School, Thames Street, St. Aldates; also additions to buildings, Luther Street (£9,500). Architect, Wm. Henry Castle, Town Hall, Oxford. Builder, H. Flint, High Wycombe, Bucks.

POOLE.—Court Hill School (£5,000). Builders, Jones & Seward, Bournemouth.

READING.—Hall, St. Luke's Church (£1,500). Architect, S. S. Stallwood, Market Place, Reading.

SHEFFIELD.—Theatre, Bramall Lane, for Olympic Rink Co., Ltd.

Tenders are invited for an electrical installation at the Women's Hall, Ecclesall Road. Particulars from the architects, Messrs. Gibbs, Flockton & Tether, 15 St. James Road, Sheffield, and tenders to the Education Office, Leopold Street, Sheffield, by January 31st.

STIRLING.—Municipal buildings for the Town Council (£20,000). Architect, E. Simpson, 16 King Street, Stirling.

WREXHAM.—Corn exchange, Queen Street (£3,000). J. England, borough surveyor, Wrexham.

YARMOUTH.—Offices at Fish Market (£1,450). J. W. Cockrill, borough surveyor.

Presbyterian Church, junction of Trafalgar Road and Nelson Road. The Trustees.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Gilmore & Co., of Fountain Street, Belfast, has been accepted for the maintenance of the fittings at the Ulster Hall.

GOVERNMENT CONTRACTS.—The following tenders have been accepted during the past month by the Government departments named :—Admiralty : Silk shades and incandescent lamps, Edison & Swan Co., Ltd.; extension of electric light and power station, Priddys Hard, Portsmouth, John Hunt, South Wharf, Cleveland Road, Gosport. General Post Office : Paper core cable, British Insulated & Helsby Cables, Ltd.; Western Electric Co., Ltd.; submarine cable, Telegraph Construction & Maintenance Co., Ltd.; insulators, Bullers, Ltd.; Doulton & Co., Ltd.; Taylor, Tunnicliffe & Co., Ltd.; table telephones, British L.M., Ericsson Manufacturing Co., Ltd.

LEEK.—An offer by the D.P. Battery Co. to increase the capacity of the battery from 300 to 400 ampere hours, and to maintain same for an additional payment of £39 12s. per annum, has been accepted.

LONDON: *Southwark.*—The Council have accepted the tender of the St. Pancras Iron Works Co., Ltd., for the supply of 100 ft. of floor lights at 3s. 11d. per foot super, for extending the present switchboard gallery at the generating station.

Westminster.—The following tenders have been received for providing and fixing eight 400-c.p. metal filament lamps in the 1st class swimming bath in Great Smith Street, in place of the existing arc lamps : L. White, £83; Leo. Sunderland & Co., £59; Coleby & Co., £55 10s.; Belshaw & Co., £49 12s.; Speedy Eynon & Co., £39 10s.; Drake & Gorham (accepted), £52.

Metropolitan Asylums Board.—An order has been placed with A. V. Gritkins & Co., at £27 15s., for re-wiring in the East Hospital block of the Children's Infirmary.

SHEFFIELD.—The Council have accepted the tender of Messrs. Ferranti, Ltd., at £274 for the supply of thirty-two oil-break switches, time-limit overload relays, current transformers, &c., to renew the existing fuses on the switchboard at the Sheaf Street Station. The tender of the British Insulated and Helsby Cables, Ltd., for the supply of six miles of Fig. 8 copper trolley wire for the tramway department has also been accepted.

SOUTHAMPTON.—An order has been placed with Messrs. Dick, Kerr & Co. for six car equipments at £240 per car.

WEST AFRICA.—*Commercial Intelligence* states it is reported that the contract for the supply of an electric crane to the port of Lourenço Marques has been awarded to Messrs. Nagel & Kamp, of Hamburg. A number of British crane-makers tendered, including Messrs. Dick, Kerr & Co., Messrs. Cowans, Sheldon & Co., and Messrs. Ransome & Rapier.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £62 10s. to £63 per ton (last week, £63 5s. to £63 15s.).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The Silverlyte Electric Lamp Co., Ltd., is to be wound up voluntarily. This has no reference to Silverlyte (1909), Ltd.

Peter Smith, electrician, 18 Mill Street, Warrington, has been adjudicated bankrupt.

Before Mr. Justice Nevill last week a petition was down for the compulsory winding up of the London Electrobus Co. It was stated, however, that the petitioning creditor's debt had been satisfied, and the petition was dismissed, without costs.

It has been arranged that the petitions of Messrs. Dick, Kerr and Co. and A. Schonfield & Co. for the compulsory winding-up of the British Aluminium Co., Ltd., shall stand over until March. A scheme of reconstruction has been drafted, and will shortly be submitted to the debenture-holders and ordinary shareholders.

The Himalaya Electric Railway, Ltd., is to be wound up voluntarily. A meeting of creditors will be held at 28 Chapel Street, Liverpool, on January 25th at 11 a.m.

Joseph Platt and Richard Bleasdale, electrical engineers, Victoria Square, Bolton, have been adjudicated bankrupts. The first meeting of creditors will be on January 28th, at three p.m., at the Official Receiver's Offices, Byron Street, Manchester, and the public examination will be held on February 2nd, at three p.m., at the Court House, Maudsley Street, Bolton.

The Unity Motor Electrical & General Engineering Co., Ltd., is to be wound up voluntarily. Mr. J. G. Taylor, 28 Baldwin Street, Bristol, is liquidator. A meeting of creditors will be held at this address on January 25th, at three p.m.

CANADIAN AGENCY.—A firm in the Midlands manufacturing an electrical and magnetting machine wish to arrange for its introduction and sale in Canada. Further particulars may be obtained from the Board of Trade Branch for City Trade Inquiries, 73 Basinghall Street, London, E.C.

REYROLLE LANTERN SLIDES.—Messrs. A. Reyrolle & Co., Ltd., of Hebburn-on-Tyne, have a large number of lantern slides illustrating their various manufactures, and they will be glad to send sets on loan for use in connection with lectures at Colleges, Engineering Society Meetings, &c.

WESTERN ELECTRIC CO., LTD.—With reference to our notice of the incorporation of the Western Electric Co., Ltd., on another page, we are informed that Mr. G. E. Pingree has been appointed managing director of the new company. Mr. J. E. Kingsbury, whose approaching retirement has been generally known, will continue until the end of February in an advisory capacity and to facilitate the transfer of the business.

CANADIAN CUSTOMS.—Amended certificates of origin on invoices for Canada have been issued to collectors of customs and others concerned, by the Canadian Department of Customs. Copies may be obtained from the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

ELECTRICAL FOOTBALL LEAGUE.—The league table corrected up to January 17th, shows that the Metropolitan Electric lead with eight points as the result of having played and won four matches. The City of London Electric, and St. James' Electric follow with six points each, and then comes the County of London Electric with two points for three matches. Robertson and General Electric are at the end of the table, both having played and lost two matches.

The Birmingham Discussion on the German Electrical Industry.—Our attention has been called to the fact that Mr. S. P. Smith, who in our report of the discussion on Messrs. Lepine and Stelling's Paper on the German Electrical Industry, at Birmingham, was described as being in the employ of Siemens Bros.' Dynamo Works, Ltd. (ELECTRICAL ENGINEERING, January 13th, page 28), has left this firm, and is now with the General Electric Co., at their Witton Works, Birmingham.

St. Helens Tramway Dispute.—At the Lancashire Chancery Court last week, an application was made on behalf of the new St. Helens Tramway Co., Ltd., for an injunction to restrain the St. Helens Corporation from carrying out a threat to disconnect the overhead electrical wire at both the Prescot and the Haydock ends of the tramway system. It was explained that the Tramways Company maintained through traffic between Liverpool, Prescot, St. Helens, Haydock, and Ashton, having by agreement running powers over the St. Helens Corporation tram lines. Last October, at their request, the Corporation connected the overhead electrical trolley wire at Haydock, as had been done at Prescot seven years ago. This obviated changing the trolley arm from one wire to the other. The Haydock to Ashton length belonged to the South Lancashire Tramways Co., and they lent three cars to the St. Helens Co. for the purpose of the through traffic. The Corporation had never authorised the South Lancashire Co. to use the town lines, and objected to their cars and threatened to disconnect the wires at both ends of the system. After some discussion, the Corporation undertook to make no alteration pending the trial of the action.

MISCELLANEOUS CITY NOTES

VICTORIA FALLS POWER CO.—The Victoria Falls Power Co. will shortly issue £900,000 of debentures, the balance of the authorised amount of £1,700,000, of which £800.000 was issued in November, 1908. The issue of any further amount was postponed until the placing of a further sum of £900,000 preference shares was carried through in London. This was successfully accomplished last April, and it has since been open to the company to make its remaining debenture issue in Berlin as soon as convenient. The *Financial Times* has it from a very good source that there can be hardly any doubt of the success of the issue, and that, in fact, it is as good as placed already.

APPOINTMENTS AND PERSONAL NOTES

Mr. W. B. Child, of Worcester, has been appointed Assistant Electrical Engineer at Leek, at a salary of £100 per annum.

Mr. E. J. Fussell, chief clerk of the Croydon Electricity Department, has resigned. A successor is to be appointed at a commencing salary of £180, rising by annual increments of £10 to a maximum of £230.

The salary of Mr. H. E. Yerbury, chief electrical engineer to the Sheffield Corporation tramways, has been increased from £450 to £500 per annum.

Mr. J. R. Salter has been appointed Consulting Electrical Engineer to the Heywood Town Council at a fee of £50 per annum.

NEW COMPANIES

WESTERN ELECTRIC CO., Norfolk House, Victoria Embankment, London. Capital, £500.000 in £5 shares. To acquire the business carried on in the United Kingdom by the Western Electric Co. of Chicago, Illinois, U.S.A., dealers in telephones, telephonic, telegraphic, and electric lighting apparatus, instruments, and machinery, electrical cables, wires and goods, electricians, &c. The subscribers are F. R. Welles, Norfolk House, Victoria Embankment, W.C., and G. E. Pingree, Norfolk House, Victoria Embankment, W.C. The number of directors is not to be less than three nor more than seven. The first are F. R. Welles, G. E. Pingree, and A. Williamson. We also refer to this new company in our Miscellaneous Business Notes.

London Tube Railway Bills.—There is no opposition at the Standing Order stage to any of the Bills relating to tube railways in London, which have been deposited for the next session of Parliament. We gave full details of these in our issue for January 6th, p. 13.

BOROUGH OF ASHTON-UNDER-LYNE.

ELECTRICITY DEPARTMENT.

THE ELECTRICITY COMMITTEE invite Tenders for the following works, viz. :—

Section A.—For one Counter Current Jet Condensing Plant.
,, B.—For one Natural Draught Cooling Tower.
,, C.—For one Exhaust Turbine and 400 KW. Direct Current Generator.
,, D.—For one Electric Balancer.

Copies of the Specification and Form of Tender can be obtained from the Borough Electrical Engineer, Wellington Road, Ashton-under-Lyne, on payment of a deposit of One Guinea, which will be returned on receipt of a *bona fide* Tender.

Sealed Tenders, endorsed "Electricity Works," addressed to the undersigned, must be received not later than 12 noon, Wednesday, February 9th, 1910.

By order,
JOHN NEAL,
Borough Comptroller.

Town Hall,
Ashton-under-Lyne.
18th January, 1910.

H. PIEPER of Liege, Belgium, the Proprietor of British Patent No. 4501 of 1905 for means for Controlling Electric Motors for intermittently working machines, is desirous of entering into arrangements with British Manufacturers with a view to the sale or commercial exploitation of the invention protected by the above Letters Patent.

Interested parties are invited to communicate with the undersigned for further particulars.

HENRY SKERRETT,
Chartered Patent Agent.
24, Temple Row,
Birmingham.

TELEPHONE SWITCHBOARD WIREMEN wanted for London, Glasgow and Manchester. Only men accustomed to the work need apply to Mr. NELSON, Central Telephone Exchange, Waterloo Street Parcels Post Office, Glasgow.

Cheques to be made payable to The Kilowatt Publishing Co., Ltd., and to be crossed London and Westminster Bank (Temple Bar Branch).

A Supplement "Electrical Engineering in Mines" is included (gratis) in "Electrical Engineering" on the first Thursday of every month.

Binding "Electrical Engineering."—Vol. V. of "Electrical Engineering" (Jan.—Dec. 1909) closed with our issue of Dec. 30. An index for the volume is now ready, and copies may be ordered from any newsagent or bookseller at the price of 1d. each (or post free, 2d.). Binding Cases, including index, are also ready, price 2s. each, post free 2s. 4d. (Abroad 2s. 6d.) Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to us, carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad.

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

SUMMARY

An article by Mr. S. W. Cuttriss describes some of the conditions of electrical development in Russia and Siberia, and urges that the openings for the application of electrical power in those countries should not be lost sight of by British manufacturers. Some Russian electrical statistics are given, and a good idea is afforded of the extent to which electricity is used.. (Page 57.)

Some particulars are given of the turbo-alternators constructed by the Allgemeine Electricitäts-Ges., of Berlin. The shaft and the rotor body are forged solid, and slots are cut in the latter to receive the teeth, which consist of packets of laminations rivetted together. Coils of copper strip wound on edge are placed in the gaps between these teeth, and are held in by metal wedges. The machines are enclosed and are provided with elaborate ventilating arrangements. (Page 58.)

In view of the fact that the Departmental Committee to inquire into the working of the Special Rules for electrical installations in mines will shortly be hearing evidence, we publish the chief points raised in a discussion on the subject at the Institution of Mining Engineers last summer. (Page 59.)

Mr. A. G. Cooper (Borough Electrical Engineer, Colne) writes with reference to the combined lighting and power meter recently described in our columns, and calls attention to a patent of his own for a similar arrangement. (Page 61.)

Among the specifications published by the Patent Office on Thursday last was one by G. C. Fricker and W. M. Mordey for an induction motor-meter. The rotor disc rotates between the opposing faces of a unipolar shunt stator, and the series coils are arranged all on one side of the disc in between the shunt poles. An iron screen separates the stator field system from the permanent brake magnet, and there is a separate brake disc.—D. K. Morris and G. A. Lister have protected a method of improving the regulation of alternators by connecting highly saturated, closed magnetic circuit choking coils across the phases.—H. F. Reason and The Reason Manufacturing Co., Ltd., describe a clockwork time-switch, in which the work required of the device when operating is considerably reduced.—A patent by Messrs. Siemens Bros. & Co. covering the well-known horn lightning arrester, and two patents by H. Hirst for cut-outs in which the fuse wire takes an irregular path round an insulating bridge, expire during the week, after the full life of fourteen years. (Page 62.)

Some particulars are given of the new generating station which is being erected for the Westminster Electric Supply Corporation in Horseferry Road. This is designed to accommodate ultimately 6,600 kw. of steam turbine plant and 14,000 kw. of converting plant. (Page 63.)

Under "Electrometallurgy and Electrochemistry" are given some notes on the use of calcium carbide

Digitized by Google

in Australia, and on the manufacture of nitrates from atmospheric nitrogen in Norway. (Page 63.)

IN a Paper read before the Manchester Section of the Institution of Electrical Engineers on Tuesday evening last, Mr. H. E. Yerbury criticised the usual methods of allocating the relative proportions of generating costs in combined lighting, power, and tramway stations, when determining the charge to be made for energy supplied to the tramways department. A detailed comparison was made between the total fixed costs of 0·865d. per unit assumed chargeable to the tramway department at Manchester, and a figure of 0·371d. obtained in the independent tramway station at Sheffield. The assumption that the difference is justified by the expense incurred in providing plant for the tramway peak load, and in conversion from A.-C. to D.-C. was characterised as incorrect. It was suggested that the charge should be based on capital and running costs in connection with the plant essential to the tramway supply only, with the addition of a profit of from 3 to 5 per cent. on the running costs. In the discussion Mr. Pearce justified the charges determined at Manchester; Mr. J. R. Salter asserted that many lighting stations actually owed their existence to the tramway departments; and Mr. Watson and other engineers also spoke. (Page 64.)

THE appeal of the British Westinghouse Co. against the judgment of Mr. Justice Joyce, in which the Bremer flame arc lamp patent was declared invalid, has been before the Appeal Court since Thursday. After hearing lengthy arguments on both sides, the Court on Tuesday reserved judgment. (Page 66.)

THE Dundee Corporation have settled, for £1,350, a claim with regard to failure to supply electrical energy.—The London County Council have decided to proceed with the construction of the Woolwich-Eltham tramways upon an overhead system with an insulated return (using two wires for each track).—The Winchester Corporation have served a notice upon the local supply company of its intention to purchase.—The first section of the electric tramways at York has been opened for traffic.—A report has been presented to the Australian Government to the effect that the measured rate system of charging in connection with the telephone service has proved unremunerative.—The Australian Postmaster-General has promised to give preference in departmental electrical contracts to wire made from local raw material. (Page 66.)

LOW-TENSION cable is required at Belfast; a Lancashire boiler and superheater at Bolton; and mains at Islington and Swansea. Particulars are given of the proposal of the Coventry Corporation to spend £54,000 upon new plant. Service-boxes, cut-outs, and meters are required at Beckenham, and mains at Worksop. (Page 69.)

IT is rumoured that the General Electric Co. of New York and the Westinghouse Co. of Pittsburg (and possibly a third undertaking) are to be amalgamated. (Page 69.)

A DIVIDEND of $1\frac{3}{4}$ per cent. per annum is declared upon the ordinary shares of the City & South London Railway Co., and 2 per cent. upon those of the Central London Railway Co. The report of the East London Railway Co. states that the lessee companies are still unable to agree upon a system of electric traction for this line. The Metropolitan Railway Co. declare a dividend of 1 per cent. for the past half-year. (Page 70.)

Wireless Telegraphy.—The Bill which has been introduced in the Canadian House of Commons with regard to cable and wireless telegraph companies provides that all such companies must file their tariffs with the Railway Board within four months of the passing of the Bill.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 27TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. "Equitable Charges for Tramway Supply," by H. E. Yerbury.

FRIDAY, JANUARY 28TH.

Institution of Electrical Engineers: Leeds Section.

6.30 p.m. Annual Dinner at Hotel Metropole.

SATURDAY, JANUARY 29TH.

Institution of Mining Electrical Engineers.

4 p.m. At Park Hotel, Cardiff. Discussion on a Paper on "Shocks," by W. Maurice.

4 p.m. Grand Hotel, Whitehaven. Discussion on a Paper on "Shocks," by W. Maurice.

TUESDAY, FEBRUARY 1ST.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology. "Face-plate Type Starters and Control Apparatus," by J. G. Travis.

Institution of Engineers and Shipbuilders in Scotland.

8 p.m. At 29 Elmbank Crescent, Glasgow. "The Design of Surface Condensers," by R. M. Neilson.

WEDNESDAY, FEBRUARY 2ND.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "Direct Current Railway Motors for High Voltages," by E. V. Pannell.

Royal Society of Arts.

8 p.m. At John Street, Adelphi. "An Improved Method of Electroplating," by A. Rosenberg.

FRIDAY, FEBRUARY 4TH.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "History and Manufacture of Electric Glow Lamps," by L. Wallis.

Telegraph Traffic.—A fairly quiet week has passed in the telegraphic world, but the El Arich route was down between L'Attaqui and Beyreuth on the 17th inst., and the line between Bagdad and Bassorah failed on the following day. Direct communication between Saigon and Bangkok was restored on the 18th inst., and on the 19th inst. the telegraphs to Sitoebondo, Bandjermasin, Balikpapan, and *viâ* Makassar, ceased operating. Telegrams for Mevado, Kwandang, Gorontalo, Makassar, Balikpapan, Moearadjawa, and Samarida can only be sent *viâ* Yab, and those for other places in the Netherland Indies *viâ* Saigon, Singapore, or Cocos-Islands. The Government of Uruguay introduced censorship on the same day. On the 21st inst. the line between Sitoebondo and Balikpapan was restored to working order, and on the 22nd inst. the Bagdad and Bassorah line was once more added to the active list. The Commercial Cable Co. has also had to attend to a faulty line.

Accident at the Tareni Colliery.—At an inquiry into the circumstances attending the death of two men as the result of the flooding of the Tareni colliery, Ystalyfera, Wales, the jury returned a verdict of accidental death, and attributed the death of the men to electric shock, and in one case to drowning also. It appears that the men were up to their waists in water, and had grasped hold of a cable for support. The electrician gave evidence to the effect that he had examined the cables on the morning of the accident, and had found nothing wrong, but that he found the insulation bad in one spot after the flood. According to the *Colliery Guardian*, the doctors did not agree as to the cause of death, one asserting that they had only received minor shocks, and that their death was due to suffocation by drowning. No blame was attached to the colliery company.

Petrol-Electric Motor Boats.—An article in our contemporary, the *Motor Boat*, describes the application of Mr. W. P. Durtnall's patent "Paragon" system of three-phase variable-ratio transmission to the driving of petrol-engined motor boats. The variation of the system described provides for three speeds, which are obtained by supplying currents at three different frequencies to the induction motor which drives the propeller. The generating plant driven by the engine consists of two machines, one an ordinary three-phase alternator with a small exciter, and the other a machine with three-phase windings on both stator and rotor; this latter machine acts as a frequency transformer, and, by applying current from the main generator to the rotor slip-rings, current is delivered at the stator terminals at a frequency above or below that of the main generator, according to the direction of rotation of the field produced by the primary current in the rotor. Then three different frequencies are obtained by using (1) the main generator alone, (2) both machines coupled to add their frequencies, and (3) both machines coupled to subtract their frequencies. By altering the motor connections a reverse is obtained. It is stated that a barge on the lower Thames is being fitted on the system, and that a scheme is in hand for a cargo boat propelled by a 160 b.h.p. suction gas engine with this transmission.

THE ELECTRICAL OUTLOOK IN RUSSIA AND SIBERIA

By S. W. Cutfriss

CAN any good come out of Russia or Siberia, the land of snow, wolves, and fettered convicts? Childhood's early training and the teaching of a sensational Press would answer, No! That such a reply is far removed from the truth, and that Russia is by no means so desolate as she is pictured, is a fact that is gradually dawning on the mind of Englishmen to-day, and instead of a country to be shunned, he finds it one of great commercial possibilities, encouraging the influx of outside capital and energy to develop its enormous natural resources.

Russia at present is not what might be called a manufacturing country, and therefore the demand for machinery and electrical goods is comparatively limited; but such a state of things is not likely to continue long, as the country is now passing through a period of industrial and commercial fermentation. The institution of the Duma, the cessation of transportation of criminals to Siberia, and guarantees which have been given for constitutional government, promise greater security for commercial ventures, and the country is already feeling the benefit. Since the natural resources of the country in agriculture, minerals, and forests are so great and practically undeveloped, and transport facilities are being rapidly improved, there is no apparent reason why in the near future the demand for machinery of all descriptions should not increase enormously. The Siberia of convicts and desolation is rapidly disappearing before the reaping machine, the gold dredge, the timber yard, and the booming towns. All this means openings for the application of electrical power, and British manufacturers will do well to keep their eyes open in that direction, which is already being keenly competed for by other nations. The growing friendly feeling between Great Britain and Russia is being evidenced by the formation of a Russo-British Chamber of Commerce in conjunction with the Russian Section of the London Chamber of Commerce, and already good results have accrued in smoothing the way for Anglo-Russian trade relations.

In an able article on the "Industrial and Commercial Resources of Siberia," by Mr. H. G. Read, which appeared in a recent number of *Cassier's Magazine*, it is stated that manufactories run on commercial lines are needed in all the large trading centres. At the present time there are hundreds of little works scattered about at long distances apart, many of them run by horse-power and others without any power at all. Practically all machinery is imported into Siberia from Russia and abroad.

The principal seat of the Russian electrical industry centres round St. Petersburg and Riga, but Moscow has developed considerably in that direction lately; the firms doing business there, however, are principally of foreign origin. In the Russian Empire there are thirty cities which possess an electrical tramway system, and among the 1,802 towns there are only 886 lighted at all. Of these seventy-four are provided with electric light and thirty-five with gas. In Central Asia electric light is unknown, and in Siberia one city only is lighted by gas and five by electric light. In the Caucasus and Vistula districts oil lighting is employed. Among the 224 towns in these districts this system is adopted by 172, while only eleven are provided with electricity and eleven with gas. In Eastern Russia there are 762 towns, of which fifty-seven are lighted by electricity, twenty-three by gas, 631 by petroleum, and 120 have no municipal lighting system at all.

The following figures taken from the *Anglo-Russian Gazette* show that electrical undertakings in Russian cities are very remunerative. The net profits of the works of the city of Vilna were £8,385, or 50 per cent.; Vologda £1,807, or 39 per cent.; Minsk £1,484, or 38 per cent.; Nicolaiev £3,455, or 33 per cent.; Orenburg £3,806, or 44 per cent.; Poltava £2,864, or 49 per cent. It is not stated whether capital charges have been included in arriving at the above results.

This article owes its inspiration to a journey which the author recently completed across Russia to the far north of Siberia, and which gave him the opportunity of making personal observations on the present position of the electrical industry in that part of the country through which he passed. Like others who have come in actual contact with the Russians and seen the country itself, it was very evident how little Englishmen understand the one, and what possibilities for profitable investment are present in the other.

Ekaterinbourg, one of the towns visited, is an important town of some 60,000 inhabitants, situated on the eastern slopes of the Ural Mountains. The electrical works are controlled by a French company, and the load is a purely lighting one. The engineer was most courteous in allowing an opportunity to inspect the generating station, but a want of familiarity with the language prevented the obtaining of many statistics which would have been of interest to engineers in this country. For the day load a vertical twin-cylinder gas-engine of apparently 60 to 70 h.p. is used. It is supplied with gas from a producer on the premises. The fuel is wood (silver birch being the timber universally used for firing purposes in the country), and the gas is stored in a large holder. The engine worked very steadily, and although it was not a recent installation, it had never given any serious trouble. The night load is taken care of by a steam plant consisting of three wood-fired Babcock & Wilcox boilers supplying steam to several direct-coupled generating sets, all of Continental manufacture. A large storage battery is installed, which was apparently charged from the gas-engine set. The plant throughout is well up to date, and includes a CO_2 apparatus. The distribution system is three-phase at 2000 volts 50 periods. The high-tension wires are carried overhead on poles, being supported from independent wires by small insulators placed every few yards apart. The roads are illuminated by enclosed arc lamps suspended over the centre; but they are by no means extravagant in the use of light, as a single lamp does duty where at least three would be used in England. The house wiring is on the usual Continental system at 110 volts, and metal filament lamps are freely used. The price charged is equivalent to 10d. per unit. How would our engineers like that?

Electric lighting has been adopted to a limited extent on the railways, some of the express trains being illuminated throughout by that means. In addition to the lamps on the roof each compartment is provided with a portable standard. The illumination of the ordinary trains is atrocious, a single candle generally having to do duty for two compartments.

On the river Ob there are some very fine passenger steamers, which are illuminated throughout by electricity in a thoroughly workmanlike manner. Few of the smaller boats, however, have yet adopted the system. Where such has been the case the work is of a very primitive nature, the fittings being apparently a scratch lot, quite unsuited for ship work. However, one is thankful for small mercies, even when the filament is nothing better than a red-hot wire, with an exasperating predilection to total extinction at times.

Digitized by Google

The telephone is almost unknown in Russia, being adopted in only fifteen cities. What a contrast to a country like Norway, where telephonic communication is practically universal throughout the land.

In a report on the projected development of means of land and water communications in Russia, the Minister of Public Works states that during the next few years there will be built many steam and electric railways, canals, and roads for connecting up all the important places and opening up the interior. Among other important improvements which the Government has inaugurated is the installation of a chain of wireless telegraph stations, placing Eastern Russia in direct communication with the furthest part of Asiatic Russia. The intention of the War Department is to erect a number of intermediate stations extending from the Baltic seaboard to the Pacific Coast of Siberia, and it is calculated that three or four stations will be sufficient to permit of messages being transmitted direct from St. Petersburg to Vladivostock.

Germany at present holds the lion's share of all the electrical business in Russia, not merely through imports, but also in the number of electrical works, which are wholly or partly controlled by German firms. Belgian and German firms are usually represented by an engineer who has the advantage of being skilled in the commercial as well as the technical side of the business, and speaks both Russian and German.

Surely there are no insurmountable difficulties in the way of English manufacturers and exporters securing a fair share of the Russian business. Taking into account the vast possibilities of the field which Russia and Siberia present, there is bound to be a large import for many years to come, as the home industry is not large enough to supply the needs of the country. Those who are best informed believe that the next few years ought to see a trade boom in that country on an unparalleled scale.

The man who wants to do business there must be prepared for a state of affairs different from that obtaining in England. A commercial traveller ought to have a fair knowledge of the Russian language, and also of German, as the latter is rapidly replacing French in commercial circles. He ought to study the real needs of the trade before he attempts to begin his campaign, and it is absolutely necessary that manufacturers should be prepared to give extensive credits. The Russian monetary system is largely based on the well-being of the agricultural portion of the community. Since money is only turned over at times of sowing and reaping, it means that six monthly credits will be asked for, and even longer periods, and the Russian merchant is usually prepared to pay a good rate of interest for such accommodation. Practically everything in the electrical line is imported, and, although there is competition already, the prices paid are such as to leave a fair profit to the manufacturer. If English firms wish to secure a share of the trade it is no good adhering to British currency and measures. They must be prepared to spend considerable money in catalogues and attractive circulars printed in the vernacular, quoting prices in roubles, and adopting either the metric or Russian system of weights and measures. Commercial travellers require a special trading permit in addition to their passport, which will cost about £4, and this has to be renewed annually. This permit has to be shown to the tax inspector before the traveller is at liberty to call on any firm. Travelling expenses must be allowed on a liberal scale, as hotel life is much dearer than in England, and a good dinner is often the easiest road to securing a desirable bargain.

In conclusion, the writer would recommend all who wish to keep themselves *au fait* with the commercial movements of the Russian Empire to peruse the *Anglo-Russian Gazette*, a weekly paper which devotes itself entirely to that subject.

A.E.G. TURBO-ALTERNATORS

SOME weeks ago we gave particulars of the impulse type steam turbine developed by the Allgemeine Elektricitats Ges., of Berlin, and supplied in this country by the Electrical Co., Ltd. (See ELECTRICAL ENGINEERING, November 4th, 1909, Vol. V., page 951.) In this turbine all the drop in pressure takes place in the nozzles. The steam flows axially through radial blades, and, changing its direction in stationary vanes, traverses a second row of blades on the same wheel. The following information with regard to the turbo-alternators manufactured by the same firm is of interest.

The chief feature in which the A.E.G. generators differ from those of other manufacturers is in the construction of the rotor field system. The shaft is a solid steel forging, the centre thickened part of which is provided with dove-tail slots all round its periphery. In each of these slots is placed a series of packets of stampings to form the teeth. The stampings are riveted together under hydraulic pressure, and are widened at the base to fit into the slots, and also widen out at the top to hold in the wedges. By this means the windings and wedges are retained against the enormous centrifugal forces. The windings are of copper strip wound on edge, and these are pressed up into shape, and insulated before insertion into the slots. The slots in the centre of each set of coils are filled up with metal bars and wedges to balance the rotor dynamically. Wire is wound over the ends of the coils, and vanes are attached at each end of the rotor to force a current of air under the ends of the coils and through the axial ducts which are provided in the laminated teeth. There are also radial ducts between the separate packets of teeth stampings, and the air escapes through these to the air gap, and thence through the stator ducts to the main outlet under the frame. The wedges over the windings are of a non-magnetic metal, but those over the bars in the centre of the poles are of iron, as are also the bars themselves. After being inserted in the slots, the wedges are turned down at their projecting ends, and are electrically connected together by short-circuiting rings at each end. They thus act also as a damping winding to prevent sudden fluctuations in the main field. The wedges press the windings inwards on to the solid shaft body, and tend to draw the teeth outwards, thus fixing them in the slots in the shaft. A most rigid construction is thus obtained.

The field coils are wound by a special machine, and layers of an insulating material suitable for the high mechanical pressure are interposed between the strips. Each coil is then compressed, bent into shape, insulated, baked at a high temperature in a vacuum oven, and thoroughly tested before its insertion in the slots of the rotor. The slip-rings are of steel, and are shrunk on to the shaft from which they are insulated by a layer of micanite. Before leaving the works, every rotor is run at a speed 50 per cent. above the normal in a special testing room, but before this is done, a balancing test is made. The rotor is run in bearings supported between springs on steel balls free to move in a direction at right angles to the axis, and the balancing weights are adjusted until both bearings remain steady.

The stators are totally enclosed, and the cooling air is drawn in through cloth filters at both ends under the bed-plate from the outside of the station, passed through the machine, and sent out through a central exhaust aperture. Enclosing the machine not only enables the air to be passed through the various parts in an ordered sequence, but prevents dust, oil, and steam from being sucked in, and considerably lessens the noise. A 1,000 kw. machine takes some 200 cubic metres of air per minute, a 6,000 kw. machine some 750 cubic metres. The stator windings are caried out in the form of bar-windings or threaded coils, according to the output and generating pressure; even for such high pressures as 20,000 volts, the coil ends are turned back and clamped down to the stator end plates in the usual way.

Electrical Engineers' Ball.—The ball of this year is to be held, as on previous occasions, at the Hotel Cecil, on Friday, February 4th. The success is already well assured. The names of the following gentlemen appear on the committee for the year, and through them only can tickets (one guinea each) be obtained:—Messrs. H. Alabaster, O. H. Baldwin, J. Horace Bowden, E. G. Byng, Guy Burney, T. Browett, J. Carlton, E. A. Carolan, A. C. Cramb, F. W. Crawter, Sydney Dobson, P. W. D'Alton, R. S. Erskine, A. L. C. Fell, G. Flett, E. J. Fox, T. E. Gatehouse, Sir J. Gavey, W. Geipel, Jas. Gray, R. K. Gray, A. E. Hadley, R. Hammond, Harold E. Harrison, J. S. Highfield, H. Hirst, W. Judd, J. E. Kingsbury, E. M. Lacey, W. E. Lane, H. M. Leaf, W. L. Madgen, W. Lee Matthews, H. T. S. McKay, P. V. Mahon, W. M. Mordey, Lee Murray, F. H. Nalder, Major W. A. O'Meara, Messrs. G. W. Partridge, Hugh A. Pearson, J. Petersen, J. S. Raworth, J. H. Rider, Martin F. Roberts, Leslie S. Robertson, L. L. Robinson, P. F. Rowell, W. Rutherford, Sydney Sharp, Alex. Siemens, A. M. Sillar, Frederick Smith, J. Spagnoletti, C. P. Sparks, T. E. P. Stretche, G. Sutton, C. D. Taite, J. Taylor, R. J. Wallis Jones, and C. H. Wordingham. Executive Committee, Messrs. P. V. MacMahon, Martin F. Roberts, and R. J. Wallis Jones. Hon. Treasurer: Mr. J. E. Kingsbury. Hon. Secretaries: Messrs. A. M. Sillar and H. Alabaster.

SAFETY PRECAUTIONS IN MINES

IN view of the fact that the Departmental Committee to inquire into the working of the Special Rules for electrical installations in mines will shortly be hearing evidence, it is as well to recall the discussion on the Paper read by Mr. Robert Nelson (H.M. Electrical Inspector of Mines) before the Institution of Mining Engineers last May, and we publish below the main points which were raised by the various speakers, so that our readers may have an indication of the various directions in which the revision of the Rules is probable. The Paper itself was published, in slightly abbreviated form, in our issue of June 10th, 1909 (Vol. V., page 527).

Mr. W. H. PATCHELL (Consulting Electrical Engineer, London), who, it will be remembered, was a member of the Home Office Committee which framed the special rules for the use of electricity in mines, said that surface work must not be overlooked, as there was some very bad work at the surface in connection with colliery undertakings, and just as much damage might be done by a fire at the top of the downcast shaft by the smoke and fumes being carried down as by a fire in the pit itself. Generally, the danger of fire was as real as danger from explosion or shock. It must be borne in mind that a shock, not dangerous in itself, might prove serious when the man's foothold was insecure. He did not share the author's antipathy to floor trenches; if the leads were brought in under the floor (whether the motor was above ground or underground), and then only brought up to the machine protected, they were safer than if they were brought up a wall and across the ceiling. Personally he had always preferred to have the neutral of a three-phase system earthed, but at the same time he had every sympathy with the man who did not want to earth his neutral. After a condemnation of "shoddy" temporary work, the speaker expressed disagreement with Mr. Nelson's advocacy of gas-tight joints, because every time an oil switch was broken there might be a slight evolution of gas, and he therefore preferred ventilated boxes. Instead of the narrow covers which were employed, and the gasket which was used so frequently, he preferred a good big flange with proper ventilation through the lid or side; a flame-tight case was wanted, and not a gas-tight case. He differed from Mr. Nelson where he said that a Home Office rule required that all motors, located in places where General Rule 8 applies, should be totally enclosed if they were not separately ventilated with intake air. The words used in the rule (No. 37) were, "completely enclosed in flame-tight enclosures." Mr. Nelson's interpretation of the rule should bar out plate protection, which he (Mr. Patchell) thought was the best thing. In support of the use of plate protection, he read some notes on a test of a motor protected in this manner made by the Lahmeyer Electrical Co. The motor was placed in a room containing an explosive mixture of firedamp and air, and the gas inside the motor was lighted by sparks from an induction coil, but the fire did not penetrate the cover of the motor, and the fumes were at all times sufficiently chilled so as not to ignite the surrounding gases. He submitted that a motor of that type was far safer than a totally enclosed gas-tight motor, because one could not absolutely enclose the motor. When the air inside expanded it must be driven out over the shaft or through the joints, and when the motor cooled again gas was sucked in. One could not stop the machine from "breathing." He agreed with the author's advocacy of switches with trip coils, instead of fuses. As a check on transformer heating, when he had had transformers in a difficult place, he had arranged a thermometer with contacts, one a little above the normal temperature, and another higher up which closed the circuits of an alarm-bell and a fire-bell respectively.

Mr. S. F. WALKER (Bath), while endorsing many of the author's opinions, expressed disagreement on certain points.

Mr. JOHN GERRARD, H.M. Inspector of Mines, Manchester District, agreed with Mr. Patchell's remarks with regard to fire. In his own district he had had three fires from electricity, but no explosion. He was not satisfied with electric coal cutters, and, after discussing the question with those who used them, he thought that greater safety was assured by the use of compressed air.

Mr. ROSLYN HOLIDAY (Ackton Hall Colliery) took exception to the author's recommendation that armoured cables should be used from end to end. Falls of roof or risings of floors were apt to break the armouring, and there was also corrosion from water, all of which was difficult to make good again in the pit. One could not solder or even make good surface contact on steel or iron armouring. If one's earthing were not perfect right through to the surface, one was putting danger into the pit: a fall might stab the armouring into the core and make the armouring alive throughout its whole length. He strongly supported the author in saying, "Have your cables in view." He admitted the risk of a fall and bringing the cable in two and producing an arc, but there was the same risk of a man knocking his lamp and breaking the glass. On the other hand, he thought there was less risk with unarmoured cables which were thoroughly inspected than with armoured cables.

Mr. G. G. L. PREECE (W. T. Glover & Co., Ltd.) said that the earthed outer system was not so safe in operation as it might seem. He had seen arcing on this type of cable through slight deterioration of the insulated inner conductor. It was almost impossible to avoid leakage at cable ends in colliery installations, and it was this leakage, combined with pit water, which as a rule was a good electrolyte, that caused the corrosion of the lead. This showed itself mostly at cleats and other points of contact with earth, and could be minimised by keeping such places dry and clear from wet dirt. Once the lead was attacked the paper or fibre insulation soon failed, and innumerable instances of the failure of lead-covered cables could be found. He considered them impossible for continuous current and inadvisable for alternating current. He had seen yards and yards of lead sheathing burnt away without giving any warning. Vulcanite bitumen cables had, without doubt, proved to be the most successful in mines, and 75 per cent. of inquiries and orders from collieries were for this type. The possession of a cable in which the ends could be left free, and which, when an accident occurred, left the fault fairly local in its damage, was surely an advantage. The cable could be wire-armoured throughout, with double-wire armouring in the shaft, and single-wire armouring in the workings, and just as good an earth could be got as with a paper lead-covered cable. Complete metallic sheathing by wire armouring was, however, not an unmixed blessing, as there had probably been more cases of shock with armoured cables than with unarmoured cables. The majority of managers preferred the latter. He quite agreed that an armoured system continuously earthed was safer, but there was always the difficulty of continuous earthing, and when repairs were made the armouring had been found to be not properly bonded. Unarmoured cables with heavy braiding, as a rule, came off much better than armoured cables in cases of fall, as they "gave," whilst the latter had the armouring forced into the insulation. Armoured cables required frequent inspections, and such frequent inspection would make unarmoured cables equally safe. The Merz-Price system was theoretically right, and acted well in the north of England for cutting out faulty feeders, but it would hardly prevent an arc from appearing externally; even steel tapes over cables would not. He agreed with the author's recommendation to use unarmoured cables with earth wires as trailing cables.

Mr. B. WELBOURN (British Insulated & Helsby Cables, Ltd., Prescot) said that there was a large body of men in the country who were at present thinking of electrifying their pits, and who got contractors to give them advice. They became hopelessly bewildered, but in the end they usually did the right thing and brought in a consulting engineer. He thought there were no less than 200 miles of cable and 70,000 h.p. of plant protected by the Merz-Price system. It had never failed to isolate a fault, and had isolated it within 1/20th of a second of its happening.

Mr. W. C. MOUNTAIN (Ernest Scott & Mountain) said in his opinion there was too much automatic gear about collieries. He believed that the bulk of breakdowns which had occurred, particularly upon the continuous-current system, had been due to badly erected installations going to earth, which put a heavy strain on the insulation of the machinery. Whatever theoretical advantages might exist in favour of an earthed system, the practical disadvantage was so great that he had always hesitated to adopt it. The trouble with automatic gear was that it gave out and cut off the supply at inconvenient moments, for instance, in starting up a heavy haulage plant or on a sudden overload arising. A time limit could be provided, of course, but this again meant additional complication. He thought a great deal of caution was necessary before adopting lead-covered cables. His experience during the past 20 years indicated that, in nine cases out of ten, lead-covered cables were so badly acted upon by the pit water that they had to be taken out. He preferred a waterproof insulation protected by a heavy serving of jute and thoroughly compounded, and if unarmoured the cable should be coated frequently with preservative paint. He had found that the soundest protection for shaft cables could be obtained by running the cables from the shaft top to the bottom in wooden troughs. The troughs must be very strong, and the cables should be put in coated with a mixture of pitch and tar or bitumen, and the covers screwed on whilst the composition was hot. His experience of rubber-covered cables in pits had been very disastrous, as the warm air and dampness acted upon the rubber. Some armoured bitumen cable used to replace rubber cables had been working for many years without giving trouble. Mr. Mountain also mentioned the heavy starting current required by squirrel-cage motors. In one case of a 50-h.p. motor, the starting current was so heavy that it lowered the voltage sufficiently to stop practically all the motors in the pit. Another

Digitized by Google

50-h.p. squirrel-cage motor connected to a 200-kw. dynamo, and used to work an endless haulage gear, caused the volts to drop from 440 to 270 at starting, and took five or six times its full-load current. He thought the size of earth connection mentioned by Mr. Nelson was unnecessarily large. For earthing ordinary armour and motor casing, he considered a solid copper wire of from 3/16 to ¼ in. diameter sufficient, but, of course, with an earthed neutral, larger earth connections were necessary. He had a strong objection to totally enclosed motors, for they were "out of sight and out of mind," and received practically no attention. Except for coal cutters, where it was necessary to have enclosed motors as a protection against falls of roof, he did not think there were many places in a pit where electricity need be introduced when gas was present. There was, however, no difficulty in making a motor which could be rendered proof against firedamp and at the same time would admit of ventilation

Mr. J. W. FRYAR (Eastwood Collieries) said that the majority of colliery installations were small, and did not warrant the employment of skilled electrical engineers. The ordinary men in charge would not be able to use delicate instruments, and it was better for the colliery manager to get a sound practical job rather than have a number of refinements. On the question of cables he pointed out two disadvantages of lead-covered cable: one was that it had to be made in shorter lengths than plain insulated cable in order to manipulate it in the pit, and another, that one could not wipe the joints, as General Rule 8 would not allow this.

Mr. H. W. CLOTHIER (Reyrolle & Co.) said that insufficient attention was paid to technical considerations in mining switchgear, and in the majority of instances, price had more influence than efficient protection and other technical details. Collieries would run less risks if qualified men were allowed more scope in the selection of electrical apparatus. Speaking of the Merz-Price system of protection, he said that his company would be prepared to demonstrate the possibility of isolating a faulty cable before the flashing occasioned by the fault could have time to create an explosion. The question of earthing the neutral on low-tension systems was open to discussion, as the first consideration was to prevent the possibility of a serious sparking to earth. He agreed that it was advisable, whenever possible, to use automatic oil-break switches in preference to fuses, but on the other hand, for small capacities this meant an increase in expense, and the switches also require more attention to keep them working efficiently, and were likely to be tied out of commission. A good form of plug fuse, if enclosed in a strong explosion-proof box having metal to metal joints, could be used with safety. He did not agree with the author's recommendation of cartridge fuses, but preferred a small form of porcelain handle tubular fuse, as replacements were easier, and cartridge fuses were not always properly replaced. He did not think there was much practical value in the suggestion of packing a fuse box with slack wood. The risks of wiring for lighting inbye could be reduced by using low-voltage metal filament lamps. His firm supplied enclosed motor switch panels which contained small potential transformers, and this arrangement could be used for such purposes.

Mr. HENRY HALL (His Majesty's Inspector of Mines, Lancashire) said that accidents appeared to be somewhat on the increase, but perhaps it was because the number of installations were increasing: still, in 1908, he believed that 13 lives had been lost through electric shock. From listening to the Paper he had come to the conclusion that the difficulties in the way of installing electricity with absolute safety was such as to tax the ingenuity of even mining engineers.

Mr. M. H. HABERSHON (Sheffield) said that the danger of armoured cable came out prominently in the discussions at the time of the drafting of the Home Office Rules. The great development in the use of electricity for power purposes underground during the last twelve years, he continued, had been chiefly with continuous current. There was now a tendency to put down three-phase plant for pumping and hauling on a large scale; but there were probably more miles of cable in collieries underground used for the purpose of coal-cutting than for any other purpose, and the bulk of that was done with continuous current. Armoured cable was a source of danger, in consequence of the necessity of making the earthing continuous. Cables for coal-cutting were put down in numerous gates and cross-gates, which were only temporary, and had to be removed sometimes after only a few months. If the comparatively few accidents with electric cables in pits were analysed it would be found that the bulk of them had occurred with some type of armoured or concentric cables, and not with unarmoured cables. In coal-cutting, with machines running on sledges, and with continuous current, one could perhaps get quite sufficiently good earth from the sledge. After using coal-cutting machines for the last eleven years, and a considerable number of them entirely with the unarmoured cable, he could state that he had had no case of serious accident due to shock. The safest method of cabling for electric power underground was to have continuous current with two separate single-conductor cables placed on either side of the roadways, unarmoured. He would avoid, whenever possible, the use of an armoured cable in a roadway underground. The proper sphere for armouring was in shafts. In the evidence given before the Departmental Committee on the Use of Electricity in Mines, those who had had the greatest experience with electricity for coal-cutting were unanimous in the condemnation of armoured cables. In wet pits compulsory use of armoured cables would certainly stop electric coal-cutting. Personally, he would prefer to put up with any trouble in connection with the commutator rather than endure the necessity of using armoured cables. He believed that the three-phase system was cheap, but he strongly objected to the statement that it was safer than the continuous-current system.

MR. C. C. LEACH (Seghill) said that the people who had to work the apparatus had not been trained in electrical work, but they were men who, in some cases, could do very little more than read and write. If delicate instruments were used in mines, these men would not be able to handle them properly, and instead of being a safeguard they would be a danger.

MR. G. SCOTT RAM (H.M. Electrical Inspector of Factories) first referred to the Merz-Price system, which cut off the pressure immediately leakage occurred. This had been used very successfully in some of the largest electric power works in the North of England, but the conditions there were not the same as in a mine. The application of the system involving the use of pilot wires would be useful in the case of shaft-cables. Beyond that point, however, the necessity of putting in a pilot wire wherever one had a branch going to a different district would condemn it, as the small pilot wire might readily be broken, and the whole device would be out of order without anyone being the wiser. The method of using the system, without the pilot wire, had, he believed, not been tried. Mr. Patchell had very rightly pointed out that in the regulation referring to the use of motors in places to which General Rule 8 applied, the term "flame-tight," and not "gas-tight," was used. The term "gas-tight" was, however, used in connection with enclosures for switches and fuses. Mr. Patchell had also spoken about the "breathing" of motors with the variation of temperature. The same phenomenon happened in the case of a switch-box. One case which he had had to investigate a year or two previously showed the danger of such a box, which was supposed to be gas-tight, with very large cubical capacity. The box was about 4 ft. high, 1 ft. wide, and 10 in. deep; somehow or other the gas got in through the gas-tight joint, and the box was blown to pieces as soon as the man touched the switch to cut off the current. If earthing the cases of coal-cutters were neglected, one never knew that a fault had occurred until an accident happened: the machine might be quite in order until suddenly the insulation broke down somewhere, and it became alive, when someone would get a shock, and possibly be killed. There had been a number of fatal accidents in the last few years from coal-cutters. Earthing through the sledge of the machine was not sufficient. In one case which he had had to investigate the coal-cutter was on a sledge standing in 6 in. of water. The insulation broke down, and a man who was about 30 yards away came into contact with the haulage-rope of the coal-cutter, and was killed. It was extremely difficult to get a good earth locally in a mine. In his opinion, the only satisfactory method was to run a special earth cable (an old haulage-rope or winding-rope might be used) right through the mine from the surface, connected to a good earth-plate at the surface and another in the sump, and in as many other places as was desired. To put an electrical installation in the charge of a man who did not understand it was simply playing with fire. He mentioned one installation in which all the apparatus was oil-immersed; even the resistance grids were in oil, and were cooled by a water-jacket. But the safety of the whole was nullified by the terminals of the resistances being brought through the case. About fifty little ends of wires about an inch long were sticking up, and were connected with the leads by little two-penny connectors, with a small thumb-screw at each end, half of which were loose. Thousands of pounds had been spent on the installation with a special view to safety, and the whole thing was spoilt in that respect by the inability of those concerned to appreciate the importance of apparently trifling details.

MR. W. H. PICKERING (H.M. Inspector of Mines, Yorkshire and Lincolnshire) agreed that there was great danger of fire at the surface. Shocks would only be individual, and would not cause a very large loss of life during the year; but there was very great danger of big explosions and very serious fires being initiated by electricity. He had reason to believe that there had been several very narrow escapes. One case had come under his own notice some years ago, in which a stone fell from the roof upon an armoured trailing cable, cut it, and caused a gas explosion. Probably there were a good many cases of cables being cut in that way when there was no gas present. The hinged switch-box with the rubber ring around it was unquestionably a very bad design. He knew of one explosion at least which had been caused by a box of that sort. The author had advocated iron of a certain thickness, with the idea, on the principle of the safety-lamp, that even if there was a small crack the flame would be cooled down sufficiently not to fire the gas. He doubted whether

Digitized by Google

that condition would obtain. He knew of a case in which a man was burnt by a flash from a box made by a very good firm. It was not, however, of quite the thickness which the author advocated; it was perhaps ⅝ in. thick. The man was burnt on the arm, and if there had been gas there, it would have fired.

Mr. G. H. TWEDDELL (Whitley Bay) thought that it was highly desirable that the leading manufacturers and the Government Department concerned should consult together and conduct a set of experiments in England to settle definitely whether plate protection was safe.

Mr. JOSEPH S. MARTIN (H.M. Inspector of Mines, Bristol) referred to the opposition to Mr. Nelson's suggestions on the part of some members who pointed out that they had to deal with very small plants, that they had put them up more or less temporarily, and that they could not afford his elaborate precautions. Electricity was not a subject to be dealt with on those lines. To make "a thoroughly good job" of it would be far and away the most satisfactory and economical. It might cost a little more to employ efficient electricians to supervise the plant and to work it, but he was certainly of opinion that in the end it would be found that the expenditure of a few pounds in that direction would be very well repaid. He would not like to see electric coal-cutters, even with enclosed motors, working at the face of some of the South Wales fiery mines. Electricity might be made use of for driving compressors at places of comparative safety, whence compressed air could be taken into the faces.

Mr. WILLIAM MAURICE (Hucknall Torkard) wrote that there was no question as to the efficacy of perfect earthing when it could be carried out; but he was doubtful if it were possible to get it done in all colliery installations. There were many collieries with comparatively small outputs, where the plant was not sufficient to justify the maintenance of a staff of skilled electricians, and where such operations as flitting coal-cutters and moving up gate-end boxes were done by coal-cutter chargemen, perhaps under the supervision of a deputy. On the cable question, he said that there were many mines in which main-road cables ran little or no risk of injury, and in which probably a severance due to falls would cause no more inconvenience than temporary interruption of supply. He had laid some scores of miles of cable underground, and had repeatedly seen them buried by falls of roof; but did not remember seeing a cable either severed or damaged in such a way as to produce an arc. He had had an opportunity of inspecting the Merz-Price system of protection, and if he were laying out a new mining installation he would be disposed to adopt it. The risks of sparks in and about switch and fuse-boxes, plugs for trailers, and on small lighting circuits, should be considered seriously by electricians in charge. The tendency, which had been noted by Mr. Nelson, to design "explosion-proof" rather than gas-tight boxes, marked a definite advance in the evolution of electric mining gear, for it was extremely doubtful whether any so-called "gas-tight" box was ever gas-tight in a mine.

Mr. JAMES DOUGLAS (New York) admitted that in the United States there was a certain amount of recklessness, but he thought that such recklessness was more on the part of people than on the part of the mine owners, who were not so absolutely heartless and callous as they were usually described. In America they had had no great trouble in their coal-mines with deaths from electric shock, but in his copper-mines they had had several deaths.

MR. ROBERT NELSON (London), in the course of his reply, referring first to danger from fire, said that inflammable material should be kept altogether clear of electrical apparatus. On the interpretation of Special Rule 37, he pointed out that it laid down that the motors should have all their current-carrying part completely enclosed in flame-tight enclosures, and no Inspector of Mines had any other opinion than that the words pointed to total enclosure. He agreed with Mr. Gerrard that the less portable electrical apparatus there was in a gassy mine the better. He would not give way one inch on the question of armoured cables. The Merz-Price system of cable protection introduced no more "refinement" than an ordinary overload trip-coil, and it was no more complicated than apparatus in common use every day in mines at the present moment. Experiments were required, however, to show that this protective system would keep the sparks inside the cable. Squirrel-cage motors offered the best mechanical construction that could be obtained in a motor, and he advised mining engineers to demand squirrel-cage motors for every service for which their use was possible. He fully realised that limitation of the squirrel-cage motor, but wound rotors should be adopted for underground work only when unavoidable. He held that every colliery using electricity should have someone on the premises who knew something about it. It was not always possible to wipe the joints in connection with lead-sheathed cables, but wherever a joint was necessary a disconnecting-box with a well-designed mechanical joint for the lead could be used. It was very surprising to him that anyone at that time day of day should advocate direct current. He thought that there would be found a marvellous unanimity among electrical engineers that for colliery work three-phase current was much safer than direct current. Some Continental rules absolutely prohibited the use of direct current in gassy mines. If Mr. Habershon would read the report which the Departmental Committee published at the time when the Special Rules relating to the use of electricity in mines were formulated, he would find that the members of that Committee advocated the use of armoured cable. On the general question of using electrical apparatus in coal-mines in places where gas might appear, he had no opinion personally as to whether electricity should or should not be used in those circumstances. He was not a mining engineer. His object in writing the Paper was to submit for the consideration of the Institution what he believed to be the best methods of overcoming such difficulties as now existed. In conclusion, he might say that very often the choice between tenders for electrical apparatus in mines was decided upon price only. He thought that price should not be even the first consideration. Reliability should be the first consideration.

Mr. Nelson subsequently communicated to the *Transactions* of the Institution a more detailed review of the controversy of armoured *v.* unarmoured cables. Experience, he said, had confirmed what was shown experimentally to the Departmental Committee which sat in 1903, namely, that falls of roof produced far more damage to an unarmoured cable system than to one that was armoured. The effect of frequent falls on an unarmoured cable system was ultimately to produce bare parts, or, at the least, parts where the insulation resistance was seriously diminished. With a cable so damaged, all telephone wires, signal wires, and haulage ropes in its neighbourhood became possible sources of danger. The possibility of an arc appearing external to a cable was much increased if there were no earthed metallic sheath. On the other hand, with an armoured cable system, if the armouring were well earthed (and precaution must be taken to see that it was well earthed, otherwise the armouring was on the whole perhaps worse than useless); if, in spite of the metal sheath, one of the cores should become displaced and be crushed into contact with the earthed armouring, then the protective device, whether fuse or maximum cut-out, should make the circuit dead. Further, an armoured cable was much less likely to be cut in two by mechanical damage than was an unarmoured cable, and therefore there was less likelihood in the former case of an arc appearing external to the cable. An armoured cable system had also one great advantage in the ease with which an efficient earth could be secured for all inbye apparatus such as motor-frames, switch-boxes, junction-boxes, &c. In many cases the only means of securing as good an earth with an unarmoured cable system would be to run a special cable from the surface or the shaft-bottom for the purpose. Cheapness would seem to be the only recommendation possessed by an unarmoured cable system under average underground conditions. If a mine manager were content to have bare parts of cable and parts in process of becoming bare, it was certainly an easy matter to keep the supply going with an unarmoured cable system. Such a system would run, practically speaking, however poor its condition, risk of shock and risk of external sparking being ignored. An armoured cable system, on the other hand, if the armouring were connected to earth, demanded attention immediately it failed; otherwise supply could not be kept going. It did not, in short, encourage slipshod methods.

CORRESPONDENCE

COMBINED LIGHTING AND POWER METER.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In last week's electrical papers an "Ingenious System" of metering was described as being brought out by the Adnil Meter Co.

I might say that I took out Patent No. 14,113 for this system of measuring in 1894. I see this week, other people drawing attention to this "novelty," and one gentleman even patented it four years ago.

This patent was sold by me to the B.T.H. Co., Ltd., and put on the market as their "Duplex" type, but in those early days the objection raised to it was that the Supply Co. did not know whether a consumer had used 1,000 at 5d. or 2,000 at 2½d. This was rather a serious matter in those days when works were run on academical lines; possibly now that they are run more commercially, the Supply Co. will be satisfied if they know how much a consumer has to pay, and not bother about the percentage of units sold as compared with units generated.

Yours truly,
A. G. COOPER.

Electricity Department, Colne, Lancs.
January 22nd, 1910.

Russian Electrical Exhibition.—H.M. Commercial Attaché at St. Petersburg reports that the Imperial Russian Technical Society at St. Petersburg propose to hold an international exhibition there, between September and November next, demonstrating the application of electricity to railways.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 20th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

129 09. **A.-C. Meter.** G. C. FRICKER and W. M. MORDEY. In a meter of the induction motor type, separate rotor and brake discs are employed. The rotor disc rotates between opposing polar faces which form a uni-polar system, including part of the meter case, and a vertical core with a single shunt coil. Each pair of series coils, with or without cores, are arranged circumferentially adjacent, and both on one side of the disc, in an intermediate angular position with relation to adjacent shunt poles. The rotor may be of cylindrical form, with a suitable arrangement of the poles. An iron screen forming part of the permanent brake magnet separates the two magnetic systems. In order to overcome the initial friction error, a starting horn is pivoted between adjacent pole pieces, so that if inclined in the proper direction, it will give a torque with the shunt current only. Ten claims, seven figures.

282 09. **Metal Filaments.** W. D. COOLIDGE. Filaments squirted from a mixture comprising tungsten powder and a binding agent of cadmium, mercury, and bismuth, are baked in the presence of a gaseous reagent such as hydrochloric acid, chlorine, or hydrogen sulphide in order to dry them. The chemical compounds formed are removed during the sintering treatment. An alternative method consists in baking the wires in a packing of metallic powder, which combines with the mercury and cadmium. These processes are said to prevent the formation of globules of the molten binding agents on the surface of the filament during baking. A special furnace for baking and sintering is described. Four claims, one figure.

353 09. **Time Switches.** H. F. REASON and THE REASON MANUFACTURING CO., LTD. The hour arbor of a time piece is provided with an adjustable dial with inner and outer flanges, between which are marked the hours. The flanges are slotted and the slots can be moved opposite any given hour on the dial. A release lever pivoted on the frame, and controlling a switch, has a pin engaging the dial flanges. When a slot moves round so as to allow the pin to move, one movement of the switch is effected, and when the second slot coincides with the position of the pin, the second movement is made. Five claims, three figures.

416 09. **Regulation of Alternators.** D. K. MORRIS and G. A. LISTER. Choking coils with closed magnetic circuits working at a high flux density, are connected across the phases. On a fall in pressure due to increasing load, the magnetising currents taken by the coils are much diminished, and the counteraction of the coils on the exciting field reduced. Auxiliary transformers may be used with their secondaries in series with the choking coils, for the purpose of further reducing the pressure across the choking coils on an increase of load. Two claims, three figures.

764 09 and 11,947 09. **Trolley Head.** E. M. MUNRO and THE RAILLESS ELECTRIC TRACTION CO., LTD. These specifications relate to the trolley head employed by this company for their trolley bus, and described and illustrated in ELECTRICAL ENGINEERING, Sept. 30th, 1909, p. 855. The method of compensating for the side strain by using horizontal springs on the arm base, and the construction of the rotating pivoted head are described. Ten claims, nine figures in all.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: HANISCH and REGINA BOGENLAMPENFABRIK GES., 1,815 09; SENFTNER [Electrodes] 8,150-1 09.

Dynamos, Motors, and Transformers: ROBERTS [Pump-motors] 12,364 08; LAKE (*F. Bissel & Co.*) [Sewing-machine motors] 753 09; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Control of motors for ship propulsion and for ventilating fans] 2,176 09, and [Driving of looms] 20,034 09.

Electric Ignition: DAIMLER MOTOREN GES., 25,967 08 and 29,615 09; DIER and PRIMEAU [Lighting gas-burners] 18,680 09.

Electrometallurgy and Electrochemistry: GIBBS [Production of metallic articles by electrodeposition] 20,858 08; DASSONVILLE [Electrolytic cleaning and bleaching] 3,200 09; SCHOTT and GEN [Electrolytic apparatus with liquid anode] 14,288 09; MILLS (*Van Winkle*) [Electroplating baths] 16,951 09; PAULING [Production of nitrous gases] 22,037 09.

Incandescent Lamps: HIRST and WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD. [Manufacture of filaments] 142 09.

Instruments and Meters: DENNY and JOHNSON [Electrical torsiometer] 3,814 09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Recording devices for instruments] 17,765 09.

Switchgear, Fuses, and Fittings: HORSTMANN and EDGAR [Time switches] 32 09; DRYSDALE [Coupling] 194/09; SIR W. G. ARMSTRONG, WHITWORTH & Co. and MURRAY [Step-by-step movement gear] 439 09; BELCHER [Tumbler-switch] 3,130 09; TUCKER [Switches] 3,877 09; RUTZKY [Insulators] 6,161 09; CLARKSON [Conduit fittings] 14,532 09; ZEE [Switches] 18,012 09; HOFMANN [Traction controller handle] 20,378 09; BUISSON [Conduit fittings] 21,855 09; LUNDBERG [Switches] 22,896 09.

Telephony and Telegraphy: KNUDSEN [Wireless transmission of pictures] 23,570 08; YEARNEAU [Telephone rent collecting] 1,896 09; AITKEN [Telephone switches] 4,173 09; MARCONI and MARCONI'S WIRELESS TELEGRAPH CO. [Wireless apparatus] 8,581 09 and 11,544 09; AITKEN and BRITISH INSULATED & HELSBY CABLES, LTD. [Telephone sub-station switching systems] 16,643 09.

Traction: EDMONDS, and MCKENZIE & HOLLAND, LTD. [Electrically operated points, frogs, and signals] 21,398 08; FOX and RAILLESS ELECTRIC TRACTION CO. [Traction system] 2,933 09; BOWLES [Brake] 25,113 09; KOHLER [Collector for overhead systems] 26,348 09.

Miscellaneous: PALMER [Electric signs] 25,882 08; THOMAS and HINE [Automatic electric organ] 91 09; SANDERSON [Make-and-break device] 272 09; PEAKE, and CAMBRIDGE SCIENTIFIC INSTRUMENT CO. [Thermo-electric pyrometers] 370 09; SCHRÖDER [Alarm clock] 13,523 09.

The following Specification is open to Inspection at the Patent Office before Acceptance, but is not yet published for sale.

Miscellaneous: PRAT [Forced-draught fan] 13,720/09.

Amended Specifications Published

The following amended Specifications can now be obtained

22,031 02. **Mariners' Compass.** BARON KELVIN, F. W. CLARK and KELVIN & JAMES WHITE. The compass bowl is suspended by knife edges in a bearing supported by spiral springs from the binnacle case.

9,851 08. **Railway Signalling.** A. J. BOULT (*Union Switch and Signal Co., U.S.A.*). This specification was amended by order of the Comptroller as the result of opposition to grant. It relates to a system of block signalling, in which the rails are electrically continuous, but adjacent block sections are supplied with A.-C. currents differing in phase.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

2,106 of Jan. 19th, 1896. **Lightning Arrester.** SIEMENS BROS. & Co., LTD. (*Siemens & Halske A.G.*). This patent covers the well-known horn lightning arrester, which consists of two metal rods vertically parallel for a short distance, and finally upwardly divergent.

2,248 and 2,249 of Jan. 31st, 1895. **Fuse Boxes.** H. HIRST (General Electric Co., London). To prevent the formation of an arc when the fuse blows, an insulating bridge is fitted between the terminals, and the fuse wire is passed through or around it in an irregular manner. According to the second patent, the fuse wire is interwoven with an insulating material, such as asbestos.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: I. A. CARR [Telephonic fault testing on D.C. three-wire systems] 20,269/05.

THE NEW STATION OF THE WESTMINSTER ELECTRIC SUPPLY CORPORATION

A VISIT was paid recently by the members of the Junior Institution of Engineers to the new generating station of the Westminster Electric Supply Corporation, in course of erection at Horseferry Road, Westminster, by kind permission of the Chief Engineer, Sir A. B. W. Kennedy, F.R.S.

The Corporation are building this new station to replace the old Millbank Street station, which is about to be pulled down in consequence of the County Council's scheme for making an embankment roadway from the House of Commons towards Chelsea. The County Council have provided the company with a new site in Horseferry Road, and are bearing the expense of rebuilding the station and filling it with plant to an extent equivalent to the present capacity of the old Millbank Street station. The actual size of the Horseferry station and the amount of plant being put in is greater than at Millbank Street, and this additional size and amount of plant is, of course, being paid for by the company.

The buildings as at present completed can ultimately hold steam turbine-driven plant generating continuous-current at 440 volts, aggregating 6,600-k.w. It can also ultimately contain about 14,000 kw. of motor-generator plant, for dealing with three-phase current at 6,600 volts, supplied from the station of the Central Electric Supply Co. at Grove Road, which supplies both the Westminster Electric Supply Corporation and the St. James's and Pall Mall Electric Light Co., and transforming this to current at about 440 volts for supplying the Westminster district.

The plant at present erected, or being erected, is as follows:—Four water-tube boilers, each with its own economiser and superheater, capable of producing 25,000 lb. of steam per hour at 200 lb. pressure with 150° superheat; two 300-kw. turbines, each driving two 150-kw. generators placed tandem, these being the balancer-sets; three 1,000-kw. turbines, each driving two 500-kw. generators placed tandem; separate surface-condensers with air-pumps for each turbine, and a special arrangement of circulating water-pumps, including strainer-boxes and rotary strainers for sucking water from the Thames, forcing it through the condensers and back to the river; direct-current switchboards for controlling the turbine-driven generators, and for controlling the D.C. feeders; a 2,000 ampere-hour battery with 200 cells in all, 100 being a positive battery and the other 100 being a negative battery, arranged across the three-wire system; two battery boosters for enabling these batteries to be charged and discharged, the boosters being regulated by hand; one 500-kw. generator arranged with two 250-kw. generators for balancing, and two 1,000-kw. motor-generators, each with single 1,000-kw. D.C. machines (the three-phase motors of these motor-generators are all of the asynchronous type, with slip rings and resistances for starting up); complete high- and low-tension switchboard for controlling the motor-generator plant; electrically-driven travelling cranes in turbine-house and motor-generator room; coal-conveying machinery, ash hoist and gear, and coal-measuring boxes between the bunkers and the boilers.

The Edison Battery.—It is announced that trials have been made in New Jersey with a tramcar equipped with the latest form of the Edison storage battery. One account gives the capacity of the battery at 12·5 watt-hours per pound weight, although 12·5 watt-hours per lb. are said to be obtainable with the lead battery, greater durability is, however, claimed for the cells. The car in question was equipped with 210 cells, including ten lighting cells, and the total horse-power given as 50. The car carried 24 passengers, and ascended some steep hills without difficulty. A figure of a halfpenny per mile has been given for the cost of propulsion, but it is not clear what items are included.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

AT the last meeting of the Faraday Society, beside the Papers reported in our last issue, Mr. Kilburn Scott gave an account of the employment of calcium carbide in Australia. Five years ago only about 2,500 tons were employed annually, but during 1909 the amount imported was about 10,000 tons, mainly from Norway and Sweden. A few years ago the cost c.i.f. Sydney was £18. It was then proposed to manufacture it in Australia at the Barron Falls. The price afterwards fell to £10 per ton, and is now about £12 per ton. At this price it is imported in iron drums as deck cargo, and goes to Australia by way of the Cape route.

The carbide is employed largely for lighting purposes, for small villages and the squatters' houses in the backwoods. As a rule the generators are made in the colony, and very few accidents are reported. Another use is to operate sprayers; such a sprayer was exhibited and worked before the meeting. These sprayers are made of steel, and the carbide, by working on water, generates a pressure of 100 lbs. The pressure of the gas drives the spraying fluid through a nozzle. The sprays are used for killing blight and insects in orchards, for washing cattle with dip, and for lining the holds of ships. For this purpose it is used by the Orient and other lines. Also it has been used for painting the inside of boilers with zinc white and turps. This operation, which originally took four days, can be done by the sprayer in four hours. The prickly pear is being exterminated by spraying with an arsenical fluid. It has even been tried to exterminate rabbits by blowing acetylene down their holes.

In reference to the proposed plant at Barron Falls, it is intended to supply a high-tension alternating three-phase current a distance of nineteen miles. The water falls 1,000 ft., and it is calculated that from 10,000 to 15,000 h.p. can be obtained at a cost of £2 15s. per h.p. year. It would be possible to make the carbide at from £8 to £9 per ton, which would therefore be able to compete with the imported article.

H.M. Consul at Christiania has issued the following information in reference to the manufacture of nitrates from atmospheric nitrogen in Norway. Up to the present £1,222,000 has been expended on the works at Notodden and Svalgfos, and on the power stations which are being constructed at Rjukan and Vamma. At the end of this year, when all the works will be completed, £3,000,000 will have been expended. Nitric acid, nitrates, nitrate of ammonia, nitrate of potash, and nitrate of soda are at present or will shortly be manufactured. The weak acids are now being concentrated by the Birkeland & Eyde & Nobel Syndicate, who are working in conjunction. The interesting point is that no coal is employed for concentrating purposes, the necessary heat being obtained from the gases as they issue from the electric furnace. When the Rjukanfos works and the Rjukan Fall works are quite complete, they and the Notodden works will, combined, represent a power of 240,000 h.p., and will have an annual saltpetre production of £1,278,000.

The value of the nitrate output in Norway in 1908 was about £111,000, and the expenses are stated to have amounted to £83,000, giving a profit of £28,000. At present the following companies are manufacturing, or about to manufacture, nitrates from the atmosphere: The Norsk Hydro Elektrisk Kvaelstof Aktieselskab, Christiania, the owners of the Notodden Saltpeter-fabrikker; the capital of the company is £1,656,000; the Vammafos (Vamma Falls) Co. (works under construction), the Rjukanfos (Rjukan Falls) Co. (under construction); the capital of the company is £700,000; the Matre and Tym Waterfalls are owned by two separate companies, the Norsk Hydro Elektrisk Kvaelstof Aktieselskab and by the Kraft Aktieselskab, but both companies work separately; the Christianssands Elektrokemishe Aktienselskab, which is the property of the Badische Anilin und Soda Fabrik, with a capital of about £11,000.

Vision at a Distance.—The *Daily Mail* gave recently some particulars of a new system for enabling images to be viewed at a distance. The invention is ascribed to Messrs. Rignoux and Fournier and consists in projecting the image on to a screen of some thousands of selenium cells. By means of a rotating contact drum the cells are connected successively to the telephone line at a high speed, and at the other end the line is connected to a coil round a tube containing a liquid which, under the influence of a magnetic field, rotates the plane of polarisation of light. A beam of light, polarised in one plane by means of a Nicol's prism, is passed through the tube, and then through a second prism at right-angles, in order to cut off the light entirely. When a current passes through the coil, the plane of polarisation is rotated 90° and the light gets through the second prism. By means of a moving mirror with as many facets as the screen has cells, the light corresponding to any particular illuminated cell is projected on to the corresponding portion of the screen, and the speeds of successively connecting the cells to the line end of the synchronously moving mirror are so great that the whole picture is viewed owing to the phenomenon of persistence of vision.

EQUITABLE CHARGES FOR TRAMWAY SUPPLY

A PAPER dealing with the charges by supply authorities to tramway undertakings for electrical energy was read by Mr. H. E. Yerbury (Chief Electrical Engineer, Sheffield Corporation Tramways) on Tuesday last at Manchester, before the local section of the Institution of Electrical Engineers. The Paper was read at Leeds on Wednesday, and will be read and discussed at the meeting of the Institution in London this evening.

The author points out that a higher price is invariably charged for energy for traction than for heating and general power purposes, notwithstanding the heavy consumption and favourable load factor, and that the price charged is considerably more than the total costs in separate tramway power stations. A table given by the author shows the lighting, power, and traction charges made by sixty-five local authorities in Great Britain owning combined stations, and from this it appears that the average price charged to the tramway departments is 1·377d. per unit, the maximum being 2d. and the minimum 0·93d. Another table gives the generating costs for ten separate traction stations. The average for these are : works costs, 0·447d., and total costs, 0·753d. Further tables give the charges made by local authorities owning combined stations to other local authorities and to tramway companies. In all cases the load factors are given; thus the average load factor of the sixty-five combined stations is about 20 per cent., and in the case of the separate traction stations 35 per cent., the highest in the latter case being 46 per cent.

Turning to consider what should determine a fair basis of charging, the author divides the total costs of generation into (*a*) "fixed charges," in which are included interest and sinking fund on land, buildings, and all plant, say, to feeder pillars or trolley wires; rent, rates, taxes, and insurance; and a sum each year for depreciation or renewals, and (*b*) "running costs," in which are included salaries and wages of officials and staff, fuel, water, oil, and waste, repairs to steam and electrical plant, repairs to ducts, feeder cables, &c., and repairs to power and sub-station buildings, &c. In order, he continues, to allocate on an equitable basis to the lighting and tramway departments their respective proportion of above costs, we must know the maximum demand in kilowatts per annum required by the tramway department, and the approximate kilowatt-hour consumption per annum. From these can be estimated the size of plant required (with reasonable spares), the standing charges of which will determine the principal item under "fixed costs"; the actual "running costs" can readily be arrived at when kilowatt-hour requirements are known. With regard to the plant, that required to meet the maximum tramway demand at times of "peak load"—including spares—should be the measure taken. This "peak load" is so little above the average, however, that the costs in, say, keeping boilers under steam and for a "stand-by staff" for this are infinitesimal. Engineers of combined stations do not appear to look upon these costs as "running costs," but invariably include them under "fixed costs," and the fair proportion of these so-called "fixed costs" to actual "running costs" is a debatable point.

The author then compares an analysis of the "fixed charges" made by the Manchester Electric Supply Department to the Tramways Department, with those of a 4,450-kw. low-tension tramway station generating about 13·5 million units per annum, as follows :—Under "fixed charges" we have for a low-tension tramway station of 4,450-kw. capacity : (1) Interest at 3·13 per cent. and sinking fund at 2·05 per cent, 0·241d.; (2) rent, rates, taxes, and insurance, 0·028d; (3) depreciation and renewals based on 1·89 per cent. per annum on total capital expenditure on power station, buildings, plant, cables, &c., 0·102d.; giving a total of **0·371d.**

It appears that about double the above is generally considered chargeable to tramway departments in determining selling price per unit. For instance, the Manchester Electric Supply Department, in selling approximately 29½ million units to the Tramways Department for year ended March 31st, 1908, in addition to above items, also adds items included in "running costs"—viz., coal, oil, waste, water, salaries and wages, repairs and maintenance of plant in the following proportions, viz. :—(1) Coal, 27·35 per cent. of amount included in "running costs" is also included in "fixed charges"; (2) oil, waste, water, &c., 27·35 per cent., ditto; (3) salaries and wages, generating station, 100 per cent., ditto; (4) repairs and maintenance of plant, &c., 33·33 per cent., ditto. On the basis of 29½ million units per annum, the "fixed charges" per unit sold are then as follows :—Coal, 0·043d.; oil, waste, water, &c., 0·004d.; salaries and wages, 0·069d.; repairs, 0·064d.; rent, rates, taxes, 0·087d.; management, &c., 0·036d.; interest and sinking fund, 0·441d.; renewals suspense account, 0·121d.; giving a total of **0·865d.** This amounts to more than the total *generating* costs in a separate generating station.

Comparing the separate items, Mr. Yerbury criticises the justice of the fixed charge for coal of 0·043d. per unit, and points out that it is usual for all coal consumed to be included in "running costs." The cost of water, oil, and waste, &c. (0·004d.), also appears, he says, to be high, and in a tramway station generating about 14 million units per annum, should be sufficient for all oil, waste, and other stores, even where reciprocating engines are in service, and in respect to water, the "fixed charge," if any, should be a very small one. Salaries and wages amount to 0·069d. per unit, and appear to be exceptionally high in view of the fact that under "management expenses" a further fixed charge of 0·036d. is included, making a total of 0·105d., which is considerably higher than the *total* charge under "management, salaries, and wages" in a low-tension tramway station. Presumably tramway departments are being charged *pro rata* for management, &c., with ordinary customers, notwithstanding the fact that the latter require an elaborate book-keeping system, also meter inspectors, and large clerical staff. A fixed charge of 0·064d. for repairs and maintenance appears to be on the safe side. Rents, rates, and taxes are set at 0·087d., whereas in the separate station they amount to 0·028d., or, including rates and taxes on cable ducts, cables, &c., to 0·056d. The high former figure is doubtless accounted for by additional buildings and plant required for converting high-pressure current to the low-pressure tramway feeders, and possibly includes a proportion of income tax, although in the author's opinion this should appear only in the profit and loss account. The charges for interest and sinking fund are 0·441d. and 0·241d. respectively; here again the difference may be due to the additional land, buildings, and plant for conversion. Renewals, suspense, or depreciation amounts, for the combined station, to 0·121d., or 1·68 per cent. per annum of capital expenditure. To bring into line a self-contained undertaking it may be assumed, as is done in Sheffield, that a sum equal to 0·75d. per car-mile is required to be set aside annually to build up a renewals fund, or 1·89 per cent. per annum of total capital expenditure. The proportion of capital expenditure on power station and all cables, &c., to that of the entire undertaking is 22·47 per cent., and spread over, say, 10 years, amounts to 0·102d. per unit, which estimate has proved so far to be sufficient for extraordinary renewals and obsolescence, as ordinary repairs and renewals are directly charged to power account.

Concluding this comparison, the author points out that it has been between a high-tension A.-C. station and a low-tension tramway station, and between units sold and units generated. Where high-tension current is transformed and distributed, the total cost per kilowatt installed amounts to between £40 and £50, and at Manchester it amounts to about £61; whereas in a low-tension continuous-current supply the initial cost of all generating plant and freehold buildings need not be more than £35 per kilowatt, and including cost of all ducts, cables, &c., £50 to £55 per kilowatt, and in the former case the combined conversion and transmission losses and also running costs are considerably higher than from the latter supply. These factors have a most important bearing on the subject of tramway tariffs, and, in the author's opinion, often negative the benefit which should be received by a tramways department obtaining electrical energy from a combined general supply and traction works.

The author also quotes the following figures for Bradford and Sheffield :—For the year ending March 31st. 1909, the Tramways Department of Bradford purchased 10,131,499 units at a cost of £47.384 11s. 8d., the price per unit being 1¼d. from the Corporation works, and 1¾d. per unit from the Shipley Urban District Council. For year ending March 25th, 1909, the Sheffield Tramways Department generated 13,373,958 units at a cost of £21.758 12s. 8d., excluding capital charges, and including all charges at a total cost of £36,765 14s. 9d., the works costs being at the rate of 0·390d. per unit, and total costs per unit = 0·659d., including maintenance of ducts and cables up to feeder pillars.

Referring to the distributing system, Mr. Yerbury states that it is desirable that the cables should be laid and maintained by the Tramways Department. With regard to the registering of the units consumed, if watt-hour meters are used, their accuracy is well within the limits allowed by the Board of Trade, and in the author's experience, with a standard high-capacity meter taking the entire output of a station compared with the readings from twenty separate meters on different feeders, the inaccuracy

Digitized by Google

has never been greater than 0·8 per cent. over a period of three years.

Concluding, the author suggests that the capital and management charges should be based on the kilowatt capacity of plant, &c., employed only for tramway supply, and that the running costs should be taken on the entire station, as a tramway load reduces the cost of production. With regard to depreciation, a percentage of 1·75 per annum on the entire capital expenditure on buildings, plant, and cables should be considered a fair allowance. Finally, it is unreasonable to expect a combined station to supply current to a tramways department without profit, and it is suggested that from 3 to 5 per cent. profit should be charged only on the "running costs."

DISCUSSION AT MANCHESTER.

Mr. S. L. PEARCE (Chief Electrical Engineer, Manchester Corporation), said that he felt the question was somewhat *sub judice*, in view of the conference between the Municipal Electrical Engineers and the Municipal Tramway Managers, which would be held in London on Friday. Mr. Yerbury had made a serious initial mistake in assuming the costs given for self-contained stations to be quite correct and comparable with the charges made by combined stations. He had also not distinguished between units generated and units sold, or between low-pressure D.C. and high-pressure A.C. stations. This omission had led him to compare unlikes, with misleading results. The figures for Sheffield and Glasgow on a strictly comparable basis were practically identical. The Sheffield figure of 0·668d. per unit, with an output of 13 million units, and a load-factor of 38 per cent., came up to 0·81d. when allowance was made for ratings on duct and cable work, income tax, and for the units lost in transmission. The Manchester (Bloom Street) figure was on the same basis, 0·88d. per unit, with a total of only 8 million units at a 28 per cent. load-factor. Glasgow was the only system comparable with Manchester; the figure there was 1·26d., as against 1·04d. on the same basis at Manchester. These figures had been admitted by Mr. J. McElroy (General Manager, Manchester Corporation Tramways), and a three years' agreement had just been made for a flat charge of 1d. per unit. Mr. Yerbury's statements with regard to the tramway load-factor were incorrect. At Stuart Street the combined load-factor was 50 per cent.; the tramway load-factor was 33 per cent., and the industrial power load-factor from 60 to 70 per cent., *i.e.*, twice the tramway load-factor. They were, therefore, justified in charging power consumers less. There was also most certainly a peak load in tramway systems; the Bloom Street curves showed distinct peaks morning and evening with as much variation as 3,500 amperes. He did not agree that no portion of the fuel, &c., and management costs should be debited to the fixed charges. Sir Alex. Kennedy had included a portion of these costs as fixed charges. With regard to low power rates, the increased power load had enabled them to put in large modern units at a low cost, say, £3 to £4 per kw., as against £9 to £10 per kw. when the plant for the tramways was installed. He did not see why the tramways should benefit by this; the new plant was not for them. He did not think the allowance of 1·75 per cent. per annum for depreciation and obsolescence was sufficient; in the case of the Sheffield plant, it corresponded to a life of 34 years, whereas a more usual figure was 22 years. He thought the cost of upkeep of cables was independent of energy supplied, and should come partly in fixed costs. He agreed that the tramways departments should have their own meters. Finally, he did not think any case had been made out for overcharging on the part of combined stations.

Mr. J. R. SALTER (South Lancashire Tramways Co.) supported Mr. Yerbury, asserting that even a 3 or 5 per cent. profit was not wanted, as a bulk supply to tramways reduced the generating costs, and that more than half the combined stations in the country would have been financial failures had it not been for the tramway load. It was not right that power customers were metered at their terminals, and tramway systems at the station switchboard. He would like Mr. Pearce to explain why the tramways had to pay for the loss in transmission. Many power consumers had been supplied at under cost price because of alleged extraneous advantages. Why could tramways not be supplied in the same way? He instanced the case of Heywood, where they first had an annual output of 68,000 units, and charged 4·19d. per unit., and after taking on the tramway load, increased their output to 670,000 units, and were able to supply at 1·23d. per unit. There the tramways had made the station a success. Tramways always had their exceptional loads when there was no power load, as on holidays, and thus actually used the power plant. His own company had to pay to the Corporation costs of 1·11d. per unit for the first 800,000 units, and 0·37d. for units over this amount. Above this they paid interest, &c., and profit, so that in all the figure reached an average of 2d. per unit.

Mr. C. C. ATCHISON (Borough Electrical Engineer, Rochdale) asserted that the supply to tramways generally cost the combined station far more than they ever got from them. There was certainly a distinct peak load, and the capital for the plant for this had to be included in the fixed charges. Mr. Yerbury had unfairly compared a system with 104 route-miles with one with only 39 route-miles. He agreed that the cables should be provided by the tramways department. The profit from the supply should, he thought, be comparable with that obtained from lighting and power consumers.

Mr. C. L. STEWART (Rawtenstall) thought that the certainty of a fixed income was a great help to combined stations in the initial stages. In the case of their own small station with regenerative control on the tramways, they often had a negative load, and the load factor was extraordinarily low.

Mr. MILES WALKER (British Westinghouse Co.) suggested that in the case of a combined station generating A.-C. current and supplying through sub-stations, a concession of 10 per cent. should be made for a tramway load on account of its being at unity power factor; if a leading current were taken, a further concession might be made.

Mr. F. H. WHYSALL complained that the question was tied up for want of a common basis of comparison.

Mr. S. J. WATSON (Borough Electrical Engineer, Bury), chairman, held that quite a large percentage of the fuel, wages, and similar costs were standing charges, as fuel was required to keep the station in a condition to supply. With regard to tramway peak loads, there was as much as 600 kw. variation at Bury, and the mean was only one-third of the full load. On the other hand, a power load was very steady. He agreed that the tramways department should provide and pay for cables, but suggested that repairs should be done by the station staff, though paid for by the tramways department. There was nothing to prevent the peak loads of power and tramways coinciding, and this had indeed happened at Bury quite recently. In charging the tramways at Bury, he estimated his general establishment charges, including management, rates and taxes, &c., and from this he took off first charges connected with consumers' accounts, then a proportion based on relative value of mains; he then divided the result in proportion to the relative maximum demands. Mr. Watson then took some figures from Mr. Yerbury's tables, and showed how by making them strictly comparable they nearly always came almost equal. He thought that there ought to be a gross profit of from 9 to 10 per cent. on capital. In his opinion, the whole matter turned on capital, and he did not agree with adding a profit of 3 to 5 per cent. on running costs only. The tramways department wanted to act as middleman and take all the profits.

Mr. YERBURY, in reply to Mr. Pearce, stated that the charges according to the standard form of tramway accounts differed only from those of lighting station accounts in that a proportion of rates and taxes and of insurance premiums was not included in the former. If the fixed charges in a combined station were to be pooled, it would, he thought, certainly be to the advantage of a tramway system to have a separate station.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

WATER COOLING TOWERS.—A leaflet from Messrs. Balcke & Co., Ltd. (27 Clement's Lane, Lombard-street, London, E.C.), contains a list of the British firms, &c., to whom this company has supplied cooling towers. These include a number of electricity works, collieries, and steel works.

ELECTRICAL ACCESSORIES.—Messrs. A. P. Lundberg & Sons (Pioneer Works, 477 Liverpool Road, London, N.), have issued an index of the catalogue numbers of the items described in their various special pamphlets relating to wiring and other accessories.

CALENDARS.—The wall calendar of the Brush Electrical Engineering Co. (Loughborough), is, as usual, an artistic production. The daily tear-off slips each contain a quotation from Shakespeare, and a coloured picture represents a large multipolar generator with a little Cupid perched upon the bearing.

BELTS, PULLEYS, SHAFTINGS, &c.—We have received from Messrs. Harpers, Ltd. (Aberdeen), a copy of their latest catalogue of accessories for the transmission of power, which is conveniently arranged as a pocket-book, and contains very complete details of belt and rope pulleys, gear-wheels, shafting, couplings, bearing pedestals, brackets, &c., and a series of views of the company's works.

TELEPHONE AND SIGNALLING APPARATUS.—The Adnil Electric Co., Ltd. (Artillery Lane, E.C.), are issuing a very complete new catalogue of over 100 pages dealing with telephones, bells, and other signalling apparatus, electric clocks, &c. In the telephone section some views of recently completed exchange equipments are given, and prices and particulars of a great variety of instruments for exchange and domestic purposes, special telephone sets for railways, loud speaking telephones with hooter call, mining telephones, special telephones for use near high-tension lines, switchboards, &c. Among the bells is a large motor-driven bell for factories, &c., and several patterns of watertight mining bells are listed. Other appliances dealt with include dial signalling apparatus for mines and other purposes, fire alarms, electric time recorders, thermometers, and water gauges, watchmen's time recorders, telegraph instruments, time stamps, electric clocks, &c.

THE BREMER FLAME ARC LAMP PATENT

Appeal Court Proceedings

THE British Westinghouse Co.'s appeal against the judgment of Mr. Justice Joyce declaring the Bremer flame arc lamp invalid, was commenced before Lords Justices Cozens-Hardy, Fletcher Moulton, and Buckley on Thursday, and continued on Friday, Monday, and Tuesday. Mr. A. J. Walter, K.C., and Mr. E. Russell Clarke appeared for the company, and Mr. W. R. Bousfield, K.C., Mr. J. Hunter Gray, and Mr. Scott appeared for Mr. G. Braulik.

It will be remembered that Mr. Braulik had first endeavoured to secure the revocation of the Bremer patent under Section 27 of the Patents Act, alleging that the lamps were manufactured mainly outside the United Kingdom. The Comptroller of Patents revoked the patent subject to appeal to the High Court, but on appeal the patent was restored. An action brought by the Westinghouse Co. against Mr. Braulik for infringing the patent was then heard, and resulted in Mr. Justice Joyce declaring that the Bremer patent was invalid for want of subject matter.

This decision is now being appealed against.

Mr. Walter, for the Westinghouse Co., recapitulated at length the evidence given in the Court below, and contended that the judge's decision was not warranted on the evidence given. He practically left it to the Appeal Judges to redecide the case on the evidence, without adducing new arguments.

Mr. Bousfield, on behalf of Mr. Braulik, emphasised the point upon which Mr. Justice Joyce's judgment was based, viz., that the lamp was described in an earlier patent than Bremer's, and that one must not rob the public of the work of previous inventors. The Bremer patent was, he said, the application of an old idea (patented in 1882 by Graham) to another type of arc lamp, and this in his opinion did not constitute subject matter for a new patent. He did not argue on the question of infringement, but based his case entirely on the alleged invalidity of the Bremer patent for want of new subject matter.

Mr. Walter, in reply, said that there had been no evidence to show that lamps made in accordance with the earlier patent had ever been successfully constructed and worked. He contended that it should not be permissible to rake up an old and unsuccessful invention, and put it forward as an anticipation of a later and successful application of a similar principle.

Their Lordships reserved their decision.

LOCAL NOTES

AUSTRALIA: *Adelaide: Tramways.*—An interim report has been presented by Mr. W. G. T. Goodman, chief engineer and general manager of the Municipal Tramways Trust, Adelaide, dealing with the working of the undertaking during the first six months. The electric system was inaugurated on March 9th, and during the following six months the total revenue amounted to £72,670, including £71,645 traffic receipts, of which £33,863 has been earned in respect of the electric car system, and £37,782 in respect of the horse-car system. This shows an increase of £15,823 on the previous, and an increase of £16,373 for the corresponding half of the previous year. The car mileage was 522,565, and the number of passengers carried 4,654,382, the average receipts per car mile being 15·55d. The expenditure amounted to £63,193. Of the balance, £1,000 has been set as reserve for renewals, and after bringing the balance from the previous half-year, and meeting interest charges, there remains the sum of £4,832. The working expenses amounted to 10·82d. per mile. There are now 50 cars running, thirty being combination and twenty open cars.

Victoria: Telephone Charges.—The *Australian Mining Standard* states that Messrs. Whitton & Holmes, the departmental accountants to whom was entrusted an inquiry into the working of the telephone system of the Commonwealth, have reported against the continuation of the toll system of charging. The report is a preliminary one, and deals only with the Victorian services, and states that the telephone service in the metropolitan area alone has returned a net profit of over £100,000. This, however, was made chiefly in the years 1901-7, the results for 1907-8 and 1908-9 being a small profit of about £4,000, and a loss of about £7,000 respectively. These two latter results are attributed entirely to the introduction of the measured rate system of charging. The opinion is expressed that the work at the exchanges of recording the calls costs in the aggregate more than the revenue derived from measured rate.

Government Contracts.—A Sydney copper refining and smelting concern has suggested that the Australian Postmaster-General should give preference in departmental contracts to wire made from local raw material. The suggestion is to be complied with in future where possible. At present, the copper wire used by the Department comes principally from the United Kingdom and America.

BARKING: *Electric Supply in Bulk.*—The offer of the British Coalite Co. to supply electricity in bulk to the Council has been considered by the Electricity and Tramways Committee, who have decided that the offer cannot be accepted on the terms mentioned.

BECKENHAM: *Therol Heaters.*—The Electricity Committee recommend the Council not to undertake the supply of Therol heaters on hire-purchase terms. The question of supplying electrical energy in connection with this apparatus has been referred to the resident engineer for report.

BIRMINGHAM: *Tramways.*—The Tramways Committee have reported upon the proposal to construct tramways along Green Lane to the city boundary, to the effect that the road is not wide enough for a single line of tramway, and that the cost of widening it would be prohibitive.

Halesowen Light Railway.—The Tramways Committee recommend the Corporation to oppose the application of a company to construct light railways in certain districts adjacent to the city, including one in the Quinton district. The reason for the recommendation is that by the incorporation of Quinton with the city, it is necessary that the Corporation should obtain control of the portion of the road over which the company are now seeking powers, and which forms the boundary between Smethwick and Oldbury on the north-east side, and the City on the south-west.

CANADA: *Railway Electrification.*—It is stated that the first line which the Canadian Pacific Railway Co. will convert to electric traction is the St. Maurice Valley branch in Quebec, which runs along the River St. Maurice from Three Rivers to Shawinigan Falls.

COLWYN BAY: *Tramways.*—The Chairman of the Llandudno & District Electric Tramways Company has written to the Council suggesting that an agreement should be come to for extending the line to Old Colwyn in accordance with the recent decision of the Light Railway Commissioners. The Council have requested Mr. Sellon to send down a draft agreement.

DEVONPORT: *The Tramways Bill.*—A Special Committee has been appointed to take charge of matters arising out of the Bill which has been deposited by the Devonport & District Tramways Co., and which proposes to vary the terms of the present agreement between the company and the Corporation.

DUNDEE: *Claim against Electricity Committee.*—The Corporation have settled, for £1,250, a claim against them by Messrs. Grimond for failure to supply electricity at a certain date. This failure to supply was in consequence of the delay in completing the new Carolina Port power station.

DUNFERMLINE: *Opposition to Tramways.*—The Corporation have withdrawn their memorial of standing orders against the Dunfermline and District Tramways Extension Order.

HENDON: *Electric Lighting.*—The Rural District Council have decided to oppose the granting of a further extension of the Northwood, Edgware, and Pinner Electric Lighting Provisional Order.

GUERNSEY: *Loan for Services.*—The Local Government Board have refused to extend the period for the repayment of £2,000 recently borrowed for services.

LONDON: *City of London Electrical Department.*—The Streets Committee are to consider a letter from Mr. A. A. Voysey, electrical engineer and inspector, in regard to the necessity for reviewing the duties and responsibilities of the officials in the electrical department, and suggesting, in the event of the Corporation deciding to increase the responsibilities of the position, to put a more robust man in charge of the department.

Greenwich: Tramways.—The L.C.C. have informed the Council that they have been in negotiation with the Board of Trade and the Admiralty concerning the construction of the tramways from Woolwich to Eltham on the overhead trolley system of electric traction, but the Admiralty has declined to agree to the adoption of the usual overhead trolley system. The County Council have therefore decided to use two overhead wires instead of one for each track in order to secure complete insulation.

Westminster: Street Lighting.—The Works Committee have arranged for an experimental installation of improved lighting for Victoria Street. A large number of residents and traders in Victoria Street have recently made complaints as to the inefficient lighting of that thoroughfare.

Digitized by Google

MANCHURIA: *Electric Lighting.*—An American Consular report states that through the initiative of the American Consulate at Mukden, an American company is arranging with the Chinese authorities to erect an electric power-house at Changchun, the junction city of the Japanese and Russian railway lines in Manchuria. The estimated cost of the plant is £12,000, and most of the material will be of American manufacture.

NORTH BERWICK: *Electric Lighting.*—A special meeting of the Town Council was held last week to consider a proposal by Messrs. Crompton & Co., for the installation of electric lighting in the borough. After some discussion it was decided to inform Messrs. Crompton that the Town Council have no objection to the introduction of electric light, and asked upon what terms they will promote and work a scheme.

SMETHWICK: *Electric Lighting.*—The Council have passed a resolution refusing to give their consent to the Smethwick Electric Lighting Order, 1910, promoted by the Birmingham & Midland Tramways Company, for the reason that the company have not embodied in the Order the terms and conditions agreed upon with the Corporation.

WEST HAM: *Tramways and Electricity Assessments.*—Appeals are to be withdrawn against the tramways and electricity undertaking assessments, which have been fixed as follows: Electricity undertaking, net rateable value reduced from £12,900, as originally proposed, to £11,500; tramway undertaking, general undertaking, from £11,900 to £10,000; East Ham parish, £400 (as originally proposed); West Ham parish, Forest Hill lines, £55 (as originally proposed).

WINCHESTER: *Purchase of Electric Light Co.*—At a special meeting of the Corporation last week the report of the Special Committee, recommending the purchase of the undertaking of the Winchester Electric Light & Power Co., was adopted. Twelve months' notice is to be given to the company of the Council's intention to purchase.

YORK: *Opening of Tramways.*—The opening of the Fulford-Nestgate section of the City Tramways took place on Thursday.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ASHTON-UNDER-LYNE.—In our notice last week concerning tenders for condensing plant, exhaust turbine and direct-current generator, and balancer, we stated that these should be sent by February 19th. This should have read February 9th.

BARKING.—The Local Government Board has sanctioned a loan of £2,500 for the electricity undertaking.

BELFAST.—The Tramways and Electricity Committee invite tenders for the supply of low-tension insulated V.B. cable during the year ending March 31st, 1911. (See an advertisement on another page.)

BOLTON.—The Corporation invite tenders for a Lancashire boiler, complete with superheater, &c. Particulars from Mr. A. A. Day, the Borough Electrical Engineer, and tenders to the Town Clerk by January 10th.

COVENTRY.—Further particulars are now available regarding the proposal of the Electric Light Committee to spend £54,200 upon extra plant. They recommend the installation of two 2,300-kw. turbo-alternators, and the scrapping of a 300-kw. reciprocating set. The scheme also includes four water-tube boilers, and economisers, in substitution for four Lancashire boilers, which are about fifteen years old, and have a total evaporative capacity of 25,000 lbs. of steam per hour, against an evaporative capacity of 76,000 lbs. per hour with modern water-tube boilers. The new arrangements are also such as to shorten the steam pipes, and consequent loss in condensation and radiation, whilst the boiler pressure will be raised from 150 lbs. to 180 lbs. per square inch. The proposal will involve no alteration or extension of the existing buildings. The estimated cost per kw. installed is £10 9s., which will reduce the total capital expenditure upon the Coventry undertaking from £57 10s. per kw. to £32 5s. per kw.

ISLINGTON.—Mains are to be extended at a cost of £300 to supply electricity at Cathcart Hill, Dartmouth Park Hill, and Wyndham Crescent.

SWANSEA.—Mains are to be extended at an estimated cost of £230, to supply the Cwmdonkin Park district.

WORKSOP.—Tenders are invited by February 2nd for the supply of underground cables. Particulars from the Borough Electrical Engineer.

Miscellaneous

AUSTRALIA.—The Sydney Postmaster-General's Department invite tenders by March 9th for the supply and delivery at the Departmental Stores, Sydney, of magneto switchboards for metallic lines, and switchboards for private branch exchanges for common battery working in accordance with Schedule N.S.W., E.E., 114/09.

BECKENHAM.—Tenders are to be invited for service boxes, cut-outs, and meters.

CHILI.—It is stated that a concession has been granted to the Bio Bio Telephone Co., Mulchen, for the extension of the telephone system from Mulchen to Collipulli, Ercilla, Victoria, Los Sauces, Lumero, Renaico, Esperanza, and Curicó.

COLOMBIA.—Electric tramways are to be constructed in the town of Cali, and a decree has been issued enabling the materials for the works to be imported free of duty.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.E.—The London County Council invite tenders for the wiring and fitting of the Cow Lane Elementary School, Rotherhithe. Particulars from the Chief Engineer to the Council, and tenders to the Clerk by February 2nd.

E.—School, West Silvertown (£10,097). Builders, H. C. Horswill, 182 Green Street, Forest Gate, E.

S.W.—Conversion of premises, Plough Road and York Road, Battersea, into cinematograph hall for Electric Theatres Bureau, Ltd., 18 Charing Cross Road, W.C.

Wing to Home for Aged Jews, 105 Nightingale Lane, Balham, S.W. Builders, W. Johnson & Co., Ltd., Besley Street, Streatham.

Conversion of stables into laboratory, offices, and stores, &c., Avery Hill Training College, Bexley Road, Eltham, S.E. L. Kayak, 3 and 4 Station Road, Belvedere.

PROVINCES.

AYR.—Residence, Prestwick Road (£1,500). Architect, J. S. Williamson, Sandgate Street, Ayr.

House, Belmont Avenue (£1,300). Architect, J. W. Morton, 9 Wellington Square, Ayr.

Additions, Davidshill Hospital. Ayrshire County Council.

BELFAST.—Additions to Presbyterian Church, Clifton Street. Architects, Young & McKenzie, Belfast.

BOOTLE.—Tenders are invited for the electric wiring and fitting of the new Orrell council schools for the Corporation. Particulars from the Borough Electrical Engineer, to whom tenders by February 3rd.

BOURNEMOUTH.—Schools £6,060). F. W. Lacey, borough engineer. Builders, J. & M. Patrick, Point Pleasant, Wandsworth.

Science, art, and technical schools (£19,060). F. W. Lacey, borough engineer. Builders, as above.

BRIDGEND.—School (400 places). D. Pugh Jones, architect, Charles Street, Cardiff.

CHESTER.—School (£5,255). Builder, Mr. Harrington, Chester.

DARLINGTON.—Secondary school (£10,000). Architect, W. Rushworth, Shire Hall, Durham.

GLASGOW.—Extensions to works of Sir William Arrol & Co., Ltd. (£5,500). Plans by firm's own staff.

ISLE-OF-WIGHT.—Hospital (£5,960). Architect, S. R. Cocks, Ryde.

JARROW.—Swimming baths. Stephen Sherriff & Son, builders.

LIVERPOOL.—Emporium for Lee & Son, Basnett Street. Builders, J. Henshaw & Sons, Chatham Street, Liverpool.

PETERBOROUGH.—Extensions, Deacon's School. Architect, F. H. Townsend, Cross Street, Peterborough.

PORTSMOUTH.—House for tuberculosis diseases. Clerk to Guardians, Portsmouth.

READING.—Alterations and additions at nurses' home at workhouse (£1,910). Architect, W. Roland Howell, Reading.

SPRINGBURN.—Extensions to store department of N.B. Locomotive Co., Ltd. (£4,000). Plans by firm's own staff.

WELLINGBOROUGH.—School (£8,360). Architects, Sharman & Archer, Wellingborough. Builders, Hacksley Bros., Wellingborough.

Manchester Section, I.E.E. Dinner.—The annual dinner of the Manchester Section of the Institution of Electrical Engineers will be held at the Midland Hotel, Manchester, on Friday, February 25th.

Electrical Trades Benevolent Institution.—In connection with the Festival Dinner of the Electrical Trades Benevolent Institution, which is to be held at the Whitehall Rooms, Hotel Metropole, on Wednesday, February 23rd, Sir William H. Preece, chairman of the committee, is issuing a letter appealing for a continuation of support to the institution, in which he mentions some typical cases of assistance given during the past year. In addition to Prof. Gisbert Kapp, who is to preside at the dinner, the following gentlemen are giving active support by serving on the organising committee:—Messrs. H. Bevis and H. W. Butler, Sir Irving Courtenay, Messrs. W. B. Esson, Emile Garcke, T. E. Gatehouse, Hugo Hirst, R. Wallis-Jones, W. M. Mordey, C. S. Northcote, W. Schmahl, W. Taylor, Edwin C. Wallis, Guy Burney, E. J. Clark, Justus Eck, W. Finlay (President, Electrical Contractors' Association), W. C. C. Hawtayne, E. F. Johnson, A. P. Lundberg, S. L. Pearce, Leonard G. Tate, L. Thurnauer, and C. H. Wordingham. The price of dinner tickets, including wine, is one guinea each. Application should be made to Mr. W. Davenport, secretary to the Institution, Ridler Place, Holland Street, Blackfriars, E.C., to whom contributions in aid of the funds may also be sent.

FLAME-ARC LAMP CARBONS

WESTINGHOUSE-BREMER BRITISH PATENTS

THE British Westinghouse Electric and Manufacturing Company, Limited, hereby give notice to all concerned that the following firms are at present the only Licensees under the above patents, and that their manufacture only can be sold as licensed thereunder:—

The Birmingham Carbon Works.
C. Conradty.
Companie Fabril de Carbones Electricos.
The General Electric Company, Limited.
H. G. Mayer & Company.
Planiawerke Actien Gesellschaft.
Schiff & Company.
Ship Carbons, Limited.
Gebruder Siemens & Company.
Siemens Bros. Dynamo Works, Limited.
Sloan Electrical Company, Limited.
C. W. Webster.

January 17, 1910

TENDERS RECEIVED AND ACCEPTED

ADMIRALTY.—It is stated that the Admiralty have placed a large order for electrical machinery and fittings with the Brush Electrical Engineering Co.

BURY.—The Electricity Committee recommend contracts being placed for coal and ash handling plant for the new power station, and also for additional switchgear at the power house.

GLASGOW.—The tender of Messrs. Ferranti, Ltd., has been accepted for switchgear at the Yorkhill sub-station.

GOVAN.—The following tenders have been accepted:—Messrs. J. Howden & Son, turbo-alternator; British Westinghouse Co., rotary converters; British Thomson-Houston Co., switchboard.

LONDON: *Stepney.*—The Council received the following for coal-conveying plant at the Limehouse power station:—Strachan & Henshaw, Ltd., telpher type, £3,820 11s. 6d., ditto, alternative (accepted), £4,040 11s. 6d.; E. Bennis & Co., telpher type, £3,843 15s.; Graham, Morton & Co., bucket type, £4,035 10s.; New Conveyor Co., Ltd., bucket type, £4,127 15s.; ditto, alternative, £4,177 15s.; West's Gas Improvement Co., Ltd., bucket type, £4,347; Naylor Bros., Ltd., bucket type, £4,401, telpher tender, informal and incomplete; Spencer & Co., Ltd., bucket type, £4,499; E. Bennis & Co., bucket type, £4,534; McMyler Manufacturing Co., bucket type, £4,557; Heenan & Froude, Ltd., bucket type, £4,965; Babcock & Wilcox, Ltd., bucket type, £5,059; Gibbons Bros., Ltd., bucket type, £5,317 15s.

Woolwich.—The Council received seven tenders for twelve months' supply of cable at the expiration of existing contracts, and have accepted that of Siemens Bros. and Co., Ltd.

STONE (STAFFS.).—The Joint Hospital Board recommend the acceptance of the tender of J. Richards, of Longton, Staffs, at £356, for the electric lighting and telephone work at the new hospital.

WEST HAM.—The Council have placed the following orders in connection with electricity undertaking: Williams & Co., coal grab, £95; Bruce Peebles & Co., conversion of alternator, £825; Sloan Electrical Co., 100,000 pairs of carbons, 63s. 6d. per 1,000 pairs, less 2½ per cent.; Westinghouse Co., annual supply of transformers, 7½ per cent. less than prices in existing contract; Babcock, Wilcox & Co., chain grate stoker, £310.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Fenchurch Buildings, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday morning was £62 10s. to £63 per ton (last week, £62 10s. to £63).

DISSOLUTIONS OF PARTNERSHIP.—The partnership between E. B. Boucher, J. R. Gardiner, and W. Grisold, trading as electrical engineers, 8 and 9 New Street, Bishopsgate Street, London as Yeoman & Co., has been dissolved. E. B. Boucher will continue.

Harold Hastings and T. C. Roberts, electrical and general engineers, 27 Queen Victoria Street, London, have dissolved partnership. Debts by Harold Hastings, who continues.

B.T.H. METAL FILAMENT LAMPS.—For the future, the B.T.H. tungsten lamp will be known as the "Mazda" lamp, and will bear that name as trade-mark. The new name will be used on the lamps, packing-cases, cartons, &c., as rapidly as the change can be effected, and in the meantime the public are notified that any lamps they may receive marked "B.T.H. Tungsten," are the same as the Mazda lamp.

CANADIAN AGENCIES WANTED.—A firm in the West of England, manufacturing dynamos and electric motors, &c., desires to appoint a reliable firm to represent them in Canada.

A Yorkshire firm manufacturing electrical instruments (transformers, balancers, compensators, &c.) is anxious to do Canadian business.

Further particulars of the above may be obtained from the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The trustee in the bankruptcy of T. A. Evans, electrical and mechanical engineer, Swansea, has been released.

The last day for receiving proofs in the bankruptcy of W. T. Harris, electrical engineer, 460 Commercial Road, Portsmouth, is Feb. 4th. Mr. E. W. C. Whittaker, 3 Portland Road, Southampton, is trustee.

A notice appeared in the *London Gazette* for Jan. 21st, calling a meeting of creditors of the London Electrobus Co., Ltd., under Section 188 of the Companies (Consolidation) Act, 1908, to be held at 15 George Street, Mansion House, London, E.C., at 12 noon on Feb. 7th. Section 188 defines the procedure, and deals with the rights of creditors in a voluntary winding-up.

The Telautograph Co., Ltd., is to be wound up voluntarily. Mr. F. A. Bagnall, 21 Budge Row, London, is liquidator.

E.C.C. STAFF DINNER.—The annual dinner and smoking concert of the staff and foremen of the Electric Construction Co., Ltd., took place on Saturday, at the Victoria Hotel, Wolverhampton. The chair was occupied by the manager, Mr. W. Bulloch, and a very enjoyable evening was spent.

MISCELLANEOUS CITY NOTES

METROPOLITAN RAILWAY CO.—Subject to final audit, a dividend of one per cent. has been declared for the past half-year, carrying forward £6,000.

AMALGAMATION OF CANADIAN POWER COMPANIES.—A rumour is current regarding a proposed amalgamation of the Montreal Light, Heat & Power, the Shawinigan Light, Heat & Power Co., and the Montreal Street Railway Co. It is also stated that a system of tube railways is under consideration in Montreal, the capital for which will be found by the new company.

CENTRAL LONDON RAILWAY CO.—A dividend of 3 per cent. per annum has been declared upon the ordinary shares for the December half-year, making 2 per cent. for the year, against 2½ per cent. for 1908. The sum of £2,040 has been transferred to reserve fund, against £20,000 in 1908, bringing this to £100,000, leaving £3,342 to be carried forward.

BRITISH COLUMBIA ELECTRIC RAILWAY CO.—A dividend at the rate of 5 per cent. per annum has been declared on the 5 per cent. non-cumulative preferred ordinary shares, plus a further dividend at the rate of 1 per cent. per annum, for the half-year to December 31st.

MEXICO TRAMWAYS CO.—A dividend of 1½ per cent. has been declared for the quarter to December 31st.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies will, unless cause is shown to the contrary, be struck off the register within three months:—Automatic Telephone Co. (1903); British Electric Separating Co.; Everyday Electricity Publishing Co.; Garcin Renault Electric Cars and Accumulators; Northern Electrical Supply Stores; Reliance Electric Co.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. H. Dykes has resigned the chairmanship of the Beckenham Electricity Committee. At the last meeting of the Council, Mr. Dykes said he was not satisfied with the policy which was being pursued in regard to the electricity undertaking.

Dr. Alexander Russell has been appointed electrical inspector under the Willesden Electric Lighting Order, 1898.

An additional technical assistant to the Borough Electrical Engineer at Hornsey, is to be appointed at a salary of from 35s. to 40s. a week.

Mr. Alfred G. Collis has resigned his position with Messrs. Ferranti, Ltd., and has joined Messrs. Cowans, Ltd., of Manchester.

Electric Driving of Printing Presses.—The appeal of Messrs. J. H. Holmes & Co., Ltd., against the judgment of Mr. Justice Neville, in which he held that the Clatworthy patent for the electric driving of printing presses had been anticipated by an American patent, was commenced before Lords Justices Cozens-Hardy, Fletcher Moulton, and Buckley yesterday. Mr. A. J. Walter, K.C., and Mr. J. H. Gray appear for Messrs. Holmes, and Mr. Astbury, K.C., and Mr. D. M. Kerly appear for the Associated Newspapers, Ltd., who are the respondents in the action. The Associated Newspapers, Ltd., had some "Kohler" equipments, and these were alleged to infringe the Clatworthy patent.

The Floods in Paris.—The serious floods in Paris, of which graphic accounts have been appearing in the daily papers during the past few days, have caused serious interference with the electric railways, tramways, and electric lighting services, as well as the telephones and telegraphs. The service on the Metropolitan and other electric railways has been partially suspended, and attempts were made to run steam trains. Many of the tramway routes have also been interrupted. In view of the confusion which naturally exists, a full account of the damage done is not yet available.

Combination of American Electrical Firms.—The daily papers state that negotiations are on foot for the amalgamation of the General Electric Co., of New York, with the Westinghouse Electric & Manufacturing Co., of Pittsburg. The *Financial News* states that the two companies have worked in close co-operation since 1896, an arrangement having been entered into in that year by which the advantages attaching to the patents owned by the two undertakings were "pooled." In order to facilitate the amalgamation, it is believed that Mr. George Westinghouse will retire from the Board of the Westinghouse Co. Rumours are also current that a third undertaking will be included in the amalgamation.

Electrification of South African Railways.—At a meeting of the South African Electric Power Commission, recently, the possibility of converting to electric traction the eastern line in the low country, and also the Springs—Randfontein line, was discussed. Mr. A. Beaton, Acting Chief Engineer of the Central South African Railways, approved of the general principle of electrification, although he had not gone into details. He anticipated a reduction of drivers by one half, and also of the firemen and coal-trimmers. Electrification would tend to minimise the present discomfort suffered by drivers and firemen working locomotives in an unhealthy and sub-tropical climate.

Digitized by Google

COMPANIES' MEETINGS AND REPORTS

METROPOLITAN RAILWAY CO.—The receipts for the half-year to December 31st amounted to £390,756, and the expenses to £205,654. After providing for debenture interest and other fixed charges, and for electrical depreciation, there is a balance of £139,098, and after meeting preference dividends, the directors recommend a dividend for the half-year at the rate of 1 per cent. per annum, carrying forward £5,927. The report states that the installation of automatic signalling on the Inner Circle has greatly facilitated the working of the railway, and a contract will shortly be let for an installation of this system of signalling on the Baker Street—Neasden line.

CITY & SOUTH LONDON RAILWAY CO.—The receipts for the December half-year amounted to £89.885, and the working expenses to £41,275. The net revenue account, including the amount brought forward, shows £50.021. After meeting debenture interest and transferring to renewal fund £1.500, there is a balance of £33.963. The directors recommend the full dividend of 5 per cent. on the preference shares and 1¾ per cent. per annum upon the ordinary shares, carrying forward £712. Both the number of passengers carried and the receipts have increased during the half-year. The meeting is on February 1st.

BOROUGH OF ASHTON-UNDER-LYNE.

ELECTRICITY DEPARTMENT.

THE ELECTRICITY COMMITTEE invite Tenders for the following works, viz. :—

Section A.—For one Counter Current Jet Condensing Plant.
,, B.—For one Natural Draught Cooling Tower.
,, C.—For one Exhaust Turbine and 400 KW. Direct Current Generator.
,, D.—For one Electric Balancer.

Copies of the Specification and Form of Tender can be obtained from the Borough Electrical Engineer, Wellington Road, Ashton-under-Lyne, on payment of a deposit of One Guinea, which will be returned on receipt of a *bona fide* Tender.

Sealed Tenders, endorsed "Electricity Works," addressed to the undersigned, must be received not later than 12 noon, Wednesday, February 9th, 1910.

By order,
JOHN NEAL,
Borough Comptroller.

Town Hall,
Ashton-under-Lyne.
18th January, 1910.

COUNTY BOROUGH OF BOLTON.

ELECTRICITY DEPARTMENT.

THE ELECTRICITY COMMITTEE of the County Borough of Bolton are prepared to receive tenders for :—

One Lancashire Boiler Complete with Superheater, etc.

Specification and form of tender may be obtained on application to Mr. Arthur A. Day, A.M.I.C.E., M.I.E.E., Borough Electrical Engineer and Tramways General Manager, Spa Road, Bolton.

Tenders, addressed to the Chairman of the Electricity Committee, Town Hall, Bolton, must be sealed and endorsed "Tender for Boiler," and delivered not later than 12 o'clock on February 10th, 1910.

The Committee do not bind themselves to accept the lowest or any tender.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton.
19th January, 1910.

CITY AND COUNTY BOROUGH OF BELFAST.

TRAMWAYS AND ELECTRICITY DEPARTMENT.

Low Tension Insulated V.B. Cable.

THE TRAMWAYS & ELECTRICITY COMMITTEE of the Belfast Corporation are prepared to receive Tenders for the supply and delivery of Low Tension Insulated V.B. Cable during the twelve months ending 31st March, 1911.

Specification with Form of Contract may be obtained from the undersigned on payment of One Guinea, which will be refunded, provided a *bona fide* Tender has been sent in and not withdrawn.

Extra copies may be obtained at 10/- each, which is not returnable.

Sealed Tenders endorsed "Tender for Cable, Electricity Department," shall be lodged with the Town Clerk, City Hall, Belfast, not later than 10 a.m. on Monday the 21st of February, 1910.

The Council do not bind themselves to accept the lowest or any Tender.

THOMAS W. BLOXAM, M.Inst. E.E.,
City Electrical Engineer.

Electricity Works,
East Bridge Street,
Belfast.

CITY AND COUNTY BOROUGH OF BELFAST.

ELECTRICITY DEPARTMENT.

STORES.

THE TRAMWAYS AND ELECTRICITY COMMITTEE invite Tenders for Twelve Months' Supply (ending March 31st, 1911), of the undermentioned materials :—

SECTION NO. 1.
1. Lubricator & Gauge Glasses.
2. Packings.
3. Oils.
4. Rubber Goods.
5. Bricks, Firebricks & Fireclay.
6. Tools.
7. Incandescent Lamps.
8. Arc Lamp Carbons.
9. Galvanised Wire.
10. Asbestos Goods.

SECTION NO. 2.
11. Trolley Wire.
12. Overhead Line Material.

SECTION NO. 3.
13. Refined Trinidad Bitumen.
14. Bitite Strip, Prepared Tape & Rubber Tape for Joints.
15. Joint Box Compound.
16. Fuse Wires.
17. Wood Troughing.
18. C.I. Street Box Frames & Covers.
19. Glazed Stoneware Conduits.
20. Cast Iron Pipes.
21. Lighting Feeder & Section Pillars.
22. Glazed Stoneware Cable Bridges.
23. Copper Cable Connectors.

SECTION NO. 4.
24. Electricity Motors.
25. Electricity Maximum Demand Indicators.
26. Automatic Time Switches.
27. House Service Cut-outs.

Form of Tender (bound up in 4 Sections) and further particulars may be obtained from the undersigned, on payment of 10/- per section which will, after the Council or their Committee have come to a decision on the Tenders received, but not before, be returned to the Tenderer, provided he shall have sent in a *bona-fide* Tender, and shall not have withdrawn the same.

The whole or any part of a Tender sent in may be accepted, and Tenders shall be open for acceptance until May 1st next.

Tenders endorsed "Tender for Stores, Electricity Department" shall be lodged with the Town Clerk, City Hall, Belfast, not later than 10 a.m. on Monday, February 21st, 1910.

THOMAS W. BLOXAM, M.Inst.E.E.,
City Electrical Engineer.

Electricity Works,
East Bridge Street, Belfast.

ELECTRIC CABLE CASING. Special clean white 1¼ in. at 22/6, 2 in. at 35/6 1000 ft. Refuse foreign. Support BRITISH industry. We compete, own make. All sizes in stock, also cable troughs for underground, woodwork all description. Send trade card. C. JENNINGS & Co., 955, Pennywell Road, Bristol.

ELECTRICAL ENGINEERING

No. 162 [Vol. VI., No. 5] THURSDAY, FEBRUARY 3, 1910. [Price One Penny.
All rights reserved. *Registered as a Newspaper.*

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

PUBLISHED EVERY THURSDAY. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.
Canada. 8s. 8d. per Annum.
Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for SITUATIONS VACANT AND WANTED, ARTICLES FOR SALE AND WANTED, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

OFFICIAL NOTICES and TECHNICAL COLLEGE ANNOUNCEMENTS are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving

Letters for Insertion, *Tuesday first post.*
Small Advertisements and Official Announcements, *Wednesday first post.*
Displayed Advertisements, *Tuesday first post.*
Corrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 208-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, London." *Telephone No.: 5509 Holborn.*

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON AND WESTMINSTER BANK (Temple Bar Branch).

BINDING "ELECTRICAL ENGINEERING." — Vol. V. of "Electrical Engineering" (Jan.–Dec. 1909) closed with our issue of Dec. 30. An index for the volume is now ready, and copies may be ordered from any newsagent or bookseller at the price of 1d. each (or post free, 2d.). Binding Cases, including index, are also ready, price 2s. each, post free 2s. 4d. (Abroad 2s. 6d.) Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to us, carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad.

SUMMARY

OUR monthly supplement on "Electrical Engineering in Mines" is included in this issue. Some correspondence on shaft cables is published, and abstracts of papers recently read on "Machine Mining," by Mr. S. Mavor, and on "Electricity in Coal Mines," by Mr. R. Nelson, are included. Some practical notes are contributed by Mr. S. Skirrow, and illustrated descriptions appear of the Electric Construction Co.'s new coal cutter and a safety gate-end switch-box, designed by Mr. H. J. Fisher. We give special reports of the discussion at the Newcastle and Cardiff sectional meetings of the Institution of Mining Electrical Engineers on Mr. W. Maurice's paper on "Electric Shocks," which forms the introduction to the first part of the inquiry into the causes and prevention of electrical accidents in mines being conducted by that Institution. A summary is also given of electrical mining patents published in January.

MR. H. E. YERBURY'S Paper on "Equitable Charges for Tramway Supply," the discussion upon which at Manchester we reported last week, was further discussed in Sheffield and London. Opinion was divided upon whether the charges should be fixed on a clear and well-defined basis, or whether local considerations and broader commercial relations between supply and demand should be a predominating factor. Mr. J. F. C. Snell defined in detail the basis upon which he thought the charges should be based. Mr. W. G. Bond said that the charge per unit made by municipalities to tramway companies should not be higher than what it would have cost the company to supply from a station of their own, built only for the tramway load. He pointed out that the question was most important in view of the customary quinquennial arbitrations to decide the price to be paid by the tramway companies to the municipalities supplying them. (Page 73.)

JUDGMENT has been given in the appeal in the action brought by Messrs. J. H. Holmes & Co. against Associated Newspapers, Ltd., for alleged infringement of the Clatworthy patent relating to electrical driving of printing presses. The appeal has been dismissed with costs, and the patent is pronounced invalid on the score of anticipation by certain descriptions of equipments published in American journals. (Page 74.)

THE action by the Gravesend and District Electric Tramways Co. against the Gravesend Corporation, in which the accuracy of the meters measuring the tramway current was disputed, concluded on Monday with a verdict for the defendants. The judgment, however, expresses no opinion as to the accuracy of the meters, the judge holding the opinion that the company's remedy was to go to arbitration on the matter, as provided for in their agreement with the Corporation. (Page 75.)

A LETTER from Mr. E. W. Cowan, called forth by the discussions on Mr. Yerbury's Paper on charges for tramway supply, urges the principle that the price of electricity for all purposes should be based on market

Digitized by Google

considerations more than on cost. Mr. A. M. Taylor also writes on the same subject, and favours the basis adopted in Manchester. A letter from the Adnil Electric Co. replies to correspondence regarding their combined lighting and power meter. (Page 76.)

WE report the first part of the hearing of an action for infringement brought by the Donnersmarckhütte against the Electric Construction Co. The Ilgner patent for the electric driving of reversing rolling mills is the one in question. The alleged infringing plant is that at the Bilston works of Messrs. Alfred Hickman, Ltd. It is not denied that the Ilgner principle is employed there, but it is asserted in defence that the Ilgner patent is invalid for want of subject matter and on account of insufficiency. The publications quoted as describing the principle include descriptions of a Ward-Leonard motor-generator traction equipment, in which a flywheel-effect is referred to, and a patent by Ferranti for a motor-generator with a flywheel for use in lighting stations to smooth out the fluctuations of a power load. Some interesting evidence with regard to the operation of reversing rolling mills was given by Mr. Swinburne, Mr. Ablett (of Siemens Bros. Dynamo Works), Mr. Parshall, Prof. B. Hopkinson, Mr. Ferranti, and Mr. Mordey. (Page 77.)

AT the annual dinner of the Leeds Local Section of the Institution of Electrical Engineers, reference was made to the backwardness shown by textile engineers in adopting electrical driving, and the unsatisfactory nature of a recent report on the subject. The section is to be known in future as the Yorkshire Section. (Page 78.)

THE annual dinner of the Students' Section of the Institution of Electrical Engineers was held in London on Wednesday of last week. Dr. G. Kapp spoke of the training of engineers, and referred to a prize offered in Italy for an efficient earthing device. Mr. W. M. Mordey, Dr. S. P. Thompson, and Mr. Hammond also spoke. (Page 78.)

AMONG the specifications published by the Patent Office on Thursday last was one by H. Hirst and the Wolfram (Tungsten) Metal Filament Lamps, Ltd., for a method of jointing metal filaments to leading-in wires. This consists in making the joint with a paste of the phosphides of copper or tungsten, and reducing the paste in a suitable manner.—A device for effecting a gradual feed and for taking the weight of the carbons off the stop in arc lamps of the supported carbon type is protected by P. Hanisch and the Regina Bogenlampenfabrik Ges.—Messrs. Siemens Bros. Dynamo Works, Ltd., describe a system of control for shunt-wound D.-C. motors driving ventilating fans or ships' propellors. Two motors are placed on the same shaft and are connected in series up to 80 per cent. full speed, which corresponds with half full load. Finally, the motors are placed in parallel and brought up to full speed by shunt regulation. A patent by E. W. Smith and the New Phonopore Telephone Co., Ltd., for apparatus for telephoning along telegraph lines expires to-morrow, after the full life of fourteen years. (Page 79.)

THE Aberdeen Corporation have offered a supply of electrical energy to the Suburban Tramways Co. at 1·75d. per unit, but the company suggest 1·25d. per unit.—The Cavehill and Whitewell Tramways Co. have offered their undertaking to the Belfast Corporation on arbitration terms.—The Devonport and District Tramways Co.'s Bill, which proposes to vary the terms of an agreement between the company and the Corporation, was referred to by the Town Clerk at the last meeting of the Council as a "monstrous proposal."—Mr. C. P. Sparks has reported upon the Newport (Mon.) electricity undertaking to the effect that the charges for power supply are too low.—People in the Potteries district have been recommended to boycott the tramways owing to the introduction of the "fair fare" system.—The Brompton & Kensington Electricity Supply Co. have introduced a new tariff for lighting and heating which involves the use of one meter only. (Page 80.)

ASTON CORPORATION propose to spend £13,550 on electrical extensions, and the Southampton Corporation £13,000. A loan of £21,000 has been sanctioned at Keighley. Mains extensions to the value of £3,000 are contemplated at Torquay. Arc lamps are required at Grimsby; electrical stores and accessories at West Ham and Marylebone; and switchboard, testing panel, and workshop motors at Oldham. A new power station is to be erected by the River Plate Electricity Co. (Page 80.)

THE Yorkshire Electric Power Co.'s accounts for 1909 show a net profit of £2,664. It is hoped to submit a scheme for the working of the East London Railway by electric traction at the meeting in July. (Page 82.)

THE London Electrobus Co. is to be wound up. (Page 82.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) FRIDAY, FEBRUARY 4TH.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "History and Manufacture of Electric Glow Lamps," by L. Wallis.

MONDAY, FEBRUARY 7TH.

P. and O. Batti-Wallah's Society.

8 p.m. Smoking concert at Holborn Restaurant.

TUESDAY, FEBRUARY 8TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee meeting at Balfour House, Finsbury Pavement, London.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "Three-wire Balancers," by A. G. Cooper.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. At 207 Bath Street. "Equitable Charges for Tramway Supply," by H. E. Yerbury.

WEDNESDAY, FEBRUARY 9TH.

Association of Engineers-in-Charge.

8 p.m. At St. Bride's Institute, Fleet Street, London. "Modern Arc Lamps and their Application," by A. Angold.

THURSDAY, FEBRUARY 10TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, Westminster. "Losses off Transmission Lines due to Brush Discharge, with Special Reference to the Case of Direct Currents," by E. A. Watson.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science. "The Elementary Graphics of Alternating Currents," by T. Tomlinson.

FRIDAY, FEBRUARY 11TH.

Physical Society.

8 p.m. Annual General Meeting. At Imperial College of Science, South Kensington.

SATURDAY, FEBRUARY 12TH.

Royal Institution.

3 p.m. Lecture I., on "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

Institution of Electrical Engineers: Glasgow Section.

7 p.m. Annual Smoking Concert at "The Grosvenor."

Central Technical College Old Students' Association.

7.30 p.m. Annual Dinner, at Trocadero.

New Equipment at Streatham Telephone Exchange.—On Saturday, January 22nd, at 1.30 p.m., the National Telephone Co. transferred the subscribers connected to its Streatham Exchange to a new central-battery equipment installed in new premises at Ena Road, High Road, Streatham, which have been specially designed. The new equipment has been manufactured and installed by the Western Electric Co., Ltd., of North Woolwich, and is of the No. 1 C.B. type, consisting of 12 subscribers' positions, giving accommodation for 1,730 lines; three incoming junction positions, one electrophone position, and one exchange testing position. The equipment is of similar design to that installed at the company's Altrincham, Birmingham-Midland, Hillhead, Bromley, Dalston, New Cross, and Liverpool-Bank Exchanges.

EQUITABLE CHARGES FOR TRAMWAY SUPPLY

A PAPER on this subject, by Mr. H. E. Yerbury (Chief Electrical Engineer, Sheffield Corporation Tramways), was discussed last week by the Institution of Electrical Engineers in Manchester, Sheffield, and London. An abstract of the Paper, together with a report of the discussion at Manchester, appeared in our last issue. Mr. Yerbury criticised the usual methods of allocating the relative proportions of generating costs in combining lighting, power, and tramway stations, when determining the charge to be made for energy supplied to the tramways department. A detailed comparison was made between the total fixed costs of 0·865d. per unit assumed chargeable to the tramway department at Manchester, and a figure of 0·371d. obtained in the independent tramway station at Sheffield. The assumption that the difference is justified by the expense incurred in providing plant for the tramway peak load, and in conversion from A.-C. to D.-C., was characterised as incorrect. It was suggested that the charge should be based on capital and running costs in connection with the plant essential to the tramway supply only, with the addition of a profit of from 3 to 5 per cent. on the running costs.

In the discussion at Manchester, Mr. Pearce justified the charges determined at Manchester, Mr. J. R. Salter asserted that many lighting stations actually owed their existence to the tramway departments, and Mr. Watson and other engineers also spoke.

Discussion at Sheffield.

Mr. A. J. Cridge (Corporation Electricity Supply Department, Sheffield) was of the opinion that, considering the low price at which power can be supplied at Sheffield, it ought to be possible for a combined generating station to supply tramway departments at a cheaper rate than they at present do, especially as the respective peaks do not occur simultaneously. He said his station would be prepared to supply the Sheffield trams with H.T., 2,000 volt, 2-phase current at 0·55d. per unit. He thought the profit of from 3 to 5 per cent. suggested by Mr. Yerbury for supplying current to a tramway department as too small.

Mr. R. L. Acland (Borough Electrical Engineer, Chesterfield) mentioned that in his town the peak of the tram load was concurrent with that of the lighting load on Saturdays. He had worked out the figures on Mr. Yerbury's basis, and found that the price to be charged would be 1·10d. per unit, as against 1·25d. the present price charged. He hoped that the joint conference which has been arranged between the municipal tramway managers and the municipal electrical engineers to discuss the subject would arrive at a satisfactory basis of charge.

Mr. I. F. Fawcett (Leeds), referring to the suggestion mentioned in the Paper that a 3 to 5 per cent. profit should be charged only on the running costs, pointed out that the fixed charges would come to a considerable amount in comparison with the running costs, and he did not consider there would be any margin of profit to a combined station on such a low allocation.

Mr. Fenton (City Council, Sheffield) said that it seemed extraordinary to him that some towns should make such high charges to tramway departments, but Mr. Cridge's proposal to supply current at 0·55d. per unit, he said, would not pay the tramway department when the other costs had been added.

Mr. Wardale said that in some instances the supply department had the trams in their grip, and made the best of it. The charges for power purposes must be kept low, because of the competition of private plants and gas engines; therefore they endeavoured to recoup themselves at the expense of the tramways.

Mr. Harold Dickinson (City Electrical Engineer, Leeds) did not agree with the statement that in the maximum demand system all consumers were supplied on the same terms, because, as a matter of fact, separate rates were charged for varying types of demand. No one had yet been able to show what was an "equitable" rate for the allocation of "fixed charges"; in his opinion, the matter was solely a question of policy. There being less competition for lighting than for power, they were justified in charging lighting consumers at higher rates of profit, and on the same principle tramway departments should be charged at a higher rate than power consumers. The supply department was justified in getting as much as it could. Ultimately the power business would grow enormously, and should be encouraged, as it would be of great commercial benefit to the town, while the tramway demand would develop to a much less extent.

Mr. W. M. Rogerson (Electrical Engineer and Tramways Manager, Halifax), who was in the chair, agreed with Mr. Yerbury in the main. In Halifax, he said, they charged 1½d. per unit for trams, and 2d. to ¾d. for power. On working out last year's figures, he found that on the basis suggested by Mr. Yerbury, the prices would have been 1½d. for trams, and 1½d. for power. He could not see any difficulty in arriving at a fair charge. The method to adopt was to separate the capital charges, find the demand in both cases, and charge each class in proportion to his demand; it was necessary at the same time to take into consideration local circumstances in trying to arrive at an equitable charge.

Mr. Yerbury, in replying, referred to the offer of Mr. Cridge, and said that it would not pay them, as the losses in transformation, &c., would bring up the cost higher than at present. Mr. Dickinson's policy of "get all you can" might be a very good one, but at the same time he did not see why there should be such a great difference in the charges to different consumers—170 per cent. in excess of works costs in one case, and as low as 9 per cent. in another. He considered that when a tram's demand is equal to half a million units per annum, the price charged should not be more than 1d. per unit.

Discussion in London.

Mr. J. F. C. Snell said that a mistake frequently made was to attempt to compare tramway supplies in various towns, the circumstances in which had no relation to each other. Many tramway stations, for instance, had to repay their loans only in 30 years, whereas with combined stations the period for repayment was 25 years. This was afterwards reduced to an average of 22 years, and now it was more frequently 17. Mr. Yerbury had made a fundamental mistake in his Paper in attempting to compare a simple direct-current station like Sheffield with a three-phase supply as in Manchester. If Mr. Yerbury had taken Glasgow, which was an independent three-phase station, and compared that with Manchester, then he would have been comparing like with like. He found that at Glasgow the total costs were 1·2d. per unit, which compared with 1·04d. per unit in Manchester, and he was told that the figure in Manchester in future was to be 1d. per unit on a flat rate. In this particular instance the combined station had the advantage. His experience was that there was not such discrepancy between supply from the two kinds of station that Mr. Yerbury suggested. A point which tramway-men frequently forgot was that, as the electrical department of the Corporation developed, the tramway department, which naturally would not grow in the same proportion as the other portion of the supply, would be in a better position to get a reduction in the future than it would be if it had its own independent station. Mr. Snell then suggested the following as the proper way to settle the price between the various departments. He took the ascertained maximum demand of the tramway department, and also the coincident maximum demand, *i.e.*, the demand of the tramways at the time of the maximum peak upon the combined station. He then took a mean of these two figures, and called it the total kilowatts demanded, and in allocating the standing charges he merely took the sinking fund and interest on this demand. In calculating the additional charges, he took management, less the charges of the distribution department; rents, rates, and taxes; insurance; wages at the power station; and if it were a three-phase system with sub-station, he added wages at the sub-stations. This total he divided by the total kilowatts demanded on the combined station, and so got a charge per kilowatt of demand. He multiplied that figure by the ascertained demand of the tramways, and so arrived at the proportion of fixed charges which the tramways should pay. In the running charges he allowed for coal, oil, repairs, and all the charges on the plant, but not on the mains, and divided that by the total units delivered to the switchboard. That gave the running charge per unit delivered to the switchboard, and by multiplying this by the actual units supplied to the tramways at the switchboard, he obtained the proportion of the running costs which the tramways should pay. In addition, he recommended adding from 5 per cent. to 7½ per cent. as profit in order to cover the risks of variation in price of coal, damage from fire, &c., which the combined station had to bear. If this system were adopted and a revision made triennially, he thought this would give the true cost of the tramway supply.

Mr. Stuart Russell (India Rubber, Gutta Percha, and Telegraph Works Co., Ltd.) said that in a combined station there were in most cases certain portions of the generating and distributing plant which were provided solely for the use of the one supply or the other, and in allocating the costs they should take the charges for capital expended on the special items, and charge them to the supply making use of them. The charges on the remainder of the capital expenditure, which was common to both supplies, should be divided in proportion to the relative maximum demands. The suggestion made by Mr. Snell that, instead of taking the actual maximum demand of the tramways, the mean between the maximum demand and the demand at the time of the maximum lighting demand should be taken, seemed to him an improvement, and gave perhaps a fairer division than by taking simply the maximum demand on the station.

Mr. E. W. Cowan (Messrs. Cowan's, Ltd.) suggested that the market value of the various classes of supply was a factor which electrical engineers had hitherto overlooked. Throughout all industry the law of supply and demand came into effect, and the neglect of this had led the commercial side of electricity supply into an entanglement which they ought to get out of. The fact that electrical energy for tramway supply

Digitized by Google

had a higher market value than electricity for other supplies was, he thought, a partial cause of the higher price.

Mr. A. H. SHAW (Electrical Engineer, Ilford District Council) said that fully half of the author's examples were small stations to which the circumstances of the larger stations could not apply, and, therefore, comparisons between them were unfair. In a small station like Ilford supplying some 20 cars, one small set was sufficient for the supply required, but the variations in the load were from no load to 25 per cent. overload on that set. Consequently the coal cost was more than on a set supplying both power and lighting. Wear and tear was also heavier on such a set. He found from experience that the maintenance and cost of repairs of such sets were very much higher than lighting sets. When the Ilford trams were first started, the Council were advised that it was illegal for one department to make a profit out of another. They, therefore, did not fix any charge for the tramway supply, but reckoned up the actual cost at the end of the year and charged that. For the last two years the charge at Ilford had been 1½d. per unit, which he did not think a very high rate for 800,000 units. At the same time, it was not low enough to satisfy his Tramway Committee, who claimed to be supplied at as cheap a rate, namely 1d., as certain large power users. In answer to the President (Prof. Kapp), he said that the load factor for traction was 26 per cent., and for the private supply mentioned 20 to 25 per cent.

Mr. C. H. WORDINGHAM (Electrical Engineer-in-Chief to the Admiralty) agreed with Mr. Snell as to combined stations. He was glad that the system of allocating the costs which he had inaugurated at Manchester was being substantially adhered to, and he would refer those who really wished to understand the subject to Dr. John Hopkinson's original Paper. He was strongly of opinion that each class of consumer, whether lighting, power, or traction, should pay the proportion of the actual cost that that consumer cost to supply.

Mr. W. G. BOND said that the Paper had only considered one municipal department supplying another. In many places, however, the municipalities depended largely for their profits upon the supply to tramways companies, and in view of the fact that a quinquennial revision of these prices by arbitration was customary, he had hoped that the discussion would lead to some general agreement as to the broad principle upon which the charges should be based. He was perfectly prepared to accept as a basis that the tramways should not be charged a higher price per unit than what would be the total costs if current were supplied from a separate station. The management for the tramway supply was small, and it was unfair to allocate the management charges in proportion to the units consumed for lighting and tramways respectively. Further, as the costs at which the supply to a company were calculated were already debited with 3 per cent. or more for interest, to add a further 5 per cent. for profit as well was not reasonable, though he thought some 3 per cent. profit over and above interest charges might fairly be added to the other costs.

Mr. C. E. C. SHAWFIELD (Borough Electrical Engineer, Wolverhampton) said that it had been complained that at Wolverhampton he was charging ordinary power consumers at a cheaper rate than the Tramways Committee, but it was overlooked that in 1902 special plant was put in for the supply of the tramways, which cost practically £100 per kilowatt, whereas the new plant, for which power consumers, cost only £20 per kilowatt, and, in addition, it was much more economical in its working. Obviously, therefore, the cost of the tramway supply must be higher than for the power consumer. Apart from this, there was another reason. The load factor of a tramway was by no means as good as it was supposed to be. In his own case the average number of cars was somewhere about 25, but towards the evening in the winter it increased to 40 or 45, fully load, and stopping at every stopping-place, just at the time when the peak load of the other consumers was on.

Mr. YERBURY in reply said that Mr. Snell had mentioned Glasgow. From figures given him within the last month, he found that the standing charges per kilowatt installed at Glasgow were £3 5s. 5d., or 0·391d. per unit. On the D.C. traction side this was 0·41d. per unit. At Leeds, which was also a high-tension station, the standing charge per kilowatt installed was £4 1s. 3d., or 0·386d. per unit, and on the D.C. traction side 0·402d. per unit. It was well known that in a low-tension station there were less losses in transmission and conversion. For instance, at Sheffield the standing charges per unit generated were 0·269d., and on the D.C. traction side 0·295d. At Manchester, which was a combined station with a total output of over 82,000,000 units per annum, the standing charges amounted to 0·4503d. per unit. Theoretically, the costs in a combined station should be very much lower than in a separate station, but in practice it was not so.

Owing to the lateness of the hour, the author will reply further in the Institution journal.

A conference upon the same subject took place on Friday between the Incorporated Municipal Electrical Association and the Municipal Tramways Association, but the proceedings were private.

THE ELECTRIC DRIVING OF PRINTING PRESSES

THE appeal against the judgment of Mr. Justice Neville in the action brought by Messrs. J. H. Holmes & Co. against Associated Newspapers, Ltd., for alleged infringement of the Clatworthy patent for the electric driving of printing presses has been heard before the Master of the Rolls and Lords Justices Fletcher Moulton and Buckley, and judgment was delivered last Thursday. A full account of the original hearing was given in ELECTRICAL ENGINEERING, Vol. V., pp. 915 and 936. Mr. Justice Neville considered the patent invalid for the reason that, in his opinion, some descriptions of an American equipment published previously to the application for the patent included the substance of the first claim (which covers certain uses of an auxiliary motor), and dismissed the action with costs. This judgment has now been upheld, and the appeal has been dismissed with costs.

The patent in question is No. 9,802 of April 28th, 1898, and was granted to W. A. Clatworthy and W. H., A., J. H., L. W., and E. Holmes, all of J. H. Holmes & Co., of Newcastle-upon-Tyne. It describes a method of driving printing presses which gives a first slow-running speed, and a gradual acceleration until full speed is reached, without any shock. This is effected by employing two motors, a main motor driving the press direct, and an auxiliary motor connected to the main motor shaft through worm gearing and a free-wheel clutch, so that the main motor can overrun the auxiliary motor. A hand-operated controller causes the clutch to be thrown into gear electrically, and then starts up the two motors in succession. When the main motor overruns the auxiliary motor, the latter is automatically switched off.

The first claim reads as follows: A system or method of electrically driving a newspaper printing machine or the like at very diverse speeds, consisting of the use of an auxiliary motor, in addition to, and driving by power gear through, the shaft of a main motor, both for the purpose of driving the printing machine at a slow and steady rate when required, and for starting the printing machine from rest, to enable the main motor to gather up power and drive without shock or excessive current substantially as described.

In the judgment, the Master of the Rolls interprets this claim to be simply for a series arrangement of a main motor and an auxiliary motor, *simpliciter*, and not for a combination of such motors in series with an automatic device such as the combination switch described in another claim. Lord Justice Fletcher Moulton points out it is the breadth of the claims that is material to the action. He considers it possible that the claim for the whole machine might have been supported. The patentees, however, were not content with claiming the whole machine, but in the first claim covered that which consisted of only two elements. These were, in his opinion, anticipated by the publication of the American description referred to. Nor does the second claim (for the two motors with the disengaging clutch) include any combination switch for securing the machine upon being handled incautiously. His Lordship reviewed at some length the gearing in the American machines, which he considered capable of everything that the plaintiffs' combination could do. Lord Justice Buckley takes up the relation of the combination starting and controlling switch with the other parts of the system, and holds that for the appeal to succeed, it must be shown that the switch is necessary to be used in Claims 1 and 2. In the light of the whole specification, however, he is of opinion that it would be equally competent to achieve the desired result by having a skilled workman to operate independent switches in the right way. If these two claims are regarded in that way, he holds that the patent was anticipated, and, therefore, invalid.

Lancashire Power Company's Consumers' Dinner.—Mr. C. D. Taite, General Manager of the Lancashire Electric Power Co., Ltd., presided on Thursday at the annual dinner of the staff and consumers. He stated it was a remarkable thing that those firms in Lancashire who had come on to the company's mains, and were driving their works electrically, were busier at the present time than those who had retained the old steam drive. In a reference to the South Lancashire Tramways Co., Mr. Taite expressed the opinion that had the Power Company been operating before the Tramways Company, the latter would have taken power in bulk. In reply to the toast, Mr. J. R. Salter, of the South Lancashire Tramways Co., said that although he had at times opposed the Power Company, he was prepared to wish them every success. Indeed, he would go so far as to say that if the Power Company would agree to supplying his Tramway Company as cheaply as they could generate electricity for themselves, he would scrap his existing generating plant.

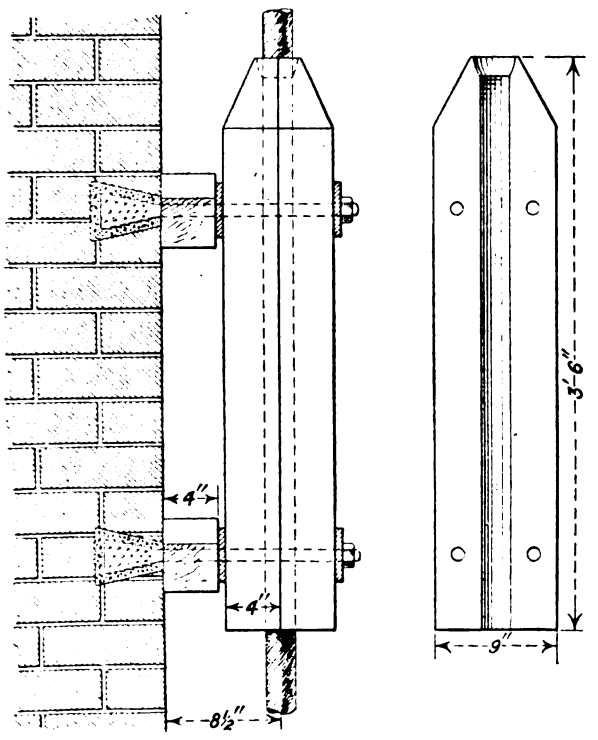
ELECTRICAL ENGINEERING
IN
MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "The Editor, Electrical Engineering, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.



CORRESPONDENCE

SHAFT CABLES.

To the Editor of Electrical Engineering.

Sir,—I read with interest the article in your last supplement on the above. The writer seems to know what shaft cable troubles are as far as mechanical injury goes, but he does not say anything relative to chemical injury caused by water in the shaft.

Most shafts, especially old ones, are liable to allow water to penetrate the brickwork, and very often the water contains a large percentage of chemical matter which acts upon the armouring, and also upon the conductor, if it does by any chance get to it. I have seen wire armouring rusted away to the insulation, and this was worse at the point where the cable

Wooden Clamp for Fixing Cable to Brick Wall.

had been clamped, for at this point the water lodges and soaks into the clamp. If a clamp be removed from the shaft and dried, a thick coating of salts will be deposited on the surface, and it is these salts that cause much trouble in shafts. I do not say this is the cause in every case, but I put it down here as a common one to be met with. In many deep shafts where the shaft side is "buckled," water drops on to the cable, and in time washes the braiding and taping away. As a precaution against this, cables should be fixed in the driest part of the shaft and clear of all pipes carrying water or steam.

Armoured cables are good for a shaft, providing they are fixed in a dry part, but even in that case they should be coated with preservative compound now and again, especially where they are gripped by clamps. A good impregnated vulcanised bitumen cable, with a good layer of bitumen near the conductor half as thick as the diameter of the conductor, with three or four layers of tape, and two layers of stout corded braiding all well compounded, and fixed as shown in the accompanying sketch is not to be beaten for shaft work. The clamps shown in the sketch are to be preferred to the short ones, as they are 3 ft. 6 in. long, and get a good grip of the cable. The rag bolts are let into the wall, secured, and run in with cement, a template being fixed to the four bolts so that the clamp will fall into its proper place. The hard wood blocks are fixed near the wall to keep the clamp out and clear of damp creeping. Two iron plates are then put on the bolts, then the back portion of clamp, the cable, which is put firmly in the groove, the front portion of clamp, and finally the front iron plates. The whole is secured by nuts until the clamp is perfectly tight at the joint. The grooves at the tops of clamps are hollowed out previous to fixing, and when fixed are run in with hot bitumen. This clamp is only intended for one cable.

It will be seen that the cable when suspended by the clamps is 8½ in. clear of brickwork, and thus leaves sufficient space, should the cable be struck, to yield and weaken the effect of the blow on the cable. The clamps should be fixed twenty to thirty yards apart. Where wood casing or trough is preferred as a protection, I should suggest that it be packed off the brickwork in such a way as to allow water and dirt to fall off all joints and supports. The trough should be large enough to allow sufficient space round the cable, and care should be taken to see that the cables do not touch each other or casing. They could be held in position by wood bridges. The trough should be filled in with bitumen quite solid, and the bridges removed. Of course, the filling in can only be done, say, one length of covering at a time, then another length of wood cover is put on and filled in, and so on, commencing from the extreme bottom. Although this method of fixing shaft cables makes a sound, solid job, I prefer the former method myself.

With regard to joint boxes in shafts, it is as well to avoid them if possible, as cable can now be made in any required length. In the case where one portion of a cable is faulty, then a joint box is handy for uncoupling the faulty cable and inserting another without much difficulty. In many shafts it is necessary to feed intermediate seams of coal from one set of cables; the cables are then looped back into joint boxes. If boxes are properly fixed and the cables properly trimmed free of tapes about 2 in. from sweated connections, then filled in within half an inch of disconnecting links, it will prove a sound job, and handy for testing purposes. The box, if fixed in the open shaft, should have a "lean-to" cover of strong timber to keep falling matter off the box, but it is preferably recommended to keep cables out of a shaft, and put them in an insett run in for three or four yards. Cables should be tested at least once a week, and if the test is lower than the previous test, immediate steps should be taken to locate the trouble. A little fault will soon lead to a serious breakdown, and my advice to colliery electrical engineers is to see that full attention is given to their cables.

One who has had Experience.

CABLES IN SHAFTS AND MAIN HAULAGE WAYS.

To the Editor of Electrical Engineering.

Sir,—*Re* article on "Cables in Shafts and Main Haulage Ways," by Mr. J. P. Simpson, published in your issue of January 6th. In the first paragraph Mr. Simpson refers to "Cables armoured with steel *tape*, wound so that the armour is locked or wedged." I presume Mr. Simpson means the well-known "Key" or "Lock" armour, a combination of shaped steel strip and steel round wire fitting into the shaped strips. The ordinary man, on reading of "steel tape," immediately thinks of a cable lapped with two layers of steel tape, wound so that they break joint one with another. This, of course, is unsuitable for shaft cables.

In the second paragraph the writer of the article says that he "has found that the best class of cable for shaft work is that in which the conductors are insulated with bitumen compounds, and the space between the insulated cores filled in with jute mixed with a plastic compound, *so as to keep any moisture from creeping in.*" I agree that it is a very important point to stop moisture from creeping in between the insulated con-

Digitized by Google

ductors, but *no fibrous material*, such as jute is, however treated with compound, can be said to thoroughly keep out moisture; on the contrary, if moisture is present and in contact, a fibrous packing gradually sucks it up, the moisture travelling along the fibre of the material.

As the author in effect states that moisture should not be allowed to creep between the insulated conductors, he will appreciate that an even better type of cable than the one he proposes will be the solid three-core bitumen cable, which was specially designed to meet the wet conditions of shafts. In this type of cable, the conductors are insulated with bitumen compound, then laid up together (no fibrous tapes being applied over the insulated conductors) round a shaped core of bitumen which fills up the central space, and is sheathed over all with a solid tube of bitumen which is ribbed internally, so as to fit the interstices between the laid-up cores; the protective covering, double armour, &c., being then applied. All that has been done in the above type of cable is the replacing of the jute packing in Mr. Simpson's cable with a *waterproof* packing of bitumen. As will easily be seen, the solid three-core bitumen cable, as described, is completely waterproof as to its insulation and packing, and as there is no introduction of any fibrous material of a possible conducting nature, such a cable has a higher insulation and dielectric strength than Mr. Simpson's cable; the *effective* dielectric in the solid three-core cable is the *total* thickness of bitumen over each conductor and around the three cores, *not* the thickness of bitumen on the separate cores only, as in Mr. Simpson's cable

If, in addition, as I strongly recommend, the solid three-core bitumen cable is made with the copper-stranded conductors having the interstices between the wires composing the strand filled with a special solid compound, which will not run or become displaced by the heating of the conductors through overload, you have a cable thoroughly waterproof—*i.e.*, water or moisture cannot enter anywhere under any conditions—and the *ideal* shaft cable.

Yours faithfully,

January 17th, 1910. GEORGE G. L. PREECE.

MACHINE MINING

A LONG Paper on machine mining, with special reference to South Wales conditions, was read by Mr. Sam Mavor before the South Wales Institute of Engineers at Cardiff on November 17th. In the course of his introductory remarks, Mr. Mavor said that the use of coal-cutting machines had rendered possible the working of seams which, on account of their thinness or other difficulties, could not be worked under present-day conditions by hand labour. By reducing working costs, coal-cutters had opened up in the thinner seams an immense field of labour that would otherwise have been lost and had provided increased employment for the miner. Also, it was an ascertained fact that wherever coal-cutting machines were used, the wages of the men were increased. The shortening of the miner's day by the Eight Hours Bill rendered more urgent the adoption of every means of maintaining or increasing output, and both coal-cutters and conveyors were valuable aids to this end. The effect of a coal-cutter was practically to double shift a pit.

These machines were to-day operating with success in thick, thin, steep, flat, faulty, and regular seams under conditions considered impossible a few years ago, and the judicious use of machinery at the coal face went far towards reducing the proportion of small coal and the amount of dirt to be washed away. There were many misconceptions regarding the alleged unsuitability of coal-cutters to conditions prevalent in South Wales, and some of these were reiterated in Government Blue Books, &c., from time to time. Mr. Mavor proceeded to deal with several of these features. In conditions of heavy pressure, for example, it was desirable that the working face should be advanced as rapidly as possible, and both coal-cutters and conveyors were valuable aids. The effect of pressure made the coal yield more freely to the cutters. There were many steam coal seams, too, in which, even if coal-cutters were not suitable, conveyors could be used with great advantage in conjunction with hand getting. Plans of collieries were shown in which the greater compactness, regularity, and definiteness of purpose of the machine worked over the hand-worked sections was very apparent, and examples were quoted to bear out the following advantages claimed to accrue from the concentration obtainable: Reduced cost of road maintenance, rails, and sleepers, reduced risk of accidents at the face and in roadways, reduced interruption of traffic in roadways, reduced danger from gas and dirt, abolition of "putting" or tramming from face to haulage, and improvement in ventilation.

In gaseous and dusty seams, machine mining alleviated the dangers and difficulties by reducing the volume of gas, owing to the concentration of the sphere of active operations, facilitated inspection for gas and simplified ventilation. It had been definitely ascertained that the total volume of dirt produced from a given seam was less with machine than with hand working, and, again, conveyors, by reducing the general breakage of the coal, also diminished the total volume of dust.

It was also a mistake to suppose that friable coal was not amenable to mechanical cutting. Long wall coal-cutters were in daily operation in scores of friable seams in every district in the country, and Mr. Mavor detailed methods of overcutting which were superior to undercutting in some such cases. Also in jointed seams there was ample scope for the profitable employment of machinery. High inclination was not by any means an obstacle to the successful operation of coal-cutters, but, on the contrary, he knew of seams inclined at 40° which were being won by long wall machines at less cost than was possible in similar seams on the flat. This part of the subject was gone into at some length, and a detailed description of the methods employed was given. The limit of steepness was generally considered to be about 45°, although he had visited a colliery in Austria where the system was practised up to about 70°.

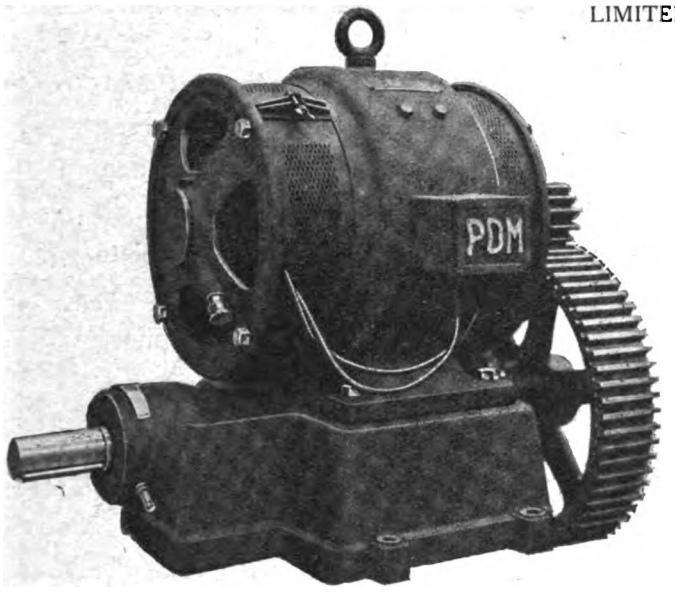
The Paper then passed on to a consideration of undeveloped thin seams, and some information regarding a system of opening out such seams as widely used in Scotland was given, in which long wall conveyors and face conveyors were utilised in piercing the shaft pillar, and exceptionally wide headings were driven.

In the latter part of the Paper, comparisons were made between the capabilities of the chain, bar, and disc types of machine. The disc and bar machines, in the author's opinion, could meet conditions impossible to the chain, but there were no conditions met by the chain which could not be satisfactorily met by the disc or bar. For comparatively shallow undercuts in hard material under favourable conditions, the disc would travel faster than the bar, but no other machine had so wide a field of application as the disc, many of which, he said, were working with perfect smoothness where other types had failed. Its great advantage was the small surface exposed under the coal, while the disc was more liable to be jammed by falling coal. Again, neither disc holes nor "stables" were required, as the bar machine could cut itself in at one end of the face and out at the other. Further advantages were the greater ease with which the direction of the cut could be altered, the freedom from vibration when overcutting near the top of a seam, and the more even demand on the power supply.

THE BIRMINGHAM UNIVERSITY MINING SOCIETY

A PAPER entitled "Electricity in Coal Mines—Some Practical Considerations" was read by Mr. R. Nelson, H.M. Electrical Inspector of Mines, before the Mining Society of Birmingham University on January 27th, Professor Cadman in the chair. The author explained at the outset that the opinions expressed in the Paper must not be taken as representing those of the Government department concerned, but were his individual opinions only.

Mr. Nelson attributed the growth of electrical working in mines largely to the fact that the efficiency of distribution was 80 per cent., whereas that of its rival, compressed air, was usually only about 20 per cent. As regards the source of supply, the author was in favour of current being obtained from a power company if prices were at all comparable with those at which electricity could be generated by the colliery itself. He favoured three-phase working, the principal advantages over D.C. supply being that three-phase motors were cheaper and mechanically stronger, their overload capacity was greater, and, in the case of squirrel-cage motors, fire risk was reduced to a minimum. A point in favour of D.C. distribution was that for the same pressure the cables cost 30 per cent. less than with three-phase supply. As, however, sparkless commutation at high pressures was difficult to obtain, the pressure of generation could be but little more than "medium pressure" as defined for the special rules for mines—namely, 650 volts. Hence, before any great distance in-bye is reached, the three-phase system is actually cheaper as regards capital cost of distribution. Safety in working, in the author's opinion, was best secured by the three-phase system.



The principal requirements for safety in operating plant in mines were: Strong metallic coverings as protection from mechanical damage and contact with "live" parts; good earth connection for the metallic coverings; and automatic provision for cutting off current immediately leakage occurred; also, in fiery mines circuits should be made and broken either under oil or in flame-proof chambers.

Mr. Nelson expressed a strong preference for armoured as against unarmoured cables primarily because the former type enables provision to be made for automatically cutting off current immediately leakage begins by means of the leakage current in the armour operating protective devices. Falls of roof damaged unarmoured cables far more than armoured cables.

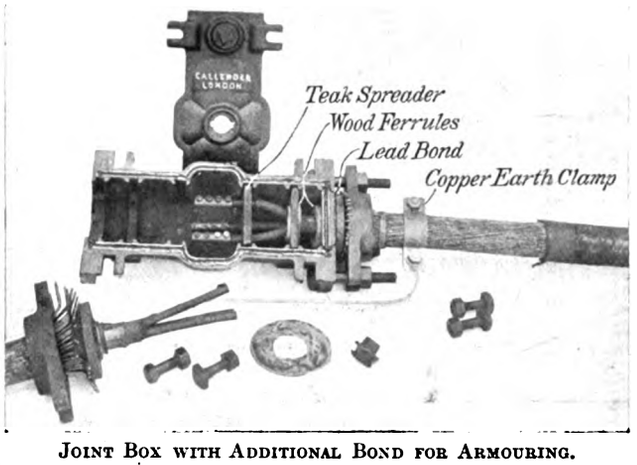
It was easy to get a good earth connection at the farthest point in-bye with the latter type of cable, but to achieve the same result with the former a special earth wire must be run. Armoured cables, however, demand vigilance in upkeep, and do not encourage slipshod methods.

Switchgear for mines should be enclosed in earthed gas-tight metal cases, the cases enclosing as little air as possible. The contacts should be oil immersed. The common fault with the present air-break boxes is that they are not gas-tight or flame-proof. Motors of the squirrel-cage type with no exposed live terminals should be used. Transformers should be oil immersed, and the cases, as well as the motor frames, efficiently earthed. Lighting cables may be run on porcelain cleats in dry places and where no fall of roof is likely, or in stout screwed steel tube, permanently and efficiently earthed. The bulbs of incandescent lamps should be enclosed in strong glass globes.

A large number of gentlemen took part in the discussion, amongst others being Professor Redmayne, H.M. Inspector of Mines, and representatives of the leading cable makers.

The majority of the speakers agreed with most of the author's opinions, the chief point of divergence being on the subject of armoured *versus* unarmoured cables, and in this connection a strong feeling was expressed by one or two members in favour of unarmoured cables except in special cases.

LEAVES FROM A COLLIERY ELECTRICIAN'S NOTE-BOOK



WE have received from Mr. S. Skirrow, of the Harton Coal Co., some notes on the erection and maintenance of colliery electrical plant, founded on his experience with both continuous and alternating current equipments. Mr. Skirrow points out that the status of the "colliery electrician" is far from satisfactory under present conditions. He is defined as a "competent person," and in the majority of cases has no official standing. Sometimes he comes under an engine-wright, who has not a knowledge of electrical matters, but is held responsible by the manager. The suggestion is made that it would be better if the electrician were placed on an official footing, and if the responsibility for the safe running of the installation were put by law partly, if not wholly, upon his shoulders. However well an installation has been arranged by the contractors, when it is first put in, a good deal depends on the colliery electrician, when such alterations are made as the moving of haulage, pumps, &c., further in-bye as the workings extend.

The choice and arrangement of cables is one of the most important of these matters. Mr. Skirrow favours bitumen insulation, and holds that decentralisation need only be secured in exceptional circumstances. He is in favour of armoured cable, well bonded across junction boxes, and with the armouring efficiently earthed in the pit by a copper plate in the slump and also at bank by two galvanised plates bonded together, and buried six inches apart in coke breeze, under a down spout, and emphasises the importance of periodical testing of the earth connections for conductivity. Cables should be carried along intake airways, as return air is apt to have an injurious effect on the armouring. Cables may be supported in tarred rope slings hanging from 3-in. plate nails, driven into props at the side of the way. Where main cables are put in iron or wooden cleats, plenty of slack should be allowed, so that the cable hangs in festoons, in order that in case of a fall, slack cable can be drawn through. Where there are sharp curves in a direction away from the wall, it is best to bury the cables if the bottom is reliable, and they should be protected in a wooden trench filled with bitumen, where they enter and leave the ground. Cables must not be passed over roof timbers. Connecting cables between controllers and resistances may be put in wooden trenches filled with clean, dry sand, and if rubber-covered they should be taped with asbestos to a safe distance from the resistance. If unarmoured trailing cables are used for portable machines an extra copper wire should be provided, through which to earth the machine.

The writer of these notes considers that leakage indicators (although these are compulsory under the Special Rules), can be dispensed with in three-phase systems if the neutral is earthed, on the ground that leakage to earth then compels attention, and he emphasises the necessity for overload release gear to be fitted to all three-phases, and not to only two. Other practical points which he mentions are the advisability of keeping a short length of loose cable in all switch rooms, &c., wherewith to discharge to earth cables that have just been made "dead," before commencing to work on them.

Attention is called to the need for constant inspection of unarmoured cables when they are used, and a case is quoted of a cable which had been placed by a wagon-way man over a spike nail, which ultimately found its way through the insulation, although three electricians at that pit passed the very point three times a day, but had failed to notice it.

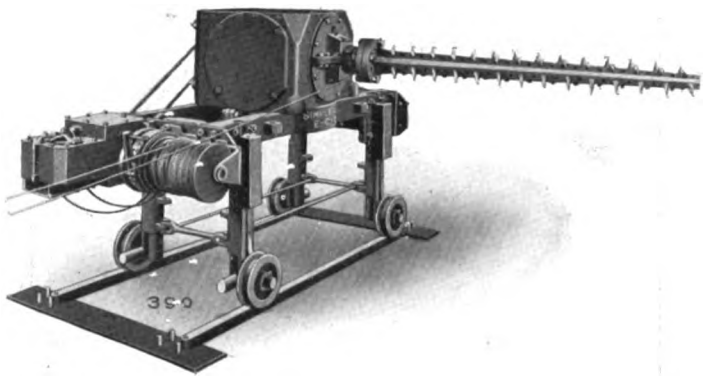
In speaking of jointing, the necessity for thoroughness is dwelt upon. Each joint should be completely finished by the man who has it in hand, who should not leave the filling up of the box with compound to pitmen or others. An example of a failure due to incomplete filling of a box from this cause is mentioned. The accompanying figure shows a good form of joint-box, with additional copper bond for the armouring. The arrangement shown is preferable to glands screwing into the ends of a box, as the latter are a source of weakness if there is a twist on the cable. This form of box can be nearly filled with the lid off, ensuring compound all round at the bottom, and the filling completed through the three plug holes in the cover. When a box is required for use a second time, the only renewal parts needed after melting out the compound are two teak spreaders, four bushes, and two lead washers. One circumstance which sometimes tends to hurry in jointing is the necessity sometimes for an official to stay with the jointers when they required a naked light. It is of the utmost importance that any shot fired in proximity to a joint-box

JOINT BOX WITH ADDITIONAL BOND FOR ARMOURING.

should be reported, and that inspection should be made. A case is mentioned of an E.H.T. link-box, which was blown to pieces without causing the switches to trip. Another matter requiring careful inspection is the condition of trailing cable plugs and sockets, as loose contact is apt to cause sparking with vibration.

Passing on to deal with transformers, Mr. Skirrow says that these are too often used as radiators for drying boots, &c. One point which requires attention is the condition of the oil, and a test is much required to tell when it requires changing. A little can, however, be drawn off from the bottom of the tank, and if it is thick it should be renewed. A useful arrangement for drying out transformers is the employment of an auto-transformer starter belonging to a coal-cutter motor. A voltage from one to five per cent. of the working voltage can be then applied by this to the H.T. winding, while the L.T. winding is short circuited.

It is an advantage to have the motors of one size in a mine all interchangeable. Among the points which Mr. Skirrow refers to in connection with motors are the need for adequate facilities for draining oil from the stator case, and for slip rings to be easy to detach in the pit without unsweating. Slip-ring motors should have the maximum rotor current marked on the name plate, and all fuse boxes should be marked with the size of fuse to be used. Oil-immersed controllers require an amount of attention, both as regards keeping the contacts in order and changing the oil, depending on how often they are used. In the case of large controllers, a tell-tale to give warning when an unusual pressure is developed inside the case is admirable. Liquid starters may be used with good results where there is no liability to explosion, as for haulages near the shaft. No-voltage releases are of particular value with fan motors to prevent them being exposed to a sudden application of the full voltage after an interruption of supply; some sort of indicator is, however, required to ring a bell to give warning when the air pressure drops.



In conclusion, Mr. Skirrow emphasises the importance of cleanliness and keeping apparatus as free from coal dust as possible, care in keeping connections and joints in order, and immediate investigation of any irregularity.

THE "SIMPLEX" COAL-CUTTING MACHINE

AN electric coal-cutter, which is manufactured by the Electric Construction Co. (Wolverhampton) under the Peake and English patents, is shown in the accompanying illustration. The machine is of the bar type, and is so arranged that it can cut both ways without alteration in the position of the main frame, and for ordinary duty drives its cutter bar direct from the motor shaft without intervening gear through an ordinary flange coupling. A new cut can be started entirely without hand holing by swinging round the motor in the frame, and for this purpose one of the elevating brackets or legs can be removed. For altering the direction of cutting, all that is necessary is to remove the hauling drum and switch to the opposite end of the machine. It is possible to cut at any point in the vertical section of the coal, from practically at floor level up to 5 ft. above floor level. The machine is slightly tilted to cut at the lowest point, and elevating brackets, made in various lengths, are used to enable the whole of the aforementioned range to be covered. With the motor supported underneath the main frame, the range is from practically at floor level to 2 ft. 6 in. above floor level; with the motor mounted above the frame, as shown in the illustration, from a point 2 ft. 4 in. to a point 5 ft. above floor level.

The hauling gear is of the friction type, with an epicyclic

SIMPLEX COAL-CUTTER WITH MOTOR MOUNTED ABOVE THE FRAME.

train of gear enclosed in dust-tight case and running in oil. It is adjustable to any desired rate of feed while the machine is running, and is to a great extent automatic in its action, unlike the usual arrangement of positive feed, which forces the machine along at a fixed rate. This machine is fed faster or slower according to the nature of the material which it is cutting and to the condition of the cutters. The machine can be mounted on flanged wheels or skids, and the change from one to the other can be made rapidly. The wheels are arranged so that they can be placed on supplementary axle pins at right angles to the main axle pins for transverse movement.

The electrical equipment consists of motor, control switch, resistance, and interconnecting cables.

The motor, which is steel-clad and flame-tight, is liberally rated. The rotating portion is of special construction for direct connection to the cutting bar. Continuous-current motors are usually compound wound, and alternating-current motors have wound rotors and slip rings. The control switch for continuous current is of the double-pole type, breaking circuit simultaneously at four points, two on each pole. The renewable contacts are of the floating type, readily adjusting themselves to the fixed contacts, and always ensuring perfect electrical connection. The resistance is compact, light, and practically indestructible. For three-phase alternating current, the switch is of the barrel type, arranged so that in the "off" position the supply both to the starter and to the motor circuit is disconnected in each phase. A modification of this controlling arrangement is made for two-phase supply. Switch and resistance are contained in a single flame-tight case. If desired, the case can be filled with oil, so that all circuits are broken under oil.

A SAFETY GATE-END SWITCH-BOX FOR MINES

AT the meeting of the Newcastle Local Section of the Institution of Electrical Engineers on Monday, January 24th, a Paper entitled "An Electrical Safety System for use in Mines" was read by Mr. H. J. Fisher. In this Paper he described a form of gate-end switch-box which he has designed to eliminate various causes of danger which are apt to be present with portable motors, such as those working coal-cutters. The chief object of the apparatus is to cut off the current automatically in the following circumstances:—Persistent overload (time-limit setting); short circuit between phases (time-limit setting); a fault between any phase and earth (instantaneous release); no-voltage, or failure of supply (instantaneous release); a break or a bad contact in the earth circuit (instantaneous release).

The system involves the use of a trailing cable, having a pilot or subsidiary wire in addition to an earth conductor. The gate-end switch is controlled by a solenoid in circuit with the pilot and earth conductor, so that if the earth circuit is not complete, current cannot pass through the solenoid, and it is impossible to close the switch.

Fig. 1 shows the arrangement for a three-phase supply having

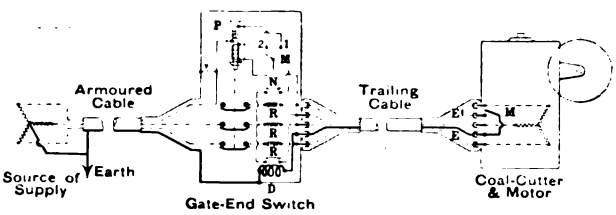

FIG. 1.—DIAGRAM OF CONNECTIONS FOR THREE-PHASE CIRCUIT.

an earthed neutral. Similar connections, but with a two-pole switch can be used on a direct-current supply with an earthed neutral-point obtained by the addition of an extra brush on the commutator of the generator in the power station. When the operating switch M is closed, and provided the pilot circuit E_1 and the earth conductor E are complete through the framework of the machine, then the solenoid P is energised, and the main switch is closed. On releasing the handle of the control switch M the switch springs automatically on to the contact No. 1, which puts a high-resistance solenoid in circuit, and also affects a change-over by which the connection through the solenoid is taken from the outgoing side of the switch. It will be seen that the main switch cannot be held in the closed position unless current passes through the solenoid, and there will be no circuit through the solenoid unless the earth circuit is complete through E and E_1, or if the supply voltage fails. By this means the switch opens automatically under the required fault conditions enumerated above.

Details of the box are shown in Fig. 2, in which is seen the

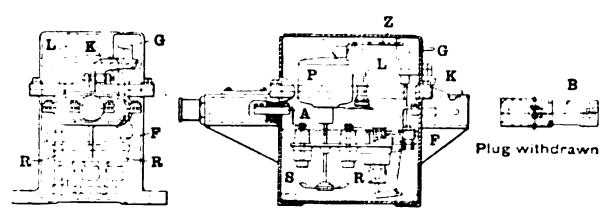

FIG. 2.—GENERAL ARRANGEMENT OF SWITCH-BOX.

three-pole oil break switch (S), with three release coils (R), and fitted with an oil dashpot time-lag device. The solenoid (P) has two windings, one of which is used to give a maximum pull at the moment of closing the switch, and the other a coil of high resistance consuming only the small amount of energy sufficient to hold up the armature when the switch is in the "on" position, but the switch is knocked out by means of simple mechanism when the weight of the armature is released by the solenoid. F is a small control switch worked by a handle on the "free handle" system, so that the trip cannot be held out of action. An indicating lamp shows through a window whether the supply is on or off. Mechanical terminals are provided, so that joints can be made without soldering, and suitable glands are fitted for earthing the armouring of the incoming cable to the box.

The trailing cable is attached to the plug B. The plug is enclosed in a strong cast-iron case, and it is so interlocked with the control switch that it is impossible to withdraw the plug when the main switch is closed. This interlocking is effected by a simple pawl at K, and it is obvious that it is impossible to

Digitized by Google

draw out an arc in manipulating the plug for the reason that the plug cannot be withdrawn when the circuit is alive. A corresponding plug is used at the coal-cutter end of the trailing cable, and a socket is made, suitable for fixing to any existing coal-cutter frame. Like the corresponding socket on the gate-end box, it carries a locking pawl inter-connected with a small switch, by which the men working the coal-cutter can open the control circuit, and so make the trailer and the motor dead, and ensure that they cannot be made alive until the switch is closed at the coal-cutter end. The plug is made reversible, so that the motor can be reversed, if necessary, by simply withdrawing the plug and reinserting it the other way round. Of course, if the plug is not in the socket, the control circuit is incomplete, and it is impossible to close the main switch.

Mr. Fisher suggests that the apparatus may be also found useful in connection with a variety of other applications than mines.

At the conclusion of his Paper, Mr. Fisher demonstrated the working of the apparatus, and referred in further detail to the difficulty experienced in relation to the earth wires in trailing cables. It was found necessary either to have them of the same size as one of the conductors, or to make the earth connection of flexible braided copper. In this latter form it is now in use in about forty coal-cutters. He referred to the question of armouring trailing cables, which was bad practice, because if the cable became crushed, due to the fall of a heavy stone, the flattening was permanent, being removed only with extreme difficulty. Moreover, there was the difficulty of kinking. The proper way to coil a long trailing cable was to lay it in a figure of eight, but pitmen in a hurry were apt to coil it in circles.

DISCUSSION.

Professor W. M. Thornton (Armstrong College, Newcastle) said that if there was any fault to find with this gate-end box, it was that it was too compact. It appeared to be both flame-proof and explosion-proof, inasmuch as the flanges appeared to be sufficiently wide to cool the gases of explosion. The question of bonding especially interested him, as a case was brought to his attention only two days ago, when an earth wire was led on to several junction boxes on its route. There did not appear to be proper bonding, and a fatal accident was the result. Perhaps one of the most important points about the gear was its absence of fuses.

Mr. L. Wood (Messrs. Sleigh & Wood) suggested two cases in which it might be possible to question the action of Mr. Fisher's gear. The first was that, when two coal-cutters were working near each other, if one of them developed a fault, could not earth current come through the frame of the other cutter and so to the pilot wire? The other case was that, if a coal-cutter lying on the ground developed a high resistance fault, and if the earth wire of a second cutter near it were broken, there might be a danger when closing the switch *M* into contact 2 of raising the frame above earth potential, and thus providing a shock for an operator.

Mr. Guns asked whether the high resistance coil in the control solenoid *P* could not be done without, and the indicator lamps put in series with one of the other coils, as in the commercial solenoid starting switches.

Mr. R. C. Morton (Messrs. Callender Cable & Construction Co.) said that the trailing cable described had been designed by the firm which he represented, in conjunction with Mr. Fisher, to meet the different conditions under which trailing cables operate, and to carry out the working of the system under real fault conditions without allowing any unnecessary interruption of the circuit. In view of the rough handling which trailing cables receive, the small wires for subsidiary circuits were very likely to get broken, but in this cable the risk was reduced by placing the pilot wire in the centre of the cable instead of between a pair of the three outer cores. Moreover, it was made so that it would both extend and contract, meeting mechanical strains from sharp bends in the cable. The earth wire was laid round the cable in a close spiral to act as an earthed shield, and its mechanical damage due to bending of the cable was thus avoided, and it was arranged so as to envelop the cable. Also any severe damage which might cut the insulation would also cut the spiral, interrupting the subsidiary circuit, and instantaneously open the main switch before damage to the main conductors could be done. In addition to a ribbed bitumen sheath, each rubber core was, before being twisted up, provided with a sheath also of $\frac{1}{16}$ in. thickness.

Mr. A. Clothier (Messrs. Reyrolle & Co.) mentioned that the firm with which he was connected had had the pleasure of developing the design of this gear in conjunction with Mr. Fisher. A recent article in a mining journal had given a summary and account of accidents in mines over a period of $6\frac{1}{2}$ years. In that time 48 accidents were due to electricity, in which 51 lives have been lost, from shock. There were also 19 accidents in which 16 lives had been lost from explosions due to electrical causes. These figures excluded doubtful cases, such as that of West Stanley, and represented an average of over 10 deaths annually. There were three deaths from explosion accidents experienced with coal-cutters, switches, or trailing cables, and eight deaths from shock from the same apparatus. Accidents on coal-cutter apparatus might seem surprising to people above ground, having regard to the moderate voltages used. The maximum voltage for a coal-cutter was 500, and in many cases accidents have happened when 250 volts or even lower have been used. This was probably due to the clammy condition of the men, the resistance of surface-contact being lower. From an engineer's standpoint, in order to avoid explosion, arcing or sparking must be avoided—a difficult thing to do absolutely. The only way to attempt it is to have absolutely instantaneous cut off of current immediately a fault which would create an arc begins to develop. In order to avoid shock, it must be impossible to get personal contact with live conductors, by complete enclosure and with interlocking arrangements, as in the device described. The protection of electrical gear must be given greater consideration. Many people in the colliery industry opposed it, some wanting a fuse with no complication in automatic protective gear, and others being frightened at the extra cost.

Mr. Hunt presumed that from the sectional drawing, the oil dashpot arrangement was provided by the oil break switch itself. If this were so, was there no trouble in sticking due to the gradual carbonisation of the oil. He noticed that in the Paper it said that the gate-end switch could not be put on when the plug is not on the motor. He supposed the shrouding on the plug was sufficiently deep to prevent a foreign substance lodging across the two essential cores.

Mr. Fisher, in reply, said that with regard to Mr. Wood's two questions, the first possibility was tried in practice, but the conductivity of the coal strata would not be good enough to give any effect such as described. In the second case, no experience of the sort had been found. In one colliery there had been eight or nine breakages of earth wires, but no complaints had been received from the men registering shocks. They seemed, as a matter of fact, to be in favour of the gate-end gear described. Replying to Mr. Guns, the lamp resistance was tried at first, but it was considered more satisfactory to make a separate connection, in order to give a clear indication to the men whether or not the current was ready for them to use. In the arrangement proposed by Mr. Guns, the lamps would not indicate before the switch was used. With regard to Mr. Hunt's question, it was almost impossible for a short-circuit to occur on the plug due to a foreign substance, as the shrouding was so deep. With reference to the oil dashpots, there had been no trouble due to sticking up to the present, as the oil was changed very frequently. It was found in practice that with certain classes of oil fire could take place if the oil was not changed frequently in all switchgear, and attention given to contacts. As a result, in the gear under his own control, all oil was drawn out once a week, filtered, and filled in again to keep it in good condition.

PREVENTION OF ELECTRICAL ACCIDENTS IN MINES

A SHORT Paper on "Electric Shocks," by Mr. W. Maurice, President of the Institution of Mining Electrical Engineers, which forms the introduction to the first part of the inquiry by the Institution into the causes and prevention of electrical accidents in mines, was discussed last Saturday at sectional meetings of the Institution at Cardiff and Whitehaven, and on Wednesday last at Newcastle. In his introductory remarks Mr. Maurice stated that it was frequently said that electrical plant was a source of danger in mines because it was badly selected, badly installed, and badly maintained, and that the blame was apportioned part to the maker of the apparatus, part to the buyer, and the balance to the individual who was responsible for its care.

There are many explanations, he continued, for the undoubted fact that there is a great deal of unsuitable apparatus in use. Mines vary in character; there are fiery mines where no experienced mining engineer would risk the installation of the most elaborately conceived and perfectly executed protective devices at present known. There are others where the local conditions would turn certain much-belauded measures of protection into sources of danger within a few weeks of erection. There are mines, again, for use in which no really satisfactory apparatus is yet available. And there are others where the simplest possible methods afford, in practice, ample security. Moreover, conditions may change in the same mines. Certain general principles may be laid down, but any attempt to confine electrical work in mines to particular systems merely argues inability to appreciate the conditions and requirements of the industry.

An individual may be a thoroughly competent electrician and yet be quite "at sea" when in charge of a colliery installation. At present there are not a sufficient number of experienced mining electricians to "go round." Many mine managers must, therefore, by sheer force of circumstances contrive without that aid to safety, which is beyond doubt of greater practical value than the over-elaboration of automatic protection.

Digitized by Google

An investigation of the kind projected by the Institution can only be of material service if it succeeded in eliciting causes. The first step in this inquiry is not that of finding answers to the question: "How can electrical accidents in mines be prevented?" but "How, and why, do they occur?"

For convenience of study the inquiry has been divided into three broad classes:—(*a*) Accidents from shock; (*b*) accidents from ignition of firedamp; (*c*) accidents from electrically caused fires.

It is known that not one, but many, elements enter into the setting up of a risk of electric shock, and the study should progress through innumerable questions of detail until it arrives at a discussion of the comparative merits of systems.

Mr. Maurice, in conclusion, submitted the following list of questions, which, however, was not intended to cover all the ground. It was, however, he said, desirable that the class of information contributed should be such as would provide answers to these questions, and at the same time bring forth others tending to throw light upon the subject which the Institution had taken in hand:—

1. What are the causes of death by electricity?
2. Define, if possible, the limits of risk.
3. Show the extent to which the ascertained range of risk applies in mines.
4. What means are there for the rescue, resuscitation, and subsequent treatment of persons suffering from shock (and burns)?
5. Assuming that shocks may be received owing to the defective condition or inadequate protection of parts of the installation, show how, and why, such defective conditions arise.
6. Have accidents occurred mainly in connection with the machinery of generation, of transmission (main lines), of distribution (branch lines), or of utilisation (motors, lighting, &c.)?
7. Detail the various conditions under which accidents have occurred.
8. Does the evidence of recorded fatalities indicate any difference in the degree of risk between different systems of supply employed in mines?
9. Are accidents from shock especially associated with any particular applications of electricity to mining? If so, what means of protection are there (under each system of supply, &c.) for that particular application?
10. What measures and protective devices are available for use in connection with (*a*) generating stations, sub-stations, switch-houses, &c., (*b*) main transmission lines, (*c*) distributing mains, (*d*) coal-cutters and other machinery operated through "trailers," (*e*) other mining machinery, and to what extent are they in use?
11. Is there any absolute protection against risk of shock, or is protection subject to the effective maintenance of conditions not wholly under human control?
12. Is risk of shock entirely a leakage problem, or are there risks apart from leakage? If so, state the varieties of risk?
13. If it is found that fatal accidents occur both on direct-current and three-phase systems, and whether regular earthing is practised or not, the question arises, have electric shock accidents any relation to systems or apparatus, or is the problem of protection absolutely controlled by the human element?
14. What measures of precaution can be taken, as distinguished from measures of protection?

Discussion at Newcastle.

Mr. Clothier (Messrs. Reyrolle & Co.), in opening the discussion, suggested that the first question was essentially a medical one. Two theories were held as regards the way death was caused. The first was that paralysis of respiration was caused, the current passing through the nerves destroying their control over the lung muscles. The second theory was that paralysis of the circulation of blood ensued. Referring to the extent of the limits of risk, he pointed out that the majority of the accidents which had occurred in mines during the last seven years had been with pressures under 250 volts. This seemed to show that it was the amount of the current which caused death. The resistance of contact and of the body was particularly low in a man working in a mine. In a record of accidents in mines which he had, he found that the lowest voltage which proved fatal was 120 volts, the shock being received from a portable lamp. With regard to the means used for resuscitation, he was in favour of the new method of laying the patient flat on the stomach and affecting respiration by pressing the back.

Mr. H. J. Fisher (Secretary of the local section) mentioned that Dr. Thornton had lately been experimenting upon the effect of electric charges on bullocks' blood. He found that the resistance of the blood increased with time. A feature that was noticeable in cases of electric fatalities was that the victims blacken quickly after death, which is analogous to the effect of morphia poisoning, and hence the theory that electric shock acts directly on the blood appeared to be correct. He knew of two cases of non-fatal shock from 5,750 volts. In one instance the man recovered after 10 weeks, and in another burns were received which took 12 months to heal. He also described two fatal cases with 500 volts. Dealing with the after effects of shock, he had noticed that paralysis often occurred after shock. He himself received a lightning shock while down a pit superintending the sweating of a joint on a cable which was connected to an overhead line on the surface which was struck by lightning. At the moment of shock he was pouring metal on the joint. The metal in the pot beneath volatilised, and for some time after he was unable to keep still owing to the nervous system being disorganised by the shock. As regards the means of resuscitation in case of shock, there is a rule that a card of instructions shall be placed in every machine room or distributing station where electricity is used, and hospital apparatus for the treatment of burns, &c., is kept at bank. A great mistake is frequently made in not continuing artificial respiration long enough. An alternative method to working the arms, which can be tried when only one rescuer is present, was to induce respiration by pressing in the pit of the stomach. Electric burns were very difficult to treat, as the skin withered, and it takes a long time for new skin to grow. There was often blood poisoning. Another danger was to the eyes, a flash often producing intense irritation, particularly at night, which was best relieved by the application of cocaine.

Mr. Wood (Messrs. Ernest Scott & Mountain) said it would be interesting to know the approximate current strengths which proved fatal, and the relative liabilities of the different parts of the body. He understood that the heart and the brain were the most vulnerable parts.

Mr. W. C. Mountain (Messrs. Ernest Scott & Mountain) referred to the fact that it was extremely difficult to define limits of safety as regards pressures, as in the Shoreditch accident death was caused at 110 volts. He believed that the average hand-to-hand resistance of a man's body, assuming his hands were dry, was about 800 ohms, so that 500 volts would give about half an ampere, which would probably be sufficient to kill. They had a man in their works, however, who could handle 500 volts without any trouble.

Mr. Ralph (Messrs. J. H. Holmes & Co.) said that it was impossible to generalise upon the physical effects of electric shock. They depended so much on whether the feet were wet, the hands were hard, and on the constitution. He had had three bad shocks, the first being at 1,850 volts from left hand to earth, the second at 900 volts alternating from hand to hand, and the third at 550 volts continuous from hand to hand. The last was the worst, as he made good contact, but in all cases he was able to let go. He knew of an old man (about 80 years of age) who was able to handle 2,000 volts direct current with impunity.

Mr. Coates thought that the conditions of death depended on the quantity of electricity, and, therefore, to some extent on the voltage, also upon which part of the body it passed through. On ordinary voltages a quarter of an ampere was generally dangerous, but on very high voltages and frequencies it was possible to carry double this current.

Mr. Carr mentioned cases of successful resuscitation of artificial respiration, and two other members spoke, one emphasising the wide difference in the recorded conditions of voltage, &c., producing fatal shock, and the other drawing attention to the use of picric acid or thermine, applied on cotton wool, in the treatment of electric burns. This not only allows the wound to heal quickly, but cleanses it of copper dust, which might otherwise produce subsequent blood poisoning.

The discussion was then adjourned.

Discussion at Cardiff.

Mr. Richards (Electrical Engineer, Maesteg) wished to know what Mr. Maurice meant by Question 2, and whether it was required to inquire into causes of death by electricity?

Mr. S. F. Walker (in the chair) said that the question was not to be taken too literally, but was cited in order to ascertain, as far as possible, the circumstances leading to the death in any case.

Mr. McCoy (Colliery Manager, Lydney) stated that he had had many years' mining experience, and was only too glad to make the best use of electricity at his colliery when occasion demanded. He did not think there was much cause for alarm, as he found a very low percentage of the accidents recorded were debited to electricity. Some accidents would happen in the most perfectly conceived apparatus installed. He believed that the electrical department, like all other branches, needed improving. In the older days, when electricity was first installed in collieries, a great deal of "cheap" work was done, but of later years great strides had been made.

Mr. Ellis (General Electric Co., Swansea) spoke of methods of earthing. Inasmuch as earthing was very important in mines, he thought it would be better, in the case of cables, and most economical, to have a concentric outer conductor, with good continuity throughout.

Mr. Humphries (Cardiff Technical School) preferred a four-core cable, say, on a three-phase three-wire system, with a definite mark of distinction, so that no mistakes could be made when jointing the cable ends, and to use one of these for an earth, connected at the surface with an earth plate. He preferred this, although the cost would be higher, yet he considered it most economical, and better than earthing to the delivery or suction pipes of a pump. Regarding the laying of cables, he preferred laying solid in the centre of the roadway under the

track, when they would be protected against "*falls*," "*run-aways*," &c.

Mr. McCoy preferred to have everything in sight, inasmuch as cables were liable to be lost, through disturbances of the strata. He believed an efficient "earth" would be obtained by boring a hole down through the ground, and inserting a bar surrounded by coke. He had found this answer all purposes in his colliery, being a damp one.

Mr. Ellis urged using a separate cable of large capacity as an earth wire.

Other members also took part in the discussion, which was further adjourned until February 26th.

The Paper was also discussed at an informal meeting held at Whitehaven on Saturday last, where a considerable number of mining men in the district were present. Mr. T. P. Martin, who was in the chair, spoke of the prospect of a regular branch of the Institution being formed in Cumberland, and Mr. J. Glynn Williams announced that a further meeting would be held on February 26th, at 4 p.m., at the Grand Hotel, Whitehaven. From the number of proposals handed in, there was every possibility of a local branch being formed.

ELECTRICAL MINING PATENTS OF JANUARY

THERE were only two patents published in January of especial interest to mining electrical engineers. No. 18,802 of 1909, published on January 13th, was communicated from Siemens Schuckertwerke Ges. to Messrs. Siemens Bros. Dynamo Works, Ltd., and describes improvements in a system of control for electrical winding-gear and haulage machinery covered by a previous patent No. 14,134 of 1908. In this system the speed of hoisting is controlled automatically so as to depend on the position of the cage in the shaft, and means are provided for obviating the irregularities of speed due to variable loads. A depth indicator worked by the winding gear to be controlled is caused to act on a differential speed gear driven at a constant speed by an auxiliary motor, instead of the indicator working directly on the speed-regulating device of the machine, as in the Leonard system. The variable-speed shaft of the speed-gear acts as a guide or master speed, and is so geared to the winding-drum that any difference in their speeds affects the regulator of the driving motor, and corrects the variation. Thus the depth-indicator may reduce the speed of the master shaft near each end of the travel of the cage, and this will cause the winding motor to slow down. The present patent covers a safety device for use in this system for the purpose of ensuring that the starting switch of the winding motor shall be brought to the off position automatically when the operating handle is put to the stopping position, and the brakes are applied. Both these specifications have diagrams to illustrate the system.

An abstract of the other patent will be found in the Patent Record on another page of this issue. It describes a method of series-parallel control for large ventilating fans driven by direct-current motors.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during January.

January 6th.—Supplement on electrical engineering in mines, opening with a practical illustrated article by Mr. J. P. Simpson on cables in shafts and main haulage ways, and containing an illustrated description of the electrical equipment of an ironstone mine, including some specially designed haulage controllers, and another illustrated article describing a three-phase winding plant in South Wales. An electric pumping plant in a New Zealand mine is also described, and other articles deal with the general question of electrical working in mines, a new electric safety lamp, and some electric mining plant seen at a visit to a well-known works. A summary is also given of electric mining patents published in December.

January 13th.—Ontario power plant at the Niagara Falls. Discussion on the German electrical industry.

January 20th.—Illustrated description of a new design of flame-proof motor. A Paper on the choice of vacuum for working steam turbines.

January 27th.—Safety precautions in mines.

METER DISPUTE AT GRAVESEND

Judgment for the Corporation

THE action by the Gravesend & Northfleet Electric Tramways, Ltd., against the Gravesend Corporation, in which the accuracy of the meters which measure the tramway energy supplied by the Corporation is challenged, was further proceeded with before Mr. Justice Hamilton on Thursday and Friday, and was concluded on Monday. The company allege that from August 7th, 1907, to August 8th, 1908, the three B.T.-H. meters installed in the Corporation power-house recorded a supply of about 40,627 units in excess of the actual supply, and that from August 7th, 1908, until the action, the meters recorded about 47,000 units too much. We reported the earlier proceedings in our issue for January 20th, p. 49.

On Thursday, Mr. H. M. Sayers gave evidence on behalf of the company, and put in figures of tests and diagrams made to compare an Aron meter with the three B.T.-H. meters, all metering the same current at the same time. During September and October of 1908, he said, the B.T.-H. meters were reading, on the average, 21·9 per cent. fast. At the same time, the readings of all the B.T.-H. meters differed from one another. In all his tests, the B.T.-H. meters showed a percentage excess over the Aron meter. His figures also brought out other facts to support the contention that the B.T.-H. meters were varying in their readings from time to time. The general experience of tramway engineers and managers is that the consumption on Saturdays is in excess of that on Sundays. He took five typical week-ends, in September and October, 1908, when the Aron meter readings varied according to the car miles run, which were less on the Sunday than the Saturday. The B.T.-H. meters on the same days and on the same load, however, showed practically in all cases, an excess consumption on the Sunday when the fewer car miles were run. In one or two instances, the readings were very close for both days.

In cross-examination, Mr. Sayers said his complaint against the B.T.-H. meters was that they were not astatic, and were surrounded by a large number of cables carrying heavy currents. He had tested the fields set up by these cables with a pocket compass, and found that they were mainly horizontal, and were in the same direction as the fields set up by the field coils of the meters. Pressed upon the point as to the direction of the stray fields, Mr. Sayers said emphatically that they were in the same plane as the field of the field coils of the meters, and thus made them read fast. He did not think that recalibration would make the meters read accurately, as they would still be subjected to the same stray fields which were the cause of the present inaccuracy. If they were moved, say, 12 ft. away from their present position, an improvement could be effected, but he believed the switchboard did not allow of this. In their present position, the meters were subjected to other fields due to the lighting cables, but it would involve a very long investigation to determine the amount of these. He agreed that the weakening of the magnets of B.T.-H. meters continued to a certain point and then remained more or less constant, and that, if this were allowed for, an accurate reading could be obtained, but his figures showed that the three B.T.-H. meters at Gravesend varied against each other day by day, both numerically and in percentages, and also varied against the Aron meter. In his opinion, the Aron meter was a better measuring instrument for tramway load than the B.T.-H. For the stray fields to interfere with the accuracy of an Aron meter it would be necessary to have a field in one direction for one pendulum, and a field in the opposite direction for the other pendulum, and a few inches away from them. But these were not the kind of stray fields that were obtained behind a switchboard. With regard to the statement that many B.T.-H. meters were still being used for tramway purposes, Mr. Sayers pointed out that all the B.T.-H. meters of this type installed during the past two years were astatic, whereas those at Gravesend were not. It was true that the meters there had been shielded, but this only protected the brake magnets and not the armatures, which were affected by the fields. Questions were then put to Mr. Sayers that the criticism of the Aron meter was that it would not register small currents accurately. On this, Mr. Sayers mentioned a test which he had carried out at Willesden in a test room with a 300-ampere Aron meter. This recorded when only one ampere was passing, or one-third of 1 per cent. of the full load current. The meter was running for 24 hours, and took 12½ units. The calculated units were 12·28. He did not know of any meter that gave such a straight line as the Aron meter.

This concluded the case for the plaintiffs.

Mr. SCOTT, for the Gravesend Corporation, submitted that there was no case. There was an agreement between the parties which both were bound by, and the only basis upon which the agreement could be upset was that the meters were, in fact, not meters with the meaning of the agreement. The company had full power to have the meters recalibrated, and if they then were not satisfied, they could go to arbitration, as provided by the agreement. On the first occasion the plaintiffs complained, he said, the meters were recalibrated and found to be reading in favour of them, and it was not until a year afterwards that they complained again.

Mr. H. A. BROWN (Town Clerk) detailed the negotiations with the company prior to the action.

Mr. J. RENNIE, who is in charge of the Electrical Standards Laboratory of the Board of Trade, produced the certificates which were originally issued in respect of the three disputed B.T.-H. meters, but declined to express any opinion as to the respective merits of various meters. The Board of Trade, he said, merely tested meters, without any cognisance of the purpose for which they were to be used.

Mr. C. F. MCINNES (Electrical Engineer to the Gravesend Corporation) disagreed with Mr. Sayers that the meters were interfered with, to any appreciable extent, by stray fields. There was only one unbalanced tramway cable, and the effect of this was taken into account in recalibrating. All the lighting cables, which were 4 ft. 6 in. away from the meters, were positive and negative, and thus the field produced by one was negatived by the other. Some of the cables were "dead." Mr. McInnes ventured the opinion that as the car miles on a tramway were reduced the consumption per car mile went up, but when asked by the judge to explain this, he said he could not, but he said it was the fact.

In the course of Mr. McInnes's evidence, figures of tests which had been made were put in, and counsel, on behalf of the Corporation, said he accepted the position that the meters were 12 per cent. fast, but the company alleged that they were 21 per cent. fast. Mr. McInnes was confident that the meters could be put right by recalibration *in situ*. The error was due to weakness of the brake magnets. He would not recommend an Aron meter for this purpose, as, he said, the mechanical portions gave trouble, and he had found the results vary from day to day.

Mr. J. H. HOLDEN, formerly of the British Thomson-Houston Co.'s meter department, and Mr. A. H. Preece, of Messrs. Preece & Cardew, also gave evidence confirming the opinions of Mr. McInnes concerning the speed of the meters.

During his cross-examination of Mr. Preece, Mr. A. J. Walter, K.C., was told that the meters were 600-ampere meters, and that they never worked beyond 130 amperes. Was it not obvious, then, he said, that as it was acknowledged that B.T.-H. meters read faster at light loads, smaller meters were necessary.

Mr. Justice HAMILTON said this was a new point, for no suggestion had been made yet that the meters were too large. Apparently the meters had worked satisfactorily from 1902 until 1907.

Mr. WALTER said it was a new point brought out by the evidence.

On Monday Mr. BOUSFIELD, in summing up for the Corporation, argued that there was no cause for action in the matter, as under the agreement between the two parties the company could have the meters recalibrated as often as they thought necessary, and the charge would then be based upon the amount of error that the recalibrations showed.

Mr. HILLS for the company urged that the result of the evidence was that the meters were impossible for recalibration, with any hope of permanent success, so far as the regularity of their reading was concerned.

In giving judgment, his Lordship said that, in view of the terms of the agreement between the two parties, in his opinion the onus was upon the company to prove that the meters were beyond all hope. He failed to see, under the terms of the agreement, any compulsion upon the Corporation to instal meters of another type, and thought that it was quite clear that there had been no breach of agreement on the part of the Corporation in retaining the original meters. There had been considerable conflict of opinion as to whether the meters could, or could not, be made accurate by the necessary recalibration, but in his opinion, the company had failed to make out their case that the meters were incapable of being made accurate within the limits of the agreement, namely, a variation of 3 per cent., and he therefore gave judgment for the defendants on the claim with costs. With regard to the action of the company in deducting £200 from the account for energy supplied during 1907–8, this was wrong, and he also gave judgment for the defendants on the counter-claim for this amount, with costs.

Tramway Running Powers in Lancashire.—Mr. Justice Eve delivered judgment on Thursday in an action taken by the Eccles Corporation to restrain the South Lancashire Tramways Co. from using a section of the Corporation lines in the Worsley Road, Eccles, of a length of about 500 yards. The company were running their cars over this section of the Eccles lines under a licence from the Salford Corporation, with whom there was an agreement, and there was also an agreement between the two Corporations. The company contended that under the agreement the power to grant such a licence was vested in the Salford Corporation, but this the Eccles Corporation denied. Mr. Justice Eve held that the grant of the licence to the company by the Salford Corporation was not a breach of the agreement between the two Corporations, and was not, therefore, *ultra vires*. The action was, therefore, dismissed with costs.

CORRESPONDENCE

EQUITABLE CHARGES FOR TRAMWAY SUPPLY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have taken part on three occasions in discussions at meetings of the Institution of Electrical Engineers upon the subject of the principles which should influence the price of electricity*; one of these occasions being the meeting on Thursday last, when Mr. Yerbury's Paper was under discussion. I gathered at that meeting, I think correctly, that the views I put forward are neither acceptable to, nor of interest to, other engineers concerned with this aspect of the question of electricity supply, and the best course for me to take under such circumstances is to "shut up." This I propose to do; it is the function of a crank and not of a sane engineer, who desires to contribute his quota towards the elucidation of truth, to force his ideas when or where they are not welcome. I do not mean to infer in what I say above that my contributions have not been treated entirely courteously; but I have not gained the active attention of any of those whose business it is to deal with these matters—at least, not so far as I know. Before retiring, however, I am begging the courtesy of your columns to say a "last word" upon the subject.

First, may I clear away a misunderstanding which I think exists, viz., that I definitely advocate an alteration in the existing methods of charging for electricity. I do not. I am not competent to presume to offer an opinion upon a matter, which is beset with many difficulties of a purely practical character, and in connection with which many safeguards must be resorted to, which may involve the setting aside of otherwise right principles. My criticism is directed entirely and solely against the adoption by nearly the whole of the electrical industry of a principle which I believe to be scientifically unsound. That principle was expressed in Mr. Yerbury's Paper on the first page, where he says that the price of any commodity is "determined firstly by its entire cost of production, and, secondly, by the number or quantity sold."

For reasons that I have given I believe that that is a scientifically untrue definition. It may be a useful working hypothesis—I don't know; but it is not true, and it is obvious that engineers who set out with false principles are not unlikely to arrive at false conclusions. To my mind, Mr. Yerbury's definition is as erroneous as to express Ohm's Law as C=E, because in both cases an essential factor is omitted. The adoption of my definition of price (which is, of course, not in any way original) would necessarily have the following consequences :—

(1) The present definition of the word "equitable" would be abandoned, and the basis of the *market price* of the service rendered would be substituted for the present basis of the relation *cost* of supplying different consumers.

(2) As a corollary of above, it would become necessary to distinguish between supplying light, heat, power, etc., disregarding the fact that electricity supply is common to all three, just as in ordinary commercial life the hours of labour which are common to the creation of value of different kinds are generally disregarded.

(3) The recognition that the greatest aggregate gain can be obtained, and its most equitable distribution secured, when every part of supply is sold at its true market price, and that selling according to cost involves the loss of profit to the producer and of profit to the consumer.

(4) The coming into line of the electricity supply business with other commercial undertakings such as railways, steamship companies, &c., which apply as far as they can the principle which I believe to be right.

It may be regarded as impracticable to apply a right abstract principle in the electricity supply business so as to gain the advantages enumerated above—that is not my immediate concern; but it is my concern to ask my brother engineers to realise what they and their consumers are losing by selling upon a wrong principle, even though, on account of practical difficulties, they can see no way of avoiding the loss.

Whether wealth is being lost to the community by the error I have called attention to or not it is impossible to say; but I do feel that there is a great risk of this being the case. Instances have come to my notice of supply being sold at prices which violated the widely established principle which I hold to be a false one and nevertheless a larger aggregate profit has been made, and a larger measure of useful service rendered.

I am, Sir, Yours, &c.,

4 Queen Victoria Street, E.C., EDWARD W. COWAN.
January 28th, 1910.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Mr. Pearce's charges, as given by Mr. Yerbury, are, I believe, perfectly fair. They err on the side of modesty, when compared with "fixed charges" which I obtained about a year ago from an analysis of the Manchester figures, extending over several years, made with the sole object of getting at the true "fixed charges."

Taking a load factor of 30 per cent., the 29½ million units referred to in the Paper would, neglecting losses in distribution, correspond with a maximum demand of 11,200 kw.; and the "fixed charges" per unit given by Mr. Yerbury then work out at the following annual charges *per kw. of maximum* demand :—Coal, £0·47; oil, &c., £0·043; salaries, &c., £0·755; repairs £0·702; rates, &c., £0·952; management, &c., £0·394; interest, &c., £4·82; renewals suspense, £1·32, total, £9·45 per kw. of M.D. per annum.

Now, Sir, I beg to suggest that the dissatisfied tramway men have the remedy in their own hands. For, if the above are true "fixed charges," in the sense that they represent the additional annual charge to the station for every additional kw. of load taken on during the peak (as I believe they do), it follows that if the tramway men make arrangements to entirely remove their load during "peak" hours, the station is left free to take on additional lighting load to that extent without increasing their plant, or their staff; and therefore the station should, in equity, remit the whole or the greater part of the "fixed charge," and charge only for the units consumed, at so much per unit. Suppose, then, that the tramway department were to put down accumulator sub-stations at various parts of the city, in order to carry the above 11,200 kw. for, say, two hours (which would certainly cover that part of the power and lighting peak overlapped by the tramways), the capital cost, including buildings, would not be materially over £11 per kw., of which the batteries would represent some £7 per kw. We then have :—

	Per annum per kw.
Interest at 3½ per cent. on £11	£0·38
Sinking Fund at 5 per cent. on £11 (including depreciation)	£0·55
Perpetual Maintenance on Cells at 12 per cent. on £7	£0·84
Salaries and Wages—say half of steam	£0·57
Maintenance of Roosters and Buildings, say 5 per cent. on £4	£0·20
Total	£2·54

Now :—

	Per annum.
11,200 kw. at £9·45 (as above)	£106,000
11,200 kw. at £2·54	£26,200
Saving per annum ...	£79,800

This saving would, of course, only be effected if the "running charge" remained unaltered.

From the figures in Mr. Yerbury's Paper, I gather that the "running charge" is (1·04−0·865=) 0·17 penny. If this is correct, then the "running charge" will be :—29,500,000 units at 0·17 penny = £20,900 per annum. But the battery losses may render it necessary to purchase, say, another 7,000,000 units, costing another £5,000, and we have :—

	Per annum.
Gross saving	£79,800
Deduct cost of extra units	£5,000
Net saving per annum	£74,800

Of course, there are other factors, concerned with the capital invested in feeders, &c., of which due account would have to be taken in considering the revised "fixed charge" to be levied by the station, and if the tramway load was unduly large in proportion to the station "private" load, the occurrence of "abortive" peaks would have to be discounted for; but the balance in hand in the above is so considerable as to set off a great many such considerations.

I have, to simplify matters, considered only the units sold, as at the generative station, which is, of course, incorrect, but does not affect the result materially. The £20,900 charge is common to both schemes, and need not therefore be considered. My analysis of the Manchester costs disclosed the fact that when curves are plotted over several years, connecting certain annual costs per kw. with increasing kw. of maximum demand, these curves tend to become asymptotic; hence Mr. Pearce is quite right in taking these values as "fixed charges," since every added kw. means a correspondingly increased annual charge.

Yours faithfully,
A. M. TAYLOR.

COMBINED LIGHTING AND POWER METER.

To the Editor of ELECTRICAL ENGINEERING

SIR,—We have read with considerable amusement the remarks by the Meter Department of Simplex Conduits, Ltd., in their letter which appeared in your issue of January 20th, wherein they referred to our combined lighting and power meter as another old friend, generally known as the three-wire system. If the Meter Department in question will again read through your description and examine the diagram more closely, we feel

* *Inst. E. E. Proc.*, Vol. 40, Part 188, p. 338; and Vol. 42, Part 193, p. 52.

Digitized by Google

sure that they will see that it cannot in any sense of the word function as a three-wire meter.

However, as they may not be acquainted with the operation of a three-wire meter, we would trepass on your space and give them a short description of this system.

In a three-wire meter the one main current coil is used in series with the one outer of the three-wire system, and the other main current coil in series with the second outer, so that the current taken by one half of the system, *quite irrespective of the type of load, heating, or lighting*, flows through one half of the meter, and the current taken by the other half of the system flows through the second half. The meter thus registers the total three-wire consumption, but has nothing to do with charges for lighting or power.

In terming our meter a three-wire meter, they were probably misled by the coils being split up in the ratio of two to one, and in consequence the power terminal of the meter is shown connected to one half of the total series turns. The lighting current therefore flows through all the series turns, whereas the current utilised for heating or other domestic appliances only flows through that proportion of the series coils which is in the ratio of the heating to the lighting rates.

We should like to point out that the connections of the power terminal to the series turns depends entirely on the ratio of the charges, and as regards the adjustment of the meter there is no difficulty whatsoever respecting the ratio of the lighting and power rates. We, of course, can arrange not only our watt-hour meter, but also our ampere-hour meters, for the same purpose as dealt with by Simplex Conduits in their Figure 2.

With reference to their concluding remark that no special type of meter is essential, we wish to point out that the ordinary meter cannot be used for this purpose, as the meters have to be adjusted to the exact ratios, and this involves not only special terminals, but also special calibration.

Yours faithfully,

ADNIL ELECTRIC CO., LTD.
(R. A. Marples, Manager.)

Adnil Building,
Artillery Lane, E.C.
January 28th, 1910.

THE ELECTRIC DRIVING OF REVERSING ROLLING MILLS

THE action brought by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges. of Zabcze, Germany, against the Electric Construction Co., of London and Wolverhampton, for alleged infringement of the fundamental patent for the Ilgner system of electric driving of reversing rolling mills, was commenced before Mr. Justice Parker in the Chancery Division of the High Court on Wednesday of last week. The installation referred to as an infringement of the patent is that at the Bilston Works of Messrs. Alfred Hickman, Ltd., and was constructed and put down by the Electric Construction Co. in the end of 1908. The fact that the Ilgner principle is employed in this plant is not denied, but it is asserted in defence that the Ilgner patent is invalid for want of subject-matter, and also on account of insufficiency. It is stated that the arrangement described in the patent will not work unless the machines are separately excited, whereas the specification particularly refers to shunt-wound machines. Further, it is asserted that some means of regulating the demand of the motor of the motor-generator is necessary, whereas nothing of the sort is described in the specification.

The patent in question is No. 7,188 of 1902 granted to Carl Ilgner of Donnersmarckhütte, and relates to the driving of reversible rolling mills. The object of the arrangement described is to reduce the fluctuations in the current demand caused by the switching in of the motor, and to enable the frequent changing of the direction of rotation and of the speed of rolling to be effected in an economical manner.

Power for the rolling-mill motor is taken from the generator of a motor-generator which is provided with a heavy flywheel and is run from the main supply. Both the starting and the speed control of the rolling-mill motor are effected by varying the excitation of the generator. The flywheel prevents the speed of the set from being reduced suddenly when the rolling-mill motor makes a sudden demand for power, and thus prevents an excessive flow of current from the main supply. To supply the demand, however, the flywheel slows down and gives up a portion of its kinetic energy to the dynamo, which, in turn, delivers it to the rolling-mill motor in the form of electrical energy. When the demand is below the normal, the set speeds up and stores energy in the flywheel. If the rolling-mill motor and the generator of the flywheel set are shunt-wound, the former can be quickly arrested by reducing the terminal pressure of the generator below that of the motor. The latter then acts as generator and drives the flywheel set. The motor of the flywheel set must be designed to drop in speed when an increase of the load takes place, and must have a limited maximum speed.

The patent has only one claim, which is as follows :—

The herein described arrangement for regulating the velocity of electrically-driven reversible rolling-mills without the use of switched-in resistances, and for effecting a gradual demand of current from the main current source so that the said demand of current does not rise to the full amount of current consumption corresponding to the work required by the rolling-mill motor on starting, consisting of a rolling-mill motor driven by a current from a motor-dynamo driven directly from the main current source and provided with flying masses, the E.M.F. transmitted to the rolling-mill motor being regulated by alteration of the field-magnet excitation of the dynamo part of the motor-dynamo which generates the current for the rolling-mill motor.

The case is in one respect parallel to that just concluded in connection with the Bremer flame arc lamp patent, as a petition for the revocation of the two Ilgner patents under Section 27 of the Patents Act, 1907, on the ground that the patented articles are manufactured exclusively or mainly outside the United Kingdom, has been made as a counter move by the defendants. This petition has been delayed by a dispute as to procedure, an appeal with regard to which is down for hearing by Mr. Justice Parker, after the hearing of the infringement action.

Mr. A. J. Walter, K.C., Mr. J. H. Gray, and Mr. G. H. Hume appear for the Donnersmarckhütte Ges., and Mr. W. R. Bousfield, K.C., and Mr. Russell Clarke for the Electric Construction Co.

On Wednesday of last week, Mr. WALTER opened the case for the Donnersmarckhütte by describing the many advantages to be obtained by applying electric driving to reversing rolling mills, and the difficulties which had to be contended with. The defendants seemed, he said, to rely very much upon the Ward-Leonard system; this was before the public in 1891, but in the eleven years betwen that date and the date of the Ilgner patent there had been no application of this system to reversible rolling mills. Ward-Leonard intended his system for controlling motors gradually and economically by varying the excitation of the generator of the motor-generator set, and had no intention of preventing heavy demands on the supply; he had admitted himself in the discussion of an A.I.E.E. paper in 1896 that he did not claim to get a greater H.P. than that which could be obtained direct from the mains. There was an enormous rush of current to the rolling-mill motor when the ingot was first nipped by the rolls, and the flywheel of an Ilgner set gave out energy to supply this sudden demand and prevented the heavy fluctuations from reaching the supply. As an example of the advantage of electric drive, he referred to a certain mill which with steam drive made 6 passes per min., and with electric 11 passes per min. when doing the same work. When no ingots were inserted it could make 30 passes per min.

Mr. J. SWINBURNE, called by Mr. Walter, pointed out that the motor of a Ward-Leonard motor-generator set was a constant-speed motor, and that the load on it would be practically the same as that on the secondary motor. The combination was intended to do away with the wasteful series-resistance control. As an engineer, he would understand the Ilgner specification to imply the use of separate excitation, as if the rolling-mill motor were self-excited, it would loose its excitation and stop when the pressure was reduced. The automatic regulator used in the defendant's plant was only a means of producing a wider variation in speed of the primary motor. There was, he said, obvious invention in the Ilgner idea. Cross-examined by Mr. BOUSFIELD, Mr. Swinburne agreed that flywheels had been used in conjunction with continuous-rolling mills, but pointed out that they would be a hindrance on a reversing mill. Mr. Bousfield stated that 45,000 h.p. seconds could be taken out of the Bilston set (above that taken from the supply at the same time) within the normal limits of speed, and that one-tenth of this was in the moving parts and not in the flywheel. He suggested that the only difference between a Ward-Leonard set and an Ilgner set was the addition of more flywheel effect, but Mr. Swinburne argued that not only was the primary motor smaller than the secondary motor, but also there was a drop of speed in the primary motor in the latter case. Mr. Bousfield then referred to an I.C.E. paper read by Dr. Kapp in 1892 in which he described the use of a flywheel on a spinning-mill motor to equalise the load and suggested applying the same idea to a motor-generator for traction work. Secondly, Mr. S. Z. de Ferranti had taken out a patent (No. 4065) of 1895 for a motor generator with a flywheel to equalise the load on the motor. Thirdly, in a paper by Messrs. Mordey and Jenkin, published previous to the Ilgner patent in 1902, the authors had described a Ward-Leonard traction equipment, and had referred to the flywheel effect and to a 15 per cent. drop of speed of the motor-generator set. In reply to these, Mr. Swinburne said that in all these cases the flywheel had only been used in the ordinary way to smooth out the fluctuations in power and to make the demand on the supply more gradual, but that there had been no idea of actually supplying power from the energy of the flywheel for the whole time the increased demand existed. The Ilgner invention consisted in doing this by combining a flywheel and a Ward-Leonard set.

Mr. C. A. ADLETT (Siemens Bros. Dynamo Works, Ltd.), the next witness for the plaintiffs, said that he had seen the Bilston plant at work. When he saw it, the regulator was not working, the speed of the flywheel set was varying about 5 or 6 per cent. and the current taken by the primary motor fluctuated between

Digitized by Google

300 and 1,500 amperes. (Mr. Clarke here pointed out that the normal load of the primary motor was 3,500 amperes, and that the regulator did not work until the demand on the primary motor was higher than this, when the speed was reduced to allow the flywheel to supply the difference). Mr. Ablett admitted, under cross-examination, that all the Ilgner sets installed whether for rolling-mills or for colliery-hoists, had regulators to reduce the speed of the primary motor.

This concluded the case for the plaintiffs.

Mr. Bousfield then opened the case for the E.C.C., and on Monday and Tuesday, Mr. F. Bray (of the Trafalgar Colliery Co.), Mr. H. F. Parshall, Prof. Bertram Hopkinson, Mr. S. Z. de Ferranti, and Mr. W. M. Mordey gave evidence on their behalf.

The report of the proceedings will be concluded in our next issue.

ANNUAL DINNER OF THE LEEDS LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE annual dinner of the above Section was held at the Hotel Metropole, Leeds, on Friday evening, January 28th, and nearly 100 members and friends sat down. Among the guests were Dr. Gisbert Kapp, President of the Institution, the Lord Mayor of Leeds, Mr. W. Penrose Green, Mr. Robt. Hammond, Alderman Ewing Matheson, Councillor H. Brown, Mr. A. G. Lupton, Pro-Chancellor, Leeds University, Mr. John McLaren (Messrs. J. & H. McLaren, engineers), and Mr. Percy Robinson, President of the Leeds and Yorks Architectural Society.

Mr. R. HAMMOND proposed "The Corporation of Leeds." That city, he said, owed its prosperity largely to its abundant supply of coal. He was impressed with the fact that where coal was, there was centred the business of the world. America's output of coal was 426 million tons, and the country was doing an enormous trade, while England, with 290 million tons, was also engaged in an immense business. Another country, which should be nameless, had an output of 207 million tons, so there was only some 200 millions left for the rest of the world. Leeds must continue to prosper, because in addition to its water facilities, its supply of coal, and its energetic citizens, it had a supply of electricity second to none in the kingdom.

The LORD MAYOR, in replying, said that Leeds was fortunate in having so many industries, and the citizens had no need to be ashamed of their electrical undertakings. The capital involved in the Corporation electric supply undertaking had risen from £60,000 to nearly £1,000,000. He would suggest to the department that they encourage in every way the adoption of electric power, but would advise the managers to make the scale of charges more understandable. The tramway system, in which 1½ millions was sunk, was working at a profit, and contributed largely to the relief of the rates.

Councillor H. BROWN, in submitting "The Institution of Electrical Engineers," was glad to find the parent body took such an interest in the local sections, as was evidenced by the presence of the President.

Dr. KAPP, in replying for the Institution, explained why electrical engineers were so numerous, by saying it was because they were the handmaidens of all other engineering professions. He was astonished that in such a great textile district as Yorkshire there were so few mills electrically driven. Mill-owners were undoubtedly prejudiced against electricity, and imagined all sorts of difficulties. About twelve months ago he had asked Prof. Barker, of Bradford, if there were many electrically driven machines in Bradford, and received the answer, "No; but we have a commission sitting to investigate the subject." Dr. Kapp thought it was rather late in the day to start investigations when the utility of electric driving had been proved so conclusively on the Continent. He had received a copy of the Report, and felt that the profession had been injured by it. The members had missed the point entirely, and the electrical engineers who formed part of the Commission had dissociated themselves from the report. It did not redound to the credit of this country that such a report should be issued. In one shop on the Continent he had seen hundreds of motors on the floor which were required for the electric driving. He would suggest that the Leeds Section might do some useful work by getting some association of experts in the manufacture of textile machinery and the users themselves to test the matter, and he would have no fear of the result.

Mr. A. G. LUPTON, Pro-Chancellor, Leeds University, in proposing the "Leeds Local Section," would not admit we were so far behind in this country with respect to textile driving, and said that in 1908 the Yorkshire Electric Power Co. derived half its revenue from that source. He predicted great strides in the future for the application of electric energy, especially in electro-chemistry.

Mr. W. M. ROGERSON, Halifax, Chairman of the Section, in his reply, referred to the fact that in future the section was to be known as the "Yorkshire" Local Section.

ANNUAL DINNER OF THE INSTITUTION OF ELECTRICAL ENGINEERS STUDENTS' SECTION

ON Wednesday of last week, the sixth annual dinner of the Students' Section of the Institution of Electrical Engineers was held at the Trocadero Restaurant, London. The chair was taken by Mr. R. C. Plowman (Messrs. Tyler & Freeman, London), and the gathering comprised some seventy students and guests.

In proposing the toast of the President and the Institution, Mr. H. W. GREGORY, Vice-Chairman, said that he would take the opportunity to thank the Council, on behalf of the Students' Section, for the help and encouragement they gave to them. He also expressed the hope that it would be made possible for the students' papers to be printed in abstract; at present, out of about thirty papers for each session, only four (Premium) papers were printed.

Dr. G. KAPP, responding, said that it always gave him great pleasure to meet students; the student he liked best was the one who never took anything for granted, who picked holes in his lectures, and who experimented intelligently. He always encouraged students to take an interest in general literature, languages and sports; man was not only a thinking machine. Foreign languages were most important; in Germany, a degree could not be obtained unless examinations were passed in English and French, and they were going to grant engineering degrees in Birmingham in future only if the student had mastered two foreign languages. He would advise German and Spanish, the latter on account of the enormous developments in South America. A smattering was not enough; it was necessary to be able to read a scientific book comfortably. English engineers were often preferred by German employers, because, though they were perhaps not so highly trained as German engineers, they had been taught to think independently and to apply their science in a better way. With regard to the position of the industry, there were already indications of improvement. Finally, he thought British engineers might try for the £400 prize which had been offered by an Italian Association for promoting the safety of the public and workmen, for an efficient method of earthing such as could be used in marble and slate quarries, and would also prevent such accidents as that at Olginate. Particulars could be obtained from the Italian Minister of Agriculture and Commerce, and the offer would be open until the end of 1911.

Mr. W. M. MORDEY supported Dr. Kapp, and stated that though the Students' Section was not a paying section financially, the Council did not expect it to be so; they had made the subscription as low as possible, as they well realised that the students were the future members and supporters of the Institution.

Dr. S. P. THOMPSON, in proposing the toast of the Students' Section, said that the Institution had realised from the earliest days that its future was bound up with those who begin as students; an ever-increasing proportion of the full members were once student members. The students should work to promote the professional and industrial interests of the Institution. Dr. Thompson then referred to the long list of illustrious men who had been presidents of the Institution, and suggested how the future engineers would look back with pride upon the present heads of the industry. It was essential that students should believe in the greatness of the Institution, and of the industry, and have a good opinion of themselves; the progress they would make would be in proportion to the amount they had of this "academical conceit."

Mr. R. C. PLOWMAN, responding, referred to the present activity of the Students' Section, and to the advantages to be derived by attending the meetings, but complained of the small percentage of active student members. The Institution did much for its students, and it remained for them to show their appreciation.

The toast of the Colleges was proposed by Mr. F. E. BURNETT, of Faraday House, and responded to by Mr. R. HAMMOND, who paid a tribute to the educational work of Dr. Thompson, and emphasised the utility of a knowledge of foreign languages.

The Theory of the Dynamometer Wattmeter.—An original communication on this subject, by Dr. C. V. Drysdale, has been accepted by the Institution of Electrical Engineers for publication in the Journal. The author goes into the various causes of error with instruments of this class, and discusses them fully from a mathematical point of view, and finally arrives at the conclusion that a wattmeter which is free from eddy currents, and in which the resistance exceeds 1,000 ohms per millihenry of equivalent shunt inductance, will never have an error of more than 0·001 in the power factor under practical conditions, except when testing condensers with very irregular wave-forms. As the above condition is very easily secured with ample torque and small power consumption, he considers that a well-made dynamometer wattmeter is superior to any other device for alternate-current power measurement.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 27th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

142/09. **Jointing Metal Filaments to Leading-in Wires.** H. HIRST and WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD. A strong and electrically good joint between leading-in wires and metal filaments is produced by applying at the joints a paste of the phosphides of copper, manganese, nickel, or tungsten with a little water or a volatile liquid such as xylol which leaves no residue. The filament carriers after this treatment are placed in a drying oven, and are then inserted in the chamber containing an inert gas, in which the paste is reduced with the aid of an electric arc. A small quantity of metal can be added to the phosphide paste. If air or other non-inflammable gas is blown against the joint during the sintering process, it is not necessary to carry this out in an inert atmosphere. Three claims, two figures.

194/09. **Combined Wall-plug and Adapter.** J. H. DRYSDALE. An ordinary bayonet lampholder is provided with two long pins which enter the socket when it is used as a wall plug. An insulating sleeve is fitted in the holder, and when it is desired to use the device as an adapter, this sleeve is released and is forced outwardly by springs until its end is flush with the tops of the pins. Two claims, three figures.

1,813/09. **Arc Lamp with Supported Carbons.** P. HANISCH and REGINA BOGENLAMPENFABRIK GES. The carbons are connected and prevented from falling by a brake or clamp on the negative carbon. This carbon rests on a refractory support pivoted to the lamp base and connected with the brake through a system of levers in such a way that when the carbon is consumed and no longer bears on the support, the latter lifts slightly and releases the pressure of the brake, with the result that the carbon feeds down and bears on the support again. When the carbons are nearly consumed, the brake slips over the top of the negative carbon and tilts the support so that the carbon is free to fall out into the ash-tray. Two claims, three figures.

2,176/09. **Driving Fans and Propeller Screws.** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) This is a system of electric driving for fans and ship propellers where the turning moment required varies as a high power of the speed. For a ship, the turning moment at 80 per cent. full speed is about half the full speed value, and that at 40 per cent. full speed is less than seven per cent. of the normal value. Two shunt or separately-excited motors on the same shaft are employed, and the armatures are connected in series up to 40 per cent. full speed; the field of one motor is reduced until all the load is transferred to one motor. This will occur at 80 per cent. full speed, and will correspond to half full load. The motors are then connected in parallel, and the load divided between them. The speed is then increased until both motors are fully loaded. The resistances for working at below 40 per cent. full speed need only be very light, as the current taken is so small. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: CRAVEN [Voltage regulation] 442/09; SCHMAHL and ARMORDUCT MANUFACTURING CO. [Armoured conductors for portable apparatus] 7,706/09; BULLERS, LTD., and DAGNALL [Insulators] 12,477/09.

Dynamos, Motors, and Transformers: WALKER [Machines] 693/09 and 29,376/09; DAY and WIESENGRUND [Generators] 6,317/09; SIEMENS BROS. DYNAMO WORKS and KLOSS [Generators for searchlights] 6,949/09.

Electric Ignition: SIR W. G. ARMSTRONG, WHITWORTH & CO. and HADCOCK [Firing mechanism of ordnance] 864/09; DAWSON and BUCKHAM [Controlling sighting of guns] 961/09 and 984/09; SIMMS MANUFACTURING CO. [H.-T. magneto apparatus] 1,263/09; STERLING TELEPHONE & ELECTRIC CO. (*Schaffler & Co.*) [Mine exploders] 24,469/09.

Electrometallurgy and Electrochemistry: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Electrolytic cells] 6,872/09; BENDER [Production of nitrogen oxides] 18,203/09.

Incandescent Lamps: WEISSMANN [Illuminating bodies] 321/09.

Instruments and Meters: BOWDEN, ROBINSON, and JACKS [Prepayment meter with warning switch] 7,005/09.

Switchgear, Fuses, and Fittings: PIDGEON [Flashing-sign controllers] 954/09; BAYLISS [Wiring conduit] 4,560/09; DRANSFIELD [Conduit clips] 8,027/09; SCHMAHL [Conduit fittings] 9,971/09; LAKE (*F. Bissel Co.*) [Motor controllers] 13,734/09.

Telephony and Telegraphy: DENNIS [Telephone meters] 986/09; DYSON [Jointing submarine cables] 10,052/09; MCBERTY [Selective switching apparatus for telephone exchanges] 20,839/09; SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Telephone exchanges] 23,310/09.

Traction: ANGER [Tramway vehicles] 26,736/08; STANSFIELD [Junction-points] 575/09; DUTTON and MCKENZIE & HOLLAND, LTD. [Signalling and interlocking] 784/09; PRICE [Visual block signalling] 886/09; CONATY [Axle-boxes] 1,031/09; PARKER [Compensators for wires under tension] 21,713/09; KÖHLER [Current collector] 26,347/09 and 26,807/09.

Miscellaneous: FURLANI [Fire alarm] 1,080/09; CHILDS and HILL [Wind-turbines] 1,175/09; SCHRÖDER [Electric clocks] 2,596/09; MAYOR & COULSON, LTD., and ANDERSON [Coal-cutters] 5,617/09; STOKER [Soldering aluminium] 12,019/09; KOECHLIN [Illumination of looms] 22,125/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electrometallurgy: PETERSON [Charging resistance furnaces] 27,674/09; SOC. ELECTRO-METALLURGIQUE FRANÇAISE [Manufacture of nickel] 287/10.

Incandescent Lamps: KUZEL [Metal filament loops] 17,627/09; FELTEN & GUILLEAUME-LAHMEYER-WERKE AKT.-GES. [Metal filament lamps] 17,960/09.

Amended Specification Published

The following amended Specification can now be obtained.

2,216/09. **Arc Furnace.** CENTRALSTELLE FÜR WISSENSCHAFTLICH-TECHNISCHE UNTERSUCHUNGEN GES. This specification relates to the production of long arcs such as those used in the fixation of atmospheric nitrogen, and was amended as the result of unsuccessful opposition to the grant of a patent.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

2,581 of February 4th, 1896. **Telephonic Apparatus.** E. W. SMITH and NEW PHONOPORE TELEPHONE CO., LTD. This apparatus is for telephoning along lines used simultaneously for telegraphic or other purposes. The call is sent by a vibrating reed acted upon by the core of a phonopore, the primary of which is normally short-circuited.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: G. CORNARO [Flame carbons] 22,090/03; BRITISH THOMSON-HOUSTON CO. (*Allgemeine Elektricitats-Ges.*) [Flame electrodes] 20,330/05.

Distribution Systems, &c.: E. T. GREENFIELD [Cable armouring machine] 22,261/02; T. E. DEVONSHIRE [Cement cable conduits] 22,003/04.

Dynamos, &c.: H. W. LEONARD [Motor control] 18,281/00; A. F. PIEPER [A.-C. commutator motor] 20,392/05.

Electrometallurgy, &c.: G. CORNARO [Furnace electrodes] 22,090/03; V. MITKEVITCH [Arc furnaces and welding] 20,769/05.

Incandescent Lamps: SIEMENS & HALSKE AKT.-GES. [Hardening tantalum filaments] 18,403/05; M. FAVERO [Lamp cap] 20,512/05.

Switchgear, &c.: C. B. WALKER [Cable sockets and thimbles] 18,298/00; VERITY'S, LTD., and E. J. SELBY [Circuit-breaker] 20,612/01; C. M. DORMAN and R. A. SMITH [Electromagnetic release for circuit-breakers] 22,421A/02; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Mercury cut-out for heating devices] 20,599/05.

Telephony, &c.: A. M. BULLARD [Automatic telephone exchanges] 21,819/04; SIEMENS BROS. & CO. (*Siemens-Schuckertwerke Ges.*) [Signalling with light waves and selenium cells] 20,371/05; A. J. BOULT (*C. E. Eyan*) [Sub-station apparatus for C.-B. telephone systems] 20,496/05; W. SCHÜTZ [Glass line posts] 20,501/05.

Traction: H. W. LEONARD [Traction system] 18,281/00; W. T. W., and P. C. PHILIPSON [Tramcar lifeguard] 20,512/01; C. BURTON, A. I. LITTLEJOHN, and P. STILL [Wire strainer] 20,365/05; A. NEELEMANS [Signalling and control of points] 20,460/05; C. D. ABEL (*Siemens-Schuckertwerke Ges.*) [Signalling] 20,467/05; O. LOSCHER [Speed indicator] 20,561/05; C. R. BAULINO and F. FESSIA [Speed indicator] 20,675/05; J. MCILWAIN [Signalling] 20,690/05.

Miscellaneous: J. WEST [Electrically-driven charging device for gas retorts] 22,002/02; MAYOR & COULSON, LTD., and H. A. MAYOR [Regulating device for motor-driven punkahs] 21,794/04; E. MACKAY [Magnetic compass] 20,545/05; H. H. LAKE (*H. H. Sylvester*) [Illuminated signs] 20,475/05; J. H. ARJOHN [Automatic feed weighers] 20,514/05.

Digitized by Google

LOCAL NOTES

ABERDEEN: *Tramway Guard Wires.*—Owing to the National Telephone Co. having largely placed their wires underground, the Tramways Committee have decided to remove a large number of guard wires, as these have now become unnecessary.

Supply to Tramways Co.—The Aberdeen Electricity Committee recommend an offer being made to the Aberdeen Suburban Tramways Co. for a supply of electrical energy for five years at 1·75d. per unit, which is 0·5d. less than the rate at present charged.

BELFAST: *Cavehill and Whitewell Tramways.*—The Cavehill and Whitewell Tramways Co. have informed the Corporation that they are willing to sell their undertaking at a price to be fixed by arbitration. The matter has been referred to a special meeting of the Corporation. A Bill is to be promoted by the Corporation for this purpose.

DEVONPORT: *Tramways Company Bill.*—At the meeting of the Corporation last week the Bill of the Devonport District Tramways Company, which proposes to vary the terms of the agreement under which certain tramways are now run by the latter, was discussed at great length, and it was decided to offer a strong opposition to the proposal. The Town Clerk said the proposals sought violated the statutory protection which was granted to the Corporation, and on the faith of which the Corporation gave their consent to the promotion of the Company's Bill in 1908. The Company also attempted to alter seriously an arrangement which was deliberately made, and on the faith of which the Corporation expended over £62,000. He doubted whether a more monstrous proposal had ever been submitted to Parliament.

HOUNSLOW: *Electricity Accounts.*—At the last meeting of the Council it was reported that there was a clear profit for the past year on the electricity undertaking of £440, as against £80 in 1908, and a deficit of £62 in 1907. It was further reported that satisfactory progress was being made in regard to the coming Electrical Exhibition, which will commence on February 17th and be continued to the 26th.

HULL: *Sale of Electrical Fittings.*—The Electric Lighting Committee have recently opened a showroom for the purpose of demonstrating the advantages of electricity for lighting, heating, cooking, &c., and this seems to have disturbed the local section of the Electrical Contractors' Association. A deputation waited upon the Electricity Committee last week, and pointed out that they were under the impression that the Corporation intended to develop the sale of apparatus at the showroom. They were assured that there was no such intention on the part of the Corporation.

INDIA: *Electric Power Supply.*—The *Financial News* states that negotiations are proceeding in London for the provision of the capital for carrying out the license granted by the Indian Government, under the Indian Electricity Act, for the supply of electrical energy in Bombay and the surrounding districts. The scheme involves the use of water power in the Ghaut Hills.

LONDON: *London County Council: Purchase of London United Tramways.*—With reference to the proposed purchase, by the L.C.C., of the portions of the London United Tramways which are in the County of London, the company object to the purchase on the ground that the L.C.C. have no tramways connected with the lines proposed to be purchased; that heavy capital expenditure had been incurred in connection with the company's lines in the County of London, and that local authorities adjoining London raise objections to any interference with the prevailing conditions of working the lines. The directors ask for an opportunity of being heard by the Board of Trade. The London County Council have informed the Board of Trade that under the Tramways Act of 1870 they have an unconditional power of purchase, and that the matters referred to by the company do not affect this power. An assurance has been given that the L.C.C. will give consideration to all matters, in order to meet the convenience of the travelling public, and also to enter into reasonable arrangements whereby the company will be allowed to run its cars to Hammersmith Broadway and Shepherd's Bush. On this understanding the Board of Trade have approved of the notice of purchase served upon the company.

Opposition to Private Bills.—The Parliamentary Committee of the L.C.C. recommends petitions being presented against the Baker Street & Waterloo, Charing Cross, Euston & Hampstead, Metropolitan District, and Metropolitan Railway Bills, which are being promoted in the next session of Parliament.

Brompton and Kensington New Tariff.—The Brompton & Kensington Electricity Supply Co. have introduced an alternative contract system of charging for lighting, heating, and cooking. Where electric light is exclusively used the company quote a fixed annual charge, payable in quarterly instalments, and in addition 2d. per unit for all current consumed up to the quantity which at the rate equals the amount of the fixed annual charge, and 1d. per unit for all current consumed thereafter. Under this system a separate meter and wiring for power supply is dispensed with. The company's ordinary tariff for heating, viz., 1d. per unit, has been increased to 2d. per unit.

Fulham: Power Charges.—The Electricity Committee report having had under consideration the charge to be made for energy supplied for driving motors, used for the purpose of producing other artificial light. A rate of 3½d. per unit, with a minimum charge of 13s. 4d. per quarter, plus the usual motor rent, has been fixed.

NEWPORT: *Position of Electricity Undertaking.*—Mr. C. P. Sparks, who was called in by the Council in relation to the financial position and management of the electricity undertaking, has now presented his report. The chief source of loss from the undertaking has been in respect of the supply for power purposes, and it is stated that the report contains recommendations for revising these tariffs. About six years ago reductions were made which involved a loss of revenue of £1,000 per annum, and it is felt that this experiment was a mistake. The full report is not yet available.

PLYMOUTH: *Reduced Electricity Charges.*—The Corporation have decided to revise the charges to the Tramways Committee and to private power users. The Tramways Committee will in future be charged 1¾d. per unit up to 750,000 units per annum, and 1½d. per unit for all in excess of that quantity. The present charge is 1¾d. per unit for any quantity. For power purposes the charge is to be 1¾d. per unit up to 100 units, and 1½d. per unit beyond that. The present charge is 1¾d. per unit.

PORT GLASGOW: *Electricity Supply.*—The Greenock Corporation are to be asked to submit terms for the supply of electrical energy in Port Glasgow.

WEST BROMWICH: *The New Tramway Fares.*—At a public meeting to consider the "fair fare" system last week, it was stated that 1,100 people had pledged themselves not to use the tramways in the district for three months. It was also stated that this number had been obtained in a casual sort of way, and that it was hoped to get at least 10,000 West Bromwich people to join in the boycott.

WIGAN: *Tramway Consumption.*—The Tramway Manager reports that since September 30th last, the current consumption has shown an alarming increase. For the 15 weeks from October 1st, 1909, to January 20th, 1910, the average consumption per car mile had increased from 1·54 to 1·70 units. A "Master" meter is to be fixed at the electricity station, with a view to determining whether the present meters are working correctly, and the cars on the Standish route are to be fitted with meters for the purpose of ascertaining the current consumption per car.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ASTON.—The Electricity Committee recommend extensions at an estimated cost of £13,550. The proposed plant will consist of a 2,500-kw. turbo-alternator, a 250-kw. motor-generator, and a 350-kw. rotary converter.

COVENTRY.—The City Council have approved of the scheme of electrical extensions involving an expenditure of £54,000, particulars of which were given in our last issue.

KEIGHLEY.—The Board of Trade have sanctioned a loan of £21,000 for electrical extensions.

LONDON: *London County Council.*—The following plant is required at the Woolwich tramway sub-station: High- and low-tension switchgear (£2,250), 150-kw. motor-generator (£675), switchgear (£650).

Bermondsey.—A loan of £4,620 for electric lighting is recommended by the Finance Committee of the London County Council.

OLDHAM.—The Tramways Committee invite tenders for (*a*) electric lighting installation at the Hollinwood depot; (*b*) switchboard and accessories; (*c*) testing panel and accessories; (*d*) workshop motors with starting panels, pulleys, &c. Particulars from the Tramway Manager, and tenders to the Town Clerk.

RIVER PLATE.—The River Plate Electricity Co. has acquired an extensive site at the port of Ensenada, near La Plata, upon which they propose to erect a new generating station.

SOUTHAMPTON.—The recommendation of the Electricity Department to carry out large electrical extensions has been passed by the Council, and an application will be made to the Local Government Board for a loan of £13,000. The new plant will include a 1,000-kw. D.-C. generator, 300-kw. two-phase alternator (50 periods), 200-kw. motor alternator, and a boiler. In addition, the Tramways Department are increasing their rolling stock by 14 cars.

TORQUAY.—The Corporation electric supply mains are to be extended to Chelston at an estimated cost of £3,000.

WIMBLEDON.—Tenders are to be invited for the pipe work required for the horizontal "Curtis" turbine to be installed by the B.T.-H. Co., Ltd.

Digitized by Google

Miscellaneous

AUSTRALIA.—Tenders are invited for (*a*) telephone switchboard by the Deputy Postmaster-General, Sydney, by March 9th; (*b*) supply of iron and steel poles by the Deputy Postmaster-General, Perth, March 15th. Specifications, &c., may be seen at the office of the Commonwealth in London, 72 Victoria Street, S.W.

CANADA.—A scheme for municipal tramways has been voted upon favourably in Toronto. There is an alternative proposal to grant permission to the Toronto Street Railway Co., to undertake the scheme, which is to be partly in a subway and partly on the surface.

CHESTER.—Five regenerative tramcars are to be converted to the old type of equipment at an estimated cost of £400. The Tramways Manager states that the coils of the new cars under the regenerative system had been a continual source of expense, and their frequent burning out was a source of considerable annoyance.

GRIMSBY.—Tenders are invited by February 19th for the supply of 80 flame arc lamps. Particulars from Mr. W. A. Vignoles, Borough Electrical Engineer. (See an advertisement on another page.)

LONDON: *Marylebone.*—Tenders are invited for various electrical stores during the year, commencing April 1st, 1910. (See an advertisement on another page.)

WEST HAM.—Tenders are invited by February 17th for the annual supply of indiarubber-covered wires and cables; electrical fittings and accessories (including conduits); house service cut-outs; house service A.C. watt meters; engine room stores; and chemicals. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.—Secondary school for boys and one for girls (200 places each), Chiswick. H. G. Crothall, architect, Middlesex Education Committee, Guildhall, S.W.

N.E.—Electric theatre, High Road, Leytonstone. Emden, Egan & Co., architects, Lancaster Place, Strand, W.C.

Electric theatre, Mare Street, Hackney, for the International Electric Theatres, Ltd.

E.C.—Offices, &c., Lombard Street, City. J. Carmichael, builder, Wandsworth, S.W.

E.—Fire station (£11,150), Bromley-by-Bow. H. L. Holloway, builder, Church Street, Deptford, S.E.

S.W.—Headquarters for 7th London Brigade, Royal Field Artillery, High Street, Fulham. Architects, Dunnange & Hartmann, 10 Lancaster Place, S.W.

Electric theatre, junction of Garratt Lane, Wandsworth, S.W., and Algarne Road, Wandsworth, for the London Concessions & Construction Syndicate, Ltd.

S.E.—Hall at Training College, Woolwich, S.E. (£2,000). Architect, Education Committee, L.C.C.

PROVINCES.

CREWE.—Training college (£22,990). C. W. Davenport, builder, Stockton Heath, Warrington.

CARDIFF.—Extension to Wesleyan Sunday School, Cathays (£1,200). Architect, Henry Budgen, 95 St. Mary Street, Cardiff.

CHELMSFORD.—School, Trinity Road (£13,480). Architects, C. & W. H. Pertwee, Chelmsford.

DURHAM.—Theatre (£10,000). Architects, Marshall & Tweedy, Newcastle.

EAST HAM.—Swimming bath with 12 slipper baths and residence for superintendent, East Ham (£1,500). A. H. Campbell, engineer, East Ham Corporation.

FOLKESTONE.—Extension to library, Grace Hill (£3,500). A. E. Nichols, borough surveyor, Folkestone.

GLASGOW.—School, Stranraer (£4,500). Architect, H. & D. Barclay, 245 St. Vincent Street, Glasgow.

Catholic Apostolic Church (£1,500). Architect, Leiper & McNab, West George Street, Glasgow.

HARROGATE.—Additions and alterations to Prince of Wales Hotel (£4,940). Architects, Richardson & Bell, Wakefield.

LIVERPOOL.—Hall and rink (£3,000). Architects, Pritchard & Clegg, 77 Lord Street, Liverpool.

STOURBRIDGE.—Hospital. Architect, H. E. Foulks, Hayley Street, Stourbridge.

UXBRIDGE (MIDDLESEX).—School, Cowley Road. Architect, H. G. Crothall, Education Committee, Guildhall, Westminster, S.W.

The Electrical Trades' Benevolent Institution.—In the list of names of the members of the organising committee of the Electrical Trades' Benevolent Institution Second Festival Dinner, published on page 67 of our last issue, the name of Mr. F. B. O. Hawes (National Electrical Manufacturers' Association) had been omitted.

TENDERS RECEIVED AND ACCEPTED

BEXHILL.—The following tenders have been accepted: Concentric cables for private lighting, Messrs. Callender's Cable & Construction Co., Ltd., £118; street lighting cable, Messrs. Siemens Bros. & Co., Ltd., £103.

ECCLES.—The Council have accepted the tender of the British Westinghouse Co. for a 150-kw. Belliss-Westinghouse traction set at £856. They have also accepted the tender of the Globe Electric Co., Ltd., at £133, for the electric wiring and fitting of the new Beech Street Council School.

LONDON: *London County Council.*—The following tenders have been accepted:—Electric insulating materials:—F. Wiggins & Sons; Micanite & Insulators Co., Ltd. Arc lamp carbons:—W. Geipel & Co.; Ship Carbons, Ltd. Electrical fittings:—British Electrical & Manufacturing Co.; General Electric Co., Ltd.; Messrs. Siemens Bros. & Co., Ltd.; Messrs. Siemens Bros.' Dynamo Works, Ltd.; Verity's, Ltd. Electric lamps:—British Tungsten Lamp Co., Ltd.

A contract has been entered into with Messrs. Hadfield's Steel Foundry Co., Ltd., for the supply of special tramway trackwork, at an estimated cost of £15,500.

The tender of Messrs. Edison & Swan United Electric Light Co., Ltd., for the wiring material for the Abbey Wood and Hammersmith car sheds, and the Woolwich sub-station, has been accepted at £281 11s.

The tender of Messrs. J. A. Bremner & Co. has been accepted for the supply of machinery oil to the Greenwich power house for the year to January 31st, 1911.

SALFORD.—The Council has placed an order with the British Insulated & Helsby Cables, Ltd., for non-fouling trolley wire for the Tramway Department at 8 $\frac{5}{16}$d. per lb.

STALYBRIDGE.—The Stalybridge, Hyde, Mossley & Dukinfield Tramways and Electricity Board has ordered four "Bennis" stokers and compressed air furnaces for 8 ft. 6 in. Lancashire boilers at their Tame Valley generating station.

APPOINTMENTS AND PERSONAL NOTES

A resolution of the Bridlington Electricity Committee to appoint the resident Electrical Engineer, consulting engineer for extensions exceeding £200 in value, at a commission of 1 per cent., was defeated at the last meeting of the Council. The opinion was expressed that if Mr. Beckett's salary was not sufficient to cover the whole management of the undertaking, including extensions, it should be increased.

It is announced that a number of important changes have been made in the Toronto Electric Light Co. Mr. J. J. Wright, who has been General Manager for 27 years, has been appointed second Vice-President and Consulting Engineer, whilst Mr. H. H. Macrae will assume the General Managership.

The salary of Mr. A. M. Mulliner, assistant electrical engineer to the Eccles Corporation, has been increased from £130 to £135 per annum. There are to be annual increases of £5 to a maximum of £150.

A.E.G. Turbo-Alternators.—In the article on these machines in our last issue (page 58), it was stated that they were supplied in this country by the Electrical Co., Ltd. We are, however, informed that the turbo-generator business was taken over on Jan. 1st by the A.E.G. Electric Co. (121-125 Charing Cross Road, W.C.), to whom inquiries for heavy plant, power installations, &c., should be directed. The Electrical Co., Ltd., retain the wholesale business, supplying lamps, fittings, and other electrical accessories and materials to electrical contractors, electricity supply companies, and electrical wholesale houses.

The Paris Floods.—During the last few days there has been a gradual receding of the water, although it will be some considerable time before the streets are clear of water. The Metropolitain has suffered severely, and parts of the flooded tunnels, especially those in course of construction, are a source of anxiety, as fresh subsidences are reported. Pumps are, however, already at work, but the clearing of the tunnels from water will be a work of time, as there is no other course than to pump it up to the street level. According to the *Times*, the interruption to the electric light service still continues. The cables in the principal power stations are under water, and there is no prospect of any improvement for the next few days. The main boulevards, as well as the majority of the principal thoroughfares, are in semi-darkness, and many theatres and restaurants complain of their consequent losses. The performances at the Opera House have been abandoned, but those at the Comédie Française and the Opera Comique have been continued by their emergency installations on the premises. Both banks of the river are now almost without any uniform or efficient light, with the exception of a few favoured quarters in the Bois de Boulogne district. There is also considerable interruption of the telegraph and telephone services by the underground sections having been flooded. The telephone service is practically stopped, but the situation in this respect is now less acute. Damage has been done also to tramway tracks in various places, and some lines will have to be relaid. The reports as to the insecurity of the Eiffel Tower are stated to be unfounded.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £62 to £62 10s. per ton (last week, £62 10s. to £63).

"IGRANIC" COMPETITION.—The Adams Manufacturing Co., Ltd., of 106 New Bond-street, London, and Bedford, recently offered a prize for the best definition of their trade mark, "Igranic." An enormous number of replies were received, and they submitted a selected number to Mr. Frank Broadbent, who has made his award to Mr. Alfred Cockburn, 9 St. George's Square, London, S.W. The following is the winning definition :—

Inspires confidence.
Gives satisfaction.
Requires no attention.
Acts automatically.
Never goes wrong.
Is immensely popular.
Combines cheapness with efficiency.

The Adams Manufacturing Co., Ltd., point out that the word "Igranic" is a coined word, and has no special definition or derivation.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The first meetings of creditors and shareholders of the "X" Syndicate, Ltd., were held on Thursday. The statement of accounts shows liabilities of £5,301, and assets £4,425, and a deficiency of £1,882 to the shareholders. The Syndicate was formed to acquire the business of the "X" Electrical Accumulator Co., Ltd. There was not a quorum present, and the meeting was adjourned.

The London Electrobus Co., Ltd., is to be wound up voluntarily. The liquidator is Mr. T. J. Garlick, 15 George Street, Mansion House, London.

CANADIAN AGENCY WANTED.—A Swiss company manufacturing electrical plant and equipment, and also specialities in turbines, variable speed motors, rivetters, drilling machines, &c., seek a competent Canadian resident agent to introduce their machinery. Particulars may be obtained from the City Trade Inquiries Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

COMPANIES' MEETINGS AND REPORTS

METROPOLITAN RAILWAY CO.—At the half-yearly meeting the report and accounts given in our last issue were adopted. Sir Charles McLaren, chairman of the company, who presided, referred to the North-East London Railway Bill, which asks for an extension of time for the construction of the electric railway from the City to Waltham Abbey, and stated that it had been suggested that the Metropolitan Railway Co. should practically work this line as a part of their undertaking. The Board had had this proposal under their consideration, and were of opinion that it would be distinctly to the advantage of the company. The terms were in negotiation at present.

THE YORKSHIRE ELECTRIC POWER CO.—The net profit for the year 1909 amounted to £2,664, against £717 in the previous year. The combined balance is carried forward. The receipts amounted to £25,762, compared with £18,643. Owing to the increased demand, a fourth Curtis turbine of double the capacity of the present ones, together with an additional boiler, is to be installed at the power-house. The meeting is on February 15th.

EAST LONDON RAILWAY CO.—At the meeting last week Lord Claud Hamilton said the directors hoped to be able to submit a definite proposal as to the conversion of the railway to electric traction at the next meeting in July.

Telegraph Traffic and Movements of Cable Ships.—It is hoped that the interruptions caused by the Paris floods and the snow in the north of England will soon be repaired. The El Arich route between Adona and Beyreuth was down on the 26th ult., and repaired on the 29th. The Indo-European Telegraph Co.'s line was broken between Kertch and Soukhoum Kale, and direct communication between Saigon and Bangkok was interrupted for a short while on the 31st ult. The French Cable Co.'s Môle St. Nicholas—Cape Haiti cable broke down on January 25th. The Perim-Assab cable has been down since July 8th last; the Dakar-Kinakry cable was not working on August 19th last; and the Tourane-Amoy cables are still interrupted.—The Lagos-Kotonou cable has been out of use since the 3rd ult., while the cable between Makassar and Balikpapan has been in need of repair since the 19th ult.—The c.s. *Colonia* has been engaged on the diversion of the Commercial Cable Co.'s Canso cable to St. John's, Newfoundland, and has had the assistance of the c.s. *Mackay Bennett*. The new cable, when opened, will be worked for the present to Canso, as hitherto.—Much bad weather has prevailed on the Canadian side of the Atlantic, rendering the work of the ships very difficult. The cable steamer *Minia* of the Anglo-American Cable Co. attended to a repair necessary off the Cape Breton coast, and also repaired a break in the cable between Halifax and Rye Beach, belonging to the Direct United States Cable Co.—The French Telegraph Co.'s Atlantic section between St. Pierre and Cape Cod had to be attended to, and the *Contre-Amiral Caubet* has sailed accordingly.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

CENTRIFUGAL PUMPS.—A new catalogue from Messrs. Balcke & Co., Ltd., describes, with the aid of excellent illustrations, a considerable range of high lift and low lift centrifugal pumps, suitable for direct coupling to electric motors, and other methods of drive. Complete tables of dimensions, speeds, capacities, prices, weights, &c., are given, and the pumps are made both in horizontal and vertical forms, from the smallest up to the very largest sizes.

FRICTION CLUTCHES, &c.—We have received from Messrs. David Bridge & Co. (Castleton Ironworks, Manchester), a reprint of an article describing the friction clutch, in which this firm has specialised for about twenty years, and which is in extensive use for driving all kinds of machinery in sizes up to 3,000 h.p. Its power of taking up the load gradually renders it particularly suitable to gas-engine drive. The clutch is of the expanding internal-drum type, and is worked by a sliding collar through an ingeniously arranged toggle gear. Messrs. D. Bridge & Co., who have also a London office at 35 Queen Victoria Street, are also well-known as specialists in rubber, gutta-percha, and balata machinery.

SHUNT-REGULATING RHEOSTATS.—A sheet from the Solenoid Regulator Co. (John Bright Street and Severn Street, Birmingham), contains a price list of shunt regulators, with conveniently arranged tables of maximum and minimum currents and total resistances which enable the size required to be picked out and the price ascertained.

SMALL DYNAMOS AND MOTORS.—We have received from the Small Power Dynamo & Motor Co., Ltd. (Old Lane, Openshaw, Manchester), a leaflet giving prices of continuous-current motors and dynamos from $\frac{1}{2}$ to 3 h.p., and 25 to 50 kw. respectively. These machines are made in the ventilated, enclosed, and semi-enclosed patterns, and a full line of accessories, including starters and regulators, is included. A useful feature is the list of spare parts with separate prices.

CALENDAR.—An artistic calendar is being sent out by the Jandus Arc Lamp & Electric Co., Ltd. (Hartham Road, Holloway), on which is a fine three colour reproduction of a portrait of Sir Thomas Lawrence.

Messrs. Venner and Co., 6 Old Queen Street, Westminster, are issuing to their friends this year a gift in the form of an ash-tray, in the bottom of which is an effective reproduction of an example of one of their well-known illuminated signs. We are asked to state that, due to their limited number, it is impossible to send one of these trays to anyone except the firm's customers, but if there are any of our readers who are customers, and have not received one, a tray will be sent to them on application.

Dublin Electrical Contractors' Association.—The annual dinner was held on Thursday last at Dublin, Mr. C. Cummins presiding. In his speech the Chairman stated that as all the subscriptions for Dublin, if it were a section of the London Association, would go to London, it was thought better to keep Dublin distinct, and not affiliate it.

The National Electrical Manufacturers' Association.—This Association has again been active in the interests of firms sending in tenders for municipal contracts. It appears that a large municipality recently issued an advertisement asking for tenders for certain electrical goods, a fee having to be paid for the specification, which fee was not to be refunded. The matter was taken up with the Town Clerk by the Association, with the satisfactory result that the amounts are to be refunded to all firms who have sent in *bonâ fide* tenders.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of **9d.** per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of **1/-** for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203-6, Temple Chambers, London, E.C.

CORPORATION OF BLACKPOOL.

ELECTRICITY DEPARTMENT.

THE ELECTRICITY COMMITTEE invite Tenders for approximately 2,500 yards of .5 Low Tension Single Cable suitable for a working pressure of 600 volts.

Particulars can be obtained upon application to

C. FURNESS,
Borough Electrical and Tramways Engineer.

Electricity Works

For further Small Advertisements, see p. viii.

SUMMARY

WE are able to contradict the report that there is to be a wholesale displacing of electric light by high-pressure gas in the street lighting of Berlin. (Page 83.)

IN view of the large number of different makes of metal filament lamps now on the market in this country, we have compiled an article giving particulars of the various sizes obtainable from each maker or supplier, and including other information about the lamps. An announcement is made of the improved efficiencies now obtainable with some of the Osram lamps, and particulars appear of several new British-made lamps. Over twenty makes are dealt with, including the latest varieties of the tantalum lamp as well as those with tungsten filaments. (Page 85.)

WE publish in this issue the first of a series of articles (which will appear monthly) describing new designs of electrical supplies and accessories. In the section devoted to fittings, switches, and accessories, descriptions are given of some fittings specially designed for tantalum lamps, a cartridge fuse, some wireless cluster fittings, an arrangement for earthing switch-covers, a locking lampholder, an ironclad switch, some plugs, &c., and also some notes on screwing conduits. Four makes of arc lamps are described, and among heating and cooking apparatus are given notes on a complete cooking outfit, a series of radiators, and a pilot-lamp adaptor for flat-irons. Electric bells are also dealt with, and other apparatus described includes portable vacuum cleaning outfits and electrically-driven pumps. (Page 89.)

AMONG the features of interest in the electrical installation of Messrs. D. H. Evans & Co.'s new premises in Oxford Street is a cable-trough at the back of the main switchboard, from which the separate cables are brought out opposite their respective terminals. The main lighting is by enclosed arcs, and show-windows and show-cases are illuminated from the outside only, a neat form of reflector box being employed for the latter. Power applications include lifts, parcel conveyors, and a very complete ventilating equipment combined with an ozone generator. (Page 95.)

A NEW high-pressure blow-off valve and a specially designed feeder pillar for use on electric capstan circuits in tropical climates are described on page 96.

WE publish extracts from a correspondence between Mr. E. Garcke and the Secretary of the Institution of Electrical Engineers regarding the duties of the Institution to the electrical industry. (Page 97.)

A LETTER from the manager of the Meter Department of Simplex Conduits, Ltd., continues the correspondence regarding the novelty of the Adnil combined lighting and power meter. (Page 97.)

THE hearing of the action between the Donnersmarckhütte and the Electric Construction Co. with regard to the Ilgner patent for the electric driving of reversing rolling mills was concluded last week, but

Digitized by Google

Mr. Justice Parker has reserved judgment. In the course of the proceedings particulars were given of the automatic regulator used by the E.C.C. at the Hickman Works. Evidence was given by Mr. H. F. Parshall, Prof. B. Hopkinson, and Mr. W. M. Mordey to the effect that there was no subject-matter in the Ilgner patent, and Mr. Ferranti also gave evidence. Summing up the case, Mr. Walter claimed that the utilisation of flywheel effect without a drop in the voltage supplied to the working motor was the result of the combination of the Ward-Leonard and Ferranti ideas, and the combination was therefore subject-matter for a patent. (Page 98.)

A NOVEL process for depositing metal films on metallic surfaces was described by Mr. A. Rosenberg before the Royal Society of Arts last week. This consists of the use of powders, the constituents of which vary according to the metal to be deposited. The powder is applied to the article to be plated by means of a wet sponge or brush and rubbed on. It has been found that even nickel can be deposited in this way. (Page 99.)

WE give details of the agreement between the Postmaster-General and Marconi's Wireless Telegraph Co., under which the ship and shore stations of the latter are transferred to the former for £15,000. (Page 99.)

AMONG the Specifications published by the Patent Office on Thursday last was one by Mr. Miles Walker for an exciter for supplying alternating current to the rotors of large induction motors to enable them to run at unity power factor or to take a leading current. The machine can also be used for exciting a synchronous generators.—W. Schmahl, of the Armorduct Manufacturing Co., has protected a flexible cable for portable apparatus, in which the outer covering consists of a braiding of rubber-covered cord, and also a water-tight conduit inspection fitting with an elastic packing round the box edge.—An insulator with an oil-cup which can be lowered down the pin for cleaning is covered by H. Dagnall, of Messrs. Bullers, Ltd.—The grant of a patent to W. Borchers for improvements in the electric smelting of titaniferous iron ores is opposed.—Application has been made for the revocation of a patent by J. D. Taylor for an automatic block signalling system.—An important patent for a motor control system in which resistances are inserted into the motor circuit between the successive changes in series-parallel control, and for a controller with an auxiliary resistance drum, expires to-morrow after the full life of fourteen years. (Page 100.)

A 600-KW. mixed-pressure turbine has been installed at Burslem.—A 550-kw. exhaust-steam turbo-generator has been installed at Darlington.—The Edinburgh electric lighting accounts for 1909 show a profit of £2,071.—Gillingham Council are to co-operate in the promotion of a Bill seeking electric wiring powers.—Hastings Corporation have agreed to put their proposed wiring powers in the hands of contractors.—Trailer cars have been sanctioned, as an experiment, upon the L.C.C. tramway system.—Macclesfield Council have decided not to put their Electric Lighting Order into force.—The "Norwich" system of charging is being tried at Redditch. (Page 101.)

EXTENSIONS are contemplated at Hanley and Grays. New mains are to be laid at Bradford, and the cooling plant at Eastbourne is to be enlarged. A tramway scheme at an estimated cost of £25,000 is to be carried out at Bacup; tramway extensions are also to be put in hand at Doncaster and Newport. Electrical stores are required at Wolverhampton, Leeds, Blackburn, Hornsey, St. Pancras, Hammersmith, Bermondsey, and Ilford. Battery plates are required at Kettering; condensing plant at Heckmondwike; motors at Glasgow; and pipe-work at Wimbledon. (Page 101.)

A 3 PER CENT. dividend is recommended on the ordinary shares of the Baker Street & Waterloo Railway Co.; 1¼ per cent. by the Great Northern, Piccadilly & Brompton Railway Co.; and ¾ per cent. by the Charing Cross, Euston & Hampstead Railway Co. The full dividend is recommended on the 4 per cent. guaranteed stock of the District Railway Co. The Liverpool Overhead Railway Co. shows a net profit of £8,965 for the past half-year. Both the City & South London Railway Co. and the Great Northern & City Railway Co. show an increase of passengers carried during the past half-year. Dividends are declared by a number of London electric supply companies. (Page 104.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 10TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, Westminster. "Losses off Transmission Lines due to Brush Discharge, with Special Reference to the Case of Direct Currents," by E. A. Watson.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science. "The Elementary Graphics of Alternating Currents," by T. Tomlinson.

SATURDAY, FEBRUARY 12TH.

Institution of Electrical Engineers: Glasgow Section.

7 p.m. Annual Smoking Concert at "The Grosvenor."

Birmingham and District Electric Club.

7 p.m. At Colonnade Hotel, New Street. "The Electric Incandescent Lamp: its Manufacture and Application," by J. Findlay.

Central Technical College Old Students' Association.

7.30 p.m. Annual Dinner, at Trocadero.

Junior Institution of Engineers.

7.30 p.m. Anniversary Dinner at Hotel Cecil, London.

TUESDAY, FEBRUARY 15TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal Technical School. Discussion on "Gas *v.* Electricity for Heating and Power Purposes."

Electro-Harmonic Society.

8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. Continuation of discussion on "Glare: its Causes and Effects."

WEDNESDAY, FEBRUARY 16TH.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. At the University. (1) "The Influence of Various Cooling Media upon the Rise in Temperature of Soft Iron Stampings," by R. D. Gifford. (2) "Equitable Charges for Tramway Supply," by H. E. Yerburg.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "Alternating *v.* D.-C. Supply for Sub-stations," by H. W. Gregory.

THURSDAY, FEBRUARY 17TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. "Electric Clocks," by F. Hope-Jones.

STREET LIGHTING IN BERLIN

THERE is a mistaken impression in this country that the municipality of Berlin have been replacing electric light for street lighting by high-pressure gas; and in fact statements have actually been made on one or two occasions that in future all the streets in Berlin are to be lighted by high-pressure gas. We are in a position to inform our readers that the report is entirely erroneous, and that, on the contrary, a decided increase in the use of flame arc lamps for street lighting in Berlin may be expected shortly. It is true that high-pressure gas lighting has been extensively used, and is being adopted in the streets that have hitherto been lighted by gas, but there is to be no wholesale displacing of electric light. In considering the matter, moreover, it must not be forgotten that the gas works in Berlin are under municipal control, while electricity is being supplied to the town by a private company.

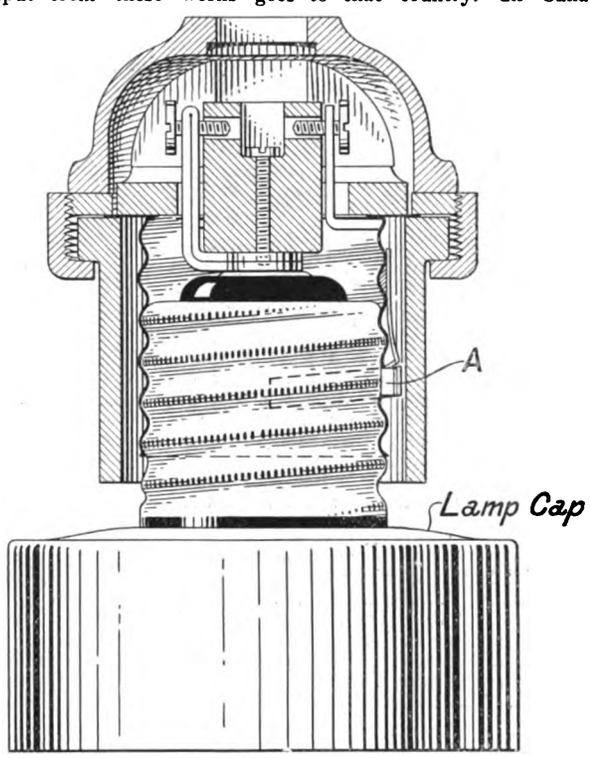
METAL FILAMENT LAMPS

THERE are now so many metal filament lamps on the market in this country that it has appeared to us that an article would be useful, setting forth clearly the sizes of lamps now obtainable and some general particulars concerning them. The demand for lamps, especially of the lower candle powers at 200–250 volts, still enormously exceeds the supply, and although makers are rapidly fulfilling back orders, yet delays in delivery are still unavoidable, lamps should be requisitioned well in advance, and customers will still have to be patient and to refrain from insisting on definite promises as to dates.

The information which we give in this article has been obtained from the various firms of lamp makers and suppliers, who have in nearly all cases been very willing to impart it, and every effort has been made to render these notes as accurate and complete as possible. While it does not cover every make of metal filament lamp on the market, yet we believe that there are few firms other than those mentioned who are actually in a position to accept large orders.

In quoting the candle-powers of the lamps we have not consistently given British candle-power, as in a large number of instances the makers and suppliers have adopted the rating in Hefner candle-power, which should be reduced by 10 per cent. in comparing with British candle-powers. In some cases the suppliers, we regret to say, are very vague as to whether Hefner or British candle-power is intended. Whenever the watt rating is mentioned, we recommend that this should be employed when ordering.

Osram Lamps.



The most important announcement we have to make is an improvement in the efficiency rating of some sizes of Osram lamps. In a new four-page list which the General Electric Co., Ltd., publish in our advertisement pages this week, it will be seen that the 200-260-volt, 50 Hefner candle-power lamp (45 British candle-power) now only consumes 55 watts instead of 63 watts as formerly, and that the 100-135-volt lamps are now rated at one watt per Hefner, with the exception of the 16-c.p. size, which takes 17 watts. In spite of these higher efficiencies, the average life of the lamps is 1,500 to 2,000 hours, and the makers announce that the decrease in light after 1,000 hours burning is less than 5 per cent. Many cases of extremely long life have been noted; we may mention in particular a 100-c.p. 200-volt lamp at the Stafford Electricity Works, which, the General Electric Co. were informed last November, had been burning 14,000 hours.

A large range of sizes is now made. For 25 volts there are three sizes, 10, 16, and 25 watts, consuming 1 watt per Hefner candle-power; the first two sizes are 4 in. long in ordinary bulbs, or 2½ in. diameter in spherical bulbs. The 50-55-volt lamps are in five sizes, from 13 to 55 watts, and with bulbs somewhat larger as the candle-powers increase. The ordinary 100-135-volt lamps are listed in four sizes, 17, 25, 32 and 55 watts respectively; the 17-watt lamp has 16 Hefner or 14·5 British candle-power, and the bulb is 4¾ in. long for the ordinary shape, and 2¾ in. diameter when of spherical shape. There are three sizes of ordinary lamps made for 150 volts, and three sizes (32, 40, and 55 watts) for 200-260 volts. The 32-watt lamp gives 25 Hefner c.p. (22·5 British), and is 5¼ in. long. All these sizes are made both in pear-shaped and round bulbs; for the last-named lamp the round bulb is 3½ in. diameter. It should also be mentioned that these high-voltage lamps are made for voltages rising in steps of five, from 200 to 250 volts, and that all are suitable for burning in any position It is unnecessary to specify this when ordering, but when lamps are required for burning in series this should be mentioned, and the "series number" should be cited if the lamps are for renewals. The watt rating is especially to be recommended in ordering series lamps, but it is clear that, in view of the large number of sizes now obtainable, series burning is rapidly being abandoned.

In addition to the ordinary Osram lamps, the General Electric Co. now supply several sizes of high candle-power, from 100 to 1,000 watts, all at 1 watt per Hefner. From the 300-watt size upwards, E.S. caps are used instead of B.C. caps, and for the 600 and 1,000 c.p. a special E.S. cap and holder is employed, which we illustrate in the next column. The thread of the lamp cap is milled, and a V-shaped piece of metal (*A*) in the holder is pressed against the milled surface of the thread by a spring, which prevents the lamp from working loose, and thus obviates the chief defect in the E.S. holder. These lamps are employed in several places in lieu of arc lamps, and in Hammersmith, for instance, 400-watt Osrams are replacing arc lamps for street lighting.

Several sizes of candle lamps are now obtainable.

We have been shown some colossal figures of deliveries of Osram lamps from the works during the last month, but still larger figures for the demand. Some delay is still occurring in delivery, in consequence, particularly in the 200-volt sizes, but it is hoped that in a very short time it will be possible to deliver back orders from stock. The Hammersmith lamp works are now doing a good share of the manufacture, and owing to preferential Customs tariff in Canada, a large proportion of the output from these works goes to that country. In Canada

Lamp Cap and Special E.S. Holder for 1,000-c.p. Osram Lamp. Scale about Four-fifths.

there is a 30 per cent. tax on electric lamps, and a further surtax on German lamps, making the duty 40 per cent. For English-made lamps, however, a preferential rebate is given, and they only pay 20 per cent. duty, so that while English lamps pay 20 per cent., Austrian lamps pay 30 per cent., and German lamps 40 per cent.

Breakages in transit are now becoming fewer and fewer. A letter received last week from the company's South African house gave the welcome information that during the past twelve months there were less than one per cent. of breakages in transit.

Tantalum Lamps.

The well-known tantalum lamp of Messrs. Siemens Bros. Dynamo Works, Ltd., is distinguished from all other metal filament lamps by its wire-drawn filament of pure tantalum, which gives it a greater durability and toughness, even if it is not quite as efficient as the tungsten filament. A striking instance of the durability of the wiredrawn tantalum filament is furnished by an incident which occurred during the Elections, when an impromptu sign illuminated by two tantalum lamps was rigged up. Unfortunately, the mast was blown down by the wind one night, and broken in two, but the lamps were found to be still burning next morning. As a general rule, the 100-volt lamps are smaller, as well as cheaper than tungsten lamps of equivalent candle-power, and the slightly lower temperature at which the filament is run gives a more pleasing quality of light, with less glare due to high intrinsic brilliancy. It was at first said that they were unsuitable for alternating currents, but the peculiar breaking up of the filament observed with alternating currents only becomes appreciable with the very thinnest filaments and on the higher frequencies, so that in nearly all cases lamps can be supplied quite suitable for alternating circuits. The tantalum lamp was early in the field with high voltages and low candle-powers, and the latest move in the latter direction was the introduction a few weeks ago of a 10-c.p. lamp for 65/120 volts.

The most recent tantalum is a candle lamp, which will soon be followed by a standard list of 2/16-volt battery lamps. With a few exceptions mentioned below, tantalum lamps are run at an efficiency of 1·7 watts per c p. From 20 to 24 volts, lamps are made for 5/10 and 16/25 c.p., and 10-c.p. lamps at various voltages from 50 to 120, while the 16-c.p. lamp is made for

D

Digitized by Google

50/80, 100/130, and 140/160 volts. Between 100 and 120 volts, the 16-c.p. lamp of ordinary efficiency is not suited to alternating current, but a special lamp having an efficiency of 2·2 watts per c.p. must be used. The well-known 25-c.p. lamps are made for continuous current for 50/130, 140/160, and 200/250 volts, but for alternating currents from 50/130 volts only. The next size is 32 c.p., and this for continuous currents suits circuits of 60/160 and 200/250 volts; for alternating currents the 1·7-watt 32-c.p. lamp can only be supplied up to 160 volts, but a 2·2-watt 32-c.p. lamp is supplied from 200 to 230 volts. The largest size at present made is 50 c.p. for 100/160 and 200/250 volts. The new 10-c.p. 100-volt lamp has a bell-shaped bulb 4¼ in. long by 2⅛ in. diameter, and the larger lamps have progressively larger sizes up to 5⅞ in. by 2⅛ in. for the larger 200-volt bulb. All the sizes can be supplied in spherical or "Sun" bulbs at a slight increase in price. The new candle lamps referred to above are made from 20 to 60 volts for 5 and 10 c.p., the former of which, above 40 volts, is, however, only suitable for continuous currents. These are fitted with S.B.C. caps, and have bulbs 3⅜ in. by 1⅞ in., and 4 in. by 1⅜ in. respectively.

Mazda Lamps.

This new name, the etymological derivation of which is inscrutable, has recently been given to the well-known tungsten lamps which are made by the British Thomson-Houston Co., Ltd., at Rugby, under patented processes differing somewhat from those under which other tungsten lamps are made. The following sizes are now obtainable for ordinary supply voltages :—*100/135 volts*—20 British c.p. (25 watts), 40 c.p. (50 watts), and 100 c.p. (125 watts); *200/260 volts*—32 c.p. (45 watts), 100 c.p. (140 watts), and 200 c.p. (250 watts). Lamps from 10 to 25 c.p. are also made for 25/27·5 volts, and 50/55 volts. Lamps for series running bear a series number, and any lamps having series numbers not more than one apart may be run together.

"Z" Lamps.

A special feature of these lamps, which are made by the "Z" Electric Lamp Manufacturing Co. (Orient House, New Broad Street, E.C.) at their works near Wimbledon, is the use of a coating of a compound known as "phospham" on the centre glass pillar, with the object of preventing blackening of the bulbs. The prices are slightly less than for most other makes of tungsten lamps. The company rate their lamps in watts, and not in candle-power, but give the efficiency as approximately 1·2 watts per British c.p. The sizes are as follows : *25/30 volts*– 8/25 and 25/30 watts; *30/45 volts*—25/30 watts; *50/55 volts*—12/35 watts; *60/135 volts*—17/20, 25/55, 60/80, and 90/150 watts; *100/160 volts*—150/200 watts; *140/160 volts*—30/50, 60/80, and 90/150 watts; *200/260 volts*– 40/60, 60/80, 90/150, and 150/200 watts. All sizes are made in spherical as well as bell shaped bulbs. A description of the "Z" lamp factory appeared in our issue of May 13th, 1909.

Aegma Lamps.

The Aegma Lamp is made by the Allgemeine Elektricitäts-Gesselschaft, and is sold in this country by the Electrical Co., Ltd. (122 and 124 Charing Cross Road). The makers were among the first to overcome the difficulties of producing reliable filaments of thin enough diameter to give the required high efficiencies in sizes as low as 16 c.p. at 100 volts, or 25 c.p. at 200 volts, both of them sizes of the utmost importance for replacing carbon lamps in existing installations. The efficiencies are given as 1·1 watts per Hefner candle-power for the low-voltage lamps (20—125 volts), and 1·2 watts per H.c.p. for 200 to 260 volts. A special feature is the mounting of each filament on a copper spring, which is provided to counteract the contraction and expansion of the filament, thus minimising premature failure. The sizes listed range from 5 c.p. at 20–40 volts (a smaller size than usual), to 400 c.p. at 260 volts. A 10-c.p. lamp is made from 40 to 80 volts, a 16-c.p. lamp up to 130 volts, and the useful 25-c.p. size (taking about the same current as the old 8-c.p. carbon lamp) up to 240 volts. Other sizes are 32, 50 c.p., 100, 150, 200, 300, and 400 c.p.; the latter four sizes are supplied in round bulbs only from 100 to 260 volts.

Leuconium Lamps.

The Stearn Electric Lamp Co., Ltd. (47 Victoria Street) were early in the field with a metal filament lamp of English manufacture, to which the name "Leuconium" was given, and some time ago we described the ingenious cluster lamp which they devised for high voltages before single lamps for pressures as high as 200 volts were articles of commerce. Briefly, the idea of the cluster or "Nevaout" system is the provision on each of a number of lamp units in series of a substitutional resistance and automatic cut-in, which comes into action when the filament fails and prevents the whole series being extinguished. There is also the additional advantage that each unit can be small and inexpensive, so that premature failure of one filament does not entail discarding an expensive lamp. In addition to the lamps on this system, the company have made great progress in the manufacture of single high-voltage lamps, and, indeed, their list contains a smaller 200/250 volt lamp than is supplied by any other maker. This is a 16 British c.p. lamp taking 25 watts at 200/220 volts, and costing five shillings. For 230/250 volts the corresponding lamp is rated at 27 watts and 18 British c.p. Other lamps for 200/250 volts are 29 c.p. (40 watts), 45 c.p. (63 watts), and 90 c.p. (120 watts). The 100/120-volt lamps include one as low as 8 c.p.; the full list is as follows :—*100/110 volts*—8 c.p. (12 watts); *112/120 volts*—9·5 c.p. (14 watts; *100/120 volts*– 14 c.p. (15·5 watts), 20 c.p. (22 watts), 29 c.p. (32 watts), 45 c.p. (50 watts), 90 c.p. (100 watts). The low-voltage lamps are as follows :—*25 volts*—8, 12, and 16 c.p.; *40/50 volts*—16, 20, and 25 c.p.; *60/70 volts*—20 to 30 c.p. Twisted flame lamps are made up to 33 volts, as well as miniature carriage lighting and medical lamps.

Cryselco Lamps.

This lamp, which is one of the more recently introduced metal filament lamps of British manufacture, is made at the Cryselco Lamp Co.'s Works at Bedford, from which the well-known carbon lamps of that name have been for some time turned out. We are informed that the following standard sizes can be delivered from stock :—*25 volts*—8 c.p. (11 watts), 10 c.p. (13 watts), 12 c.p. (15 watts), and 16 c.p. (20 watts): *50/60 volts*—8 c.p. (11 watts), 12 c.p. (15 watts), 16 c.p. (20 watts), 25 c.p. (32 watts), and 32 c.p. (40 watts); *100/110 volts*—16 c.p. (20 watts), 25 c.p. (32 watts), 32 c.p. (40 watts), 50 c.p. (65 watts), 100 c.p. (130 watts); *200/250 volts*—25 c.p. (35 watts), 30 c.p. (40 watts), 40 c.p. (55 watts), 50 c.p. (65 watts), 100 c.p. (130 watts), 200 c.p. (260 watts). The bulbs, of course, vary in size, but it may be said that the 100-volt 16-c.p. lamp is 4¾ in. long, and the 200-volt lamps from 25 to 50 c.p. are 5⅞ in. in length. Among special lamps are 12, 16, and 24-volt train lighting lamps of 8, 10, 12, or 16 c.p., in 2 in. by 3 in. bulb. Candle and tubular lamps can also be obtained up to 110 volts. All the above are British candle-powers.

Sunbeam Lamps.

These lamps are manufactured by the Sunbeam Lamp Co., Ltd., at their works at Park Road, Gateshead. The standard sizes are as follows (British c.p.) :—*25 volts*—8/12 c.p. (10/15 watts), 12/16 c.p. (16/20 watts), 20/25 c.p. (25/32 watts); *50/55 volts*—10/12 c.p. (13/15 watts), 12/16 c.p. (16/20 watts), 20/25 c.p. (27/32 watts), 28/32 c.p. (35/40 watts); *60/80 volts*—14/20 c.p. (18/25 watts), 22/25 c.p. (27/32 watts), 28/32 c.p. (35/40 watts); *100/135 volts*—14/20 c.p. (18/25 watts), 23/25 c.p. (28/32 watts), 28/32 c.p. (35/40 watts), 40/50 c.p. (50/63 watts), 80/100 c.p. (100/125 watts), 150/200 c.p. (220/250 watts), 250/300 c.p. (330/375 watts), 350/400 c.p. (450/500 watts); *150/155 volts*—28/32 c.p. (35/40 watts), 40/50 c.p. (50/63 watts); *200/260 volts*—22/25 c.p. (32/35 watts), 32/35 c.p. (40/45 watts), 40/60 c.p. (56/75 watts), 80/100 c.p. (125/140 watts), 150/200 c.p. (220/250 watts), 250/300 c.p. (330/375 watts), 350/400 c.p. (450/500 watts). Candle lamps are also made for 25, 33, and 50 volts up to 16 c.p.

Auriga Lamps.

The lamp known by this name is supplied by the British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester). Among the sizes made, taking only the most usual voltages, are the following :—*25 volts*—9 c.p. [British] (11 watts), 14 c.p. (18 watts), and 22 c.p. (28 watts); *50 volts*—8 c.p. (11 watts), 14 c.p. (18 watts), 18 c.p. (20 watts); *100/110 volts*—14 c.p. (18 watts), 18 c.p. (22·5 watts), 25 c.p. (30 watts), 45 c.p. (55 watts), and 100 c.p. (125 watts); *200/250 volts*—22 c.p. (30 watts), 28 c.p. (40 watts), 45 c.p. (63 watts), 100 c.p. (140 watts). The 100-volt lamps up to 25 c.p. are in pear-shaped bulbs, 120×55 millimetres; a 135×64 mm. bulb is used for the 100-volt 45-c.p. lamp and the two smaller sizes of 200-volt lamp; the 45-c.p. 200-volt lamp is of slightly larger diameter, and the 100-c.p. lamps have round bulbs 160×120 mm. 24-volt lamps, chiefly intended for train lighting, in round bulbs 73×47 mm., are also made for 8 c.p. (10 watts), 10 c.p. (12·5 watts), and 12 c.p. (15 watts).

Metfil Lamps.

The "Royal Ediswan Metfil" lamp is made throughout at the Edison & Swan United Electric Light Co.'s works at Ponders End, Middlesex, where the experience of many years of lamp-making has been brought to bear on overcoming the difficulties of metal filament manufacture and mounting, and a special process has been developed. A very large number of sizes and forms have been standardised, and these are all rated in British candle-powers. For 25 volts six sizes are made, ranging from 8 to 30 c.p., in bulbs 4 in. overall by 2¼ in. diameter. Lamps of moderate c.p. are also listed for 50-55 volts and 60-65 volts. The ordinary 100/120-volt lamps are produced in four sizes, 16 c.p. (21 watts), 25 c.p. (35 watts), 30 c.p. (40 watts), and 50 c.p. (62 watts). These have bulbs 4½ in. long by 2⅜ in. diameter. The smallest 200/250-volt lamp is 30 c.p. (40 watts), in bulbs 5⅞ in. by 2⅜ in., and 40 c.p. (54 watts) and 50 c.p. (68 watts) lamps are also made for these pressures. 100- and 200-c.p. lamps are also made for both high and low voltage. Crinkled, tubular, olive and plain flame lamps are made in various sizes up to 50 volts, and, as has been the case for the last 20 years with carbon lamps, the company are prepared to make any special lamps to order to customers' own requirements. Standard Metfil lamps can now, we are informed, be delivered in practically any quantities from stock.

Digitized by Google

Eclipse Lamps.

This lamp, which is being sold in this country by G. Braulik (8 Lambeth Hill, E.C.), is made by the Felten Guilleaume-Lahmeyerwerke. One of the most interesting features is the method adopted to prevent blackening of the bulbs, in spite of the high efficiency at which the lamps are run (1 watt per Hefner c.p.), by the use of a coating of a compound of phosphorus round the glass centre stem. Another feature is the inclusion in the visible centre of the neck, where the leading-in wires are sealed in, of a packing impregnated with a chemical which changes in colour with the effect of light and forms an index of the number of hours the lamp has been burning. This is of great use to contractors dealing in these lamps, as when a lamp is returned as faulty it can readily be seen whether it has been much used or not. It is important to notice that the bulbs of all the sizes are particularly small for tungsten lamps; the 100-volt 16-c.p. lamp does not exceed the ordinary carbon lamp in size, and even the 32-c.p. 220-volt lamp is not more than 4¾ in. in length, including the cap, or smaller than the 100-volt lamp of several makers. No special shades are therefore required. The list of standard sizes is too long to reproduce, but it may be mentioned that a 16-c.p. lamp is made up to 130 volts and a 30-c.p. lamp up to 250 volts. The voltages of 75, 150, and 175 are standardised in addition to the more ordinary pressure, and no less than 48 sizes of low-voltage lamps are listed from 2 volts 1 c.p. to 16 volts 22 c.p., in addition to 50 sizes between 25 and 75 volts. High candle-power lamps are made in high and low voltages up to 500 c.p., and an interesting feature of these is the grouping of the filaments in two sections, so that failure of one filament only extinguishes half the lamp.

Foster Lamps.

The most recent British-made tungsten filament to make its appearance is that which has just been put on the market by the Foster Arc Lamp & Engineering Co. (Warple Road, Wimbledon, S.W.). These lamps are made from start to finish at the Wimbledon works; the company even blow their own bulbs, and are laying down the most approved plant for manufacturing filaments. At present about 500 lamps a day are being turned out, but the company expect very shortly to manufacture about two million lamps per annum. A considerable stock is already on hand, and we are informed that good delivery can be given, and the company make a special point of being able to supply almost any shape of bulb desired by their customers. An average efficiency of 1·25 watts per British c.p. is given, but it is stated that the low-voltage lamps are more efficient than those of higher voltage. At present the following sizes are listed :— *25 volts*—10, 16, and 25 c.p.; *50/55 volts*—10, 16, 25, and 32 c.p.; *100/135 volts*—16, 25, 32, and 50 c.p.; *200/260 volts*—25, 32, and 50 c.p.

Welsbach Lamps.

A good deal of stir was caused a few months ago by the placing of a metal filament lamp on the market in this country by the Welsbach Incandescent Gas Light Co., Ltd. The lamp in question is made by a Berlin firm of considerable experience, and is at present supplied in the following ordinary sizes : *100/130 volts*—16 Hefner c.p. (17 watts), 25 c.p. (28 watts), 32 c.p. (35 watts), 50 c.p. (55 watts), 100 c.p. (110 watts); *200/250 volts*—32 c.p. (40 watts), 50 c.p. (63 watts), 100 c.p. (110 watts), 200 c.p. (220 watts); 25-volt lamps are also made for 10, 16, and 25 c.p., and 50/55-volt lamps for 12, 16, 25 and 32 c.p.

Simplex Lamps.

The metal filament lamp sold by Simplex Conduits, Ltd. (Charing Cross Road, W.C.), is also a tungsten filament lamp, and has an efficiency given as 1·25 watts per Hefner c.p., or 1·0 watt per British c.p. Test results show an increase of candle-power during the first 200 hours or so, followed by a gradual decrease, but even at the end of 1,000 hours the loss is only about 1/5 c.p., and the mean consumption works out at only slightly over 1·3 watts per c.p. The following sizes are made for ordinary voltages :—*60/130 volts*—16 c.p.; *60/135 volts* and *140/160 volts*—25, 32, 50, and 100 c.p.; *200/260 volts*—25, 32, 40, 50, and 100 c.p. All these are made in pear-shaped bulbs, and some of the larger lamps can also be obtained in round bulbs. 25/45-volt lamps are made from 8 to 25 c.p., and 50/55-volt lamps from 8 to 32 c.p. The c.p. rating is Hefner.

Boddy's "Metalik" Lamps.

A good deal of attention has been drawn to the "Metalik" lamp sold in this country by Messrs. G. M. Boddy & Co. (15 Gray's Inn Road, W.C., and Newington Buildings, Liverpool), by the publication of records of extremely long life under working conditions, the figure in one case having reached over 9,000 hours. The efficiency throughout the range is given as 1·25 watts per (British) c.p., and exceptional toughness is claimed for the filaments. The popular 14 (British) c.p. lamp is made from 60 to 135 volts, and a 22-c.p. lamp from 200 to 260 volts. The full list of sizes (in Hefner c.p.) is as follows : *25/45 volts*—8, 12, 16, and 25 c.p.; *50/55 volts*—8, 16, 25, and 32 c.p.; *60/135 volts*—16, 25, 32, 50, and 100 c.p.; *140/160 volts*—25, 32, and 50 c.p.; *200/260 volts*—25, 32, 50, 100, and 200 c.p. Candle lamps will be on the market shortly.

"M.S." Lamps.

The "M.S." Lamp Co. (74 Melrose Avenue, Cricklewood, N.W.) are one of the few firms who are supplying a lamp as low as 9 (British) c.p. for 100/125 circuits. It should also be noticed that the prices are somewhat lower than the majority of tungsten filament lamps. They also supply the following candle lamps, with S.B.C. or S.E.S. terminals : *25/80 volts*—9 and 14 c.p., and *100/130 volts*—14 and 22 c.p. Another speciality is a miniature pear-shaped lamp (2½ in. long) for *100/125 volts*—25 (Hefner) c.p., with ordinary B.C. cap. Of the ordinary lamps, 15 sizes are standardised between 25 and 80 volts, and in addition to the new 9-c.p. 100/125 volt lamp mentioned above, the following sizes (British c.p.) are made for the usual supply voltages : *80/135 volts*—9 c.p. (12 watts), 14 c.p. (17 watts), 22 c.p. (28 watts), 29 c.p. (35 watts), 45 c.p. (55 watts); *160/260 volts*—22 c.p. (31 watts), 29 c.p. (40 watts), 36 c.p. (50 watts), 45 c.p. (63 watts), 90 c.p. (110 watts). The 9-c.p. lamp has a bulb only 3½ in. long, and the high-voltage bulbs none of them exceed 4½ in. in length. We understand that low-voltage lamps can be delivered in two to three days, and those for the higher voltages in 8 to 10 days.

"Field" Lamps.

One of the latest recruits to the ranks of British-made tungsten filament lamps is the "Field" lamp, by Messrs. Feld Bros. & Co., Ltd. (25 Budge Row, E.C.). An exceptionally elastic filament is claimed, and a specially arranged double frame is provided in the case of high voltages. The efficiency is given as 1·1 watts per H.c.p., and so far the following sizes are standardised : *25 volts*—12, 16, and 25 c.p.; *50 volts*—12, 16, 25, and 50 c.p.; *100/130 volts*—16, 25, 32, and 50 c.p.; and *200/230 volts*—25, 32, 50, and 60 c.p.

Gral Lamps.

It is now some time since the Armorduct Manufacturing Co., Ltd., introduced the Gral tungsten lamp, which was among the first to appear in the lower and more convenient candle powers. With regard to the efficiency of these lamps, the makers have found as a matter of experience that the best results are obtained by proportioning the lamp in such a manner as to secure a consumption of about 1·1 watts per Hefner c.p. for low-voltage, and 1·2 watts for high-voltage after completion. The consumption after a short period, we are informed, is considerably reduced until it approximates 1 watt and 1·1 watts respectively per candle or less. A lamp constructed on this principle is stated to possess a very much longer life than a lamp in the construction of which 1 watt per candle is aimed at in the first place. The 100/130-volt lamps vary from 16 to 600 c.p., and lamps from 32 to 600 c.p. are made for 200/260 volts. The bulb of the 200-volt 32-c.p. pear-shaped lamp is 6 in. long, including the cap. Round bulbs are also made. 25- to 80-volt lamps are also made with pear-shaped or round bulbs, as well as in the plain or tungsten flame or tubular styles with small (S.B.C.) caps. Some of these may be found convenient for converting existing multiple candle fittings by wiring them for series.

"E.O.A." Lamps.

A lamp known as the E.O.A. metal filament lamp is supplied by the Electric & Ordnance Accessories Co., Ltd. (Cheston Road, Aston, Birmingham). An efficiency of 1·1 watts per c.p. is claimed, and the following are the sizes at present listed :— *25/45 volts*—8, 10, 12, 16, and 25 c.p.; *50/55 volts*—8, 10, 12, 16, 25, and 32 c.p.; *60/135 volts*—16, 25, 32, 50, and 100 c.p.; *140/160 volts and 200/260 volts*—25, 32, 50, and 100 c.p. Special as well as pear-shaped bulbs are made in the larger sizes.

"Metallum" Lamps.

The "Metallum" lamp is supplied by the Brush Electrical Engineering Co., Ltd. (Supplies Department, 106-112 Belvedere Road, Lambeth, S.E.). It has a tungsten filament made by the colloid process, and is somewhat different in appearance from the majority of makes of tungsten lamp, owing to the way the filaments are mounted at an angle with intermediate supports. In addition to a number of sizes for voltages from 20 to 80, the following are those standardised for the usual supply voltages : *100/110 volts*—14½ c.p. (British) (24 watts), 21 c.p. (30 watts), 25 c.p. (33 watts), 36 c.p. (45 watts), and 72 c.p. (90 watts); *200/250 volts*—29/36 c.p. (48/60 watts), 36/54 c.p. (60/78 watts), 72/90 c.p. (105/110 watts); *240/250 volts*—29 c.p. (48 watts). Lamps are also made for 150/155 volts. The smaller 100-volt pear-shaped bulbs are 5⅛ in. overall by 2⅜ in. diameter, and the 200/250-volt lamps vary from 6 to 6¾ in. in length. We are informed that all the standard sizes can be delivered from stock, and that any possible sort of special lamps can be made to customers' requirements.

The National Lamp.

A recently introduced metal filament of which we have been sent a sample is that supplied by the National Lighting Corporation, Ltd. (Saracen House, Cock Lane, Snow Hill, E.C.). A 16-c.p. lamp is supplied from 60 to 130 volts, in addition to those of 25, 32, 50, and 100 c.p. The 200/260-volt sizes range from 25 to 100 c.p., and sizes are also standardised for 25, 45, 50, 55, and 140/160 volts.

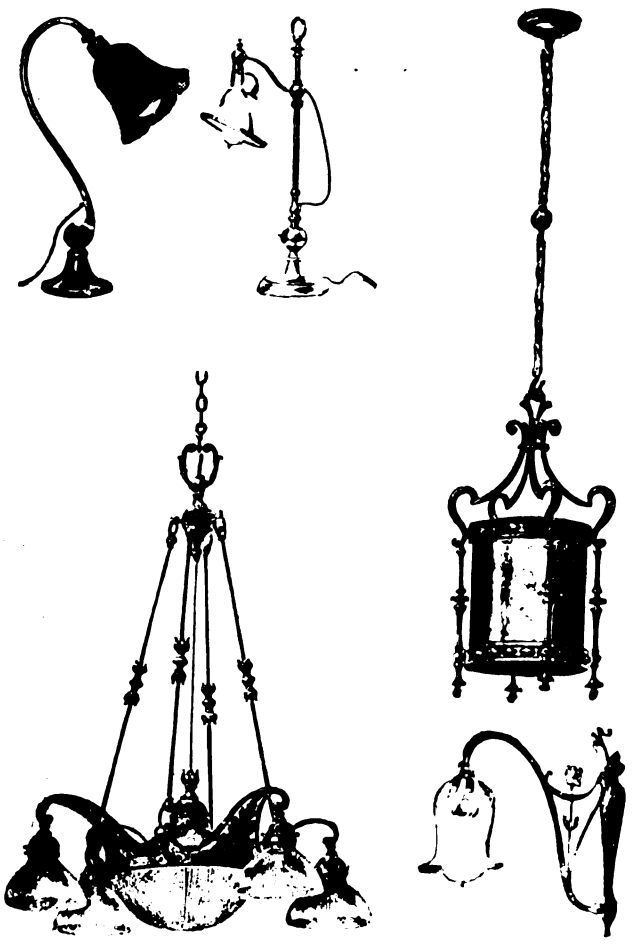
Another firm who has sent us particulars of metal filament lamps is the Omega Electric Lamp Co., Ltd. (Elysium Street, Fulham). The 100/120-volt sizes range from 14 c.p. (17 watts) to 50 c.p. (63 watts), and for the 200/250 volts the sizes are 22 c.p. (32 watts), 27 c.p. (40 watts), and 43 c.p. (63 watts); 25- and 50-volt lamps are also made. Any special sizes and shapes will be made to order up to 120 volts.

Messrs. J. L. Cateaux & Co. (10 Bush Lane, E.C.) have sent us particulars of the "Rugby" British-made metal filament lamp, for which they are selling agents. These are made in various sizes within the following limits:—*25 volts*—6 c.p. (7·5 watts) to 20 c.p. (25 watts); *50 volts*—12 c.p. (15 watts) to 32 c.p. (40 watts); *100/100 volts*—14 c.p. (17 watts) to 80 c.p. (100 watts); *200/250 volts*—25 c.p. (35 watts) to 200 c.p. (260 watts). Spherical as well as oblong bulbs can be supplied for any of these sizes. Candle lamps with S.B.C. caps are also made for any voltage up to 110 volts for any c.p. up to 16. The candle-power ratings are British.

NEW ELECTRICAL SUPPLIES AND ACCESSORIES

DURING the present increased activity in installation work, electric light contractors, and also consulting engineers and architects, are suffering from the need of a systematic record of the new designs of lamps, fittings, and various accessories which are being placed on the market. The lists and leaflets which they receive direct from the makers are not always kept, and are very seldom systematically filed and indexed, and a demand has arisen for something more complete and in a more collected form than the notes and short articles that appear in the various electrical papers (including our own) from time to time. To meet this want, Electrical Engineering is publishing on the second Thursday of every month a descriptive review of the new patterns, designs, and sizes of lamps, holders, switches, fittings, and other accessories, heating and cooking apparatus, bells, telephones, &c., which have been put on the market during the previous month, giving the names and addresses of the firms selling them and any other indications that will assist the buyers.

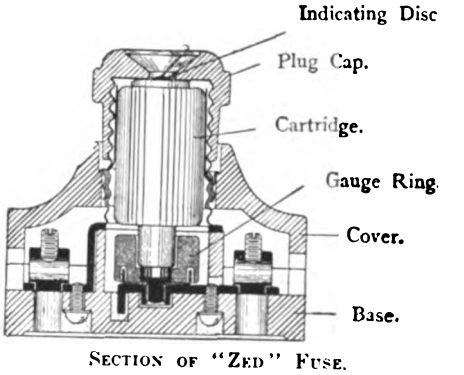


We shall be grateful if manufacturers and suppliers will help us by sending us all their new lists and leaflets as soon as published, and by keeping us very fully informed of any novelties they are bringing out as soon as they are on the market.

Incandescent Lamps.

A special article on another page deals with the subject of metallic filament lamps, and gives particulars of the leading lamps of this class, mentioning several new developments.

Fittings, Switches, and Accessories.



Messrs. Siemens Brothers' Dynamo Works, Ltd. (Incandescent lamp and fittings department) have of late turned an increasing amount of attention to fittings,

Some New Fittings Specially Designed for Tantalum Lamps.

particularly, of course, those adapted to tantalum lamps. Their "majolica," and "solar" fittings and "tantalum arc" clusters with holophane glassware, are now well known amongst other fittings for interior and exterior use. We have before us, however, particulars of an extensive range of entirely new designs, and are able to illustrate a few examples. We would draw particular attention to the large electrolier, using a central holophane bowl in conjunction with four holophane reflector shades, and giving a remarkably good distribution of light, free from glare. The firm also supplies numerous designs of artistic hall lanterns in antique brass, oxidised silver, or oxidised copper finish at very favourable prices. We also illustrate a special table or desk standard, provided with a swivel arrangement, in which three stops are arranged, so that the lamp may be adjusted at various angles. This is supplied in polished brass finish, and has the advantages of being cheap and easily fixed. A special adjustable desk standard supplied with opal shade is also shown. This can be obtained with a sliding bracket arm for adjusting the height of the lamp, whilst the shade and bracket arm can also be moved or adjusted at will. We think that this particular style of fitting should appeal to all who are interested in office lighting of the most up-to-date style. Numerous designs of water-tight fittings and protected hand lamps, fulfilling B.O.T. regulations, are also produced in great variety, and a number of designs of outside weather-proof lanterns are stocked.

The Siemens firms have had considerable experience with the non-interchangeable "cartridge" type of fuse, and some interest attaches to the latest form which these take, under the name of the "Zed" fuse system. The general arrangement of a typical fuse is shown in the accompanying section. A

Section of "Zed" Fuse.

special feature of the cartridges, apart from their solidity and sound construction, is the indicating device. The top of each cartridge is fitted with a small coloured metal disc or button which is clearly visible through the glass window of the plug cap when the cartridge is mounted in its fitting. When the fuse blows, a wire which holds the coloured disc in place is fused, and a small spiral spring displaces the disc, so that the position of the disc at once shows whether the cartridge is intact or has fused. To insert a new cartridge, the plug cap with the old cartridge is unscrewed, the cartridge withdrawn and the new one inserted, and the plug cap again screwed into place. Only the cartridge has to be renewed, the plug cap lasting indefinitely. Non-interchangeability of the cartridges is

Digitized by Google

obtained by making the lower contact stud of varying diameter according to the current capacity, and providing the base of the fuse fitting with a gauge ring having a central hole of corresponding diameter into which the stud must fit. The colour of the gauge ring is different according to the current, and is the same as that of the indicating disc in the corresponding size of cartridge, so that the correct cartridge for any fitting is easily ascertained by noticing the colour of the gauge ring. The cartridges are constructed to blow with a continuous overload of about 80 per cent. in the case of the smallest size, decreasing to 45 per cent. for the 60-ampere cartridge. On a dead short, the cartridge will break the circuit instantly and without any danger of a permanent arc being established. A number of new forms of distribution board embodying these fuses have been standardised, and those desiring further particulars should write for list No. 6E.

into two groups with two switches; the third terminal in Fig. 3 is for this purpose. The saving in labour over the ordinary methods with ball fittings is manifest. Fig. 4 shows one of these wireless clusters fitted with "Sun Tantalum" lamps, Holophane reflectors, and an opal reflector shade at the top.

On the occasion of our visit to Mr. Trippe's showrooms we saw some other extremely ingenious fittings. In the case of ordinary ball fittings, it is not possible to remove the shade or reflector, if one shade is used covering the group of lamps, unless the "flex" is first disconnected from the ceiling rose. This is obviated in one type of cluster fitting with a large opal reflector, which is clamped by a split ring that can be easily unfastened, and the reflector can then be drawn down over the fitting when the lamps are taken out. Another useful device was an arrangement for group switching by means of a switch within the

FIG. 1.—ORDINARY BALL FITTING WIRED.

FIG. 2.—BENJAMIN "WIRELESS CLUSTER," OPEN.

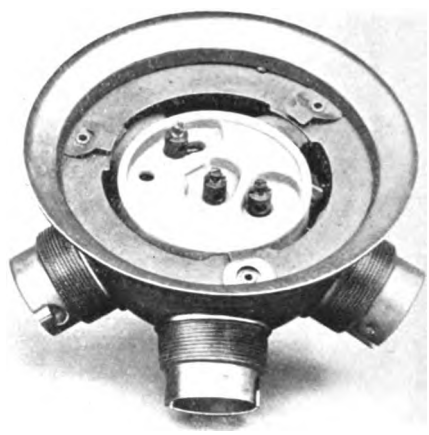


FIG. 3.—BENJAMIN "WIRELESS CLUSTER," WITH PORCELAIN TERMINAL BLOCK.

Although the Benjamin "Wireless" Cluster has been on the market for some time, there are many wiring contractors who have not realised its advantages. We have, therefore, prepared the illustration above from samples lent us by Mr. C. F. TRIPPE (36 Brooke Street, Holborn). Fig. 1 is an ordinary 5-lamp ball fitting wired with "flex"; Fig. 2 is a 6-lamp cluster fitting opened to show the solid connection pieces inside; and Fig. 3 is a cluster fitting of the same size which embodies the very latest improvement, viz., a porcelain terminal block fixed above the strip

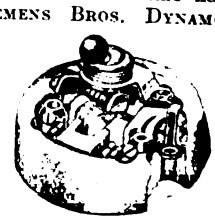

FIG. 4.—A BENJAMIN CLUSTER FITTING COMPLETE.

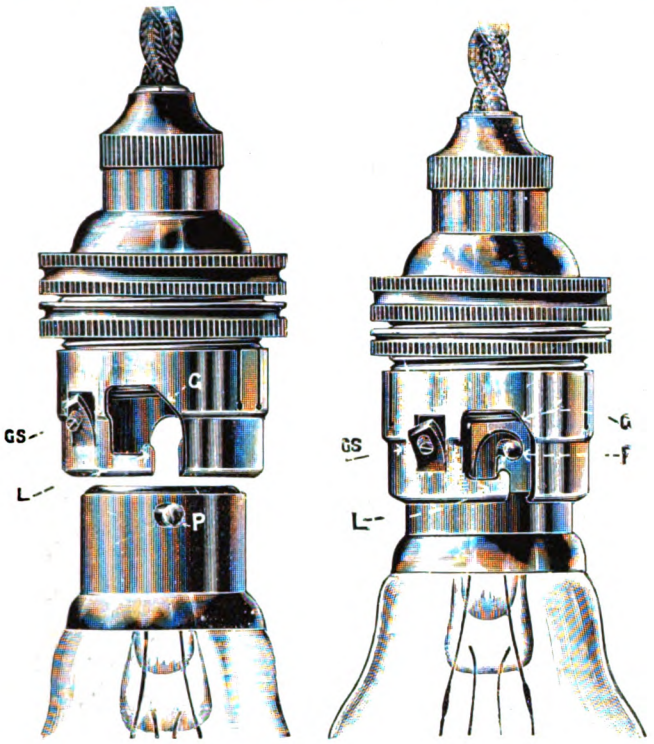
connections, so that the wireman has nothing to do but to connect the wires to the terminals. The connections in the so-called wireless cluster can be arranged so that all the lamps can be connected on one switch, or so that they can be divided

canopy, or the fitting itself, worked by a cord. In the fitting shown us there were three different ways in addition to the off position.

A device which has been much wanted for some time has just been introduced by Messrs. SIEMENS BROS. DYNAMO WORKS, Ltd. (Caxton House, Westminster), in the shape of the earthing attachment for switches of the tumbler type, shown in the accompanying illustration. By means of the copper strip held under a nut to the bridge piece carrying the handle and cover, the whole of the non-current-carrying parts can be earthed through one of the holding-down screws through the base to the conduit system, and all possibility of shock is avoided. Attention may also be drawn to the excellence of the switch itself, which we have found from inspection of a sample to be very easy in action, owing to the way the contact arm is interlocked with the handle.

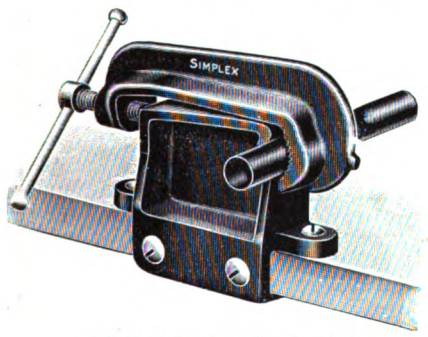


SIEMENS TUMBLER SWITCH WITH EARTHING DEVICE.

With the increasing use of expensive metal filament lamps, a greater need arises for a form of locking lampholder, from which lamps cannot be easily abstracted. A device designed for this purpose, which has just been put on the market by Messrs. W. SANDERS & Co. (Falcon Electrical Works, Wednesbury) is shown in the illustration opposite. The apparatus is screwed on the lampholder in the position shown at *A*, so that the lip *L* is near the bottom of the holder slot, and so that slots in lamp-lock, and in holder, coincide. The lamp is inserted and turned round in the ordinary way, when the pin *P* will bear against the inclined side *G* of lamplock slot, and carry the lamplock round into position as shown *C*. If it is required to prevent the lamp from being removed, the grub screw *GS* is turned until it engages the lampholder. The lamp cannot be removed while the lamplock is in the position B, but the lamp may be switched off by dropping the lamp, with its pins resting on the lip of lamplock, where it will hang on its pins in perfect safety. It will be noted that owing to the width of slit in the lamplock, the latter is not moved back into position *A* in attempting to remove the lamp. To remove the lamp, the-

Digitized by Google

lamplock must be turned by hand from the position *C* to *B*, after releasing the grub screw *GS*. It will be noticed that the lamplock may be used to convert any standard shade carrier holder into a "switch-holder," and persons who do not mind turning a lamp in its socket will no doubt use it for this



A B

Messrs. Sanders Bros.' Lamplock.

purpose. There are many cases where lamps are now removed from sockets (spoiling the appearance of fittings, and exposing the lamp to risk of breakage, or loss while lying about) to save them from being switched on when wired up with others on a switch; and in these, and many other cases, this lamplock will find a secondary use.

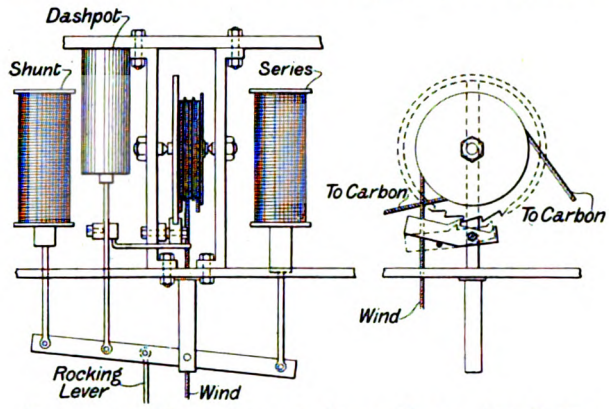
Simplex Conduits, Ltd. (113-117 Charing Cross Road, London, W.C.), have sent us some interesting notes with regard to the screwing of conduits. When there is trouble in threading conduit, the contractor is apt to blame the manufacturer, although frequently the wireman's tools or his methods are at fault, contributed to, perhaps, by the fact that screwing a tube in a proper manner is not such a simple operation as would

A Cheap and Simple Vice.

at first appear to be the case. A properly constructed vice is one of the first essentials, and there is no excuse for using a makeshift arrangement where a simple portable vice of the pattern illustrated, which can be readily attached to any workbench by means of four screws, and may be adjusted to take in all sizes of conduit, can, we understand, actually be bought for 3s. In the case of new dies and taps, plenty of oil should be used, and it should be applied where the cutting edges of the die are in contact with the conduit, and care should be taken to see that the oil gets well down into the threads. This will obviate small pieces of metal lodging inside the threads and causing the die to cut imperfectly, by tearing the threads on the tube when screwing back. In addition to this, before placing the die in the stock, any dirt or loose pieces of metal which may be in the die, and the inside of the stock should be removed, so that there is no chance of the die being thrown out of truth. It is further recommended that the tube be occasionally oiled (by means of a squirt oilcan, applying the oil through the die). If the die be screwed back one or two turns after every three or four turns in the cutting direction, it will assist in getting a clean thread on the tube. In the case of inferior welded tube, the saving in the first cost of the tube is more than lost by the difficulty in screwing, for it is practically impossible to form a clean thread over a bad weld without damaging the tackle.

A convenient form of iron-clad switchbox is one of the novelties included in the new catalogue (No. 95) of fuses, switchgear, accessories, fittings, &c., just issued by Messrs.

"Easy Wiring" Iron-clad Switch, Messrs. Dorman & Smith.



Dorman & Smith, Ordsall Electrical Works, Salford, Manchester. The switch is arranged with bevelled faces to couple to the inlets, so that it can be easily removed without disturbing the pipes or wires. Wiring is also much facilitated. The whole catalogue is well arranged and illustrated, comprises some 225 pages, and covers extensive standard lines of Messrs. Dorman & Smith's well-known "damper" and other fuses, switches, circuit-breakers and fittings. Further novelties include a range of sockets and plugs, hand lamps, &c., designed and made in accordance with the latest regulations and recommendations of the Home Office. Another new line which should be mentioned is the "L" series of patent "easy-wiring" mill and other fittings. In order to facilitate wiring the usual fittings, this line of fittings should be welcome to contractors and users generally, inasmuch as it has been designed with the object of facilitating wiring up, this result being attained by the usual lampholder nipple being dispensed with, the wires having a straight run through from the tube into the lampholder insulator, thereby eliminating dangerous bends in the insulated wires. All the various types of mill and other fittings are stocked of suitable size for metallic filament lamps. The fittings section also includes a line of porcelain body fittings, suitable for use in dye works, chemical works, laundries, &c. A new series of brass ships' fittings, possessing the same advantages as to easy wiring as the "L" series of iron fittings mentioned above, is also shown.

One of the new catalogues issued during last month dealing with installation material is a price list of plugs, wall sockets, branch blocks, and ceiling roses, issued by the Adnil Electrical Co., Ltd. (26-30 Artillery Lane, Bishopsgate Street Without, E.C.). Among the very numerous patterns of plugs and sockets listed, attention may be drawn to the conveniently arranged flush floor sockets, with doors that close flush even when the plug is inserted, as the double doors are shaped to allow the flexible wire to pass out between them. Watertight sockets are also dealt with, and other features of the list are adaptors, including some combinations not frequently found, and branch blocks for open wiring.

Arc Lamps.

THE ABBEY ELECTRIC CO. (17 Victoria Street, London, S.W.) have recently improved their flame arc lamp. The feeding mechanism is illustrated in the accompanying sketch, and comprises one large single ratchet wheel and a double-toothed pawl, or click, controlled by the solenoids. This pawl is rocked backwards and forwards by the rocking lever of the lamp, either by the shunt or series coil, as the case may be. There is now also added a small auxiliary coil, connected in parallel with the shunt coil. This device, which can be seen in the general view, acts automatically in connection with a carbon switch. Thus,

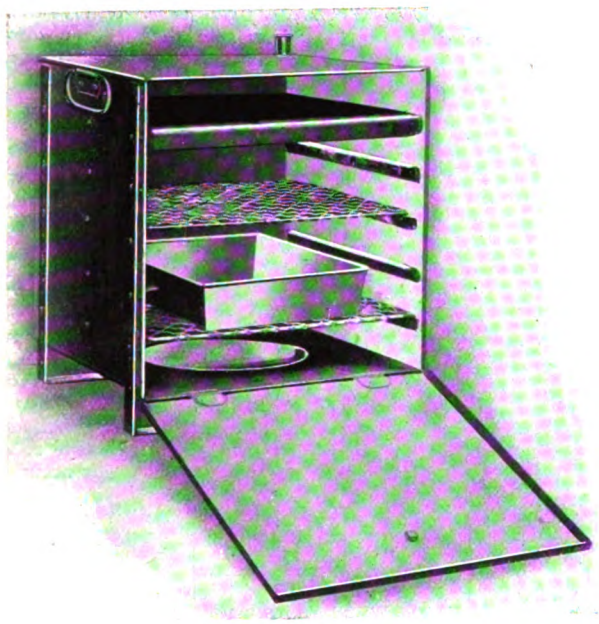
SKETCH OF MECHANISM OF ABBEY FLAME ARC LAMP.

GENERAL VIEW OF INTERNAL PARTS OF ABBEY FLAME ARC LAMP.

if the lamp is carelessly trimmed and the carbons are placed too high in the economiser, then it will require more than the drop of one tooth of the ratchet wheel to make the arc strike. When the current is switched on, the shunt coil pulls up its end of the lever, and brings the tips of the carbons together, at the same time allowing them to drop one tooth. If, however, the carbons have been set too high, the end of the stroke will have been reached before the carbon points come into contact. In this case a carbon switch closes just at the end of the stroke, and completes a circuit through the small auxiliary coil referred to above. This coil has a loose plunger with a carbon contact at the end, which rests on another contact through which the current to the shunt coil flows; when the auxiliary coil is energised it immediately breaks the circuit through the shunt coil, and so allows the rocking lever of the lamp to drop again. As soon as this happens, however, the auxiliary coil ceases to be active; hence the plunger drops on to its contact again and once more completes the circuit through the shunt coil, and consequently again draws up the rocking lever of the lamp, thus allowing the carbons to drop one more tooth and so strike the arc. This apparatus works so quickly that it is not noticeable when switching on the lamp, even if the carbons are trimmed *three* teeth too high, and it is most valuable when a number of lamps are burning in series, in which case the carbons may not all start quite even after switching off the day before. To give an idea of how this automatic cut-out works, we may say that if current is switched on to the lamp without any carbons in, and the carbon holders pulled up to the top of the slide rods, they will continue to come down tooth by tooth until they have reached the bottom, or the end of the run, when the shunt coil is automatically switched out of the circuit, and remains so until the lamp is retrimmed. This apparatus is not brought into action at all when the lamp is burning and feeding in the ordinary way, as the stroke of the lever does not go quite far enough to close the carbon switch if the arc is already struck. It has also now been made quite impossible for the carbon points to come below the bottom rim of the economiser, which is made rather deep. Thus a steady arc is assured, and the life of the carbons is appreciably lengthened. The lamp is made in two sizes, which burn 16 in. or 24 in. carbons, and owing to the facts stated above, these last for a minimum of 12 or 20 hours respectively with a continuous run.

A new illustrated catalogue which has just been issued by ARC LAMPS, LTD. (Sphere Engineering Works, St. Albans, Herts), describes the Davy "Sunrae" flame lamps, and several patterns of the Davy patent shuntless enclosed lamps. In the former lamp, there are four converging carbons, and the two carbons of like sign are adjacent and support each other by being in contact at the ends where the arc is struck. Current is supplied near the burning ends through nozzles through which the carbons pass, and feeding is accomplished by gravity without any mechanism. Striking and regulating is effected by a rocking lever controlled by a series coil; a spiral spring takes the place of the usual shunt coil. A long-burning pattern with a length overall of 41 in. burns 35 hours, and requires 50 volts per lamp for series running. A 33 in. lamp gives from 18 to 20 burning hours, and a 24 in. lamp from 10 to 12 hours. These lamps are suitable for both A.-C. and D.-C. circuits. Among the enclosed type lamps is a line taking from 5 to 10 amps. on A.-C. circuits at from 90 to 100 volts per lamp; there is also a group of D.-C. lamps for from 3 to 10 amps. at the same pressure. A twin-carbon lamp for running singly on 200 to 250 volt circuits takes from $2\frac{1}{2}$ to 3 amps. in its D.-C. form, and from $3\frac{1}{2}$ to 4 amps. in its A.-C. form. A miniature D.-C. pattern, called the "Mite" enclosed lamp, only 18 in. long, runs singly on 100 to 125 volt circuits or two in series on 200 to 250 volt circuits. This lamp gives from 250 to 300 c.p. at $1\frac{1}{2}$ to 2 amps., and as in the case of all the other lamps, has no shunt coil to give trouble. Many other patterns are described in the list, which also includes full instructions for adjusting and working the lamps.

The latest design of the FOSTER ARC LAMP & ENGINEERING Co. (Worple Road, Wimbledon, London, S.W.) is known as the Foster "Q" type flame arc lamp, and is of particular interest on account of the peculiar form of moulded multiple carbon that is employed. An illustrated description of this lamp appeared in ELECTRICAL ENGINEERING, Jan. 6th, 1910, page 3. With a four-carbon electrode, a lamp of this type, 40 in. in length overall, gives from 40 to 50 burning hours; a double-carbon lamp gives from 25 to 30 hours. The lamp is suitable for both A.C. and D.C. circuits. Feeding and striking is effected by an improved form of brake mechanism, and, contrary to the usual practice in flame lamps of the converging carbon pattern, striking is performed by an upward movement of the electrodes.



We understand that the well-known "Victor" D.C. lamps manufactured by THE ELECTRIC & ORDNANCE ACCESSORIES CO., LTD. (Cheston Road, Aston, Birmingham), have undergone only very slight constructional changes during the past year, the lamps having given entire satisfaction. A new catalogue has been issued, however, and a few slight improvements in design and reductions in price are noticeable. The distinguishing feature of the "Victor" lamps is the magnetic clutch which is employed to grip the positive carbon and to strike the arc; in the case of enclosed lamps, this is the only moving part,

Digitized by Google

and as all clockwork and other mechanisms are dispensed with, a very solid and simple construction is obtained. A "D.E." type lamp of this pattern has 70 to 90 burning hours, and the designs illustrated include a number of special lamps for shop lighting, and for the lighting of ships' decks. The miniature lamps include both indoor and outdoor patterns for use in place of high candle-power incandescent lamps; the former is fitted with a porcelain adapter, to which connection is made by means of a plug. These lamps are standardised in two sizes, 1½ amp. and 2½ amps., and take 100 volts per lamp. From 25 to 35 burning hours are obtained. The "Victor" D.C. flame arc lamp is made on a similar principle to the enclosed lamps, but both the converging carbons are provided with magnetic clutches. Current is led in to the carbons at the clutches near the burning ends, and so metal cored carbons are not required. Special features of this lamp are the short overall length of 30 in., and the fact that the case does not have to be removed to renew the carbons. The burning hours are from 16 to 18. A large number of accessories, including some reflectors for shop lighting, are also listed.

Heating and Cooking Apparatus.

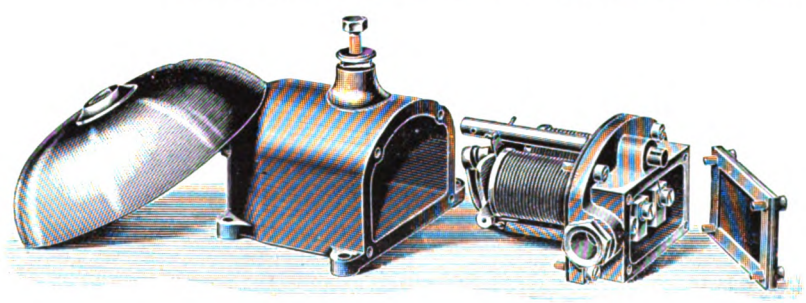
The "Tricity" cooker of the Berry Construction Co. (Charing Cross House, Charing Cross Road, W.C.), which is

"Tricity" Oven.

"Tricity" Oven on Stove.

distinguished from all other systems in having no resistances or connections on the actual cooking utensil, but effecting the heating partly by induced currents in the metal of the utensils themselves, and partly by conduction from a hot plate heated mainly in this manner has been well known for some time, but considerable extensions in its applications are now being made. The latest attachment to be introduced is an oven, which fits on to the top of the stove, as shown in the accompanying figures. This, when placed on a cooker already hot, attains a working temperature of 300° F. in five to seven minutes. Several other new utensils have also been brought out, and the company are now offering a complete cooking outfit comprising the following articles at the low price of £7 15s.: Electric stove, oven, 5-pint kettle, 2½-pint kettle, 6-pint saucepan, 3½-pint saucepan, steamer grill, grease pan, toaster, 4½-pint china casserole, 2½-pint china milk boiler, 1½-pint china saucepan, 9-in. china frying-pan, clothes guard, 5-lb. flat iron, and iron stand. It must, of course, be remembered that the system is only applicable to alternating currents, as the stove depends on the transformer principle for its action.

Several recently introduced new patterns of radiators are included in a catalogue from the British Prometheus Co., Ltd. (Salop Street Works, Highgate, Birmingham). Among them may be particularly noticed a cleverly contrived imitation log fire fitted with Prometheus convector elements, illuminated in such a manner as to give a highly artistic effect. Another feature of the list is the description of bead screens for use with lamp radiators, which increase the convection effect, and shield unpleasant glare.



Simplex Conduits, Ltd., who are sole selling agents for "Prometheus" heating and cooking apparatus for the South of England, are selling the combined lamp carrier and adaptor illustrated herewith, an important application of which is in connection with electric irons. These, it may be mentioned, are one of the few pieces of electric heating apparatus which the ordinary householder can, without misgivings, connect to his lighting circuit when a special power circuit and meter are not installed, for they are used only for short periods at a time, and the number of units consumed are, therefore, comparatively unimportant. There is a danger, however, with electric irons that they may be left on circuit when not in use, and not only waste electrical energy, but also give rise to fire risk, for before the heating element breaks down, a high enough temperature may have been reached to ignite the ironing cloth if the iron has been left standing on it. The adaptor shown is wired for this purpose with the lamp in parallel with the iron circuit, and the lamp thus acts as a pilot lamp, and calls attention to the fact that the iron is still in circuit.

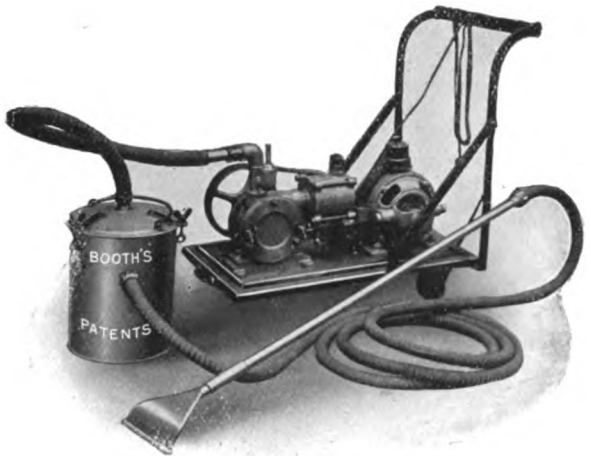
Pilot Lamp Adaptor.

Electric Bells.

A new waterproof bell which has been introduced by the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.), is shown in the accompanying illustration. An inspection of an actual sample shows that the whole is a solidly made piece

Plunger Type Waterproof Electric Bell. (Sun Electrical Co.)

of apparatus, much more substantial than the usual design. The striking plunger, which is worked by the armature, passes through a hole in a special boss in the case, and is protected by being under the gong, so that the entrance of water is not likely, although it is not packed in any way. The bell, however, is naturally not intended to be used submerged. Renewable carbon contacts are used instead of platinum, and an ingenious arrangement permits of their adjustment from the outside of the case. All the joints in the case are rubber packed,



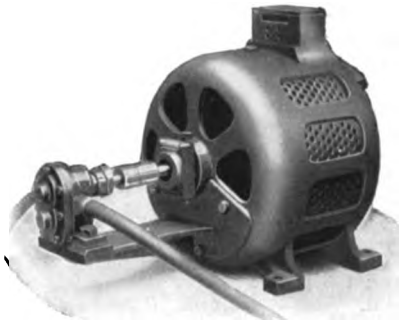
Digitized by Google

and the leads enter an enclosed terminal compartment through a gland. Three wires are brought out, so that the bell can be used either as a single stroke or trembler bell.

The FOSTER ARC LAMP AND ENGINEERING CO. have called our attention to their special transformer for bell ringing from alternating current supply circuits, which obviates the use of batteries. The standard bell transformer is only 3½ inches in length, and weighs 2½ lbs., and steps down to 6 or 8 volts.

Miscellaneous.

In view of their extensive experience with vacuum cleaning in all its branches, the new portable electrically driven outfits of the BRITISH VACUUM CLEANER CO., LTD. (Parsons Green Lanes, S.W.), are of considerable interest. The very smallest machines act on the bellows principle, but in all the moderate and larger size outfits a rotary vacuum pump is used. The type shown in the illustration, which is known as model R, has a ½-h.p.



BRITISH VACUUM CLEANER CO.'S "MODEL R" PORTABLE ELECTRICALLY DRIVEN OUTFIT.

motor, and a belt-driven rotary pump of very simple construction, mounted on an easily-moved trolley, and the dust collector separate. The pump runs at 650 r.p.m., and a working vacuum of 15 to 18 in. is produced. The complete equipment only weighs 120 lbs. The whole is covered with a mahogany cover, which need not be removed when the machine is running, and noise is reduced to a minimum. Large fixed outfits are also made.

An interesting apparatus is the "Arnold" portable suction cleaner, which is being placed on the market by MESSRS. DRAKE & GORHAM, LTD. (66 Victoria Street, Westminster, London, S.W.). This comprises a small centrifugal blower, to the inlet of which is attached the fan-shaped mouth or suction nozzle. The blower is driven by a small high-speed motor. Nozzle, blower, and motor are built up together in a compact form, and are attached to the end of a pole, the whole having the appearance of an awkward-looking broom, and weighing only 10 lbs. Fitted over the exhaust pipe of the blower is the neck of a large cloth bag, the opposite end of which is attached to the pole. The dust is drawn up with the air by the blower, and the bag, which is always distended, allows the air to be blown through it, but acts as a filter and retains the dust. A 30-ft. braided cable connects the motor to the wall-plug, or adapter, and there is a switch on the motor case. The apparatus can be obtained with motors for any pressures from 100 to 250 volts, and the 200-volt pattern takes only 0·5 amp., or 100 watts. Thus, with a power rate of 2d. per unit, the cost of working would be only ⅕d. per hour, and only ⅗d. per hour if run off the lighting circuit with a rate of 5d. per unit. An important feature is the provision of a small vibrating brush in the nozzle, which agitates the fibres of the rug or carpet and loosens the dust or dirt. This brush is reciprocated with a ¼-in. stroke at a speed of some 10,000 strokes per minute by the motor. The list price of this cleaner is ten guineas.

We give herewith an illustration of a small direct-coupled electrically driven pump, which is being introduced by MESSRS. POOLEY & AUSTIN (25 Victoria Street). There are a number of purposes in connection with private house and other installations where pumps of this class are likely to prove useful. They are made in sizes from 100 gallons per hour up to 3,000, and are entirely self-contained, as they require no extra bedplate. In the illustration an alternating-current motor

DIRECT-DRIVEN ROTARY PUMP. (MESSRS. POOLEY & AUSTIN.)

is shown, but, of course, a similar arrangement can be adopted for a continuous-current motor.

A new list of advertising signs and flashers has just been issued by the SUN ELECTRICAL CO. An ingenious novelty is the "Singlelite" sign, in which one lamp is used in conjunction with suitable shades and reflectors, to illuminate a circle of gilt letters in an openwork frame. Nothing but the letters catch the light, so that they appear to float in space, giving a brilliant effect, especially when placed against a dark background. Very numerous ordinary glass front signs are also included, as well as ornamental window signs, which also take part in the illumination of the window itself. Another novelty is the "mirrorgraph" sign in which the device is only visible when the light is on, the surface having at other times a surface as of an ordinary mirror. There are also several cleverly arranged small signs for counters, windows, and small notices, including collapsible folding signs, and such accessories as thermal and motor-driven flashers and time switches are dealt with.

Our attention has been called to a portable accumulator lamp, specially designed for police purposes, which MESSRS. L. E. WILSON (20 Cross Street, Manchester) have introduced. The complete lamp measures 5½ in. by 2¾ in., and weighs 29 ozs. The case is serviceable and highly lacquered, fitted with a belt attachment, and there is a detachable bull's eye reflector, together with a strong and convenient switch. The accumulator has a capacity of 4 ampere-hours, and one charge will maintain a brilliant light for 8 to 10 hours. The glow lamp is of the metal-filament type, and gives a brilliant white light.

Rail Planing Machine.—H.M. Trade Commissioner for Australia reports, says the *Board of Trade Journal*, that representatives of an Australian company owning and working a patent for a rail planer machine for the treatment of railway and tramway rails on the track, without removal, are coming to England for the purpose of having a machine constructed for demonstration purposes. They intend then to make arrangements for the construction of machines in the United Kingdom, and for contracting for the use of the machine on railway and tramway systems. The machine is driven by petrol, and costs about £2,000 to construct in Australia. It is working successfully on the Melbourne tramways. The names and addresses of the representatives may be obtained by British firms interested on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

Annual Return of Tramway Capital and Traffic for 1908-9.—A Board of Trade return dealing with tramways and light railways in 1908-9, shows that since the year 1878 the route length of line open for traffic has increased from 269 miles to 2,526 miles; the capital expenditure from £4,207,350 to £71,023,239; the number of passengers carried from 146 millions to 2,660 millions; and the net receipts from £230,956 to £4,595,779. The number of passengers carried in the year is equal to about 60 times the estimated population of the United Kingdom. Of the total of 1,680 miles of line owned by local authorities 1,490 miles are worked by those authorities themselves, and the remaining 190 miles by leasing companies. Last year the route mileage open of electric line was 2,286 miles out of a total of 2,464; this year it is 2,360 miles out of 2,526. Of the 298 undertakings, 176 belong to local authorities and 122 to companies or other parties. The net receipts of local authorities who work tramway undertakings belonging to them or leased from other local authorities amounted to £3,268,514 on the year's traffic, out of which they have applied £964,010 towards the reduction of tramway debt and £280,225 in relief of rates, while carrying £680,202 to reserve and renewal funds. In the cases of four local authorities and four companies, the returns show an excess of working expenditure over gross receipts.

Digitized by Google

LIGHTING AND POWER IN A LARGE DRAPERY STORES

THE electrical installation in the new building of Messrs. D. H. Evans & Co., Ltd., of Oxford Street, London, which has been carried out by Messrs. Duncan Watson & Co. (102 Charing Cross Road, W.C.), contains several features of interest. Current is supplied from the 480-volt direct-current three-wire system of the Marylebone Borough Council Electricity Department, and to ensure continuity of supply there are three services; two of these are 0·3 sq. in. cable taken directly from two separate feeder pillars, and one is a 0·25 sq. in. cable from the street lighting distribution network. These three cables are brought to a common set of bus-bars. The three sections of the neutral bus-bar are connected by copper links, but the three sections of each of the outer bars are separated by isolating fuses. These bars are arranged as in a street pillar, and are erected on an angle-iron framework in a locked compartment. From this set of bars two sets of cables are taken off through fuses on the outers to the main switchboard. One set is for the power supply and the basement lighting, and the other is for the main lighting. Should a fault occur on any one of the three service cables, the isolating fuses will blow, and at least one of the sets of cables running to the main board will remain alive.

The main switchboard is 25 ft. long by 7 ft. high. The switches and fuses for the lighting, and 240-volt power circuits on the two sides of the system are arranged respectively at the two ends of the board, and in the centre are the 480-volt power switchgear and the Borough Council meters. The latter comprise a Reason three-wire maximum demand meter and a wattmeter for the main lighting circuits, a basement lighting meter, and the power meters; there are two rates of charging. On the board are also an ammeter and a recording voltmeter, which can be connected by flexible to any desired terminals, and a meter with a flexible cable and a contact device at its end which can be inserted in the contacts of any switch to obtain the consumption of any circuit.

A novel feature in the construction of the board is the provision of a galvanised iron trough for distributing the cables at the back. This trough is divided longitudinally into three parallel portions, and is lined with Uralite. The steel conduit containing the lighting and power cables from all parts of the building terminate above this trough, and the cables drop down into one of the three channels. The back channel contains all the 480-volt power cables, the middle one 240-volt power cables, and the front one 240-volt lighting cables. In all cases "Anchor" vulcanised rubber cables are employed. Each cable passes through an ebonite bushed hole in the bottom of the trough opposite that part of the board where the switch terminal for its particular circuit is situated. This arrangement gives a particularly neat construction.

The wiring all over the building is in enamelled, screwed, seamless steel conduit, which is bonded together and effectively earthed. All the arc lamp circuits in the basement and on the ground and first floors are brought down to the main switchboard, and all fuses and series resistances are in the basement. The incandescent lamp circuits are, of course, supplied from distributing fuse-boards on each floor.

The chief power applications are three Otis passenger lifts and one Waygood lift in the old building, a rotary blower for the Lamson pneumatic cash dispatch system, ventilating fans, conveyors, and a combined water and air pump. There are also four service lifts and four dinner lifts, all electric. The Lamson blower is driven by a 25-h.p. Rhodes motor, and supplies a very large system comprising some 60 tube stations. There is a spare motor, and means are provided for changing over the belt drive from one to the other. The ventilating system, which was carried out by Ozonair, Ltd., comprises a large Sirocco fan belt-driven by a 15-h.p. Crompton motor, which draws in fresh air at the base of the building through a wet filtering screen, and blows it through ducts into the various rooms and out at the top of the building, where there is an 8-h.p. exhaust fan. At the inlet of the main fan there is a pipe leading from an ozone generator, which is supplied with alternating current at 6,000 volts by means of a transformer and a small Crompton rotary converter.

The fire protection system includes, besides a complete equipment of hydrants, a Grinnell sprinkler system, and in order to create a pressure high enough for the efficient working of the sprinklers at the top of the building, there is a hydraulic accumulator in the basement and an air pressure tank on the roof. The latter holds 60,000 gallons. Water is pumped in by means of a combined air and water pump, belt-driven from an 8 h.p. motor, and this pump is also used to keep up an air pressure over the water in the tank of 80 lbs. per square inch.

The parcel and box-handling equipment includes three spiral shoots. One of these in the old building deposits the parcels direct on a turntable, from which they are sorted for dispatch. At the base of one of the others in the new building, there is a canvas belt conveyor, which travels along the subway under the road between the two buildings, finally depositing the parcels on the turntable. This conveyor is constructed in several sections, as it has to follow a winding course, and each section is driven by a separate motor. These are 240-volt machines of from 1½ h.p. to 3 h.p.

Among the other applications is a 3-h.p. motor driving the automatic stokers which feed the boilers for the hot-water heating system, and a number of small motor-driven appliances such as dish- and knife-cleaners, potato-peelers, &c.

The internal lighting of the ground and first floors is carried out with enclosed arcs of the Brockie-Pell B.E. type. These take 5 amperes, and are connected two in series across the 240 volts. There are also a few 3-ampere lamps of the twin-carbon B.E. type. The basement lighting consists entirely of open inverted lamps supplied by the Electrical Co., Ltd., taking from 8 to 9 amperes, and connected five in series. These are hung close to the white ceiling, and give a most pleasing effect. There are no lamps of any kind in the show windows, but these are lighted from the outside by flame arc lamps of the Electrical Co.'s "Sunshine" pattern.

No lamps are exposed in the show cases either, as, apart from the risk of fire, it has been found that the heat of lamps is often apt to damage the goods exhibited. An ingenious device is used, however, consisting of a sheet metal fitting with glass reflectors and a Cloisonné-glass front. This stands on the glass top of the show case, and most of the light is thrown directly downwards, and reaches to the bottom shelves of the case. Part of the light is also reflected through the Cloisonné-glass front, which has either merely artistic designs or an advertisement of some kind. The fitting contains four 17-watt 20-volt Osram lamps. It is interesting to note that it was found that any lamps with a higher specific consumption caused the glass top of the case to crack on account of the heat generated. In all, there are 40 flame lamps outside the shop windows, 380 enclosed and open inverted arcs for interior lighting (including those in the old building), and some 3,000 incandescent lamps, mostly metal filament.

A private inter-communication telephone system affords communication between the work-rooms and the various departments of the shop, but there are also National Telephone slot call-boxes all over the building, and a private exchange. In order that the as-

Digitized by Google

sistants may use this system for inter-communication between departments, they are provided with special metal discs.

In conclusion, we should like to express our thanks to Mr. M. Pulver, of Messrs. Duncan Watson & Co., who kindly showed our representative over the installation, and who has been chiefly responsible for the work, and was the designer of the switchboard trough and the show-case fitting described.

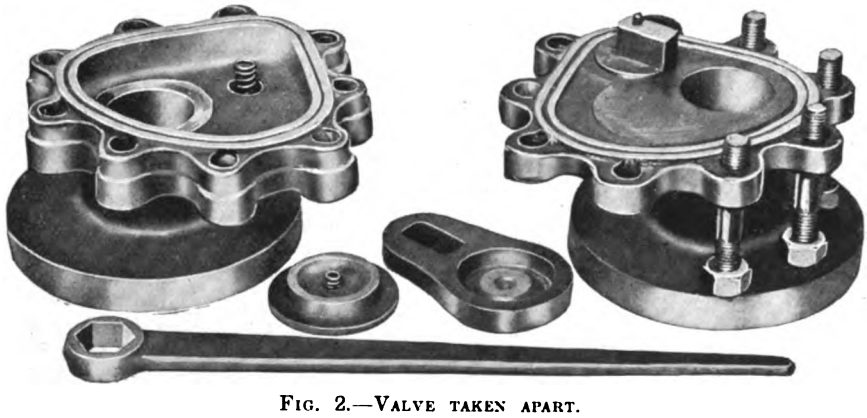
The new building itself was erected to the plans of the architect, Mr. John Murray.

A NEW HIGH-PRESSURE BLOW-OFF VALVE

THE accompanying illustrations represent a new form of valve for high-pressure blow-off purposes, &c., which is being put on the market in this country by Messrs. Wallach Brothers, Ltd. (Finsbury Square, E.C.). The construction of the valve is made clear by Fig. 2, which shows the two parts of the casing taken apart, and the parts composing

FIG. 1.—VALVE COMPLETE.

the valve itself separately. The faced disc of the valve slides over a seating against which it is held up by a pair of springs, and is actuated by an arm which is moved from outside the casing by means of a spindle, with a square head to receive a spanner. It will be seen that a full way opening is obtained, while the working face is easily accessible for examination. The arrangement of the springs, one of which is in the centre of the valve face, fitting in the circular recess in the arm, while the other, is over the spindle, keeps the valve from tilting. Also the second spring keeps the spindle tight by causing a collar on it to press upon a special packing ring. The lower part of



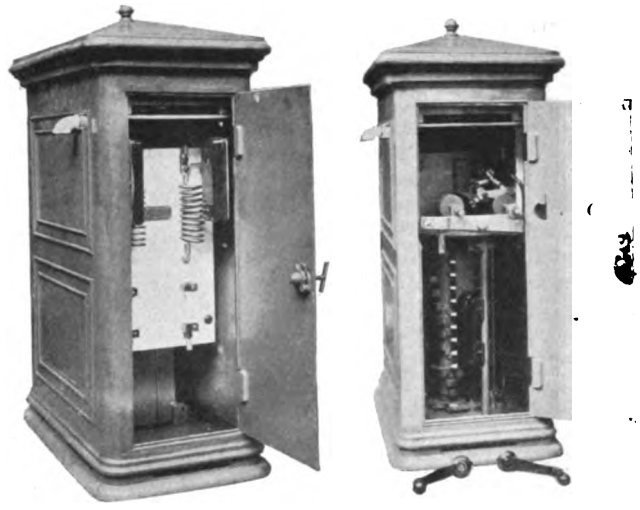


FIG. 2.—VALVE TAKEN APART.

the casing is of brass, and the upper part of cast-iron, while the moving parts are of Admiralty gun-metal. From an inspection of a sample valve it is evident that the whole is of workmanlike construction, as it is of simple design.

Theory of Alternating Currents.—At a meeting of the Dublin Local Section of the Institution of Electrical Engineers on January 20th, a Paper was read by Mr. T. Tomlinson, entitled "The Elementary Graphics of Alternating Currents." The author deals with the effects of self-induction and capacity on a strictly diagrammatic and physical basis, and deduces a number of vector and circle diagrams for determining the results of various combinations of resistance, self-induction, and capacity in series and in parallel.

FEEDER PILLARS FOR CAPSTAN CONTROL IN INDIA

THERE are various special requirements which apparatus designed for tropical countries have to meet, and the feeder pillars shown in the accompanying illustrations, which were produced at the General Electric Co.'s Witton Works for use in India, form a good example. It was required to arrange in each pillar the complete switchgear for the control and efficient protection of a direct-current 15-h.p. capstan motor, consisting of double-pole main switch, double-pole fuses, drum-type controller, starting resistance, choking coils, lightning arresters, and sealing ends for the lead-covered motor cables, and weight and

VIEWS OF CAPSTAN CONTROL FEEDER PILLAR.

dimensions had to be kept within certain given limits to admit of transportation without dismantling. Only such material could be used which would stand the very trying climatical conditions; for instance, no fibre, presspahn, nor even slate could be employed. Particular care had to be taken to prevent the ground moisture from rising into the pillar, but at the same time efficient ventilation had to be provided to carry away the heat generated in the starting resistance. Furthermore, the pillars had to be absolutely safe against the torrential rains which fall periodically. As the pillars were to be operated by natives, they had to be what is generally termed "fool proof."

The pillar is provided with two doors, one at each of the short ends. One of these doors gives access to the choking coils, main fuses, and lightning arresters, the other to the controller and main switch. The choking coils and the main fuses, which are of the well-known G.E.C. porcelain bobbin type, are mounted on a white marble slab reaching across the whole width of the pillar, thus separating effectively fuses and lightning arresters from the rest of the gear. The lightning arresters are of the short-gap magnetic blow-out, series resistance type; they are contained in boxes, and are mounted on the sides of the pillars right and left of the choking coils.

The bottom of the pillar is closed against the cable trench by a diaphragm of boiler plate, through which the lead-covered cables are brought by means of brass-screwed glands made tight with steam packing. The controller is placed on this diaphragm, and, as it stands at a right angle to its actuating shaft, bevel gearing had to be employed for its operation.

In the controller itself only micanite is employed as insulating material, and the drum consists of solid iron castings clamped on to a square steel shaft covered with a thick coat of micanite, and is so designed as to have the smallest possible air-gap in the way of the magnetic lines, thus considerably increasing the efficiency of the magnetic blow-out. The contact fingers are arranged similarly to the drum castings, on a micanite shaft, with which they form a self-contained unit, that can be removed as a whole for inspection and overhauling. The blow-out coil is of ample proportions, and keeps quite cool with the normal current passing permanently, giving a strong field even with the no-load current of the motor.

Digitized by Google

The double-pole main switch, of the magnetic blow-out laminated brush type, is mounted on a white marble base, which is bolted on one side of the pillar near the controller, with which it is mechanically interlocked in such a way that it cannot be opened unless the controller is in the "off" position, and if the controller drum should be turned for inspection purposes while the switch is "off," it is impossible to close the switch. The actuating shafts of both the main switch and the controller penetrate the door of the pillar, and a further device is provided which securely locks this door as long as the main switch is "on." It will be seen, therefore, that to open the door of the pillar it is necessary, firstly, to switch off the controller; secondly, to open the main switch; and thirdly, to remove the switch handles as well as the controller handle. These handles can, of course, only be removed in the "off" position.

The starting resistance is lodged in the top part of the pillars under the cover, so that the heat generated is freely radiated by the covers. Furthermore, ventilating slots are provided in the pillars themselves near the bottom and under the cover. The slots near the bottom are slanting upwards and inwards at a steep angle to prevent rain-water drifting in, while the upper slots are securely protected by the overhanging edges of the cover. The resistance itself is of the cast-iron grid type. The individual grids are threaded on micanised steel rods, and are insulated from each other by mica washers, and all connections are bolted.

THE DUTIES OF THE INSTITUTION OF ELECTRICAL ENGINEERS TO THE ELECTRICAL INDUSTRY

WE have received from Mr. E. Garcke copies of a letter from the Secretary of the Institution of Electrical Engineers in reply to a letter of his own of December 10th last (published in ELECTRICAL ENGINEERING of December 23rd, 1909, Vol. V., page 1084). Mr. Garcke's original letter was called forth by a ruling of the President that "politics" were not to form part of the discussions of the Institution, and expressed the view that the Institution did not take a sufficiently prominent part in legislative and administrative matters affecting the welfare of the electrical industry.

The Secretary, in his letter (which is dated January 28th), states that the Council administration of the affairs of the Institution of Electrical Engineers is governed by its Memorandum of Association. The main object of the Institution, he continues, is to promote the general advancement of electrical and telegraphic science and its applications. The Council have always given, and will continue to give, as broad an interpretation to the Memorandum of Association as is consistent with the avoidance of matters which, while possibly affecting one section of the industry beneficially, might be injurious to the interests of another section, or contrary to the public interest. The Council are constantly engaged in the consideration of matters affecting the industry which come within the proper scope of the objects of the Institution, and in regard to legislation they have always welcomed applications from Government Departments for advice or assistance, and have repeatedly taken the initiative in putting before such departments the views which they may have formed on questions connected with the general advancement of the industry. Accounts of the Council's action in regard to these matters appear in due course in the annual reports of the Institution.

To this Mr. Garcke has written a reply, dated February 3rd, in which he reviews the actions taken by the Council in such matters during the last 22 years as recorded in the annual reports, which he says clearly show that the Council has given in the past a broad interpretation to the Memorandum of Association. The points which he wishes to emphasise are :—

(1) That no industry of the magnitude and importance which the electrical industry has now attained can permanently subsist in this country with adequate advantage to British capital and labour unless it possesses an authoritative, representative, and efficient organisation for the promotion and protection of its general legislative, industrial, and commercial interests.

(2) That the electrical industry in this country does not possess such an organisation. It possesses several most praiseworthy societies for the furtherance of sectional interests, but apart from the Institution of Electrical Engineers there is no organisation in the country which is able to represent the industry as a whole, and this correspondence, although it has brought out the fact that the Institution has the power to meet this much-felt want, and that the Council has occasionally exercised this power, still leaves it open whether the Institution may be relied on to provide an organisation as above defined.

(3) The Council of the Institution having from time to time given their attention to certain legislative and commercial questions, many members have formed the belief that the Institution does, in fact, in all cases, protect the legislative and commercial interests of the industry in a manner rendering any other efforts with this view unnecessary.

(4) At the same time many members (including Mr. Garcke) are of opinion that the Council have not dealt with legislative and commercial matters in such a manner as to offer reasonable hope of preventing the industry from being very seriously prejudiced relatively to other industries and interests in this country.

Mr. Garcke continues :—

"In support of this expression of opinion I would point out that in 1902 the then President of the Board of Trade informed the deputation from the Institution that a Bill would be introduced to give effect to the recommendations of the Joint Select Committee of both Houses of Parliament which sat in 1898, but the subsequent annual reports of the Council contain no reference to any efforts that may have been made by the Council to get this official promise realised. I have in my previous letter referred also to what I most respectfully consider the neglect to deal properly with the Electric Lighting Bill of last session, and you are good enough to inform me that this matter will be dealt with in the next annual report, but may I be permitted to point out that the Bill was passed substantially in its objectionable form by the House of Lords in May last before the presentation of the last annual report of the Council, which, however, contained no reference whatever to the Bill. If it had not been for the efforts subsequently made by a few members without the benefit of the great influence of the Institution the Bill would, it is believed, have become law in a form which would undoubtedly have put an end to the profitable investment of capital in many provincial electric lighting undertakings.

"No one," he concludes, "who feels any responsibility for any part of the capital invested, or for the material welfare of those who are engaged in the industry, can avoid the conclusion that it is regrettable that an Institution which is capable of such excellent work, and which enjoys a thoroughly representative character and possesses the requisite influence and means, has not devoted a larger portion of its energies to the promotion and protection of the commercial prosperity of the industries which it represents, and I am quite sure that I am but expressing the feelings of a large number of the members of the Institution in saying that the Council would render the industry an inestimable service if they would at this juncture provide for the electrical industries in this country the much-needed organisation to be constituted either entirely within the Institution or partly within and partly outside the Institution, so that steps may be taken with a view to improving the general industrial conditions under which electrical undertakers, manufacturers, and contractors are working."

CORRESPONDENCE

THE INSTITUTION LIBRARY.

To the Editor of "ELECTRICAL ENGINEERING."

SIR,—The Institution of Electrical Engineers possesses a library which contains the most complete collection of electrotechnical books in this country. The membership of all classes of the Institution, including students, amounts to no less than 6,000, of whom, probably, not more than 1,700 or 1,800 live near London, and yet only these London members have access to the library, because as I found recently, to my intense surprise, no arrangement has been made to permit of books being loaned to country members.

In view of the fact that the Institution, unlike many societies, does not reduce the subscription of the country members, I trust that you, Sir, will use your influence with the Council so that the concession may be granted at an early date.

ASSOCIATE MEMBER.

COMBINED LIGHTING AND POWER METER.

To the Editor, ELECTRICAL ENGINEERING.

SIR,—Apart from the statement that we amused him, which we cannot contradict, there is scarcely anything in your correspondent's reply to our letter of 18th ult., appearing in your issue of 20th ult., that is relevant to what we said.

We pointed out that the "ingenious system" is nothing new in principle; this has since been corroborated by others. Further, that no special meter is necessary, assuming the ratio of lighting and power tariffs to be 2 to 1; this is undoubtedly the case in spite of your correspondent's remarks. Watt-hour meters have generally four terminals (at least Bergmann meters have), and it is an easy matter for the central station meter man to connect the meter up according to the diagram given in your issue of January 14th.

As to the difficulty of adjusting for the proper ratio, this, of course, is theoretically non-existing, but practically it would necessitate making and stocking a large variety of series coils so as to obtain the required ratio in every instance.

Here the shunted ampere-hour meter comes in to advantage, and we take the credit of having pointed this out.

Yours faithfully,

SIMPLEX CONDUITS, LIMITED.

116 Charing Cross Road, W.C. W. WAHL,
February 3rd, 1910. *Manager, Meter Dept.*

THE ELECTRIC DRIVING OF REVERSING ROLLING MILLS

THE hearing of the action brought by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges. of Zaboze, Germany, against the Electric Construction Co., of London and Wolverhampton, for alleged infringement of the fundamental patent for the Ilgner system of electric driving of reversing rolling mills, was concluded on Wednesday last, but Mr. Justice Parker has reserved judgment.

The plant at Messrs. Alfred Hickman, Ltd., which, it is alleged, infringes this patent, consists of a large motor-generator set which includes one motor, two cast-steel flywheels each weighing 32 tons, and two continuous-current generators. Motor, generators, and flywheels are all mounted on one shaft, and run at a speed of 300 r.p.m. One generator supplies current to a motor driving a 36-in. cogging mill, and the other to a motor driving a 24-in. finishing mill.

Although the capacity of the gas-driven generating sets which supply power to the motor is only about 1,000 h.p., the kinetic energy of the flywheels enables as much as 12,000 h.p. to be developed for short periods. The mills are reversed by altering the direction of the current supplied to the motor, and are controlled by varying the excitation of the generators. It is stated that they can be reversed in about six seconds, from the full speed of 120 r.p.m. in one direction to full speed in the other direction. The drop in the speed of the flywheel motor which is necessary in order that the flywheels may give up energy to the dynamos, is produced by means of an automatic regulator. This comprises a rheostat in the motor field circuit, the weighted arm of which is fixed to the spindle of an auxiliary motor. The field coils of this auxiliary motor are in series with the motor armature of the flywheel set, and when the current taken from the main supply exceeds a certain predetermined amount, the torque on the armature of the auxiliary motor is such that it rotates and moves the rheostat arm, cutting out resistance. This effects an increase of the motor field of the flywheel set, and consequently a drop in speed, and the flywheel therefore gives out energy to the dynamos, which is thus passed on to the rolling-mill motors to supplement that supplied directly from the mains. The flywheel gives out 49,000 h.p. seconds for a drop in speed of 20 per cent., and the amount supplied direct from the mains is 2,300 h.p. If the maximum load on the generator is 9,000 h.p., the flywheel will thus supply the difference of 6,700 h.p. for 7·3 seconds.

An abstract of the patent in question, the general facts of the case, and a report of the first two days' proceedings were given on page 77 of our issue of February 3rd.

It will be remembered that the E.C.C. do not deny that the Ilgner principle is embodied in the Hickman set, but assert in defence that the patent is invalid for want of subject-matter. In support of this assertion, various previous publications are quoted, including a description of a Ward-Leonard motor-generator traction equipment, in which a flywheel effect is referred to, and a patent by Ferranti for a flywheel motor-generator for use in lighting stations to smooth out the fluctuations of a power load. After Mr. Walter had stated the case for the plaintiffs, interesting evidence as to the working of electric rolling-mills was given on Thursday, January 27th, by Mr. J. Swinburne and Mr. Ablett, of Siemens Bros. Dynamo Works, and this concluded the case for the Donnersmarckhütte Ges.

On February 4th, Mr. BOUSFIELD opened the case for the defendants, asserting that, without any special device to reduce the speed, the Ilgner arrangement was no different to the previous flywheel combinations, and that there was, therefore, no subject-matter for a patent. It was essential, he said, that there should be a regulator; in the case of the Hickman 2,000 h.p. primary motor, the speed-drop without the regulator was only 2 per cent., and more than 5 per cent. could not be safely obtained with any shunt motor. He held that the Ilgner idea was only the application of a flywheel in an obvious way. Mr. Justice Parker here expressed the opinion that Ilgner had meant that the drop of speed could be obtained either by means of a special design or by the addition of some suitable automatc device; but Mr. Bousfield held that the specification did not even suggest the use of a regulator. Continuing on the following Monday, Mr. Bousfield said that the E.C.C. regulator was set so that it did not act until there was a greater demand than 2,300 h.p. If they had series windings only, they would get an increase in back E.M.F. of only about 2 per cent., with an increase in load of 10 per cent., whereas with the regulator they could get anything they liked. He claimed that the Ferranti specification already referred to described an apparatus for use in cases where the load was fluctuating, and where it was desired not to interfere with the regularity of the ordinary supply; and that it could be applied to a rolling-mill. He claimed that there was no invention in the Ilgner system, inasmuch as there was no novelty in the manner in which the known principles had been put together. The introduction of the special regulator in the E.C.C. equipment, however, was in itself subject-matter for a patent.

The first witness was Mr. F. W. BRAY, managing director of the Trafalgar Colliery Co., who produced a drawing and gave particulars of a main and tail haulage plant which had been in use at his pit since 1894 for hauling trains of coal up an incline. This was worked electrically, and water resistances were used for regulating the field of the generator. There was no resistance in the motor circuit. Mr. JUSTICE PARKER said he did not see how this could be regarded as anticipation. It was simply the application of regulation in the field of the dynamo, which was a perfectly obvious thing to do after Ward-Leonard.

Mr. H. F. PARSHALL expressed the opinion that in the application of electricity to the driving of rolling-mills, the Ward-Leonard system was the only one which could be used. In 1893 Kapp suggested the use of a reversible machine for equalising the load on tramway feeders, and he had been rather astonished that Kapp should think there was anything novel in the application of a flywheel to an electrical machine. The use of flywheels on electrical machinery had become common since the introduction of traction loads. Reading the Ilgner specification by itself, he could not understand it without reading into it the Ward-Leonard and Ferranti systems. Cross-examined by Mr. Walter, Mr. Parshall agreed that nothing was said about a regulator for producing a drop-in speed in the Ferranti specification, but it described the use of a non-synchronous motor which had a certain range of speed variation in itself. He did not think there was any invention in the Ferranti patent, because he had had the same thing submitted to him in America two years previously. The Ward-Leonard system and flywheels were used in America several years before the Ilgner patent.

Professor BERTRAM HOPKINSON agreed with Mr. Parshall's evidence as to the use of the Ward-Leonard system in the driving of rolling-mills. In 1902, the date of the Ilgner patent, he was perfectly familiar with the only possible way of driving rolling-mills, viz., to vary the field of the generator supplying the motor, and, had a proposal been put before him, he would have been forced to adopt such a method in combination with a flywheel. In cross-examination, Professor Hopkinson said that although the Ward-Leonard system was normally a constant speed one, yet Mordey and Jenkin had referred in their Paper to speed variation. He admitted that, personally, he might have rejected the ordinary Ward-Leonard system, or have devised some other way of getting a motor with a larger variation in speed for rolling-mill work. It would not have been a difficult problem in 1902. It was true that the Ferranti patent was primarily for preventing fluctuations on the lighting plant, but the principle could be applied to rolling-mills and other purposes, and this fact, in his opinion, did not detract from the question of validity or anticipation.

Mr. S. Z. DE FERRANTI said that his patent No. 4,065 of 1895 was taken out really for the working of lifts on the City & South London Railway without there being any injurious effect upon the rest of the system. In view of the small generating plant of the railway company, the working of electric lifts was a very difficult problem at the time, and the company would not add to the very small number which they had in use. At the time he took the patent out, he was very doubtful about the subject-matter, and he therefore tried to show all sorts of useful combinations with a view to getting something patentable. The primary idea was flywheel storage. The machines shown in his specification were, in principle, exactly the same as those used at Messrs. Hickman's works; they showed exactly the right proportions with an enormously heavy flywheel. Mr. Ferranti also referred to the driving of printing presses in London on the Ward-Leonard system.

Mr. W. M. MORDEY said the Ilgner system was an ordinary application of the flywheel, and no new result was obtained from it. He had used flywheels on motors for driving large shops for a long time, and he regarded the flywheel as one of the tools in the designer's tool basket. It was all familiar before 1902. In his Paper he arrived at the conclusion that the Ward-Leonard system was very much the best one for dealing with a variable load, but he did not think he had made any discovery or invention in that. Ilgner merely accentuated

Digitized by Google

the natural flywheel action of a motor-generator set, *i.e.*, the flywheel effect of the armatures. Under cross-examination, Mr. Mordey said the regulator at Messrs. Hickman's works only came into operation when the current exceeded 1,500 amperes. Mr. Walter suggested that the speed of the motor could be varied as much as 10 per cent. without the regulator, and not only 2 per cent., as stated by Mr. Bousfield, but Mr. Mordey said such a variation would affect the source of supply, which it was the aim of the system to avoid. The maximum demand for the installation at Messrs. Hickman's was 9,000 h.p., and without the regulator the primary motor would be overloaded. Mr. Walter contended that a simple series winding would be suitable, but Mr. Mordey disagreed.

In summing up for the defendants, Mr. Bousfield claimed that the Ilgner idea was merely the application of Ward-Leonard control to the Ferranti flywheel set, and an application which was bound to suggest itself. It was undoubtedly an analogous use of an old contrivance, and there was, therefore, no subject-matter. There was, he said, no interaction between the Ward-Leonard control and the flywheel effect, and therefore a patent could not be taken out for the combination. Mr. Justice Parker here mentioned that he was satisfied that there had been no anticipation of the combination; it remained, however, to be decided whether the combination was subject-matter.

Mr. Walter then finally addressed his Lordship, pointing out that the Ilgner patent was for a method of obtaining and utilising a drop in speed of an intermediate flywheel machine without causing thereby any drop in speed of the working motor; this effect was the result of the combination of the Ward-Leonard and Ferranti ideas, and the combination was, therefore, subject-matter for a patent.

IMPROVED POWDER PROCESS FOR PLATING METALS

AT the Royal Society of Arts on Wednesday of last week, Mr. A. Rosenberg described a novel process whereby metals of all kinds may be coated with any other metal, including nickel. The process, which is the outcome of five years' experimental work, consists in the use of a mixture of pulverulent materials to which has been given the trade name of "Galvanit," and the deposition is accomplished by the application of a particular powder, according to the metal to be deposited, by means of a rag or brush, and rubbing the object to be coated, in the presence of moisture. No preliminary chemical treatment is required, provided the objects are reasonably clean and bright.

For the deposition of each particular metal there is required a corresponding powder, containing the appropriate ingredients, and all metals generally deposited by ordinary electroplating can be deposited by "Galvanit" powders. The powder consists of 5 parts by weight of ammonium sulphate, 1 part of magnesium, 10 parts of chalk, 2·5 parts soapstone, and 15 parts of the metal to be deposited. The magnesium prevents the mixture from absorbing moisture, and the chalk acts as a diluent and polishing agent.

The new process is said to depend upon the reaction which ensues between one ingredient (the electro-positive metal), and the other ingredient (the metallic salt) on the addition of moisture to the mixture. In this reaction the electro-positive metal constitutes the anode, and the object treated the cathode. The finely-powdered electropositive metal in the mixture makes innumerable contacts with the cathode surface, and acts as so many minute anodes. These set up local circulating currents, and as these currents leave the liquid they throw down a deposit on the cathode from the metallic salt in solution. Mr. Rosenberg states that a probable explanation is that the water is decomposed, the salts in contact with the cathode are reduced to the metallic state by the nascent hydrogen, and the acid thus formed is prevented from corroding the deposited metal, both by the motion applied and by being immediately removed into the liquid by diffusion. It is possible to increase the thickness of the deposit by the aid of heat, although this is not necessary. An interesting and unexpected result is that aluminium surfaces may be coated by the "Galvanit" process. Another interesting possibility is its application for "tinning" joints.

In the discussion on the Paper Prof. SILVANUS P. THOMPSON, F.R.S., who presided, said that he was satisfied that real electrolytic films of metal were deposited, and that none of the metal of the article treated was lost. He was particularly astonished that the author was able to accomplish nickel-plating by this means. Dr. H. BORNS asked for information as to the thickness of the deposit, and also as to the behaviour of the deposits under mechanical strains. Dr. F. MOLLWO PERKIN pointed out that nothing had been said with regard to the cost of the process; magnesium, which entered into the composition of the powders, was by no means cheap. Mr. C. H. WOOLF spoke as to the lasting qualities of the powders. Samples of zinc and silver powders, which came into his hands early last year were still practically in the same state of efficiency. He had found the deposits of metal lasted for a very long time. In reply, Mr. ROSENBERG said that the films withstood mechanical strains quite well, pieces of covered metal being bent backwards and forwards without injury to the deposit. He admitted the powder process might be a little more expensive than ordinary plating, but the speed and convenience of the process more than compensated for this. From the ordinary user's point of view the price worked out favourably, for a shilling tin of powder contained sufficient to coat a surface of six square feet with a fairly thick deposit. The amount deposited could easily be ascertained by weighing; he had proved that each application increased the weight of the deposit.

WIRELESS TELEGRAPHY

The annual report of the Liverpool Underwriters' Association, which was presented at the annual meeting on Friday, expresses approval of the agreement by which the entire system of wireless telegraphy employed in the United Kingdom for communication with ships has been acquired by the Government. The report expresses the hope that the work which remains to be done of establishing a complete system of electrical communication with the light vessels and outlying lighthouses around our coasts will now be proceeded with.

A Reuter telegram from Berlin states that, in consequence of the favourable results of experiments in wireless telegraphy in Germany and the colonies, and between individual colonies, wireless stations will be erected in German East and South-West Africa, the Cameroons, and the German South Sea colonies, so as to establish wireless communication between the motherland and the colonies.

It is announced that about one dozen Allan line steamers are to be fitted with Marconi wireless telegraph apparatus.

A white paper had been issued giving the terms of the agreement between the Postmaster-General and Marconi's Wireless Telegraph Co., Ltd., and the Marconi International Marine Communication Co., Ltd., under which the company surrender their wireless stations at Liverpool, Withernsea, Caister, Lizard, Rosslare, Niton, North Foreland, Crookhaven, and Holyhead, to the Postmaster-General for a consideration of £15,000. The details of the agreement were published in our columns at the time the Postmaster-General made his first statement on the subject, and the official document now issued adds little to the information then made public. It will be remembered that the Marconi Co. retain their high power stations at Poldhu and Clifden. One of the conditions of the transfer is that the Postmaster-General may use the patents of the company for a period of fourteen years from the date of the agreement without having to pay royalties. The use of the patents provided for in the agreement extend to communication between ship and shore, and also for inland transmission in the United Kingdom. Provision is also made for the use of the company's patents between the United Kingdom and British possessions, or a foreign country. The official document also includes an agreement between the Postmaster-General and Lloyd's, under which the Lloyd's wireless telegraph stations at North Foreland, Mallin Head, and Browhead (or Crookhead) are to be transferred to the Postmaster-General in the same way as the Marconi stations. The sum total to be paid is £2,400, and the Postmaster-General undertakes during a period of 15 years to furnish to Lloyd's, all maritime intelligence received at any shore station under his control. In the event of the Postmaster-General, within a certain period, deciding to discontinue wireless communication at these stations, Lloyd's are to have the option of repurchasing them.

A feature of the Electrical Exhibition held last month in Chicago was a complete wireless telegraph installation shown in action on a Wright aeroplane suspended from the roof. The exhibit was in charge of the U.S. Signal Corps.

Help has been rendered to the Alaska-Pacific liner *Kentucky* in consequence of the receipt of a wireless message to the effect that the steamer was sinking 240 miles off Cape Hatteras.

The *Australian Mining Standard* gives some details taken from the report of the conference recently held in Melbourne regarding the wireless telegraph scheme for linking up British possessions in the South Pacific. The recommendations of the conference are that the stations should be established at or near Sydney (Australia), Doubtless Bay (New Zealand), Suva (Fiji), and Ocean Island. It is estimated that the cost of construction will be about £70,000, to which the Imperial Government would contribute £23,334, New Zealand £16,333, Fiji £3,500, and the Commonwealth Government £26,833. The maintenance charges are put at £24,820 per annum, the Imperial Government contributing £7,716, New Zealand £6,248, Fiji £1,112, and the Commonwealth of Australia £9,734. These estimates are for high-power stations. For a more restricted service the total cost of maintenance is estimated at £17,170. In our issue for January 13th, page 26, we notified that tenders were being invited for the construction of some of these wireless telegraph stations.

Railway Electrification in Vienna.—It has been decided, says the Vienna correspondent of the *Financial News*, to convert the Vienna Metropolitan Railway to electric traction. The work will be carried out by Siemens-Schukert Werke, with the financial assistance of the Austrian Länderbank.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 3rd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

693/09. **Exciter for Asynchronous Machines.** MILES WALKER (BRITISH WESTINGHOUSE CO.) In order to enable large induction motors to work at unity power factor or to take a leading current, the rotor winding is supplied with current from an auxiliary machine. Such a machine can also be used to excite an asynchronous generator. The armature has a number of windings in star connection, the free ends being connected to the bars of a commutator. The field system comprises a number of poles equal to, or a multiple of the number of phase circuits of the rotor of the motor or generator to be excited, and a corresponding number of brushes are provided for collecting the current from the commutator. The field system is energised by windings in series with the armature, and compensating windings are provided in the pole faces. Five claims, two figures.

7,706/09. **Protected Cable.** W. SCHMAHL and ARMORDUCT MANUFACTURING CO., LTD. A protected flexible cable for use with portable lamps, tools, radiators, &c., consists of two or more conductors braided with rubber-covered cord. This cord is formed of twisted cotton or yarn, surrounded with one or more layers of rubber. Before braiding, a layer of rubber is put over the insulated conductors, and finally, the whole is vulcanised. One claim, one figure.

9,971/09. **Conduit Inspection Fitting.** W. SCHMAHL. To render an inspection box water-tight, it is provided with a grooved packing rim filled with a permanently plastic packing material, which protrudes above the face of the rim, and is squeezed out between the rim and the cover when the latter is screwed on. Two claims, four figures.

12,477/09. **Line Insulator.** BULLERS, LTD., and H. DAGNALL. This comprises a porcelain head, into which is screwed the pin, and an oil cup supported by projections on the pin just below the head. The hole through the cup is provided with slots. When the slots and projections are caused to coincide by rotating the cup, the latter can be lowered for cleaning or filling. Three claims, three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: WITTGENSTEINER [Feeding mechanism] 7,508/09; SIEMENS-SCHUCKERTWERKE GES. [Lamps] 15,605/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: W. T. HENLEY'S TELEGRAPH WORKS CO. and NICHOLS [Underground cable disconnecting boxes] 1,800/09; STRATTON and CLAREMONT [Manufacture of cables] 6,151/09; ALLGEMEINE ELEKTRICITÄTS GES. [Transformer distribution system] 6,313/09; LINKE [Fixing wires to insulators] 13,786/09.

Dynamos, Motors & Transformers: ALLGEMEINE ELEKTRICITÄTS GES. [Power transmission systems] 11,339/09; LE TALL (*Westinghouse Electric & Manufacturing Co., U.S.A.*) [Machines] 19,393/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Motor control] 20,246/09; JOHANNET [Equalising torque of motors] 22,317/09; TUCH [Power transmission gear] 25,217/09.

Electric Ignition: BOUSFIELD (*Nightingall Gas Control Co.*) [Control of gas lamps] 1,264/09; DONALD [Engine ignition] 1,755/09; STUART-BAILEY and STOREY [Mine cartridges] 7,714/09; BUCKLEY [Apparatus for igniting miners' lamps] 8,112/09; R. BOSCH [Engine ignition] 18,457/09; MILTON [Interrupter] 21,962/09.

Electrometallurgy & Electrochemistry: AKTIEBOLAGET SWEDISH NITRIC SYNDICATE [Concentrating nitric acid] 10,592/09; BINGHAM [Furnace electrodes] 14,858/09; SOC. ELECTRO-METALLURGIQUE FRANCAISE [Manufacture of nickel] 14,946/09; SALTPETERSÄURE INDUSTRIE GES. [Arc furnace for treating gases] 19,466/09.

Storage Batteries: NYA ACKUMULATOR AKTIEBOLAGET JUNGNER and ESTELLE [Positive plates for alkaline cells] 8,195/09.

Switchgear, Fuses & Fittings: JENNER [Sign and switch] 1,132/09; ANDRÉ [Voltage and speed regulators] 1,157/09; SELBY, SANDERS and PRESTON [Switches] 1,662/09; SIMPLEX CONDUITS, LTD., WATERHOUSE and SHEPPARD [Water-tight switches] 3,106/09; LEA [Fuse] 3,345/09; "WATT"-INSTALLATIONEN FÜR STARK- UND SCHWACKSTROM CARL SCHULZ [Push-button switches] 23,526/09.

Telephony & Telegraphy: WEBB [Multiplex microphone transmitter] 12,473/09; FAIRWEATHER [*Aktiebolaget L. M. Ericsson & Co.*) [Common battery telephone system] 25,022/09.

Traction: IMBERY and CHAMEN [Tramcar brake] 925/09; COLEMAN [Signalling] 1,426/09; DAHLHEIM and VOGT [Operating points from car] 1,521/09; S. P. (SUCHOSTAWER PATENTS) SYNDICATE and SAYERS [Surface contact system] 1,875/09; WHITEHEAD and SMITH [Signalling] 6,816/09; MILLER and SPENCE [Signalling] 13,254/09; PRICE [Automatic block signalling] 15,099/09; NELSON, ORMSBY and NICHOLSON [Locking railway-carriage doors] 15,475/09; HARRINGTON and YOUNG [Automatic brakes] 16,067/09; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Spring-switches for electrically setting points and signals] 19,662/09; LA BARRE [Automatic signalling] 21,665/09; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Overhead equipment] 28,024/09.

Miscellaneous: SOC. D'ELECTRICITE "NILMELIOR" and COLAS for every one of the main switch drum.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: HEIMANN and SCHAEFFER [Running arc and incandescent lamps in series] 747-8/10.

Electric Ignition: L. DUTHEIL, R. CHALMERS & Co. [Commutator] 1,130/10.

Switchgear: SOC. ANON. ATELIERS JASPAR & MELLER [Automatic electro-magnetic regulators] 1,087/10.

Telephony: STILLE [Telephone relays] 65/10.

Traction: GIFF [Signalling system] 25,196/09.

Miscellaneous: SOC. D'ELECTRICITE "NILMELIOR" and COLAS [Indicating and registering devices] 827/10.

Opposition to Grant of Patent

24,590/08. **Electric Smelting.** W. BORCHERS. Opposition has been entered to the grant of this patent, which is for a process of treating titaniferous iron ores in an electric furnace. The slag produced by the regular operation is transformed into a reducing agent, consisting of iron, titanium, carbon, and silicon by raising the temperature to 2,000° C., and adding carbon. New charges of iron ore are added in such limited quantities that all the iron oxides and the silica are reduced, with the exception of a small quantity which forms with the titanic acid the reducing agent for the next charge of ore.

Application for Revocation

15,978/09. **Electric Block Signalling System.** J. D. TAYLOR. Application has been made for the revocation of this patent under Section 26 of the Patents Act, the applicant having failed to enter opposition before the grant of the patent. The patent is for an automatic block signalling system, in which electrically continuous rails are used. Sources of supply for the signalling currents are so connected to the rails as to produce points of equal or zero potential midway between adjacent points of supply, and the relays controlling the signals are connected to the rails at suitable distances.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

3,093 of Feb. 11th, 1896. **Motor Controller.** J. DEVONSHIRE (*W. H. Knight and J. W. Darley, U.S.A.*). In a series-parallel motor controller the change-over from series to parallel connection of the two or more motors is effected in a number of stages, and resistances are inserted and removed successively when the changes are made. The controller contains a rheostat drum geared to the main drum, and making several revolutions for every one of the main switch drum.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: CROMPTON & Co. and E. W. ABBOTT [Suspension device] 22,362/04; J. M. WELLINGTON and W. F. DANIEL [Feeding mechanism] 22,522/04.

Dynamos, &c.: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Cooling of rotors of induction motors] 20,990/05; E. ARNOLD and J. L. LA COUR [A.-C. commutator motors] 21,034/05.

Electric Ignition: A. H. NICHOLSON [Ignition System] 21,173/05.

Storage Batteries: A. J. FIPPARD [Cell covers] 21,279/05.

Switchgear, &c.: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Plug fuse] 22,573/03; E. F. MOY and P. H. BASTIE [Resistances] 22,647/04; OTIS ELEVATOR CO. (*Otis Elevator Co., U.S.A.*) [Control gear] 20,950/05; BRITISH THOMSON-HOUSTON CO. and E. B. WEDMORE [Switch for measuring instruments] 21,439/05.

Telephony, &c.: I. B. BIRNBAUM and F. G. BELL [Fire alarm circuits on C.B. telephone systems] 10,400A/05.

Traction: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Electro-pneumatic brakes] 21,067/05.

Miscellaneous: F. EASTERFORD [Fire alarm] 22,538/03; O. MESSTER [Running phonographs and cinematographs synchronously] 22,566/05; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Insulation of strip conductors] 22,906/03.

LOCAL NOTES

BARKING: *Position of Electricity Undertaking.*—A proposal that an independent expert should be called in to report upon the position of the electricity undertaking has been referred to the Electricity Committee.

BURSLEM: *Mixed Pressure Turbine.*—A 600-kw. mixed pressure turbine has recently been put into service. Messrs. Bellis & Morcom supplied the turbine and Messrs. Siemens the generator. An additional Babcock & Wilcox boiler, capable of evaporating 10,000lb. of steam per hour, has been erected, making the fourth of its size at present erected in the works. A CO-2 recorder and a Lea recorder have also been installed.

DARLINGTON: *Exhaust Steam Turbine.*—A 550-kw. exhaust steam turbo-generator set has been installed at the Council's electricity works. Exhaust steam from the reciprocating engines in the power-house is made use of.

DUBLIN: *Cavehill and Whitewell Tramways.*—A draft Bill has been approved for mutual running powers between the Corporation and the Cavehill and Whitewell tramway systems.

DUNDEE: *New Plant.*—Owing to the increased demands which are being made on the electricity department for current since the inauguration of the new high-tension system, it has been necessary to install at the Lochee sub-station another 250-kw. rotary converter set. This set is being supplied by the British Westinghouse Co., and the switchgear by the British Thomson-Houston Co.

EDINBURGH: *Electric Lighting Accounts.*—The report of the Electric Lighting Committee for the year to May 15th, 1909, states that owing to the introduction of metal filament lamps, the increase in the maximum load was only 296 kw. The total connections amounted to 992,392 eight c.p. lamps, the connections during the year being 53,478. The motor load was increased by 601 h.p. The net profit amounted to £2,071, after meeting all expenditure and capital charges. This has been applied to the relief of rates.

FIFESHIRE: *Opposition to Tramways.*—The Fife County Council will oppose the proposed extension of the Dunfermline & District Tramways Co. system to Rosyth.

GILLINGHAM: *Wiring and Fitting Premises.*—The Council have been provided with a list of Corporations who are supporting the proposal of Mr. E. E. Hoadley (Maidstone) to promote a Bill conferring electric wiring and fitting powers upon municipalities. As a consequence, they have agreed to contribute £10 towards the expenses of promoting the Bill. The Association of Municipal Corporations is to be asked to support the measure.

HASTINGS: *Wiring and Fitting of Premises.*—The Electrical Contractors' Association have been informed that the Council have inserted in the clause, contained in the Bill which they are promoting in the next session of Parliament, for giving them power to supply electrical fittings, lamps, motors, &c., the words, "through a contractor but not otherwise." This will dispose of the opposition of the Electrical Contractors' Association to the Bill.

LEITH: *Cost of Tramways.*—Sir Alexander Kennedy, Consulting Engineer to the Edinburgh Corporation, has written to the Council stating that the cost of the extension of the Leith electric tramway system to Granton appeared very much in excess of the normal cost of such work. The Leith Borough Surveyor has replied that the total cost was £18,274 18s. per mile of double track. The superintending and engineering fees accounted for £2,897; altering gas and water pipes, £4,400; and chilled blocks in order to prolong the life of the paving, £2,371. If the cost of these special items were deducted, the cost of the tramway per mile worked out at £14,766 per mile of double track, which he did not think unreasonable.

LONDON: *London County Council: Trailer Cars.*—The Board of Trade has agreed to the use, as an experiment, of single-deck trailer cars on the Euston Road to Hampstead Heath tramway route, on the understanding that the Commissioner of Police concurred in the proposal, and that the trailer cars should not be run on any part of the route between the hours of 10 a.m. and 5 p.m. The Board reserves the right to withdraw its consent at any time.

Hammersmith: Advertising Electricity.—In connection with the joint advertising scheme of the Associated Municipal Electrical Engineers of Greater London, the Council is to purchase from them £50 worth of literature, to be supplied during one year as ordered.

Paddington: Tramways.—The Council have decided to oppose the construction of a tramway by the L.C.C. from Marble Arch to Cricklewood.

MACCLESFIELD: *Electricity Supply.*—The Corporation Electric Lighting Order will shortly expire, and the Board of Trade have intimated their intention of not renewing it unless the Council show that they are taking steps to put the Order into force. At their last meeting, the Council decided not to exercise the powers but to offer facilities for the company to put them into force.

REDDITCH: *The "Norwich" System of Charging.*—The Council are giving a trial to the Norwich system of charging for electrical supply upon the basis of the rateable value of the premises supplied.

ROTHERHAM: *Electric Supply.*—The Town Clerk reports that the Sheffield Corporation has decided not to proceed with their application for a provisional order to supply electricity to the parish of Tinsley.

STRETFORD: *New Plant.*—At the last meeting of the Lighting Committee, the chairman and the resident electrical engineer directed attention to the approaching necessity for extensions of plant to deal with next winter's load. Consideration of the matter was postponed until the next meeting.

TORQUAY: *Metal Filament Lamps.*—The engineer has been instructed to fix a 1,000-c.p. metal filament lamp to one of the arc-lamp standards as an experiment.

WEST HARTLEPOOL: *Proposed Purchase of Tramways.*—At the last meeting of the Council it was decided to promote a Bill for the purchase of certain portions of the undertaking of the Hartlepools Electric Tramways Co. The decision was arrived at by a majority of one.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRADFORD.—Mains are to be laid at an estimated cost of £1,578.

CANADA.—Application has been made for the incorporation of the Ottawa & Montreal Transmission Co., Ltd., with a capital of £3,000.

EASTBOURNE.—The Electrical Engineer reports that the cooling plant will have to be enlarged at an approximate cost of £250.

GRAYS.—A Local Government Board inquiry was held last week concerning a loan for extensions of the electricity works.

HANLEY.—The Electrical Engineer has been instructed to prepare plans and estimates for extensions at the electricity works.

HECKMONDWIKE.—Tenders are invited for an evaporative condensing plant capable of dealing with 20,000 lbs. of exhaust steam per hour. Particulars from the Borough Electrical Engineer, and tenders by February 16th.

INDIA.—The Secretary of State for India invites tenders for electric cranes. Particulars from the Director-General of Stores, India Office, Whitehall, S.W., to whom tenders by February 15th.

KETTERING.—The Council require 1,440 positive battery plates for a 360-ampere-hour battery at the electricity works. Particulars from the Borough Electrical Engineer, and tenders by February 14th.

SOUTH AFRICA.—The New Modderfontein Gold Mining Co. propose to issue 50,000 new shares of £4 each at £11 per share to provide for, among other things, the complete electrical equipment of their plant.

WIMBLEDON.—Tenders are invited for the supply and erection of pipe-work, valve, &c., at the electricity works. Particulars from the Borough Electrical Engineer, and tenders by February 28th. (See an advertisement on another page.)

Miscellaneous

AUSTRALIA.—Captain R. Muirhead Collins, representative of the Commonwealth in London, has received tender forms, specifications, &c., in connection with the supply of a dust extractor, required by the Postmaster-General's Department, Brisbane, Queensland. Tenders will be received by the Deputy Postmaster-General, Brisbane, until March 30th, 1910.

BACUP.—The Town Council have approved a scheme for electric tramways from Bacup to Shawforth at an estimated cost of £25,000. An inquiry was held last week by the Light Railway Commissioners. An arrangement will be entered into with the Rochdale Corporation for the working of the line when constructed.

BLACKBURN.—The Electricity and Tramways Department require general stores, including insulating material, fuse-boxes, switches, motors, motor-starting switches, and conduit. Particulars from the Borough Electrical Engineer or Tramways Manager, and tenders by February 16th.

DONCASTER.—An inquiry was held last week by the Light Railway Commissioners respecting a proposal to extend the Doncaster tramways to Bentley Colliery. The proposed line has a length of 4 furlongs 4½ chains, and is estimated to cost £5.050, in addition to £2,550 for equipment.

GLASGOW.—Tenders are invited for three electric motors, &c., for the workshop at the Shieldhall Outfall Works of the

Digitized by Google

Corporation. Particulars from the Office of Public Works, 64 Cochrane Street, and tenders by February 16th.

HORNSEY.—Meters and cables are required by the Borough Council. Particulars from the Borough Electrical Engineer, and tenders by February 19th.

ILFORD.—Tenders are invited for the supply of electrical goods, including meters, lamps, cables, carbons, fuse-boxes, joint-boxes, &c. Particulars from the Borough Electrical Engineer, and tenders by February 22nd.

LEEDS.—Tenders are invited by February 28th for the annual supply of stores including india-rubber covered cables, mains, boxes, and fittings, jointing and insulation materials, electric lamps, fittings, and accessories. Particulars from Mr. H. Dickinson.

LONDON: *Bermondsey.*—Tenders are invited for arc lamp carbons, cable and joint materials, conduits, meters, main fuses, meter boards, joint-boxes, &c. Particulars from the Borough Electrical Engineer, and tenders by February 14th.

Hammersmith.—The Council require electrical stores. Particulars from the Borough Electrical Engineer, and tenders by February 16th.

St. Pancras.—A supply of arc lamp carbons is required. Particulars from the Electricity Department, and tenders by February 28th.

MEXICO.—It is stated that the Chapala Hydro-Electric & Irrigation Co. is considering the question of constructing an electric railway about 120 miles long between Guadalajara and Aguascalientes.

NEWPORT.—A scheme for extending the tramways to the Eastern Dry Docks is contemplated.

SOUTH AFRICA.—*The British and South African Export Gazette* states that orders for a quantity of electrical plant may be anticipated in the near future from the Pigg's Peak Development Co., Ltd. The Johannesburg Municipality are about to give out contracts for 12,800 yards of cable.

WOLVERHAMPTON.—Tenders are invited for electrical stores, &c., for the two years ending March 31st, 1912. Particulars from the Tramways Manager, and tenders to the Twon Clerk by February 12th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.W.—Building, Regent Street, and Kingley Street, S.W. Architects, Woodward & Sons, 13 Southampton Street, W.C.

Building, rear of 33 Sloane Street, Chelsea, S.W., abutting upon Hans Crescent, Chelsea, S.W. Architect, W. R. Lore, 10 Basinghall Street, E.C.

N.W.—Alterations and additions to Great College Street School, St. Pancras (£4,541). Builders, C. F. Kearley, 4 Great Marlborough Street, W.C.

N.E.—Shops in front of Dalston Junction Railway Station, N.E. A. Whitelaw, London & North-Western Railway Company, Euston, N.W.

PROVINCES.

BIRMINGHAM.—Premises for Best & Lloyd, Ltd. Builders, G. Webb, Soho, Birmingham.

BURSLEM.—Rink (£1,840). Architects, E. T. Watkins & Adams, Swan Chambers, Burslem.

DUNFERMLINE.—Swimming baths. Clerk to Town Council.

EDINBURGH.—Tenders are invited by the 14th inst. for an electric lighting installation at the New Slaughter Houses, Gorgie. Particulars from the Corporation Electrical Engineer, and tenders to the Town Clerk.

GLASGOW.—Offices and warehouses, Ingram Street (£35,000). Architects, J. W. & J. Laird, Hope Street, Glasgow.

Extension to Samaritan Hospital (£12,000). Architects, McWhannel, Rogerson & Reid, West Regent Street, Glasgow.

HUDDERSFIELD.—Presbyterian Church. Trustees, Huddersfield.

HENDON.—Entertainment Hall. Architects, Barnes & Burton, Jesmond Road, Newcastle.

LEEK.—Drill Hall (£3,000). Builder, T. Godwin, Hanley.

NOTTINGHAM.—Pavilion, Bulwell Hall Park (£2,000). A Brown, Borough Surveyor.

PORTSMOUTH.—Secondary school (£6,000). Builders, H. Jones & Son, Portsmouth.

ROTHERHAM.—Tenders are to be invited for the completion of the electric wiring at the High School.

SHEFFIELD.—United Methodist Chapel, Stubbins Lane, and new road, for the trustees.

SHREWSBURY.—Alterations and additions to Vaughan's Mansion, College Hill (£1,160). Architect, A. E. Williams, County Chambers, High Street, Shrewsbury.

WEST HAM.—Milling room and label store, Ward Road, Stratford, for Cadas, Ltd., chemists and druggists.

TENDERS RECEIVED AND ACCEPTED

BIRKENHEAD.—The tender of the Brush Electrical Engineering Co., Ltd., has been accepted at £795 for fitting ten small cars with top covers. In reply to a complaint that the work was not kept in Birkenhead, the Chairman of the Tramways Committee states that the lowest local tender was over 6 per cent. higher than that of the Brush Co.

BRADFORD.—The tenders of the Edison & Swan United Electric Light Co., Ltd., and Pope's Electric Lamp Co., Ltd., have been accepted for the supply of incandescent lamps.

BRIGHTON.—The Council have accepted the tender of Messrs. Richardsons, Westgarth & Co., Ltd., for a double-cylinder Parsons-Brown Boveri turbine, and a Siemens' alternator of 3,500 kw. capacity, at £11,370.

The following tenders have also been received for a 1,300 h.p. induction motor:—General Electric Co., Ltd. (accepted), £1,076 10s.; Brush Electrical Engineering Co., £1,210; Bruce Peebles & Co., Ltd., £1,225; Crompton & Co., Ltd., £1,280; British Westinghouse Co., Ltd., (*a*) £1,343, (*b*) £1,367; Siemens Bros. & Co., Ltd., £1,390; Britsh Electrical Plant Co., Ltd., £1,425; British Thomson-Houston, Co., Ltd., £1,467; Lancashire Dynamo & Motor Co., Ltd., £1,535; Dick, Kerr & Co., Ltd., £1,609; Phœnix Dynamo Manufacturing Co., Ltd., £1,635; Electrical Construction Co., Ltd., £1,643.

For 300-kw. balancing set:—General Electric Co., Ltd. (accepted), £930; Bruce Peebles & Co., Ltd., £950; British Westinghouse Co., Ltd., (*a*) £1,072, (*b*) £1,445; Electric Construction Co., Ltd., £1,078; Phœnix Dynamo Mnfg. Co., Ltd., £1,090; Brush Electrical Engineering Co., £1,100; British Electric Plant Co., £1,136; Crompton & Co., Ltd., £1,250; Lancashire Dynamo & Motor Co., Ltd., £1,270; Siemens Bros. & Co., Ltd., £1,315; British Thomson-Houston Co., £1,403; Dick, Kerr & Co., Ltd., £1,461.

Thirteen tenders were received for high-tension switchgear, ranging from £277 to £572. That of the British Westinghouse Co., at £393, has been accepted.

DERBY.—The tender of Messrs. C. A. Parsons & Co., Ltd., for a 1,000-kw. turbo-alternator at £5,203 has been accepted, subject to the consent of the Local Government Board to the necessary loan.

EASTBOURNE.—The following tenders were received for condensing plant and pipe-work for the electricity works:—Willans & Robinson, Ltd. (accepted), £1,888; E. Scott & Co., Ltd., £3,150 10s.; Davenport Engineering Co., £2,640; Prockter & Kenyon, Ltd., £2,607 7s.; Belliss & Morcom, Ltd., £2,500; Richardsons, Westgarth & Co., Ltd., £2,463 12s.; J. P. Hall & Sons, Ltd., £2,450; Browett Lindley & Co., £2,365; Worthington Pump Co., Ltd., £2,348; Mirrlees, Watson & Co., Ltd., £2,340; Westinghouse Electric Manufacturing Co., Ltd., £2,280; Midland Engineering Co., Ltd., £2,198; W. H. Allen & Son, Ltd., £2,140; I. Storey & Sons, Ltd., £2,137 12s.; Brush Electrical Engineering Co., Ltd., £2,014; J. Thompson, £1,779 10s. Not to specification:—C. A. Parsons & Co., Ltd., £1,959; Michael Pal & Co., Ltd., £2,173.

ECCLES.—With reference to our note under this heading last week, Messrs. Browett, Lindley & Co., Ltd., inform us that they, and not the Westinghouse Co., have the order for the generating set referred to. The engine is of Messrs. Browett, Lindley's manufacture, the generator is by the Westinghouse Co., and the condenser by Messrs. Korting Bros., Ltd.

LONDON: *London County Council.*—The tender of E. Newbold & Co., Court Road, Sutton, has been accepted at £133 for the installation of electric lighting and bells at the Poplar Educational Divisional Offices.

The tender of John Mowlem & Co., Ltd., at £39,792, for the roadwork and platelaying (exclusive of rails and special trackwork) in connection with the reconstruction, on the conduit system, of the tramways from Brockley Road to Forest Hill, has been accepted.

The following tenders have been received for the supply, delivery, and erection at the central car repair depot in Woolwich Road of four electric travelling cranes: S. H. Heywood & Co., Ltd., £2,285; Applebys, Ltd., £2,412 10s.; Ransomes & Rapier, Ltd., £2,490; Thos. Broadbent & Sons, £2,536; Royce, Ltd., £2,576; Babcock & Wilcox, Ltd., £2,585.

An offer, amounting to £410, of the British Thomson-Houston Co., Ltd., for fitting a pair of equipments for coupling two single-deck electric cars has been accepted.

Chelsea.—The Council have accepted the tender of Messrs. Rawlings Bros. & Co. at £58 10s. for overhauling and rewiring where necessary the electrical installation in the Town Hall.

Stepney.—The Council have received the following tenders: Turbo-generator and accessories, converting machinery, switchgear, &c., at Blyth's Wharf—C. A. Parsons & Co. (Bruce Peebles alternator), £18,978 10s. and £19,091 (the latter accepted), (Westinghouse alternator), £19,198 and £19,403 (Dick, Kerr alternator), £19,518 (Parsons alternator), £19,614; Richardsons, Westgarth & Co. (Bruce Peebles alternator), £19,279 and £19,394 (General Electric alternator), £19,405 (Siemens alternator), £19,527 (Electric Construction alternator), £19,601; British Westinghouse Electric & Manufacturing Co., Ltd. (Westinghouse alternator), £19,500, £19,450, £18,920, and £19,070; J. Howden & Co. (Bruce Peebles alternator), £19,410 and £19,466 (Siemens alternator), £19,600 (Dick, Kerr alternator).

Digitized by Google

£19,689 (Brown, Boveri alternator), £19,800; Brush Electrical Engineering Co., £19,682 and £19,582; Willans & Robinson, Ltd. (Bruce Peebles alternator), £19,966, £19,506, and £19,506; British Thomson-Houston Co., Ltd., £20,509; Lahmeyer Electrical Co., Ltd., £20,759; G. Braulik (Maffer-Schwartzkopff Werke), £20,824.

For supply and delivery of cable for period ending December 31st, 1912: Henley's Telegraph Works Co., Ltd. (accepted), £8,095 10s.; British Insulated & Helsby Cables, Ltd., £8,237 15s.; W. T. Glover & Co., Ltd., £8,268 10s.; Siemens Bros. Dynamo Works, Ltd., £8,287 10s.; St. Helen's Cable Co., Ltd., £8,335; Callender's Cable & Construction Co., Ltd., £8,352 12s. 6d.; Western Electric Co., Ltd., £8,574 5s.

For conduits, troughs, and covers for the period ending December 31st, 1912: Siemens Bros. Dynamo Works, Ltd. (accepted), (*a*) conduits, £2,280 13s. 4d.; (*b*) troughs and covers, £878 3s. 4d.; Henley's Telegraph Works Co. (*a*) £2,363 3s 4d., (*b*) £878 3s. 4d.; Albion Clay Co., Ltd., (*a*) £2,379 13s. 4d.; W. T. Glover & Co., Ltd., (*a*) £2,645 10s., (*b*) £949 13s. 4d.

For boilers and accessories: E. Danks & Co., Ltd., £13,761 10s. (accepted); Clarke, Chapman & Co., Ltd., £16,382; Babcock & Wilcox, Ltd., £16,960.

For the supply and delivery of 1,000 fuse-boxes: Reason Manufacturing Co., Ltd. (accepted), 50 amp., 1s. 6d.; W. Lucy & Co., 50 amp., 1s. 6d., and 25 amp., 1s. 3½d.; Crompton & Co., Ltd., 50 amp., 1s. 7d.; Johnson & Phillips, Ltd., 50 amp., 1s. 8½d.

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. A. D. Chalmers, electrical engineer to the Gillingham Town Council, has been reduced from £350 to £300 per annum, plus 1 per cent. on the gross profits.

Mr. T. D. Clothier, Borough Electrical Engineer of Bootle, has been granted an honorarium of £50 in view of the satisfactory condition of the electricity undertaking, and the additional responsibility in connection with the proposed alterations at the power station.

Sir Clifton Robinson has retired from the managing-directorship of the London United Tramways, Ltd., and will be succeeded by Mr. A. Stanley, General Manager of the Underground Electric Railways Co., of London, Ltd. Sir Clifton Robinson left London on Tuesday to undertake a tramway project for Messrs. Speyer Bros. in the Phillipines.

The salary of Mr. L. L. Robinson, Electrical Engineer to the Hackney Borough Council, is to be increased by annual increments of £50, instead of £25, until the maximum of £750 per annum is reached.

British Association.—This year's meeting of the British Association for the Advancement of Science will be held at Sheffield on August 31st and following days, under the presidency of the Rev. Prof. T. G. Bonney, Sc.D., LL.D., F.R.S. Among the sectional presidents are:—Section A (Mathematical and Physical Science), E. W. Hobson, Sc.D., F.R.S.; Section B (Chemistry), J. E. Stead, F.R.S.; and Section G (Engineering), Prof. W. E. Dalby, D.Sc.

The Paris Floods.—A note in *l'Electricien* gives some particulars of the damage done by the Paris floods to the electrical undertakings of Paris. Some galleries of the Edison Co.'s substation in the Rue Bergère were flooded, and both accumulators and transformers were submerged, in spite of the efforts of a pair of powerful pumps. The substation of the same company in Rue Trudaine, however, continued to be available, but the water reached that of St. Denis in the afternoon of January 29th. The supply to the Clichy section was also insufficient, as the plant in the station in the Rue des Dames does not suffice for the needs of the district, and the three-phase station at Asnierès, which normally provides most of the supply, was entirely flooded out. The municipal station at the Halles was seriously handicapped, and a total stoppage in a station, and the situation became very critical in the Champs Elysées district, owing to damage to the cable system. As regards the left bank of the river, the large station at Issy les Moulineaux was put out of action on January 28th, and the underground Palais Royal station was entirely under water. The damage in all cases is serious, and no definite date can be given for the resumption of supply. The relative positions of the above stations were explained in an article on "The Paris Electricity Supply," ELECTRICAL ENGINEERING, Vol. V., page 719 (August 12th). All the five telephone exchanges of the Telephone Co. were inundated, and some 1,600 employees thrown out of work. They are, however, all being paid a sum of 1 franc per day, and 50 centimes for their wives and each child or aged relation depending on them for support. According to *La Lumière Electrique*, great trouble was experienced at the Central Post and Telegraph Office in Rue Grenelle, and it was only by the most energetic pumping that the water was kept from the accumulators, motor-generator, &c., which supply various small motors working telegraph and other apparatus. The general telegraphic service, however, was not interrupted. The military wireless telegraph station at the Eiffel Tower was flooded, and it is feared that much of the apparatus has been irretrievably spoiled. A certain amount of communication was maintained with the nearer military stations by means of a 3-kw. portable military equipment.

MISCELLANEOUS CITY NOTES

MONTREAL LIGHT, HEAT, & POWER CO.—A dividend at the rate of 7 per cent. per annum has been declared for the quarter to December 31st.

WESTMINSTER ELECTRIC SUPPLY CORPORATION.—A dividend at the rate of 10 per cent. less tax is recommended for the December half-year.

METROPOLITAN DISTRICT RAILWAY CO.—A dividend at the rate of £4 per cent. per annum is recommended on the 4 per cent. guaranteed stock for the December half-year. Last year the dividend was £1 15s. per cent. The directors propose to set aside £10,000 as reserve for renewals.

NATIONAL TELEPHONE CO.—A dividend at the rate of 6 per cent. on the deferred stock is recommended for the December half-year, less tax, carrying £170,000 to reserve, and £11,000 forward.

ST. JAMES & PALL MALL ELECTRIC LIGHT CO.—A balance dividend on the ordinary shares of 5s. per share, making 10 per cent. for the year 1909, is recommended.

DUNDEE, BROUGHTY FERRY & DISTRICT TRAMWAYS CO.—An interim dividend at the rate of 6 per cent. has been declared upon the preference shares.

SOUTH LONDON ELECTRIC SUPPLY CO.—A dividend of 5 per cent. per annum is announced for 1909.

CHELSEA ELECTRICITY SUPPLY CO.—After paying 4½ per cent. for the year on the ordinary shares for 1909, a balance of £1,362 is carried forward.

CITY OF LONDON ELECTRIC LIGHTING CO.—A dividend at the rate of 7 per cent. per annum on the ordinary shares is recommended for the December half-year, carrying forward £24,000.

PROVINCIAL TRAMWAYS CO.—It is proposed to write down the company's capital by £124,560, by converting the £10 ordinary shares in five shares of £1 each.

BRITISH ALUMINIUM CO.—Mr. A. W. Tait, the receiver and manager, has published details of the proposed scheme of reconstruction, which involves a voluntary winding up of the company, and the registration of a new company to take over the assets. Under the scheme, provision will be made to pay off existing liabilities, and to provide further working capital. The following will be directors of the new company: Mr. A. W. Tait, Mr. R. W. Cooper, Mr. George Flett (Messrs. Dick, Kerr & Co.), Captain Stephen H. Pollen, Mr. W. B. Rommel, Mr. E. E. Sawyer, and Mr. J. Taylor (B. I. & H. Cables, Ltd.). Mr. W. M. Morrison will be general manager.

Black Smoke Prosecution.—The City of London Electric Lighting Co. were fined £5 and 2s. costs at the Tower Bridge Police Court last week for allowing black smoke to issue from a chimney shaft at the Bankside Power House. For the company it was stated that every known smoke prevention appliance had been tried by them, and that they used the best coals. The magistrate said he only fined the company a nominal penalty in view of the fact that they had done everything in their power to prevent a nuisance.

Telegraph Traffic and Movements of Cable Ships.—A new telegraph office has been opened at Cassinga in Angola, and wireless communication has been established with the Comoron Islands and Madagascar, but as the connection is to be regarded as an extension of the telegraph system, a charge for the wireless service will not be made.—A similar connection has been made between the Caroline and Palaos Islands, only in this case the wireless service must be paid for.—The lines of the Indo-European Telegraph Co. were restored to working order on the 31st ulto., and the "*via* Makassar" route was working normally on 1st inst. On the following day the line between Bagdad and Bassorah failed, and the El Arich route beyond Gaza broke down on the 2nd inst. for a short period.—The French cables in the West Indies are still giving trouble, for, now that the C.S. *Pouyer Quertier* is at the western end of the West Indian system to repair the Nedle St. Nicholas—Cape Haiti cable, the cable at the Eastern end between Paramaribo and Cayenne has broken down. As a result, telegrams for French Guiana must proceed *via* Salinas in Brazil.—Now that the floods in Paris have happily subsided, it will be possible to effect repairs to the telegraph system.—The wireless station at Bowden, Jamaica, belonging to the Direct West India Cable Co., is open to the public.—On the 5th inst. communication between Singaradja and Ampenan was interrupted; telegrams for the latter place are being posted from Singaradja.—On the same day the cable between Sevakopmund and Mossamedes failed, as well as that between Lagos and Bonny, and the line between Saigon and Bangkok.—On the 6th inst. the line between Bagdad and Bassorah was again working, and on the 7th inst. success attended the efforts to repair the cable between Lagos and Bonny.

A Safety Gate-end Switchbox for Mines.—We regret that in our report of the discussion on Mr. H. J. Fisher's Paper before the Newcastle Local Section of the Institution of Electrical Engineers on page xxi. of our supplement on ELECTRICAL ENGINEERING IN MINES last week, Messrs. Wood and Morton were incorrectly described. Mr. Wood is with Messrs. Ernest Scott & Mountain, and the Mr. Morton who spoke was Mr. W. R. Morton, of W. T. Glover & Co., Ltd., who were the makers of the trailing cable in question.

COMPANIES' MEETINGS AND REPORTS

POWER GAS CORPORATION.—The report to the year ended Sept. 30th, shows a total profit of £6,440, including £2,660 brought forward. The directors propose to create a reserve fund of £750, carrying forward the balance. Regret is expressed at the death of the vice-chairman, Dr. Ludwig Mond.

At the annual meeting the above report and accounts were adopted. Mr. Alfred Mond, the chairman, referred in his speech to the utilisation of peat in gas plants, and stated that there was now in Tuscany a Mond-peat plant with sulphate of ammonia recovery, which was being used to supply a large area with electricity, the dynamos being driven by gas engines. The German Mond Co. also had a plant at work, and was putting up another large installation. The Power-Gas Corporation had erected a plant which had been successfully run in England, and he thought recent developments in this direction opened up a considerable scope for the company for future years.

MEXICAN LIGHT & POWER CO.—Resolutions have been passed authorising an increase of the capital of the company by the creation of 36,000 additional preference shares and 54,000 ordinary shares of $100 each. The new capital is mainly required for extensions of the transmission line to Pachuca, and for the purchase of an electric power company in that district. The company have now under construction 50,000 h.p. additional plant at their Necaxa works.

CENTRAL LONDON RAILWAY CO.—The report for the December half-year shows a gross profit of £62,359. A dividend at the rate of 3 per cent. per annum on the undivided ordinary shares is recommended, 4 per cent. per annum on the preferred ordinary shares, and 2 per cent. on the deferred ordinary shares, leaving a balance of £35,281. A balance of £33,241 is carried forward.

At the meeting on Thursday, Sir Henry Oakley, the chairman of the company, stated that the company's engineer has in hand the final plans and basis of the contract for the construction of the extension to Liverpool Street.

GREAT NORTHERN & CITY RAILWAY CO.—The accounts for the December half-year show a net revenue of £17,304, which is insufficient, however, to meet the fixed charges. Consequently the sum of £5,709 has been provided from outside sources to enable these to be met. The report states that the directors, after careful consideration have, with great reluctance, felt compelled to abandon the hope of constructing the extension to Lothbury in view of the financial position of the company, and its present restricted traffic. The Earl of Lauderdale presided at the half-yearly meeting on Friday. For the first time since 1907 the traffic has shown a slight increase. Negotiations with the Great Northern Railway Co. with a view to making the terminus of the Great Northern & City Co. the City terminus of the Great Northern Co. have been dropped owing to the terms asked by the latter being prohibitive.

LONDON, BRIGHTON & SOUTH COAST RAILWAY CO.—Speaking at the half-yearly meeting last week, the Earl of Bessborough (chairman) stated that the electrical train services between London Bridge and Victoria had met with immediate and considerable response on the part of the public, particularly in the populous districts of Denmark Hill, Peckham Rye, and Queen's Road. In the very first week there was an increase of over 40,000 passengers, and during the two months since the line was opened there had been a steady and continuous gain week by week. The increase in passengers during the two months, as compared with the corresponding period of 1908-9, amounted to the large figure of 440,536, or just on 63 per cent. The increase in the first month was 189,000, or 55 per cent., and in the second month 251,000, or 71 per cent. Every credit must be given to the principal contractors, the Allgemeine Company of Berlin, for the very thorough and careful manner in which the constructional work has been done and the equipment installed. The traffic results showed that the company had got back nearly the whole of their lost traffic on that section, and these results had led the Board to think of the advisability of extensions. The A.E.G. had readily accepted the conditions of the contract, that, with the exception of the motors, which are the patents of Drs. Winter and Eichberg, and not made in this country, the whole of the plant and work should be English. It was satisfactory to know that the President, Dr. Rathenau, and the managing director, Mr. Hamspohn, of the Allgemeine Company, are most appreciative of the way in which the work has been carried out by their sub-contractors, Messrs. R. W. Blackwell & Co., and have testified to the excellence of the overhead structure, to the perfection of the electrical work, and the solidity, comfort, and smooth running of the rolling stock, for which latter the Metropolitan Amalgamated Carriage Co. of Birmingham, was responsible. It had only been possible to obtain these results by the co-operation of the whole of our executive staff, but special mention must be made of the company's consulting electrical engineer, Mr. Philip Dawson, who had supervised the work throughout. Thanks were due to him for the capable way in which he had carried out his duties, and had dealt with and solved many difficult problems presented by the peculiar conditions of the line. He believed he was right in saying that this was the first recorded instance where electric traction established on an ordinary steam railway had worked from the commencement so smoothly and uninterruptedly, and in this connection it was only fair to acknowledge the ready co-operation and help of the London Electric Supply Corporation, and the efficiency and regularity with which their part of the task had been performed.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 15s. to £62 5s. per ton (last week, £62 to £62 10s.).

SIMPLEX CONDUITS TELEGRAPHIC ADDRESS.—Messrs. Simplex Conduits, Ltd., have registered the telegraphic address, "Siconduliim," for their office at 116 Charing Cross Road, London, W.C., and all telegrams intended for the attention of Mr. Waterhouse, purchasing department and publicity department, should be so addressed.

CANADIAN AGENCIES WANTED.—A North of England firm, manufacturing overhead electric cranes, electric jib cranes, electric capstans and winches, electric transporters, &c., is anxious to get into touch with a large manufacturing firm in Canada open to co-operate with them in extending their Canadian business.

A London firm manufacturing arc lamps, metal filament lamps, automatic transformer switches, transformers, carbons, globes, reflectors, and other accessories, is open to appoint agents at Montreal, Toronto, Ottawa, and Winnipeg, and in British Columbia.

Further particulars may be obtained from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

INCREASE OF PRICE OF RUBBER TAPE.—We are informed by Messrs. Siemens Bros. & Co., Ltd., Caxton House, Westminster, S.W., that the prices of the rubber tapes contained in their lists Nos. 510 and 510A have been increased by a further 10 per cent., making a total increase of 20 per cent. since these lists came into operation.

CHANGE OF ADDRESS.—Owing to increase in business, the London offices of Messrs. Everett, Edgcumbe & Co., Ltd., are to be removed from 87 to 117 Victoria Street, Westminster, where all communications should be addressed in future. Telephone numbers and telegraphic address remain unaltered.

National Industrial Education League.—It is proposed to form a National Industrial Education League with the object of initiating some measure of instruction in technical matters during the last two years of ordinary elementary school training. A large number of trade societies and manufacturing companies have given their support to the proposal, and a conference will shortly be held. The offices of the League are at Craig's Court House, Charing Cross, London, S.W.

Metropolitan Tramway Managers' Association.—The annual dinner was held at the Trocadero Restaurant on Wednesday last week. Sir Clifton Robinson, who was in the chair, said that after fifty years' experience of tramway working he felt the time had come when, with more freedom and less responsibility, he might be able to do even better work than he had done in the past. For this reason he was retiring from the managing directorship of the London United Tramways Co., Ltd. Mr. Edgar Speyer subsequently made the announcement, reported elsewhere in this issue, that Sir Clifton Robinson was going to the Philippines.

Electrically Driven Hose Weaving Machinery.—Messrs. Merryweather & Sons, Ltd., inform us that their Greenwich fire engine works are driven electrically throughout, and that their weaving sheds, which adjoin the fire engine factory, are fitted with special electrically driven looms and other machines for making canvas hoses. They state that they produce a much stronger web by the use of electrically driven looms, as, owing to the great pull exerted upon the yarn by such machines, a light or inferior yarn will not stand the strain; consequently only the best yarn can be used. These weaving sheds are, we understand, the only ones existing in London.

Submarine Cable between Italy and Sardinia.—In January the laying of a new cable between Italy and the Island of Sardinia was completed by Messrs. Pirelli & Co., of Milan. The first cable between Italy and Sardinia was laid in 1875, and its upkeep entrusted to the Eastern Telegraph Co. until 1905, after which date it passed into the care of Messrs. Pirelli & Co., to whom the contract for the supplying, laying, and maintenance for five years was allotted. The core of the new cable is completely armoured with a brass tape as a protection against the teredo. A peculiar condition of the specification was, that the sag was to be not less than 5 per cent. in depths up to 55 fathoms, nor less than 10 per cent. in depths of more than 55 fathoms. The maximum depth reached by the cable is about 700 fathoms.

The Telewriter.—The Postmaster-General has granted a twenty-one years' lease to the Telewriter Syndicate for the establishment of telewriter exchanges in London.

ELECTRICAL ENGINEERING

NO. 164 [VOL. VI., NO. 7] THURSDAY, FEBRUARY 17, 1910. [PRICE ONE PENNY.
All rights reserved. *Registered as a Newspaper.*

"Electrical Engineering," although the Cheapest Electrical Paper (Price **1d.** *weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.*

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

PUBLISHED EVERY THURSDAY. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.

Canada. 8s. 8d. per Annum.

Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for SITUATIONS VACANT AND WANTED, ARTICLES FOR SALE AND WANTED, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

OFFICIAL NOTICES and TECHNICAL COLLEGE ANNOUNCEMENTS are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving

Letters for Insertion, *Tuesday first post.*

Small Advertisements and Official Announcements, *Wednesday first post.*

Displayed Advertisements, *Tuesday first post.*

Corrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 203-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, London." *Telephone No.: 5509 Holborn.*

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON AND WESTMINSTER BANK (Temple Bar Branch).

A Supplement "Electrical Engineering in Mines" is included (gratis) in "Electrical Engineering" on the first Thursday of every month.

BINDING "ELECTRICAL ENGINEERING." — Vol. V. of "Electrical Engineering" (Jan.—Dec. 1909) closed with our issue of Dec. 30. An index for the volume is now ready, and copies may be ordered from any newsagent or bookseller at the price of 1d. each (or post free, 2d.). Binding Cases, including index, are also ready, price 2s. each, post free 2s. 4d. (Abroad 2s. 6d.) Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to us, carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad.

SUMMARY

THE principal feature of the power station which has been put down for the electrical driving of the G.W.R. Carriage and Wagon Works, Swindon, is the pair of 250-h.p. Campbell suction gas producers, each supplying a vertical four-cylinder gas engine. Electric motors are gradually being introduced throughout the works, which will ultimately be practically entirely electrically driven. Continuous current at 250 volts is employed and overhead feeders are used. (Page 107.)

A DESCRIPTION is given of the recently installed electrical equipment of the Brunswick Mills, of the Bannerman Mills Co., at Manchester. Power is taken at 6,500 volts three-phase from the mains of the Manchester Corporation, and transformed down to 400/415 volts in the mill sub-station. Induction motors are used throughout; in some cases placed in towers outside the walls of the mill. Thirty-seven motors are used, aggregating 1,640 h.p. (Page 110.)

A NEW method of planing machine drive by reversing motors has been introduced by the Lancashire Dynamo & Motor Co., which presents considerable advantages over belt drive. The power is supplied through a small motor-generator, which enables a variable voltage to be applied to the main motor, and the control to be effected entirely on the generator field. Considerable economy of power is obtained by regenerative action at the end of each stroke, and very high cutting speeds are possible. (Page 113.)

MESSRS. DICK, KERR & Co. announce that they have made arrangements to manufacture steam turbines under the Bergmann patents in England. The turbine which they will build is of the impulse type, with initial velocity stages. (Page 115.)

IN a Paper read before the Institution of Electrical Engineers in London, Mr. E. A. Watson described some experiments made to determine the amount of the loss by brush discharge off wires charged to high D.-C. pressures, and the critical voltage at which that loss commences. He concludes that the critical voltage for direct current is the same as the maximum value of the critical voltage for alternating current, so that there is an advantage of 41 per cent. for direct current. It was found that the presence of water vapour considerably increased the loss off dirty wires, although it did not affect clean wires, and the author concludes that a factor of safety of from 1·5 to 2 should be allowed after calculating the critical voltage in the usual manner. The actual mechanism of the loss is also considered. In the discussion, Mr. J. S. Highfield gave some interesting figures relating to a H.T. direct-current transmission line, and Dr. Alexander Russell criticised some of the author's conclusions. Mr. E. H. Rayner described similar experiments made with a H.T. wattmeter, confirming the author's results. Mr. H. M. Hobart welcomed the disproof of the contention that, with regard to the critical pressure, there was an advantage of 2 to 1 in favour of direct current. It was now proved to be only 1·41 to 1, as he had always held. (Page 117.)

MR. YERBURY'S Paper on equitable charges for tramway supply has been further discussed at Glasgow. The majority of the speakers disagreed with the author in the matter of relative prices charged for traction and power supply, and thought that in most circumstances it was perfectly fair to charge large power consumers at a lower rate than tramways. (Page 118.)

A PAPER by Mr. A. G. Cooper, read last week before the Manchester Section of the Institution of Electrical Engineers, dealt with the balancing of three-wire systems, both by motor-generators and compensators or "static" balancers connected to slip-rings on the generator. (Page 119.)

AN interesting lecture on protection from lightning was delivered last week by Sir Oliver Lodge in Birmingham. (Page 120.)

AN action by the "Z" Electric Lamp Manufacturing Co. against Messrs. Marples, Leach & Co., as agents for the Bergmann Elektricitätswerke, for alleged infringement of their patent No. 21,654 of 1906, was commenced in the Chancery Division before Mr. Justice Parker on Thursday. The patent in question relates to the use of phospham as a means of preventing the blackening of metal filament lamps by removing the carbon remaining in the filaments after manufacture. The defendants allege that although they use phospham in a similar way, it is for quite a different purpose, viz., as a carrier for red phosphorus for the purpose of improving the vacuum and so preventing a disintegration of the filament. (Page 120.)

IN the Appeal Court on Saturday, judgment was given in the appeal of the British Westinghouse Co. against the decision of Mr. Justice Joyce that the Bremer flame arc lamp patent was invalid on the ground of want of subject matter. The Court of Appeal decided that the lamps sold by Mr. G. Braulik were an infringement of the Bremer patent, and also that the objections to the latter on the grounds of anticipation and want of subject matter failed. The patent was therefore restored, an injunction being granted against the sale of the infringing lamp, and also an inquiry as to damages, the latter being stayed for a month with a view to an appeal to the House of Lords. (Page 122.)

AT a meeting of the Illuminating Engineering Society on Tuesday, a discussion took place upon the question of glare in relation to artificial illumination. The Council are considering the desirability of forming an international committee to gather information from all parts of the world and to publish a report upon the subject. (Page 122.)

THE makers of the Foster metal filament lamp have written to us concerning the efficiencies of their lamps. A suggestion is made that the Institution of Electrical Engineers should loan books from their library to provincial members. (Page 123.)

THE proposal to convert the Isle of Wight railways to electric traction does not receive the support of the railway companies.—The Bury St. Edmunds Corporation propose to hire out high candle-power metal filament lamps for exterior shop-lighting.— Professor J. A. Ewing, F.R.S., will open the new power station of the Dundee Corporation.—A scheme for the lighting of Lucknow is to be prepared.— The Local Government Board have sanctioned a portion only of the loan of £103,000 recently applied for by the Dublin Corporation.—Electric heating and cooking apparatus is to be hired out at Dublin, a month's trial being allowed. (Page 123.)

EXTENSIONS are contemplated at Bridlington (£2,699); Dundee (£60,000); and Nuneaton (£2,105). Two 500-kw. generating sets are required at Carlisle, and electrical accessories and stores at Gillingham, Watford, Swindon, Bristol, Birmingham, and Dublin. (Page 124.)

THE accounts of Messrs. Bruce Peebles & Co. show a loss of £5,683 for 1909. The scheme for reconstructing the British Aluminium Co. has been sanctioned by the shareholders. The capital of the Provincial Tramways Co. is to be reduced from £400,000 to £275,440. (Page 126.)

AMONG the specifications published by the Patent Office on Thursday last was one by Siemens Schuckertwerke for an enclosed flame arc lamp with a receptacle above the globe, in which the fumes are cooled and the chemical particles deposited.—A construction for radial commutators, with provision for a radial circulation of air from the shaft along the working faces, is covered by the American Westinghouse Co.—The Saltpetersäure Industrie-Ges. describes an arc furnace for treating gases, with a device to restart the arc if it should be blown out.—A method of reversing traction motors to effect braking is covered by the British Thomson-Houston Co.—Opposition has been entered to the grant of three patents. The first is that covering the paper-film plate discharger employed in the Lepel system of wireless telegraphy, and the second is for wireless apparatus, including a similar discharger, by the Ges. für Drahtlose Telegraphie. The third patent opposed is by R. Hopfelt, and relates to a process for removing hydrocarbons from metal filaments.—Application has been made for the restoration of a lapsed patent covering a spring-clip terminal. (Page 128.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 17TH.

Royal Institution.

3 p.m. Afternoon Lecture I., "Illumination: Natural and Artificial," by Prof. S. P. Thompson, F.R.S.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London, "Electric Clocks," by F. Hope-Jones.

FRIDAY, FEBRUARY 18TH.

Tramways and Light Railways Association.

7 p.m. Annual General Meeting at the Gaiety Restaurant, London.

7.30 p.m. Annual Dinner at Gaiety Restaurant.

SATURDAY, FEBRUARY 19TH.

Royal Institution.

3 p.m. Lecture II., on "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

General Electric Co.

6 for 6.30 p.m. Annual Dinner at the Trocadero.

Birmingham and District Electric Club.

7 p.m. Annual Dinner at Colonnade Hotel, New Street.

TUESDAY, FEBRUARY 22ND.

National Electrical Manufacturers' Association.

2.30 p.m. Annual General Meeting at Balfour House Finsbury Pavement, London.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "The Present Aspect of Electric Lighting," by H. W. Handcock and A. H. Dykes.

WEDNESDAY, FEBRUARY 23RD.

Institution of Electrical Engineers: Leeds Section.

7.15 p.m. At the University. "Notes on Overhead Lines," by W. B. Woodhouse.

Electrical Trades Benevolent Institution.

7 for 7.30 p.m. Festival Dinner at Hotel Metropole.

THURSDAY, FEBRUARY 24TH.

Royal Institution.

3 p.m. Afternoon Lecture II., "Illumination: Natural and Artificial," by Prof. S. P. Thompson, F.R.S.

Electrical Driving of Textile Mills from the Manchester Corporation Mains.—We publish on another page a full description of the electrical driving of the Brunswick mill of the Bannerman Mills Co., Manchester. In connection with this, Mr. S. L. Pearce (Chief Electrical Engineer to the Manchester Corporation) has very kindly given us the following list of other mills also supplied by the Corporation mains: Butler Street Mill of the Fine Cotton Spinners' Association, 1,000 h.p., consuming approximately 1,500,000 B.T.U. per annum; portion of the McConnell Mill of the Fine Cotton Spinners' Association, 400 h.p., consuming approximately 500,000 B.T.U. per annum; the Carruther Street Doubling Mill of Messrs. Andrew & Bramhall, 400 h.p., consuming approximately 900,000 B.T.U. In addition to the above, which are actually at work, an 800-h.p. installation, consuming about 1,250,000 h.p., is definitely arranged for Messrs. G. Byrom & Sons, Victoria Mills, Droylsden, and negotiations are in progress for a further 2,500 h.p.

Digitized by Google

ELECTRICAL EQUIPMENT AT THE G.W.R. CARRIAGE AND WAGON WORKS, SWINDON

ALTHOUGH a considerable amount of electric driving has been a feature of the Locomotive Works of the Great Western Railway at Swindon for some time, it is only recently that a beginning has been made in the use of electric power in the adjoining Carriage and Wagon Works. The arrangements at the latter works, however, which include a new power station equipped with a large suction producer gas plant, are of considerable interest even if the number of motors installed is not yet very large. The older station at the locomotive works is also equipped with gas engines, but these run on lighting gas. The last engine to be put down there, a 250 h.p. vertical engine, supplied by the Campbell Gas Engine Co., of Halifax, is of similar type to those described below in connection with the new station and running on producer gas, so that when these have been running a while an interesting comparison will be able to be made. The older engines at the Locomotive Works, also of 250 h.p., are six in number, and were supplied by the British Westinghouse Co. It is, however, more particularly the purpose of this article to describe the equipment of the Carriage and Wagon Works.

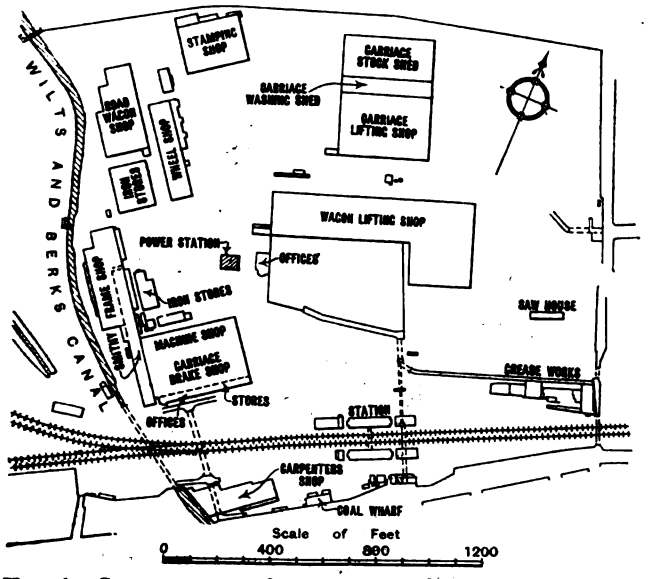

FIG. 1.—SKETCH PLAN OF CARRIAGE AND WAGON WORKS, SHOWING POSITION OF POWER STATION.

The position of the new power house, which has now been running for some months, is shown on the sketch plan in Fig. 1. It consists of a compact building divided into producer room and engine room, and with fuel storage accommodation at one end. The present equipment is of 500 b.h.p., but the building will accommodate a further 250-h.p. set. The station is primarily intended for the needs only of the Carriage and Wagon Works, and should be sufficient for the demand for some time to come, but interconnection between it and the power station at the Locomotive Works at a future date is contemplated.

A section of the power house is given in Fig. 2. The fuel storage stage is sufficient to hold a several weeks' supply. Only the best anthracite is used, the price paid at present being 21s. per ton. An elevated firing platform enables the fuel to be shovelled direct into the charging hoppers of the producers. At present one charge of about 2 cwt. every three-quarters of an hour is sufficient to deal with the light load. Only one producer is kept going at a time, and the plant usually works considerably below half load.

The producers themselves are interesting as being among the largest which the Campbell Gas Engine Co. have yet put to work. Each is rated at 250 b.h.p., and they are entirely independent, having even separate chimneys for blowing off. It will be noticed from Fig. 5 that ample ventilation of the producer room is secured by one side being open to the air. Each producer is 6 ft. 3 in. in height and 3 ft. 9 in. internal diameter, and is provided with two scrubbers, each 16 ft. high by 3 ft. 6 in. diameter. A section showing the arrangement of the producer is given in Fig. 3.

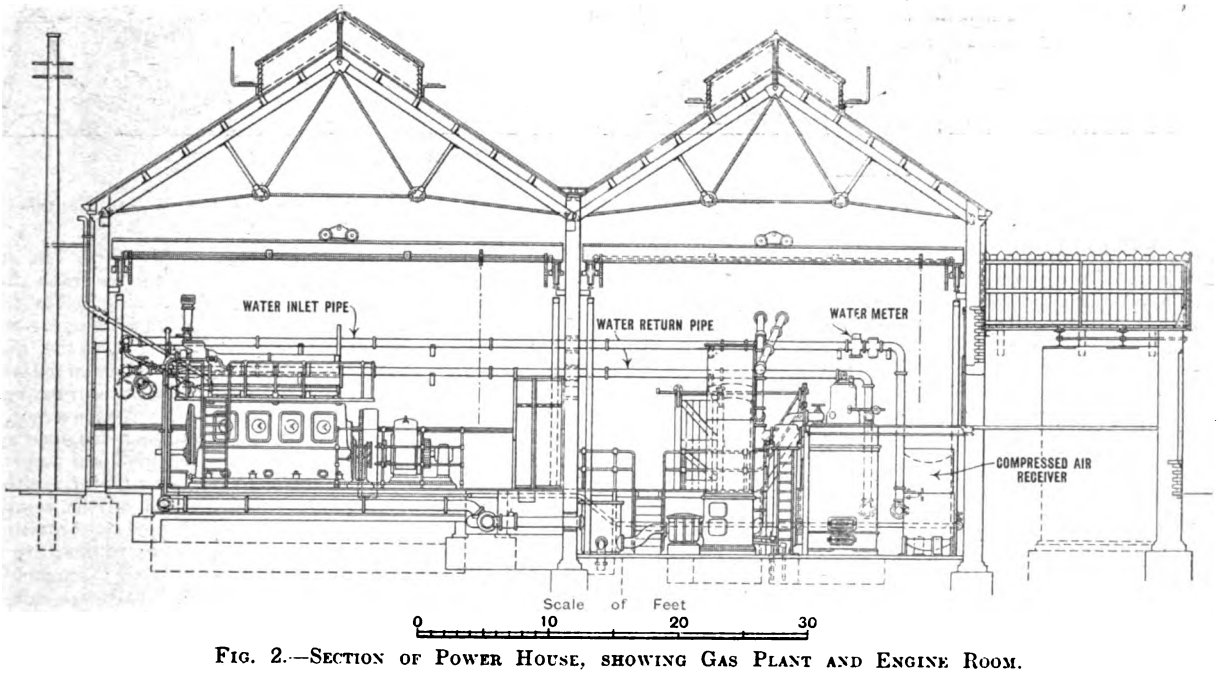

FIG. 2.—SECTION OF POWER HOUSE, SHOWING GAS PLANT AND ENGINE ROOM.

The essential parts of the Campbell suction producer are the actual producer where the gas is generated, the vaporisor or evaporator where steam is produced, the superheater where the air and steam are further heated before entering the producer,

Digitized by Google

and the coke scrubber where the gases are cooled and purified. These parts are all clearly shown in Fig. 3, together with the charging hopper, ashpan, and arrangement of piping. The generator body is made of rivetted steel plate, and has doors on either side to facilitate the clearing away of ash and clinker. The lining is of special firebricks, with a packing of sand between them and the generator body. The ashpan is separate, and is of cast iron, as this resists corrosion better than steel. The vaporisor is placed directly on the top of the generator, and is arranged to allow for expansion and contraction, and to be easily opened out for cleaning. The superheater is between the producer and the scrubber, and also acts as a separator, removing a large proportion of the dust from the gas before it enters the scrubber. The scrubbers in the Campbell producer plants are of particularly large size in order to ensure the thorough purification and cooling of the gas without frequent changing of coke. As in the ashpan of the generator, the lower part is made of cast iron on account of its better ability to resist corrosion, as the water which falls to the bottom of the scrubber is slightly acid. All controlling valves are of the screw-down type, as it has been found that plug cocks have a tendency to stick. The gas-box from which the engine draws its supply is provided with a safety test cock to enable the quality of the gas to be tested before starting the engine.

variation of speed. The mechanical efficiency of each engine is given as 85 per cent., and the following are the guarantees of consumption and thermal efficiency:—

Consumption:—

Full load ...	...	0·9 lb. of anthracite per b.h.-p. hour.
¾-Load	...	0·97 lb. " " "
½-Load	...	1·1 lbs. " " "

Thermal Efficiency:—

Engine and producer at full load,	I.H.-P.	22·8	per cent.
" " " " "	B.H.-P.	19·3	"
Engine only	I.H.-P.	30	"
" "	B.H.-P.	25·5	"

The engines work on the ordinary four-stroke cycle, and are single acting; a section through one cylinder is shown in Fig. 4. The cylinders are entirely independent of one another, so that in case of accident the engine may be run with one or more cylinders idle. An important point in the arrangement of the valve gear is that this is quite clear of the cylinder covers, which can be removed and replaced in a few minutes. The engines are provided with two cam shafts, one inside the crank chamber for the exhaust valves, and the other running across the top of the cylinder, and operating the magneto ignition gear and the inlet valves. Governing is effected entirely on the quantity system by acting on a throttle valve, and hand adjustment enables small changes in speed to be made while running. No variation of the air adjustment is made by the governor. The ignition of these engines is on the low-tension magneto system, and each cylinder has its own separate magneto and tappet gear. An adjusting gear is provided, so that the time of ignition can be varied while the engine is running, and on the erection of the engines the utmost care was taken in synchronising the ignition of all the cylinders to ensure steady running by taking indicator cards. Forced lubrication is used throughout, and the pressure is produced by a submerged valveless ram pump driven by eccentrics on the crankshaft. The water circulation is taken direct from the mains. The exhaust valves are water cooled, and at times of heavy load a water spray can be turned on in each cylinder, and in the exhaust pipe. Starting up is effected by compressed air in one cylinder in the usual way.

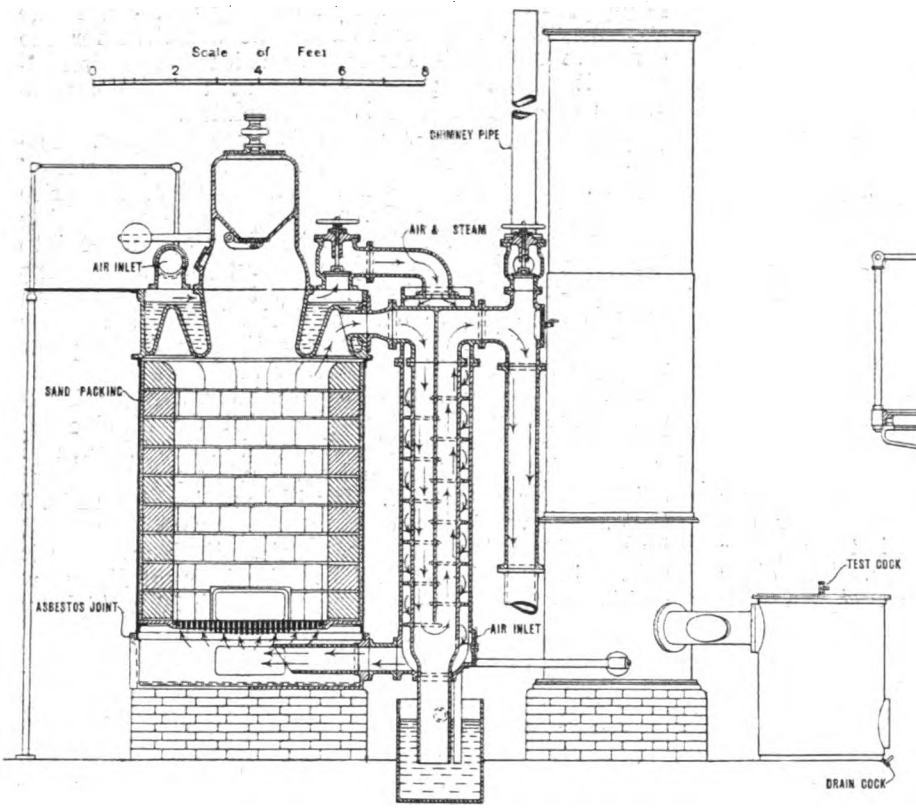

FIG. 3.—SECTION OF GAS PRODUCER.

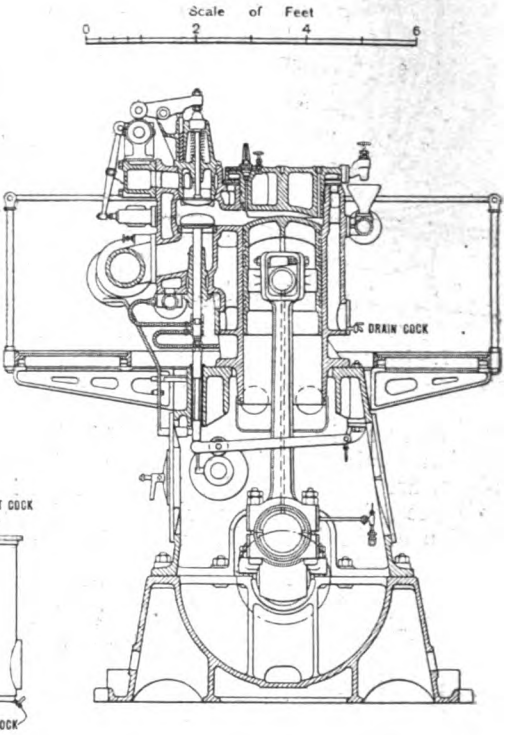

FIG. 4.—SECTION OF GAS ENGINE.

A view of part of the interior of the engine-room is seen in Fig. 6. The generating sets are also two in number. Normally each engine works off its own producer, but cross connecting pipes are provided so that either or both engines may be supplied from either producer if necessary.

Each engine is designed for a normal load of 250 b.h.p., but is capable of a maximum load of 290 b.h.p., and is of the Campbell Gas Engine Co.'s vertical four-cylinder type, running at 225 r.p.m., a speed considerably lower than Messrs. Campbell's standard speed with this class of engine, but adapted so that they could run at the same speed as the existing engines in the Locomotive Works. Each cylinder is 17-in. bore by 20-in. stroke. The crank-shaft is 8½ in. diameter, with a total length in bearings of no less than 57 in. Each engine is fitted with a 5-ton flywheel 7 ft. 6 in. diameter, and the guaranteed coefficient of fluctuation per revolution is 1/150. The governing is guaranteed to be within 5 per cent. from full load to light load, and within 2½ per cent. as regards permanent

Each engine is coupled directly to a six-pole continuous-current generator of the General Electric Co.'s standard type, made at their works at Witton, Birmingham. The armatures of these machines are bolted right

Digitized by Google

up to the engine flywheels without intermediate bearings. Each machine is capable of an output of

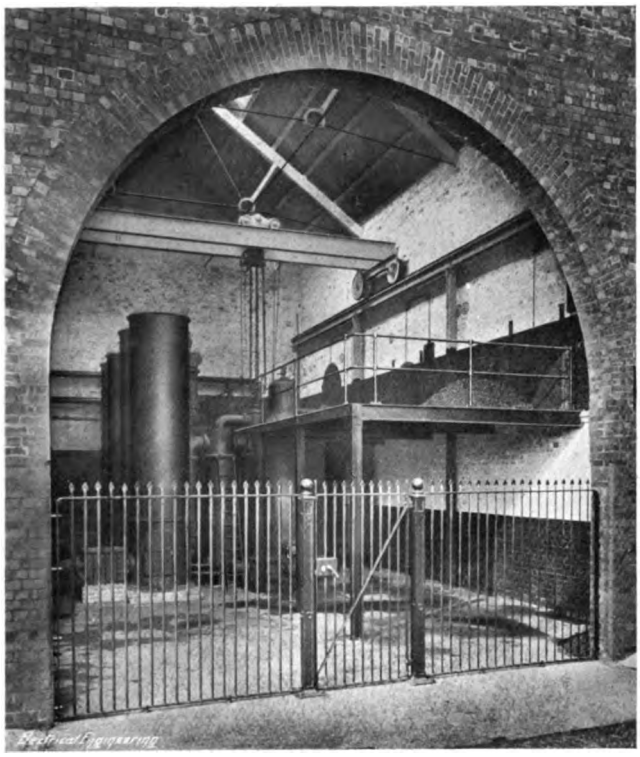

Fig. 5.—View of Gas Producer Plant.

150 kw. at 250 volts when driven by the engines at 225 r.p.m., and is compound wound. They have not been fitted with commutating poles, as they are amply large enough for the work under the conditions of speed and voltage, and can work with constant position of the brushes at all loads.

The General Electric Co. have also supplied recently a similar machine for the station of the Locomotive Works.

The switchboard, part of which can be seen in Fig. 6, was constructed by the Great Western Railway Co.'s own staff, and is of very simple, straightforward design. At present only two generator panels and two feeder panels, giving accommodation for four feeders, are equipped, but blank slate panels are in place for one further generator and four additional feeders. There is a single pair of 'bus-bars, and the transmission is on the two-wire system at 250 volts. Each generator panel has a three-pole automatic circuit breaker, supplied by Messrs. R. W. Blackwell & Co., which acts as combined double-pole main switch and equalising switch for the compound winding. No fuses are used either in the generator or feeder circuits, so that the feeder panels only contain double-pole automatic cut-outs, of the British Thomson-Houston Co.'s design, and the necessary ammeters. The shunt-regulating rheostats are worked by hand wheels on the lower part of the board, where there is also a total output meter. An Evershed leakage indicator with push buttons for testing the insulation of the two sides of the circuit separately is mounted on the wall near the board.

Four two-wire 250-volt overhead feeders, consisting of covered cable supported on messenger wires from wooden poles, leave the power station, and are taken direct to the following departments: the carriage fitting shop, the carriage lifting shop, the road wagon shop, and the wagon lifting shop. In the first three of these, motors are already at work, as will be seen below, and the electrical equipment of the last is to be proceeded with shortly. The introduction of electrical driving is being made gradually as occasion offers. It is intended ultimately to adopt electric motors prac-

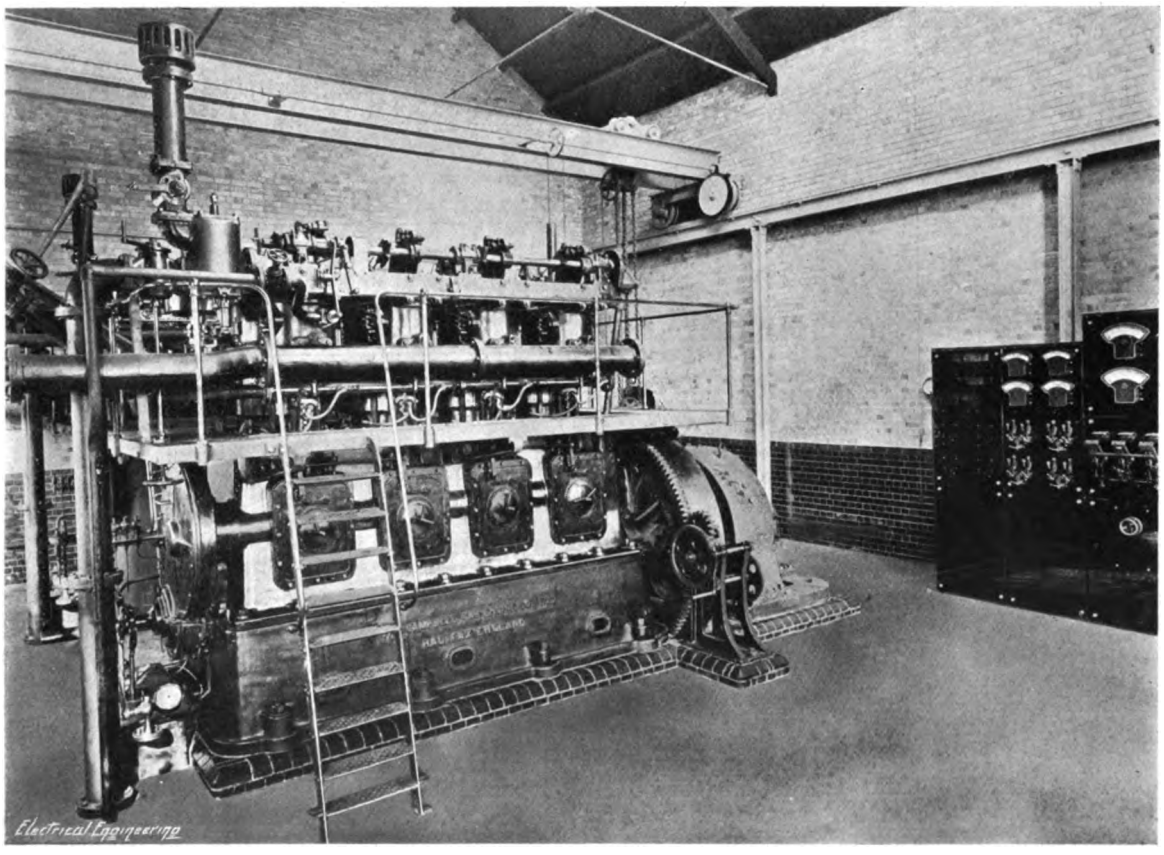

Fig. 6.—View of Engine-room, showing Generating Sets and part of Switchboard.

tically throughout the works, except for such machinery as is already hydraulically actuated or in such special cases as in the stamping shop, where steam is obtained from waste heat from the furnaces.

E

Digitized by Google

In the carriage fitting shop, which has five commodious bays, the machinery of the underframe and bogie section is now mainly electrically driven, but most of the remainder of the shop is still driven by steam. Various different arrangements of motor drive are used; in two cases short lengths of shafting are driven through belting by motors supported on brackets a few feet from the floor, but independent drive is used for the larger machines. An example of this is a large double-headed slotting machine driven by two motors placed in pits under the floor at either end of the machine, mounted on slide rails and driving through short belts entirely covered in. An adjoining large milling machine is driven by a motor similarly placed. The above-mentioned motors were supplied mostly by Messrs. Greenwood & Batley (Leeds), and are of the semi-enclosed type. One of the short lengths of shafting, however, is driven by a Crompton motor. As a rule, the starting panels are of the ironclad type, placed on the wall or affixed to a stanchion near the motor in question. The feeders are brought to distributing boards with tubular fuses. From the distributing boards to the motors all wires are in screwed Simplex conduit. Several bays of this shop are served by 10-ton electric travelling cranes, supplied by Messrs. Craven Brothers, of Manchester. In another part of this shop a row of five large grindstones and four emery wheels are driven from a shaft by a single motor. In this case a short section has been detached from a length of shafting running all along one side of the shop under the floor and a motor belted to it.

In the carriage lifting shop, to which another feeder runs, there is a 25-h.p. Greenwood & Batley motor running at 650 r.p.m., which drives the saw-mill, and a 40-h.p. Royce motor running at 400 r.p.m. driving a long row of about a dozen wheel lathes and a wheel-balancing machine. A motor is also being installed to drive the paint mill in this shop, which is at present driven by a gas engine running day and night continuously. In the road waggon shop the only application of electric power at present is a 25-h.p. Greenwood & Batley motor, which drives a group of wood-working machinery through the original shafting. As already stated, a feeder is also provided to the wagon lifting shop, but no motors have as yet been put in.

In conclusion, we wish to express our thanks to Mr. G. J. Churchward (Locomotive Superintendent to the Great Western Railway) for permission to visit the works and for putting drawings and photographs at our disposal; and to Mr. C. S. Wilson, one of the assistant managers, for conducting our representative round the works. We should also acknowledge the assistance given to us by the Campbell Gas Engine Co.

ELECTRICAL DRIVING AT THE BRUNSWICK MILL, MANCHESTER

THERE has been a considerable amount of controversy recently in regard to the electrical operation of textile mills, but it is instructive to note that during the last five years, since the first electrically operated mill was set to work, the Acme Spinning Co.'s mill at Pendlebury, electrical driving to the extent of some 50,000 b.h.p. in alternating-current induction motors has been installed in the United Kingdom, and that to date there is in the region of 300,000 b.h.p. of motors installed in similar mills in the United States alone. The Continent also is responsible for the installation of motors to a considerable extent. This is conclusive evidence of the remarkable progress electrical driving has made since its introduction in the United Kingdom. It is also instructive and significant that of the 50,000 b.h.p. in operation in the United Kingdom, approximately 20,000 b.h.p. are driven by current supplied from outside sources.

One of the latest electrical installations to be set to work in the United Kingdom is the Brunswick Mill of the Bannerman Mills Co., Ltd., Bradford Road, Manchester. This mill is one of a very old-established concern, and has been run for many years in the ordinary way, having been driven from steam engines and the power transmitted to the various mill rooms by means of belt, rope, and gear drives. The mill has for several generations been continuously and successfully driven in this manner, and it required, on the part of the mill authorities, considerable confidence in the reliability and commercial economy of electrical transmission to depart from their time-honoured

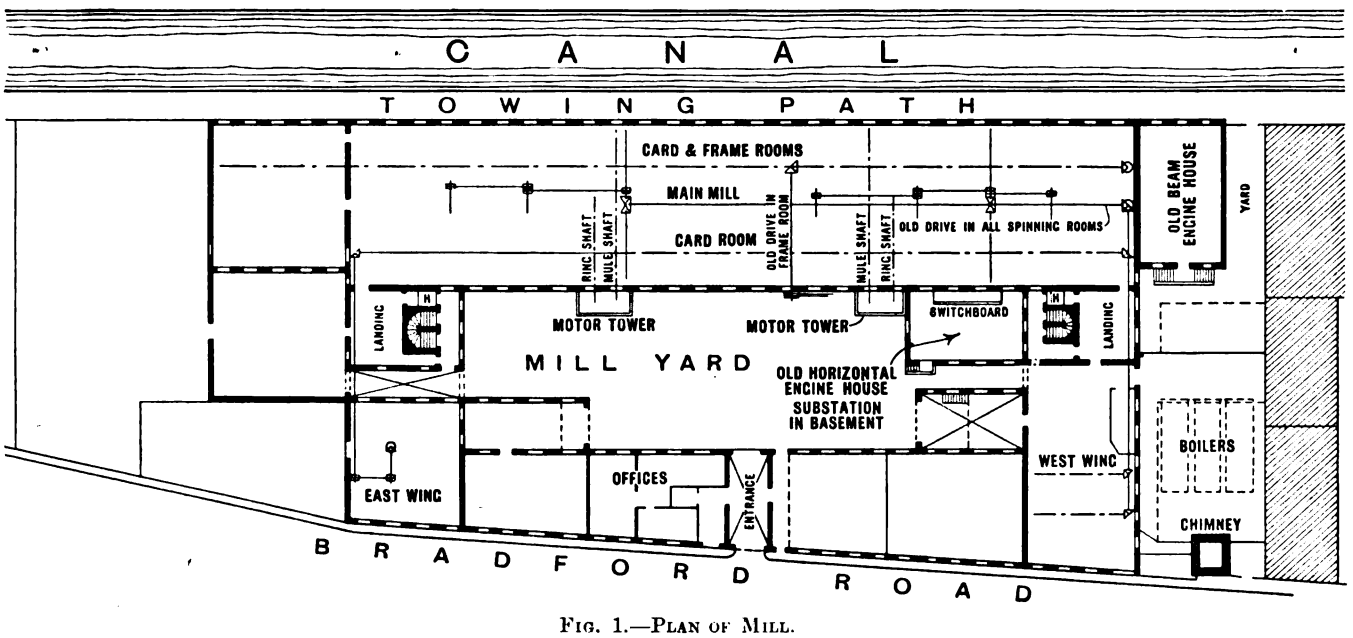

FIG. 1.—PLAN OF MILL.

Full lines indicate old transmission (shafts, &c.) dispensed with. Dotted lines indicate present transmission by electric drive.

Digitized by Google

method of driving. It is, however, characteristic of the enterprise and foresight which have invariably distinguished the career of the managing director of this company, Mr. C. W. Macara, the well-known President of the English Federation of Master Cotton Spinners' Associations, and of the International Federation of Master Cotton Spinners' and Manufacturers' Associations, that, after exhaustive investigations had been made, it was decided to place the continuity of the running of the mill in the hands of an outside source of power, viz., the electricity department of the city of Manchester. The installation now completed has, we understand, amply justified the confidence shown in the electricity department, and the arrangement between the two parties may be cited as an example of the enormous influence a centralised electric power supply may exert in the industrial development of a district.

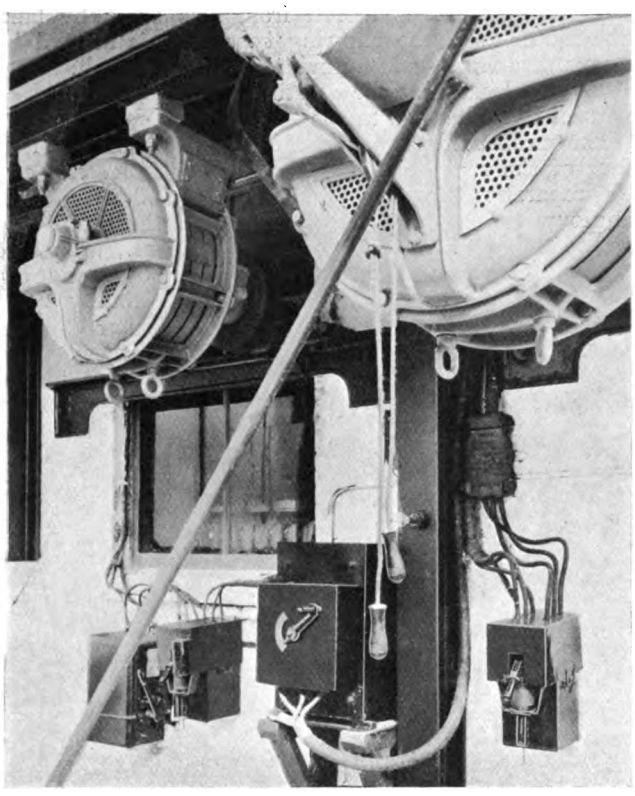

Fig. 2.—Arrangement of Motors in Tower.

The installation, carried out by the British Thomson-Houston Co., Ltd., electrical engineers and manufacturers, of Rugby, under the general supervision of the City Electrical Engineer, Mr. S. L. Pearce, is one of the largest single-mill equipments at present working electrically in the United Kingdom. The mill contains both mule- and ring-spinning spindles, and on the Federation basis is rated as equal to 100,000 mule spindles, spinning from 36's to 72's counts from American and Egyptian cotton. The whole of this machinery was originally driven by means of a two-crank beam engine and a single-crank horizontal steam engine with a combined power of 1,600 i.h.p. For transmitting the power from these engines to the various rooms in the mill, spur and bevelled gears and upright shafts from the large beam engine were adopted, and rope driving with bevelled gears from the small horizontal engine. By adopting the electrical drive, practically all of these gears and upright shafts were dispensed with, and to-day there remain in the mill only two small pairs of bevelled gears, one at the foot and the other at the top of an upright shaft, which, for purely local reasons, have been allowed to remain for driving a small amount of light machinery in the east wing of the mill. The mill to-day is driven throughout from the mains of the Manchester Corporation by means of three-phase induction motors, working on a 400-415-volt supply at a frequency of 50 cycles per second. The current for driving the mill is supplied from the Corporation mains at 6,500 volts; a duplicate set of mains being carried to a sub-station arranged in the basement of the original small engine house. It is there transformed from 6,500 volts to a working pressure of 400-415 volts for the motors, and to 220 volts for lighting purposes. The mill contains in all

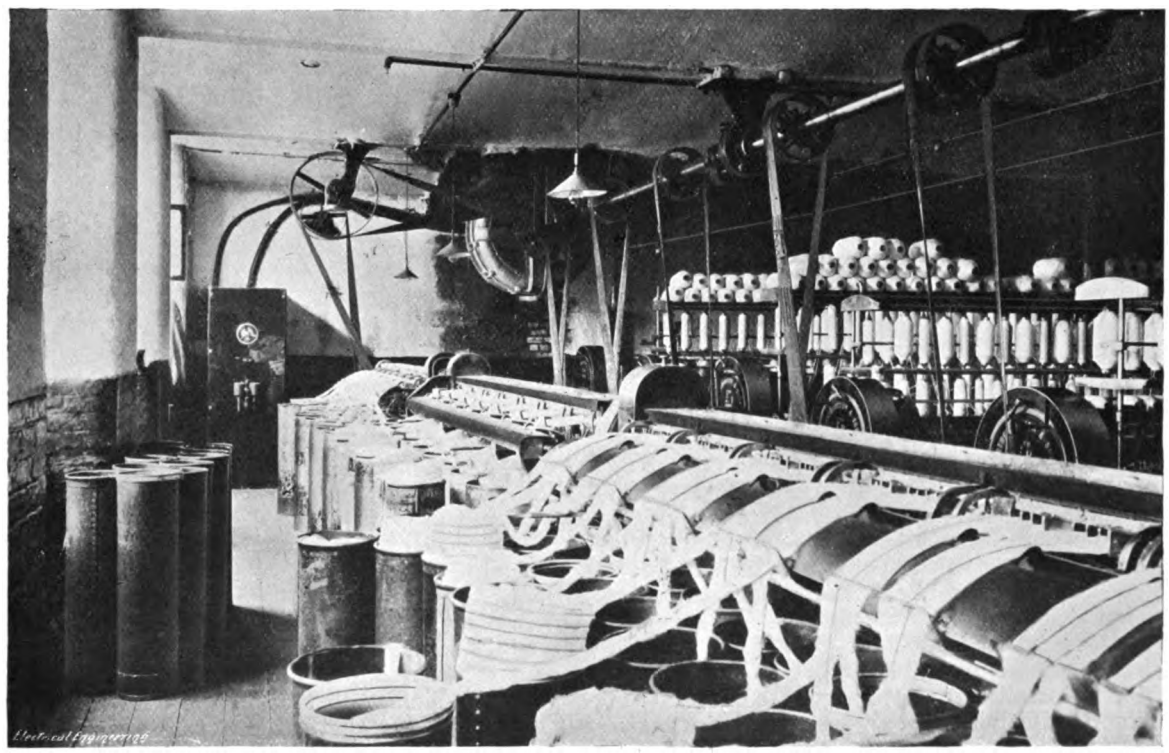

Fig. 3.—View of Frame Room.

Digitized by Google

thirty-seven motors aggregating 1,639½ b.h.p. The capacity of the two E.H.T. feeders is ·15 sq. in. each, and they are connected through non-automatic oil switches straight on to the sub-station bus-bars. For the power supply, four Westinghouse 500-k.v.a. oil-cooled three-phase transformers have been installed, and for the lighting supply one similar unit of 90-k.v.a. capacity. The H.T. and L.T. switchgear is of the British Thomson-Houston Co.'s own manufacture, one panel—on which is mounted the operating gear for mechanically remote-controlling the H.T. oil switches, as well as for the direct operation of the L.T. switchgear—being allocated to each unit.

Fig. 1 shows a general plan of the mill, and indicates the position of the two engines which originally drove it, together with the methods in use up to the time of the installation of the electrical drive for transmitting the power from these engines to the various main rooms. It will be noted that the problem of converting the mill from the mechanical to the electrical drive presented some unusual features, probably unique, and it is interesting to record that the methods adopted have proved very satisfactory to all concerned.

In describing the methods adopted for driving, it is proposed to commence at the point at which the raw cotton is received in the mill and follow it through the various manufacturing processes until it is ready for despatch as the finished product. The bale hoist is situated in the west wing, and for driving this hoist a small motor is installed inverted on the ceiling of the blowing room, and driving by belt on to the hoist shaft. There is therefore no current consumption at this point, except at those times when the hoist is actually working.

For driving the bale breaking, mixed lattices, and blowing-room machinery a special motor of 45 b.h.p. is installed in the blowing room directly connected by flexible coupling to the line shaft, from which the blowing-room machinery is driven. This line shaft now runs at 480 r.p.m., having been speeded up from its original speed and the line shaft pulleys altered accordingly. The line shaft driving the bale-breaking and mixing room is driven from this shaft by belt. The motor is of the slip-ring type, and is started by means of a triple-pole automatic trip oil switch, and a totally enclosed metallic starting rheostat mounted on a panel erected close to the motor.

The main card room, which is situated on the first floor of the main mill, and containing 112 cards and 16 preparation frames, is driven by a 150-b.h.p. slip-ring type motor, directly connected to the main card line shaft, which is running at 290 r.p.m., a flexible coupling being installed between the motor and the line shaft. In this room there were originally three main lines of shafting. By the installation of electrical driving one of these lines was dispensed with, and two rows of cards driven from one shaft placed between the two rows, the remaining line shaft being driven from this by ropes. The starting apparatus for this motor is a triple-pole automatic trip oil switch, and totally enclosed metallic starting rheostat mounted on a suitable panel placed close to the motor.

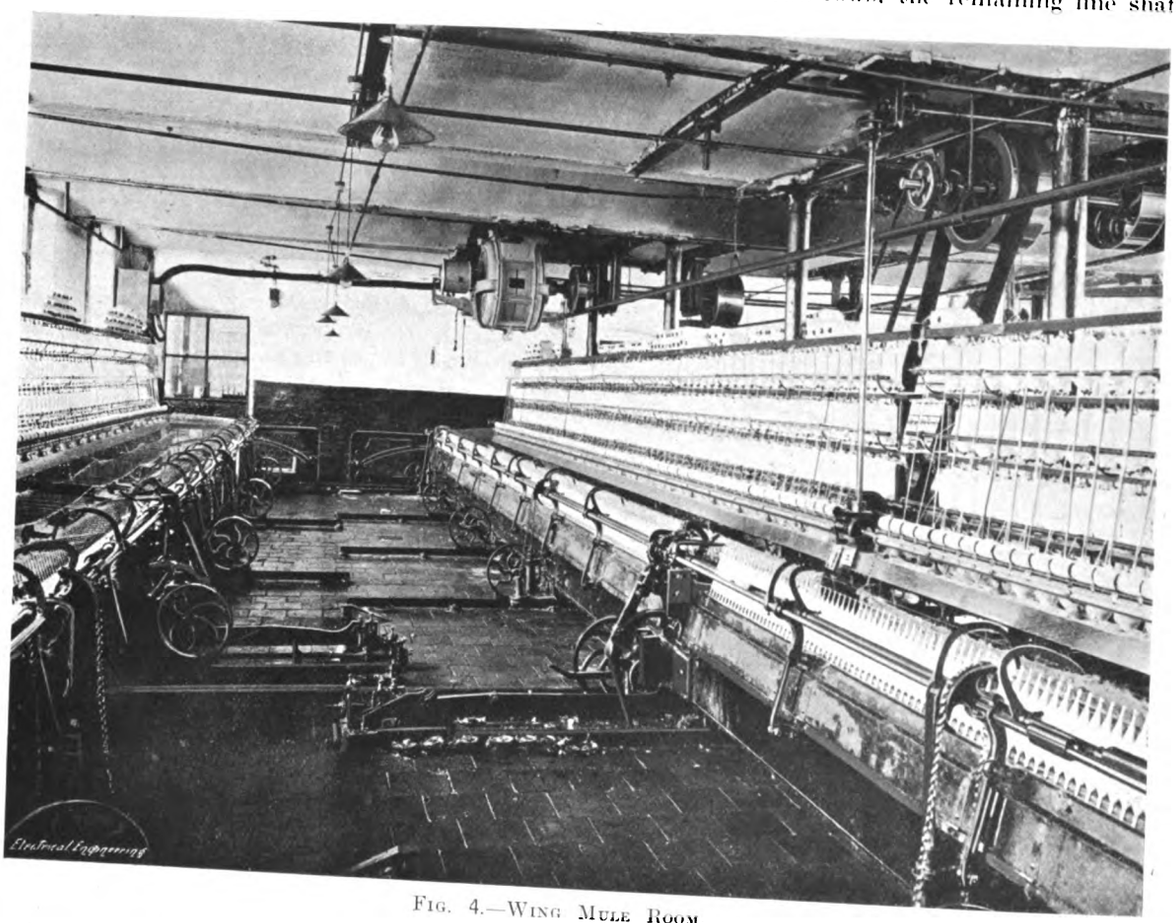

FIG. 4.—WING MULE ROOM.

The speed frame room, containing 64 drawing, slubbing, intermediate, and roving frames, is situated on the second floor of the main mill. This room is driven by means of a 130-b.h.p. slip-ring type motor, directly connected to the main-line shaft by a flexible coupling, running at 485 r.p.m., the installation being generally similar to that in the card room mentioned previously. In both these cases, since the rooms driven contain preparation machinery, and the atmosphere is often charged with cotton dust, it has been found advisable to cover in each of the motors with a sheet-iron case connected by shallow air trunks with the outside atmosphere, a small electrically driven fan being installed for drawing air from the outside of the mill on the one side through the motor, and out again to the other side of the mill. Two small roving rooms,

Digitized by Google

one in each of the two wings, are each driven by one 18-b.h.p. squirrel-cage type motor, directly connected by a flexible coupling to the line shaft running at 475 revolutions per minute; each of these motors is started by an oil-immersed star-delta starting switch, situated close to the motor.

The ground floor, and the third, fourth, fifth, and sixth floors in the main mill, each containing four pairs of mules and ten ring frames, presented one of the most difficult problems for solution, and the method adopted for driving these rooms is undoubtedly one of the most interesting features in the entire installation. The positions of the machines in the various flats rendered it practically impossible to group more than two pairs of mules on each motor. This in itself was a somewhat difficult requirement, inasmuch as the power demand for driving this particular class of machine varies to a considerable degree, the maximum demand being at the very least twice the minimum, and the cycle of operations being comparatively rapid. A further serious consideration affecting the method of procedure to be adopted was the necessity for such an arrangement as would enable the mill to continue its ordinary working during the change over. The method adopted, therefore, to drive these flats was to build two motor towers, one at each end of the mill on that side of the mill nearest the courtyard. The towers, which are independent of the main mill structure, are built entirely of steel framing and glazed casing, no brickwork being used. In each of these towers two motors per floor are installed for driving each spinning room, there being in all ten motors per tower. Fig. 2 shows the arrangement of a pair of such motors, together with their switchgear. Each of the motors for driving the mules is of the slip-ring type, rated at 75 b.h.p., running at 485 revolutions per minute, and coupled directly to the mule line shaft by means of a flexible coupling. Each of these line shafts runs the full width of the mill, and drives by belt the four countershafts for the mules, special pulleys being provided on the line shafts to suit the increased speed. The ten ring frames, which are situated in the two lines along the middle of each spinning room, are divided into groups of four and six, and, owing to the fact that it was necessary to provide that the mill authorities could conveniently alter the speed of these frames to suit the various counts to be produced, a novel and ingenious system of rope transmission, which provides for three changes of speed at the spinning frame, was adopted. The six frames on each floor at the western end of the mill are driven from a line shaft carried half-way across the room and running at 725 revolutions per minute (probably the fastest running line shafts in the world driving ring spinning frames), a squirrel-cage type motor of 45 b.h.p. capacity being directly coupled to the line shaft by means of a flexible coupling. Rope pulleys of special design to provide the three changes of speed required are installed on the line shaft, the frames being driven by ropes over adjustable gallows pulleys. The four ring frames on each floor at the eastern end of the mill are driven in a similar manner from a line shaft running at 725 revolutions per minute, directly coupled to a 30 b.h.p. squirrel-cage type motor, there being in all five floors driven in this manner. A view of one of the frame rooms is given in Fig. 3, and one of the wing mule rooms is seen in Fig. 4.

The starting apparatus for each of the motors in the two towers is arranged in the towers on the same floor as the motor, as shown in Fig. 2, and a special arrangement of emergency push-buttons is fitted in each room, so that in case of necessity any motor may be stopped from the inside of the mill.

The winding and beaming machines situated on the various floors of the east wing are driven by means of an 18 b.h.p. motor, 475 revolutions per minute, squirrel-cage type, driving by belt on to a line shaft, the power being transmitted to the various floors by means of a light upright shaft and two pairs of bevelled gears. The mill hoists throughout the mill are each driven by separate motors, as also is the mechanics' shop.

Advantage has been taken of the alterations carried out to equip the mill throughout with sprinkler apparatus, the sprinkler tank being arranged on the top of the eastern motor tower. The supply of water to this tank is by means of an electrically-driven high-lift turbine pump, provided with special starting apparatus, which automatically starts up the motor, in order to keep the tank filled when any of the sprinklers in the mill are in operation. The pump continues to run and supply water until it is shut off by hand.

The main mill switchboard is arranged on the first floor of the original small engine-house directly over the Corporation sub-station. There are in all ten main motor feeder circuits on this board, and one incoming feeder circuit, also one main lighting board. Each of the motor feeder circuits is fitted with a triple-pole oil switch having automatic overload cut-outs. Each circuit has polyphase indicating and integrating wattmeter, and the information obtained in this manner forms a complete check on the operation of each department.

The distributing mains and branch cables between the mill switchboard and the various motors are of the three-core steel tape armoured type throughout, and are carried along and fixed to the mill walls and ceilings. Where more than one motor is fed from the same circuit, enclosed distributing fuse-boxes are installed, each of the three phases being in a separate box. The whole of the distributing boxes for the main mill motors are erected on a steel framework on the first floor level of the western motor tower, from which separate cables are run to each motor. The distributing boxes for the two wings of the mill are erected on the landings by the staircases.

The mill is lighted by about 1,000 carbon filament 220-volt lamps, a separate three-phase lighting transformer being installed to provide this lighting current, and the mill circuits being arranged so as to preserve the balance of load between phases. The wiring throughout is carried in heavy gauge steel screwed tubing fixed to the mill walls and ceilings, the whole being in strict accordance with most recent practice and requirements of the fire insurances offices.

As a result of the experience to date, the mill management are able to make a definite pronouncement that they are obtaining from the same machinery a larger production, and they are of opinion that the more regular turning obtained gives an improved quality of yarn. This statement, coupled with the fact that the manufactures of this company have always been of the highest grade, is eloquent testimony to the advantages which accrue from the application of electrical power to the textile industry.

We should not conclude this article without expressing our appreciation of Mr. Macara's readiness in allowing a description of the equipment to be published, and recording our indebtedness to Mr. S. L. Pearce (Chief Electrical Engineer to the Manchester Corporation), and also to the British Thomson-Houston Co., who kindly put full particulars with drawings and photographs of this important contract at our disposal.

Faraday House.—We are informed that the annual dinner of the Faraday House Old Students' Association will be held at the Queen's Hotel, Leicester Square, on Thursday, March 17th (St. Patrick's Day). The President for the year, Mr. Reginald S. Downe (General Manager, Brompton & Kensington Electricity Supply Co., Ltd.), will be in the chair. All Faradians who wish to be present should communicate with Mr. Foulds, Faraday House.

ELECTRICAL DRIVING OF PLANING MACHINES

A NEW system of electrical planing machine drive by reversing motors has been brought out under the name of the "Lancashire" system by the Lancashire Dynamo and Motor Co. (Trafford Park), Manchester, for which considerable advantages, especially in the direction of higher speed and more perfect control are claimed, as against the ordinary method of reversing by shifting belts. Owing to the slip of the belts when reversing, their life is very short, and also a certain amount of

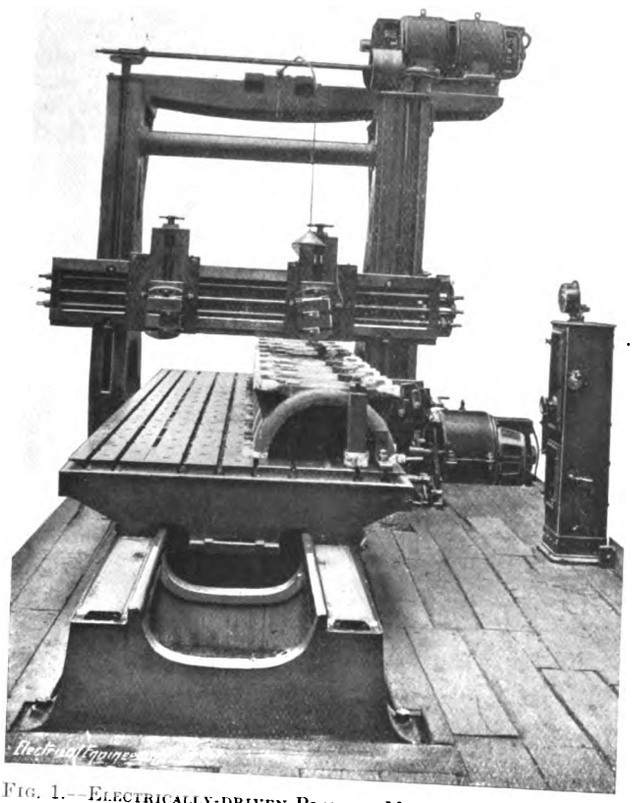

FIG. 1.—ELECTRICALLY-DRIVEN PLANING MACHINE, "LANCASHIRE" SYSTEM, SHOWING MOTOR GENERATOR.

time is lost at each reversal. Again, variation in cutting speed is hard to obtain without elaborate gear boxes or complicated mechanism. Further disadvantages are want of accuracy in the point of reversal, a certain liability in spring planers for the table to jump on intermittent work, and waste of power owing to the large amount of energy stored in the heavy belt pulleys which have to be reversed, also in many cases the tool is only actually removing metal during a small portion of the cutting stroke, but the table only runs at the same speed whether the tool is cutting or not. Again, owing to the design of the belt-driven high speed planer, strokes of less than 3 ft. are not possible for any length of time, due to burning of belts and heating of pulleys. The Company claim that their new system avoids these disadvantages, and thereby tends to a diminution of production costs by reducing charges for maintenance and depreciation.

The principal feature of the system is the use of a motor generator running at a high speed, mounted in any convenient position on the machine, and supplied with power from the electricity supply available. Either alternating or direct current may be employed, and if no current is available, the special generator may be driven from a line shaft instead of by a motor. The generator is connected electrically direct to the planer motor, which is coupled or geared to the planer driving shaft. This generator and motor are direct current machines and wound for any convenient voltage. A reversing switch is actuated by a tappet rod from the reversing gear of the planer, and when this is thrown over it reverses the direction of the current in the field winding of the generator, thus reversing the direction of rotation of the planer motor, and at the same time it so regulates the voltage of the generator by which the speed of the planer motor is decided as to cause the planer motor to run at the speed required according to whether it is on the cut or return stroke.

The cutting speed may be varied by hand to suit the work being done, by means of a regulating resistance in the generator field, this resistance being put in circuit by the reversing switch on the cutting stroke only. This gives a constant return speed, but, if desired, the return speed can be varied also. By this means the speed of cutting may be varied by turning one handle from 15 ft. per minute, or even less if desired, to the full return speed of the planer, and any number of intermediate speeds are obtainable. Of course, the maximum speed of cutting is limited by the speed the tool will stand. The system is a truly regenerative one, as the energy stored in the planer table and its load, as well as that stored in the revolving parts of the planer and motor, is returned to the circuit at each reversal, by causing the planer motor to become a generator at this instant, and to give out energy through the motor generator to the line. This not only results in a considerable saving in power, but a very powerful braking effect which causes the motor to reverse instantaneously. The switchgear required is simply that for an ordinary variable speed motor, and is made in ordinary starting panel form. The only switch moving at each reversal of the planer is the reversing switch, which only deals with the field current of the generator, this being equivalent to the current required by a few incandescent lamps. There are no switches or resistances in the main circuit except the ordinary starting switches, which are operated only when starting or stopping the machine for the day. If it is desired to control the planer from various points round it, small switches for the field circuit will be supplied by means of which the planer may be instantly stopped and started from any point at which one of these switches is fixed. The arrangement of the various parts of the equipment is clearly shown in Figs. 1 and 2.

The reduced loss of time per cycle obtained by this system, as against belt driving, is seen in the following table, which

speed the tool will cut at. This gives not only a wide variation, but twenty or more intermediate speeds.

Owing to the true regenerative working of this system, there is absolute control at the reversal. This control is not by springs or anything which can become fatigued or change its properties. At any given speed, and with the table loaded or

Block planed on belt-driven machine. Block planed by the "Lancashire" drive.

Fig. 3.—Samples of Work to show Accuracy of Stopping at End of Stroke.

unloaded, a planer fitted with this system will plane up to a line. This is strikingly shown in Fig. 3.

Fig. 4 gives a power diagram from a recorder chart, from which it is seen that the stored energy in the moving parts is returned to the circuit at each reversal and not wasted. This makes a considerable saving in the power used. The return speeds obtained are higher than have been obtained with any other system. By a simpler and inexpensive attachment the table can be speeded-up to the full return speed during those portions of the cutting stroke when the tool is not actually cutting, and at the same time the control is so perfect that the tool starts to cut again at the proper rate of cutting. This system permits of strokes as short as 2 in. if the mechanical design of the planer is suitable, or it can be reversed by hand if necessary. This makes it possible for work to be done at high speeds which would formerly have had to be done on a slow-speed planer.

The switchgear is little more than that required for an ordinary motor. The panel illustrated here is an ordinary starting panel; the hand-wheel in the centre regulates the

cutting speed, and the case at the side contains the switch referred to before for starting and stopping the planer motor for changing tools, etc. The reversing switch is not in the main circuit and does not have to deal with any heavy current.

It may, perhaps, be objected that the cost of this system is high. This is not so as the variable voltage-control permits the use of a motor with a much smaller frame than the usual variable-speed constant-voltage machine, and as the motor generator may be a high-speed machine, its cost is small. The switchgear is simpler and less expensive than any other system.

This system claims to save the cost of renewal of belts and the cost of renewal of springs; also broken tools and spoilt work, and a considerable portion of the power bill; and, most important of all, to save *time* and to reduce production cost.

THE DICK, KERR–BERGMANN STEAM TURBINE

FOLLOWING their success in the construction of high-speed generators for turbine drive, Messrs. Dick, Kerr & Co. (Preston) have decided to extend their sphere of action to include complete turbo-generator sets by undertaking the manufacture on a large scale at their own works of steam turbines also. They have accordingly arranged with the Bergmann Elektricitäts-Werke to manufacture turbines under their patents and designs, so that the machines will in no way be experimental, but will embody the result of very extended experience.

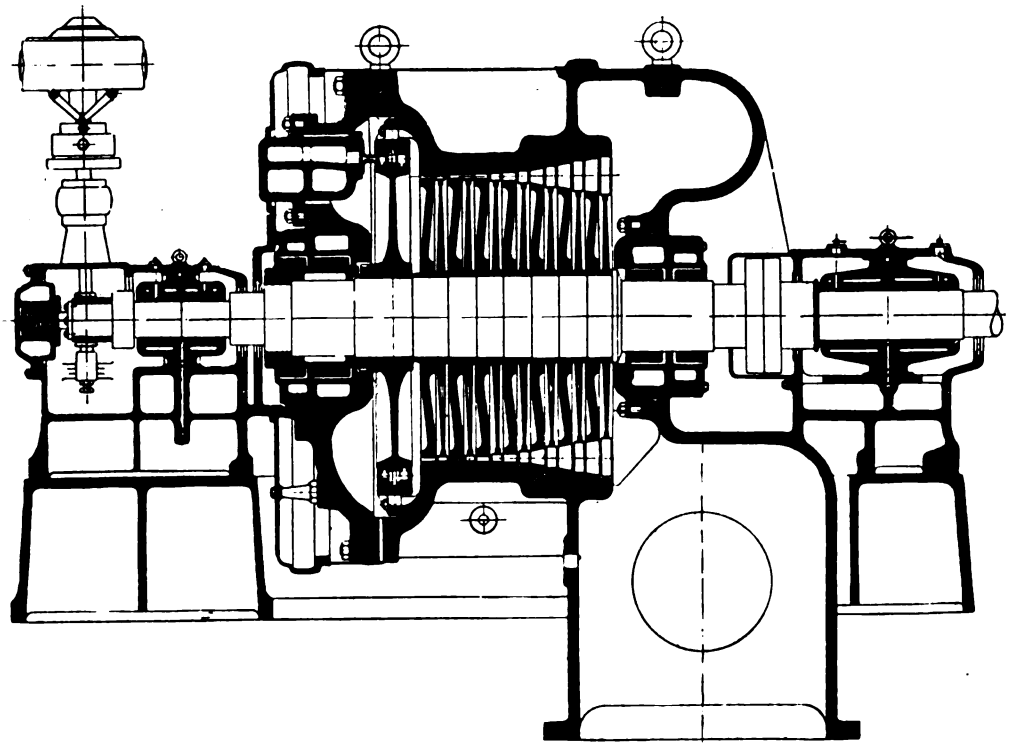

Fig. 1.—Section of Turbine.

The Dick, Kerr–Bergmann machine can be classed as an

impulse turbine with velocity stages, and the firm sum up the advantages of this type over the reaction turbine as greater

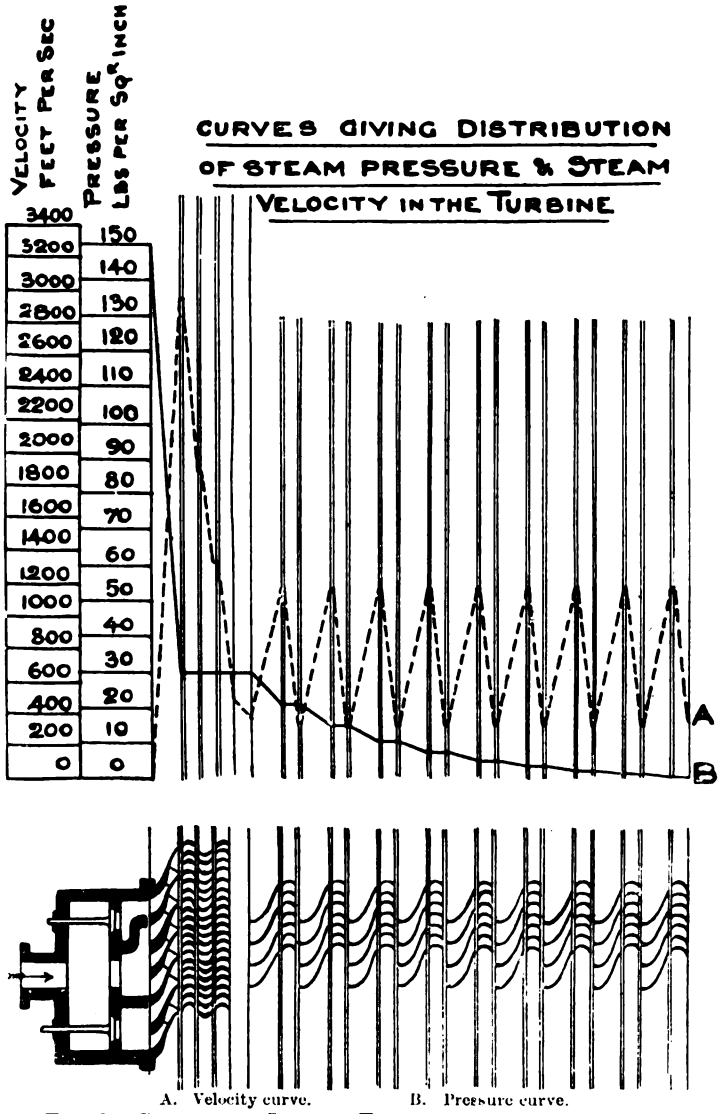

FIG. 2.—CURVES FOR IMPULSE TURBINE WITH VELOCITY STAGES.

security due to larger possible clearances, reduced number of stages, with the possibility of using partial admission, and entire absence of axial thrust. In the first or "velocity" stages, the steam in the same pressure stage is led, after leaving the first set of blades, to sets of neighbouring blades, under such conditions that its velocity is not entirely destroyed until it has passed all the blades of the same stage. The advantage of these velocity stages lies in the possibility of economically utilising a considerable fall of pressure in one stage without excessive increase in the peripheral speed.

This principle of velocity stages is used for the first wheel which carries two series of blades, between which are the reversing guide blades carried on the turbine body. After the steam has passed through the first series of blades, it is deflected by the reversing vanes back to its original direction, and then loses the remaining velocity in the second series of blades. Curves A and B (Fig. 2) show the varying pressure and velocity at different stages. The construction adopted is that of a short impulse turbine, with from 5 to 15 pressure stages. Owing to the conversion of a large fall in pressure in the first stage, high pressures and temperatures are kept away from the turbine body.

Up to the largest sizes, the body consists of a single cast-iron cylinder split horizontally. At the admission end, the cylinder is closed by a cover in one piece, made in the smaller sizes of cast-iron, and in the larger machines of cast-steel. A special cover on the exhaust end is not required. The body is supported freely on one support, which surrounds the vacuum end of the lower cylinder and the exhaust flange. This pedestal takes the entire weight of the cylinder, and is at the same time utilised to support the turbine and generator bearings. The outer bearing pedestal is provided with a flange bolted to the end cover near the centre, which ensures accurate alignment without restricting expansion. The end-bearing pedestal also carries the governor, oil pump, and guide block.

The interior of the cylinder is divided by diaphragms carrying the guide blades. These guide wheels are built in two halves with an annular space in the middle through which the turbine shaft passes. At this point special sealing rings (in two parts) of white metal are fixed which enclose the shaft without rubbing, and are provided with grooves to reduce the steam leakage between the neighbouring chambers to a minimum.

As the steam expands in the first set of guide vanes from the working pressure down to a pressure of from 15 to 45 lbs., the sealing of the body from the atmosphere only requires to provide against this pressure, and is provided by a simple labyrinth device.

The physical conditions which govern the expansion of steam in the first set of guide blades necessitate nozzles, the section of which increases from the narrowest part to the end. From ten to twenty such nozzles are placed together to form a nozzle segment, and this segment forms the first set of guide blades which is situated immediately behind the throttle valve and regulates the admission to the velocity wheel. By means of control valves, a certain number of the nozzles can be opened and closed, thus regulating the area of the steam passage.

The guide blades for the remaining stages are of a much simpler construction. The steam channels have the same section throughout their length, and are made of vanes of sheet nickel cast into an iron ring which forms the periphery of the guide wheel. The guide wheels are in halves, fitted together with a steam-tight joint. There is an opening in the centre of each guide wheel through which the rotor shaft passes. The rotating wheels of all stages are complete discs of Siemens-Martin steel, cast with a thickened hub bored to provide a firm seating on the shaft. The first wheel is provided with a bulb-shaped rim in which two slots are turned to carry the two series of blades. The slots are dove-tailed to fit the base of the blades (Fig. 3), which are composed of special nickel steel.

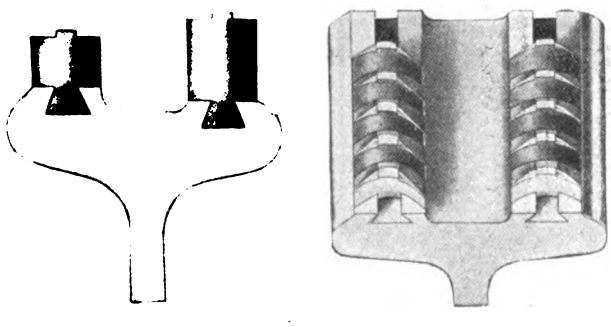

FIG. 3.—METHOD OF CARRYING BLADES IN VELOCITY WHEEL.

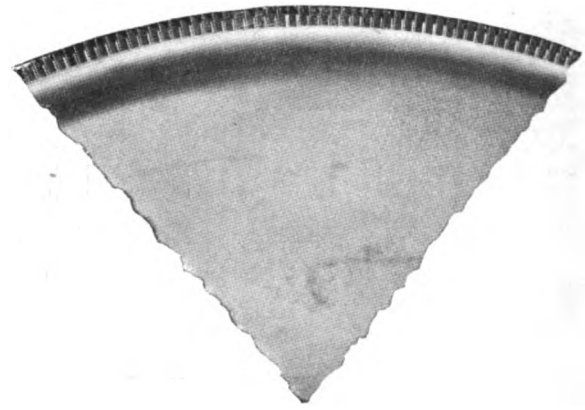

FIG. 4.—SEGMENT OF VELOCITY WHEEL.

The high-steam velocity in the first stage necessitates a channel of constant area in order to avoid wasteful steam eddies. This is attained by the blades having a special profile. In the case of the following stages (the normal pressure stages) this is not required. In Fig. 3 are seen the first and second series of blades upon which the steam impinges after leaving the nozzles. The reversing vanes come between the two series of blades. As,

Digitized by Google

however, the velocity wheel has only partial admission, the reversing vanes are only necessary on the corresponding segment. A segment of the velocity wheel with blading completed is shown in Fig. 4. The ends of the blades are closed by means of a band, consisting of several short pieces of thin plate riveted to the blading, which forms a confined passage. The wheels of all other stages have blades also of nickel steel. The blading is standard for all sizes of machines, and in consequence gives complete interchangeability for all wheels and turbines. Very substantial construction is obtained by riveting the roots of the blades to the discs. A band similar to that used for the velocity wheel is carried on the ends of the blades. The shaft is of nickel steel.

The bearings are provided with water-cooled oil pressure lubrication. The oil supply is kept in circulation by means of a small geared pump driven direct from the turbine shaft. The oil leaves the pump with a pressure of from 15 to 30 lbs. per square inch, and flows through the whole length of the bearings and thence to an oil reservoir, in which it is cleaned and cooled.

It has been possible in the case of the smaller units to use only three bearings and a rigid coupling between the generator and turbine shaft. The larger units have four bearings, two for the turbine, and two for the generator. In this case a flexible coupling, consisting of a number of fine steel wires, is used.

The spring-controlled governor is of the "Hartung" type, driven by a worm from the shaft. It controls a guide valve which directs the flow of the pressure oil into one of two channels. From here the oil passes either into the top or bottom of a relay cylinder, the piston rod of which is connected to the throttle valve. As, after each process of governing, the valve is moved back to the neutral position, there is no fear of the governing being carried too far. The operation of governing is entirely independent of the pressure of the steam supply. It is therefore possible, in special cases, to run the turbine without adjustment with a steam pressure which is much less than the normal. Every governor is provided with an arrangement allowing the speed to be adjusted 4 to 5 per cent. above and below the normal. To improve the steam consumption at light loads, the first set of guide blades is divided into several groups, each of which is controlled by means of a hand operated valve, which can be opened and closed according to the load.

A safety device is provided which closes the steam inlet valve as soon as normal speed is raised more than 10 per cent. The arrangement is carried direct on the main shaft without the use of any intermediate gearing, in order to secure the reliable working of the device under all circumstances. It should be noted that the steam supply in such cases is not cut off by means of the throttle valve, but by means of the main stop valve, which is entirely closed. In order to prevent the valve seat being damaged by sudden closing, an air cushion is provided. The operation of the safety device does not depend upon the will of the driver. The main stop valve cannot be opened until the safety device is in the correct working position. This safety device can be also arranged to come into operation in case of failure in the oil circuit.

Exhaust and mixed pressure turbines have been standardised on exactly the same lines as the high pressure, and follow the same details of construction. The chief difference in the construction of a purely exhaust turbine would be in the suppression of the velocity stage, and a slightly different form of bearing at the steam admission end. Interchangeability of parts, which is so distinct a feature of this form of construction, applies equally to the exhaust type as to the high pressure.

LOSSES OFF TRANSMISSION LINES DUE TO BRUSH DISCHARGE

A PAPER entitled "Losses off Transmission Lines due to Brush Discharge, with Special Reference to the Case of Direct Current," was read before the Institution of Electrical Engineers in London on Thursday last by Mr. E. A. Watson, of Liverpool University. The author described the results of experiments made with 6-ft. lengths of wire of various diameters, which were mounted in a long metal cylinder, and connected to an electrically driven influence machine capable of working up to 70,000 volts. Tests were also made on parallel wires, 12 yards long, and 1 yard apart. The Paper also contained some suggestions as to the mechanism and amount of the loss off lines worked at such a high pressure that the critical voltage is exceeded and a corona or brush discharge formed.

The author's experiments showed that there is a definite critical stress at which a loss begins from a direct-current line just as for an alternating-current one, and that the D.C. voltage required to produce this stress is the same as the maximum value of the A.C. stress. Thus, for a given wire, the critical voltage for D.C. working will be 41 per cent. higher than that for A.C. working with a sine wave. The frequency will make no difference to the critical voltage, but will affect the losses considerably if the critical voltage is exceeded. The value of the critical stress appears to be substantially the same, whether the wire is positive or negative, provided it is clean, but for dirty wires the stress at which loss begins is much lower for the negative than for the positive wire. Other experiments showed that the critical stress is greater the smaller the diameter of the wire, and that the critical stress is reduced by reduction of the pressure of the surrounding air, but not proportionately. Further, it was found that the presence of water vapour in the air does not affect the loss or the critical stress for a clean air. An actual transmission line does not, however, says the author, behave like a clean wire, and it is found that a factor of safety varying from 1·5 to 2 should be allowed after calculating the critical stress in the usual manner from the diameter and distance apart of the wires. This factor depends somewhat on the conditions of the district in which the wire is situated, and is probably less for a line in a clean mountainous region than for one in an industrial district. The loss is also affected by the presence of water vapour in the atmosphere, especially for low values of the electric stress, and a considerable loss takes place before the wire is uniformly enveloped in a corona or becomes noticeably luminous.

After comparing the results obtained by other experimenters, Mr. Watson proceeds to consider the various theories for the actual cause of the loss in the corona. He doubts the usual assumption that the diameter of the corona is the same as that of the wire for which the voltage considered is the critical one, and suggests that the dielectric strength of air is not a constant, but is much greater near the surfaces of conductors than it is in bulk. This would cause the corona to have a greater diameter, and a method of determining this diameter is given. It is shown that the resistance of the corona offered to the capacity current flowing to its outer boundary is not sufficient to account for the actual loss, and the author doubts the accuracy of the assumption that the loss is due to the movement of charged layers of air from the wire under the influence of the electrostatic stress, although the formula derived on this assumption gives, in certain cases, a loss of the right order of magnitude. The author concludes that the loss which occurs with direct current when the critical stress is exceeded is due to the production of gaseous ions at the surface of the wire, and that the actual current lost depends partly upon the amount by which the stress at the wire exceeds the critical value, and partly upon the disposition of the wires. Further, he suggests that with A.C. lines part of the loss may be due to the energy stored in the layers of air surrounding the wire, and which, upon breakdown, becomes converted into heat, but that this is insufficient to account for the whole loss which is observed, and that part of the loss is probably due to the same cause as that for direct currents.

The results of the author's experiments are plotted in a series of curves, giving the loss in milliamperes per km. plotted against the electric stress in kilovolts per cm. for various wires. One set of curves shows the variation of apparent electric strength of air with the diameter of the wire and for different atmospheric pressures, and the values obtained from these agree well with the results of previous experimenters. Another set shows that the electric strength for a given wire varies in proportion with the atmospheric pressure between ½ and 1 atmosphere, but not for lower pressures. The experiments made with parallel wires in the open gave critical stresses considerably lower than those obtained from the tests of the same wire in a cylinder, the explanations being, it is thought, that the wires were dirty. For a 0·7 mm. wire, the loss commenced at 53 kilovolts per cm. when wet, and 65 kv. per cm. when dry (in the cylinder the figure was 81·4 kv. per cm. for the dry wire), and increased up to a loss of approx. 11 milliamps. per kilometer in both cases for a stress of 110 kv. per cm. The reason for the loss being approximately the same at high pressure appears to be that the loss prior to the formation of the true corona, which alone is affected by the presence of water vapour, would become relatively of less importance after the corona had formed. Further, it was found that a given increase of voltage above the critical voltage produced a much smaller increase in the value of the current lost per kilometer of line in the case of parallel wires than in the case of the wire in a cylinder, for the same voltage and wire.

Digitized by Google

DISCUSSION.

The discussion was opened by Mr. J. S. HIGHFIELD (Chief Engineer, Metropolitan Electric Supply Co.), who stated that, so far as he could see, the losses given in the Paper were high as compared with those which occurred in actual practice. Thus Mr. Thury had informed him that on a 180 km. double-wire line with a 7 mm. wire working at from 50,000 to 60,000 volts direct current and carrying 75 amperes, the current loss was negligible. Again, on the Lausanne line with 72 km. of wire and over 3,000 insulators, the total current loss was only 1/10 amp. The author's results showed that the critical pressure for A.C. had a maximum value equal to the critical pressure for D.C., and this meant that the stress on the insulators would be the same with 140,000 D.C. as with 100,000 volts A.C. assuming a sine wave in the latter case. He hoped the author would make further tests with parallel wires in the open.

Dr. ALEXANDER RUSSEL (Principal, Faraday House) thought that the D.C. voltage required to produce the critical stress would be not exactly equal to, but within 4 or 5 per cent. of, the maximum value of the corresponding A.C. voltage. He suggested that a wrapping of a material with a higher electric strength than air might be placed round overhead wires to increase the critical pressure. Dr. Russel then criticised certain formulæ in the Paper, but said that they might be taken as substantially correct.. He did not agree with the author's theory that the air near the wire had a higher electric strength than that of air in bulk; the electric strength of air was, he thought, a definite constant figure, and he preferred to think that the results obtained were due to the fact that the stress near the wire was not that given by the formula on account of ionisation effects.

Mr. E. H. RAYNER (National Physical Laboratory) stated that he had recently carried out similar experiments to those described in the Paper, with the aid of an electrostatic watt-meter. The latter had been devised in the first place for measuring the watt losses in insulation, and could work at 15,000 volts or higher pressures. His results agreed remarkably well with Mr. Watson's. With regard to the relative effect of D.C. and A.C. voltages, it appeared that ionisation and the consequent loss began at the same maximum stress.

Mr. J. S. COOPER (British Westinghouse Co., Manchester) suggested that the nature of the wire used might have an effect on the results. Experiments by Mr. Mershon had shown a greater loss from aluminium than from copper with wires of the same diameter and at the same pressure. He did not think it was a physical effect, but it might be due to difference in the surface texture. If, as the author stated, the brush discharge loss was an important limiting factor to the voltage which might be employed, it would often be advantageous to substitute aluminium for copper, as the former gave a 30 per cent. larger diameter for the same conductivity, and the corona limit might therefore not be reached.

Mr. H. M. HOBART welcomed the confirmation by Mr. Watson, Mr. Rayner, and by Dr. Russel (within 4 or 5 per cent.) that the handicap of A.C. against the D.C. working with regard to the breakdown voltage was of the order of 40 per cent. only. At the meeting at which Mr. Highfield's Paper on the Thury H.T. transmission systems was read, the opinion was almost unanimous that the ratio was 2 to 1, even Lord Kelvin concurring though expressing surprise that it should be so. He, however, had analysed the figures given in Mr. Highfield's Paper, and had arrived at the lower ratio, and he was glad to see his results confirmed. He still considered that the A.C. system was the best for transmission purposes, and it was important that all engineers should soon arrive at a definite conclusion.

Mr. J. T. IRWIN (Central Technical College) questioned whether the voltage applied in the experiments was a constant one, and showed some interesting oscillograph curves of breakdown across an air condenser.

Mr. WATSON reserved his full reply for the *Journal*, but pointed out with reference to the A.C. *v.* D.C. controversy, that though the 1·41 to 1 ratio was correct for air, it might not be when considering insulators, as the porcelain might be weakened by the heating due to dielectric hysteresis, and by the incipient breakdown stresses at sharp edges.

EQUITABLE CHARGES FOR TRAMWAY SUPPLY

THE Paper on this subject, by H. E. Yerbury (Chief Electrical Engineer, Sheffield Corporation Tramways), on which we have already reported discussions by the Institution of Electrical Engineers in Manchester, Sheffield, and London (see ELECTRICAL ENGINEERING, January 27th, page 64, and February 3rd, page 73), was further discussed at Glasgow on Tuesday, February 8th.

In the Paper, Mr. Yerbury had criticised the usual methods of allocating the relative proportions of generating costs in combined lighting, power, and tramway stations when determining the charge to be made for energy supplied to tramways. He contrasted the figures of 0·865d. charged at Manchester, with the 0·371d. obtained at the Sheffield independent station, and denied that the difference was justified by the expense of extra plant for the peak and conversion. He would base the charge on capital and running costs for the tramway plant only with a profit of from 3 to 5 per cent.

The discussion at Glasgow was opened by Mr. H. RICHARDSON (Chief Electrical Engineer, Dundee), who pointed out that the conditions differed between traction and power consumers. In spite of the shorter hours, large power consumers had a better load factor than tramways with their large variations of load, and were often considerably cheaper to handle. Also the occasional coincidence of the tramway and lighting peaks had to be allowed for. The traction charge at Dundee was 1·125d. per unit.

Prof. F. G. BAILY (Heriot Watt College, Edinburgh) did not agree with Mr. Yerbury that power rates were generally too low, and pointed out that cost of production was often lowered by getting into a new market at under ordinary cost. It was not unfair that power should be charged at a lower rate than lighting.

Mr. A. H. BURBRIDGE (Burgh Electrical Engineer, Kilmarnock) thought that the maintenance of the cables should not be in the hands of the tramway department unless they employed a qualified electrical engineer. He also complained of difficulties in keeping tramway supply meters in order. He thought that the spare plant kept for tramway supply in small combined stations was excessive.

Mr. W. W. LACKIE (City Electrical Engineer, Glasgow) was sorry that Mr. Yerbury had not come to any definite conclusion. He did not agree with his allocation of the fixed charges, and thought that the interest, sinking fund and depreciation charges allowed for at Bradford were too low for present-day requirements. There was a great difference between a tramway and an ordinary power supply of the same dimensions; as to the former, special plant was required on account of the earthed return, whereas the power consumers were served by the same plant as the lighting consumers. It was possible that at Glasgow, combined stations would now give reduced costs, but in the early days the tramway demand had been far in excess of that for lighting. If interest, sinking fund, and depreciation were added to the figure given for Glasgow, the total price came out about 1·227d. per unit.

Mr. J. MCMAHON (Tramway Manager, Dumbarton) thought that no definite answer had been given to Mr. Yerbury's query why the costs were usually less than for power from a combined station. At Northampton, with a plant costing about £17,000, they turned out 876,000 units per annum at a total cost of 0·62d. per unit. Mr. McMahon proceeded to make some comparisons between the tramway and lighting and power stations at Glasgow, but Mr. Lackie intervened and said that these should be regarded as separate, as there were trunk interconnecting mains over which more than a million units passed per annum.

Mr. J. ROBERTSON (Burgh Electrical Engineer, Greenock) pointed out that comparisons were useless between very cheaply equipped stations and those built to last. There was no reason why power should not be supplied at a charge below that for traction if the reduction in cost occasioned by the extra load compensated for the reduced price. The maximum demand system took no account of the time at which the peaks occurred. He then showed some curves of the fluctuations of the supply at Greenock, where the tramway load factor was 12·3 per cent., the combined load factor 18·0 per cent. and the load factor for the power supply 25 per cent.

Mr. C. CAMPBELL MCMILLAN (Glasgow) thought that the question was a commercial rather than an engineering one. When both parties were departments of one municipality, the matter had not the importance that it had when one party was independent.

Mr. R. M. NEILSON remarked that each case should be considered on its own merits.

Mr. A. W. DRYER (Electric Control, Ltd.) said that at Chicago, the old generating stations had been scrapped and the supply was now taken from another company at a rate of £3 per kw. per annum of highest load demand for one hour plus 0·25d. per unit. This had worked out to about 0·4d. per unit—a 4,000 kw. battery was used to take care of the peak.

Mr. P. F. ALLEN (Clyde Valley Electric Power Co.) considered that selling prices depended partly on manufacturing price, partly on the salesman's ability, and to a large extent on local and trading conditions.

Mr. YERBURY, in reply, expressed the view that where increase of load had led to reduced costs, the old consumers should share in the benefits. It was a kw. charge plus a small unit charge that he advocated. It was usual that traction came to a station which had already a lighting load, and the traction supply should get the benefit of any reduction in price. Mr. Yerbury also took up a number of other points raised at some length, and the discussion was protracted to a late hour.

Long Distance Telephony.—Telephonic communication was recently successfully established between the Royal Palace in Stockholm and the Ducal Palace in Karlsruhe, Baden, Germany. The Egner-Holström heavy current microphone was employed, and the route was *via* Helsingborg, Copenhagen, and Hamburg.

BALANCERS FOR THREE-WIRE SYSTEMS

A PAPER on "Balancers for Three-wire Systems" was read by Mr. A. G. Cooper on Tuesday, February 8th, before the Manchester Section of the Institution of Electrical Engineers. The author first reviewed the principles of the ordinary continuous-current balancer, which usually consists of two shunt machines mechanically coupled together, with their shunts cross-connected, and of such capacity that they are capable of continuously carrying a little more than half the observed out-of-balance current. (This subject was dealt with at some length by Mr. W. A. Ker in a Paper read last December before the Glasgow Section of the Institution—see ELECTRICAL ENGINEERING, Vol. V., page 1077.)

Some tests of a set of this kind were referred to which gave a voltage regulation within 3 per cent. on full load.

The usual double balancer starter and potentiometer regulator were described.

An improvement on the above figure, viz., 3 per cent., could, he said, be obtained by putting on some series turns to compensate for the armature drop, but to get the best effect and to avoid other complications in case of a heavy short, these coils should also be cross-connected. By over compensating the armature drop by additional series turns the out-of-balance side can be even raised above the opposite side.

Another form of balancer is a machine with a single shunt field connected across one of the outers and the middle. This has a double-wound armature with a commutator at each end, but is rather a poor balancer, and really only a middle wire former. In another modification, the double commutator armature is wound with one set of windings shorter than the other, so that the longer set come under the influence of auxiliar on field in series with the middle wire. This type of machine has been in use for a number of years at Blackburn, and has given every satisfaction. It will maintain the voltage equal within 1 per cent. over the whole of its range.

A description was then given of the application of Messrs. Crompton & Co.'s "C.M.B." auto-converter to balancing. This machine was fully described in ELECTRICAL ENGINEERING, July 8th, 1909, Vol. V., page 629.

The later part of the Paper was devoted to the so-called "static" balancers, the use of which in this country has mostly been in connection with rotary and motor-converter installations by making use of the secondary coils of the transformer, connecting the middle wire of the system to the star-point of the secondary coils of the transformers which are supplying the rotaries. This has been shown to be bad from an efficiency point of view. It is better to have a separate static balancer than to use the secondary coils. The static balancer consists of a choking coil with only one winding on each limb according to the number of phases used. The terminals are connected to equally spaced connections round the armature of the dynamo to give the selected phase proposed to be used. From the slip-rings an alternating E.M.F. is obtained which is connected to the terminals of the choking coil, while the star-point is connected to the middle wire. When the system is balanced, there will be a strong choking action which will prevent any large flow of alternating current from the slip-rings. When an out-of-balance current flows through the balancer and the armature, there will be a drop in volts due to the resistance, but this is practically no greater than in most balancers, if the static balancer is suitably designed. The greater the number of phases, the better is the regulation.

For single-phase, Dr. Garrard has given a difference of voltage worked out on an assumed internal drop in the armature on a 10 per cent. out-of-balance as 0·66 per cent., 3-phase 0·58 per cent., and 6-phase 0·49 per cent. In practice, however, it is not usually convenient to fit more than three slip-rings to the generator. In the event of using a static balancer with a compound wound, or a machine with commutating poles, the series winding must be split, half being connected in the negative side and half in the positive side of a generator.

The author gives some results of tests of a 360-kw. 8-pole, 500-volt, provided with three slip-rings, and a static balancer designed for an out-of-balance current of 170 amperes, showing a regulation method from 0·2 to 0·5 per cent., with out-of-balance currents from 10 to 80 amperes. If very heavy out-of-balance currents have to be dealt with, in proportion to the size of the static balancer and generator, then a middle wire booster can be attached to the machine to boost the out-of-balance side.

DISCUSSION.

The discussion was opened by Mr. J. S. PECK (British Westinghouse Co.), who could not see the objection to using the secondary coils of the transformers for balancing in rotary converter installations unless a three-phase connection was used. He also pointed out that where the frequency was low, perceptible flickering of the lamps could be caused by a static balancer. This was less, however, with two-phase connections.

Mr. H. GRAY (Borough Electrical and Tramways Engineer, Accrington) pointed out that, except where the balancer was under close supervision, there was some danger with crossed fields, owing to liability to run away if a heavy overload or short circuit occurred on one side. At Accrington they used a static balancer in connection with a 200-kw. motor-generator giving general supply from the traction circuit with ¾ load (300 amperes) on the outers, and 100 amps. taken from the static balancer (which totals to about full load on the plant), the percentage variation on either side of the middle wire from the normal was 2·4 per cent. He thought that a static balance took the shock of a short circuit better than a rotary set.

Mr. G. W. WORRALL called attention to the arrangement of the La Cour converter when supplying three-wire systems where the middle wire was connected to the neutral of the winding of the induction motor side, and a similar effect to that of a static balancer was obtained.

Mr. ATCHISON (Borough Electrical Engineer, Rochdale), however, thought that it was a mistake to employ auxiliary plant such as converters for balancing, and referred to the serious out of balance loads caused by cinematograph theatres, which were trying to a small undertaking. He had heard of very unhappy experiences with double commutator balancers.

Mr. C. F. SMITH (Manchester School of Technology) thought that in comparing the connection on static balancer with rotating balancers, it was sometimes forgotten that a static balancer has not the same functions as a motor-generator balancer. The former simply provides a return path for the out-of-balance, and it is compensated for in return.

Mr. C. L. E. STEWART (Borough Electrical Engineer, Rawtenstall) had had satisfactory experience with balancing rotary converters on the secondaries of the transformers, but in his case the supply was two-phase.

Mr. J. FRITH mentioned the old five-wire system in Manchester, and said that some of the customers were given a selecting switch, and they could take which of the four circuits they liked; presumably they would like the brightest. The balancing systems mentioned in the Paper were quite suitable for steady conditions, but for sudden fluctuations something with the quickness of action of the Tyrill regulator or the Highfield and Entz booster was required.

Mr. S. J. WATSON (Borough Electrical Engineer, Bury) considered that the best form of balancer for a power station was a battery divided into two parts across the three-wire system left continuously on the mains. He had got over the difficulty of balancing cinematographs by running a short middle wire direct from the generating station to which the services to the cinematographs were connected, so that the disturbance was entirely restricted to those users who actually cause the variation. Under the Cinematograph Act, which had recently become law, it was not allowed to take into the cinematograph room a pressure above 100 volts, so that if the inspectors insist on the regulations being carried out, motor-generators will have to be used in all cases where the supply pressure exceeds 100 volts. A disadvantage of any balancing arrangement is that you do not compensate for out-of-balances on any particular feeder, but only of the station balance as a whole.

Mr. COOPER replied briefly to some of the points raised. In small stations like his own they did not cater for sudden loads, and found ordinary balancing quite sufficient. There were two cinematograph theatres on his system, both with motor-generators.

Telegraph Traffic.—On the 8th inst. direct communication between Saigon and Bangkok was restored, while the line between Bagdad and Bassorah broke down on the same day.—On the 9th inst. the cable between Accra and Lagos failed, but a quick repair was effected on the 11th inst. Telegrams during this failure were handled without increase of rates.—Merchants trading with Uruguay will welcome the announcement that the censorship imposed recently has been countermanded.—The cables enumerated some time ago as being down have not yet been repaired.—The Western Telegraph Co. will soon be laying the new Argentine cable, manufacture of which is now proceeding.

Admiralty Wireless Secrets.—On Wednesday of last week R. S. Knowlden, a draughtsman on H.M.S. *Vernon*, appeared at the Winchester Assizes charged with stealing Admiralty wireless apparatus and drawings. The prisoner pleaded not guilty to the larceny indictments, but admitted an indictment under the Official Secrets Act. The Solicitor-General, on behalf of the Crown, accepted the statement that the prisoner took the apparatus and drawings home only to work up his knowledge of the subject, but pointed out that it was, nevertheless, an offence under the Official Secrets Act. Mr. Justice Lawrence agreed with the course taken by the prosecution not to go on with the larceny charges, and bound the prisoner over in £250, and one surety of the same amount.

PROTECTION FROM LIGHTNING

A LECTURE was delivered on the 10th inst., by Sir Oliver Lodge (Principal of Birmingham University), to the members of the University Engineering Society on the above subject. He said that the old idea of protection from lightning was that there was a charge of electricity in the clouds which had to be conducted to earth by an easy path. It was thought that if a copper conductor were provided, that conductor would be chosen in preference to all inferior conductors. The problem is not really so simple as this, but is concerned more with the best method of dissipating the enormous energy contained in a lightning flash. It is not wise to get rid of the energy too quickly. From an electrical point of view, a thin iron wire is the best lightning conductor, although sometimes there is not time for a poor conductor to discharge the flash. Lightning flashes are oscillatory, as has been shown mathematically by Lord Kelvin, and the oscillations are of the order of 10 million per second. The ohmic resistance of the conductor is unimportant, but the impedance due to self-induction is very great. In all lightning conductors the current flows only on the surface; especially is this the case with iron conductors where the current penetrates to a depth of less than 1 millimetre beneath the surface. Experiments were performed to show how a lightning flash frequently prefers to discharge across an air-gap rather than travel round a loop of wire.

There are two kinds of flash—one the simple direct discharge between an electrically charged cloud and earth, and the other an induced charge, as when a cloud intervenes between the cloud carrying the primary charge and the earth, the two clouds practically form a condenser. When a discharge takes place from the first into the second, the charge on the earth side of the lower cloud is suddenly relieved, and the disruptive discharge from the latter to the earth may take such an erratic course that it is almost impossible to guarantee protection by lightning conductors unless the building to be protected is completely enveloped in a metal cage.

To envelop buildings as far as is reasonably practicable in this manner is what should be aimed at, and it is quite wrong to suppose that a conductor placed on the tallest part of a building will render it immune from lightning. The lecture was illustrated by lantern slides and by experiments. The most striking experiment was that which showed how, although flashes may be discharging between a cloud represented by a metal sheet and surrounding objects represented by metal balls, yet, when a pointed conductor is introduced, all flashes to the balls cease, and silent discharge occurs between the cloud and the pointed conductor, although the latter is no nearer the cloud than were the balls.

Wireless Telegraph Notes.—We are informed that the Compagnie Générale Transatlantique have given orders for two of their cargo steamers (the *Florida* and the *Caroline*) plying between France and the United States to be equipped with the Bellini-Tosi "Wireless Compass" system. The equipment consists of a diminutive directive receiving system on the Bellini-Tosi method, and by its means the direction from which signals are arriving is readily ascertained at distances up to about 15 or 20 miles. The apparatus is intended solely for navigational purposes, and is of special value in foggy weather. A greater range is not required, as the danger zone lies within these limits. The passenger liner *Louisiane* of the same company was temporarily fitted with the wireless "compass" some little time ago, and the experiments made have shown that time can be saved when entering New York Harbour in thick weather by the aid of signals received from the coast stations of known position, whose bearings can be directly determined by the wireless "compass."

The Metal Filament Lamp Trade in Germany.—The Deutsche Gasglühlicht Gesellschaft (Auer-gesellschaft), the makers of the Osram lamp in Germany, have announced that they are increasing their manufacture of metal filament lamps in order to make up for what will be lost on price reductions. Contrary to what was previously announced, the necessary extension of plant, &c., will be carried out without any increase of capital. The Allgemeine Elektricitäts-Ges., of Berlin, has without any warning reduced the prices of its metal filament lamps, which are now listed as follows: 25, 32, and 50 Hefner c.p., 100-130 volt, 2 m. (approx. 2s.), and 50 Hefner c.p., 200-250 volt, 3 m. (approx. 3s.). In consequence of the inconvenience of such a sudden reduction to dealers, the other principal manufacturing firms have come to an agreement not to reduce prices without previous arrangements with the dealers and other parties concerned. The firms include Siemens & Halske A.-G., Deutsch Gasglühlicht A.-G., Bergmann-Elektricitäts-werke A.-G., Julius Pintsch A.-G., Ehrich & Graetz, and the Wolfram-Lampen A.-G., of Augsburg.

THE "Z" METAL FILAMENT LAMP PATENT

Action for Infringement

THE action by the "Z" Electric Lamp Manufacturing Co. Ltd., against Messrs. Marples, Leach & Co. (now Adnil Electric Co., Ltd.), for infringement of their patent No. 21,654 of 1906 was commenced before Mr. Justice Parker in the Chancery Division on Thursday. The real defendants in the action are the Bergmann Elektricitäts-Werke of Berlin, for whom Messrs. Marples, Leach & Co. are agents in this country. Mr. A. J. Walter, K.C., and Mr. A. H. Colefax appear for the "Z" Co., and Mr. Terrell, K.C., and Mr. Maconachie for Messrs. Marples, Leach & Co.

The patent in question covers a process for removing the last traces of carbon in filaments manufactured from compounds of tungsten, by combining the carbon with the nitrogen in the ammonia given off by heating suitable phosphorous compounds in vacuo. Phospham is said to be particularly suitable, as, not only is the nitrogen released at a comparatively low temperature, but the phosphorus, which is at the same time set free, reduces any metallic oxide which might be present in the filament. The phospham may be included in the paste previous to squirting, or may be introduced into the vacuum furnace in which the filaments are sintered. Alternately, the phospham compound may be applied to the supporting wires or pedestal in the lamp, in which case the decarbonisation is effected when the filament is raised to incandescence after the lamp is sealed.

The defence to the action is that the invention in question is not useful in that the substances mentioned do not act as described. Further, insufficiency is alleged, and also want of subject matter. In addition, anticipation is alleged, and the following patents are cited:—British patents, No. 10,741 of 1890, granted to Messrs. Siemens Bros. & Co.; and No. 10,867 of 1901, granted to C. D. Abel; also German patents Nos. 133,701 and 137,569 of 1901, granted to Eberhard Sander.

MR. WALTER, in opening the case, detailed the process of manufacture of metal filaments, and said that it was the practice of the "Z" Lamp Company to paint phospham on the glass supporting-rod of their lamps, although as a matter of fact every method described in the specification had been tried successfully. The Bergmann Company used phospham in precisely the same way, and what answer there was on the question of infringement he did not know. The pleadings of the defendants seemed to infer that the patent in question was one for the manufacture of pure tungsten—in fact, that it was a chemical patent. The pleadings generally were so vague that he was a little in doubt as to what the real defence to the action was.

MR. JAMES SWINBURNE, on the question of validity, said that none of the specifications cited by the defence had anything to do with the use of phospham as described in the "Z" Company's patent. On the point that the complete specification was insufficient, he said he had had no difficulty in carrying out all the processes described. Phospham was purchasable before the date of the patent. The blackening of lamps was generally attributed to the particles of carbon remaining in tungsten filaments, but it was all largely surmise. His own theory was that there was a current crossing inside the lamp, through the gas, and that the presence of carbon in the filament assisted this. Whatever the facts, it had been proved that phospham prevented blackening, but whether this was by the removal of the carbon he could not say.

MR. SWINBURNE'S cross-examination by Mr. Terrell, K.C., was first directed to the fact that in their final state, before the application of phospham, the Bergmann lamps contained a considerably smaller percentage of carbon than "Z" lamps after treatment with phospham. It was stated that a 32-c.p. 100-volt Bergmann filament contained only 0·014 to 0·017 per cent. of carbon before treatment, against about 0·2 per cent. in the "Z" lamp after treatment. Mr. Swinburne agreed that the former quantity, if correct, which he doubted, could be regarded as negligible, and that the application of phospham would not have a very marked effect upon it. Mr. Terrell detailed the process of making the Bergmann filaments as follows:—A mixture of tungsten powder, nitro-cellulose, castor oil, and amyl-acetate, was rolled into a stiff paste and squirted through a diamond die. At this point the amount of carbon was 2·5 per cent. The filaments were then heated in a chamber at 1000° C., in vacuo, which was relieved to the extent of two or three millimetres of mercury by means of hydrogen. The carbon was then reduced to 0·78 per cent. The process of sintering was next gone through, current being passed through the filaments in an atmosphere of hydrogen, and this reduced the carbon from 0·014 to 0·017 per cent. Mr. Swinburne said the process was the same as that employed in the manufacture of the "Z" lamp, but he should have expected the carbon to be about 0·2 per cent.

MR. TERRELL, in the course of further questions, asserted that the defendants used phospham for quite a different purpose from decarbonisation. They did not accept the theory that

Digitized by Google

blackening was due to carbon, but believed it was due to the tungsten itself and bad vacuum, and in proof of that produced a very much blackened lamp, a portion of the inside of which had been cleaned with chlorine water. This could not have been done, he said, had the blackening consisted of carbon. They therefore painted phospham on the glass stems of their lamps as a vehicle for carrying phosphorous in order to produce phosphene, which improved the vacuum and so prevented the tungsten being disintegrated and deposited on the glass.

A very lengthy discussion took place as to the composition of phospham. The latest edition of Watts' "Dictionary of Chemistry" gives it as PN_2H, but marks it as doubtful. Mr. Swinburne said he had experimented with four brands, but did not know the composition of any one. Mr. Terrell suggested that what the "Z" Company used was phospham treated with water. It was also stated that a substance was sold by one firm under two different names, one of which was phospham. Mr. Terrell claimed that PN_2H could not possibly decompose and give off ammonia except at a very high temperature, and if the substance used by Mr. Swinburne in his experiments decomposed and gave off ammonia, as it must do to get rid of the carbon, at less than 200° C., then he could not have been using phospham.

MR. H. BALLANTYNE said he had made phospham according to the methods laid down by Rose, Pauley, and Besson, and had also purchased samples from Shuckhardt and Karlbaum, and gave the following results of his tests:—Rose gave off 4·5 per cent. ammonia at 260° C., and 1·7 per cent. at 320° C.; Pauley, 2·04 per cent. at 260–270° C., and 2·21 per cent. at 350° C.; Besson, 2·63 per cent. at 270–280° C., and 5·78 per cent. at 350° C.; Shuckhardt, 4·29 per cent. at 200° C., 3·49 per cent. at 280° C., 1·95 per cent. at 350° C., and 0·94 per cent. at 450° C. He claimed that this substantiated the statement in the patent that phospham decomposed at comparatively low temperatures. He then described a method of making filaments which he said was that adopted by the defendants (but which Mr. Terrell said was not), in which the sintered filaments showed 0·225 per cent. of carbon, and not 0·014 to 0·017 as stated by Mr. Terrell. He used a mixture of 14 grammes of tungsten and 2·1 grammes of collodion, the latter consisting of 40 parts nitro-cellulose, 20 parts castor oil, and 110 parts amyl-acetate.

On Monday Mr. Ballantyne handed in lamps which he had made, some of the filaments of which contained phospham, and some did not. All the lamps had been run for one hour, and the globes of those not treated with phospham showed distinct blackening, whilst those treated with phospham did not. He had also made 15 lamps, the filaments of which had been painted with Karlbaum phospham, and on breaking a number of them they all gave off a phosphorus smell. The filaments in these lamps had been made according to the process described by Mr. Terrell, but without adding any phosphorus to the phospham. Very good results were obtained with regard to blackening, and in his opinion this experiment disproved the statement of the defence that phospham was merely an inert vehicle for carrying phosphorus. He had also proved by experiments that Karlbaum's phospham gave off a considerable percentage of ammonia during heating up to 400° C. Further, he had scraped off the phospham residue on the stems of 12 Adnil lamps, and on heating had found ammonia was given off. Other experiments carried out by him showed that the addition of 1 per cent. of phospham to the filament considerably reduced the amount of carbon in it. The suggestion of the defence that phosphoramide was used in the manufacture of the "Z" lamps could not be correct, because this gave off 28·5 per cent. of ammonia, whereas Shuckhardt phospham, the material used, only gave off 11·22 per cent., whilst the theoretical figure was 9·46 per cent. This phospham gave off ammonia up to 300° C., whereas phosphoramide did not begin to give off ammonia until a temperature of 220° C. was reached. During a long cross-examination, Mr. Terrell argued that it was impossible to get pure phospham, and quoted inconsistent theories of various authorities as to the constitution of the substance. Mr. Ballantyne said he made his phospham in accordance with the best knowledge on the subject, after having studied all the theories.

On Tuesday Mr. Ballantyne, in further cross-examination, admitted that phospham would not get rid of the last traces of carbon in a filament from the chemical point of view, although the amount remaining was negligible from the manufacturing point of view. The best result he had obtained by the use of phospham was 0·095 per cent. of carbon, and such a filament did not cause blackening. This was by painting phospham on the stem of the lamp. When including phospham in the tungsten paste, the best result was 0·22 per cent. of carbon. He agreed with Mr. Terrell that Karlsbaum and Shuckhardt phosphams were of totally different constitution, but their effect upon tungsten filaments was practically the same

In answer to Mr. Justice Parker, Mr. Terrell said his case was that the description in the specification was such as to lead a manufacturer to do things which would not, and did not, act, and, in fact, could not act. He agreed that the mere fact that the specification might be wrong in its chemical theory would not affect the validity of the patent, but if the instructions were not sufficiently clear to enable the result desired to be achieved, then the patent was not a good one. In the course of some further discussion, Mr. Terrell admitted that Messrs. Bergmann had used Shuckhardt phospham in precisely the same way as the "Z" Co.

Mr. Justice Parker said that this practically amounted to an admission of infringement if the patent were valid.

Mr. Terrell said this was not so, as the Bergmann Co. did not use phospham for the removal of carbon.

Mr. W. L. PAKENHAM gave evidence as to certain experiments carried out for Mr. Swinburne, the general effect of which was that the use of phospham greatly improved the filaments from the point of view of blackening. In fact, the "Z" Co. was formed with this object in view.

This closed the case for the plaintiffs.

Mr. OTTO HEHNER was the first witness called for the defendants, and confirmed the details of manufacture at the Bergmann Works and the results obtained in relation to the proportions of carbon already given by Mr. Terrell in his cross-examination of Mr. Swinburne. He stated that his experiments proved the impossibility of removing all the carbon from the tungsten filaments by means of phospham as described in the patent, and on this, in subsequent cross-examination, Mr. Walter suggested that the tungsten paste used by Mr. Hehner had not been sufficiently ground, a point which Mr. Swinburne had discovered and rectified in his own experiments. Another matter spoken of by Mr. Hehner was the temperature at which ammonia was given off by phospham. He directly contradicted the claim of the specification that ammonia was given off at comparatively low temperatures, and further stated that experiments had shown it to be given off at 130° C., and then to stop altogether. Since his interest in this case, he had suggested the use of silica instead of phospham for pasting on the stems of the lamps as a vehicle for red phosphorus, and this had been adopted with quite satisfactory results.

The case was still proceeding when we went to press.

Rugby Engineering Society.—The second conversazione of this society was held at Rugby, on February 11th, and was attended by over 400 members and friends. Among the exhibits was a full-size Blériot monoplane, and a large number of models were exhibited by members of the society. In addition, there were working models and demonstrations of gyrostats, the Brennan Monorail car, and many other things of scientific and engineering interest. A series of short lectures and music were also provided.

Central Technical College Old Students' Association.—The Annual General Meeting and Dinner of this Association was held on Saturday at the Trocadero Restaurant, London. Mr. H. A. Humphrey, the President, occupied the chair and responded to the toast of the Association proposed by Sir Philip Magnus, M.P. The toast of the visitors was given by Prof. A. Chatterton, who was one of the original students at the opening of the college, and who is now at home from India on furlough. Mr. W. H. Allen replied. Prof. W. T. Pope, F.R.S., who was at the College from 1887-1890, was elected President for the coming year. The dinner was well attended, and, in fact, more members were present than on any previous occasion. An excellent musical entertainment had been provided, and an item not on the programme, which met with a cordial reception, was a song with chorus by one of the guests, Mr. A. L. C. Fell (Chief Officer of the L.C.C. tramways). Old students of the College who are not yet members of the Association should communicate with the Hon. Sec., Dr. E. Frankland Armstrong (98 London Road, Reading). Attention of old students should also be directed to the Association's Employment Agency, of which Mr. Edw. Wheeler (Central Technical College, S.W.) is Honorary Secretary.

The Paris Floods.—*Le Génie Civil* contains a long article on the Paris floods, with some striking illustrations. In addition to the troubles experienced in the supply stations mentioned in a note on page 103 of our last issue, there has been a good deal of interruption to the electric traction systems. At Vitry, where a considerable area was under water, the Thomson-Houston station of l'Est-Lumière, from which supply is given to the East Parisian tramways, was flooded. The electrified section of the Orleans railway from the Austerlitz station to the terminus in the Quai d'Orsay, which is on the third rail system, was also interrupted owing to the flooding of the tunnel and the Quai d'Orsay station itself. The Métropolitain was affected by the flooding of its generating station at Bercy, which together with the large station of the Société d'Electricité de Paris at St. Denis supplies power to the line, extensive sections of the line itself were also flooded, and in some districts, more particularly in the neighbourhood of the St. Lazare station, the tunnels were entirely filled with water. The pumping out of these will be a work of considerable time. Our contemporary publishes an excellent map showing the areas affected and the lines interrupted.

The renewed rise of the Seine is considerably hindering the work of repairs necessitated by the recent floods, and it is stated that the authorities have been unable as yet to commence the repair of the damaged telephone lines. Some 14,000 subscribers are said to be still cut off.

THE BREMER FLAME ARC LAMP

Patent Restored

JUDGMENT in the British Westinghouse Co.'s appeal against the decision of Mr. Justice Joyce declaring the Bremer flame arc lamp invalid, was delivered in the Appeal Court on Saturday.

It will be remembered that Mr. Braulik had first endeavoured to secure the revocation of the Bremer patent under Section 27 of the Patents Act, alleging that the lamps were manufactured mainly outside the United Kingdom. The Comptroller of Patents revoked the patent subject to appeal to the High Court, but on appeal the patent was restored. An action brought by the Westinghouse Co. against Mr. Braulik for infringing the patent was then heard, and resulted in Mr. Justice Joyce declaring that the Bremer patent was invalid for want of subject matter. We reported fully the proceedings before Mr. Justice Joyce in ELECTRICAL ENGINEERING, Vol. V., pp. 571, 617, and 909. The patent is No. 18,786 of 1902.

LORD JUSTICE FLETCHER-MOULTON said that the questions of insufficiency and infringement were hardly argued on behalf of Mr. Braulik in the appeal, and the substantial questions were want of subject matter, and anticipation by the Graham and Crosby specifications. If the former defences were still relied upon, then he decided that on both grounds they failed. With regard to the other two points, the Bremer patent claimed to have got over the difficulties of instantaneously adjusting the electrodes in order to compensate for irregularities in the feed, and to keep the light steady. He was of opinion that this claim was justified by the evidence. No lamp of the type described by Bremer was in successful use at the time of the patent, but since then 14,000 of them had been sold, apart from alleged infringements. This success had undoubtedly been due to the Bremer construction. He commented upon the fact that the defendant was repeatedly asked to produce a specimen of his commercial lamp, but did not do so, and this, combined with the fact that the plea of non-utility was abandoned, left no doubt in his mind that the Bremer lamp was a substantial advance in arc lamp manufacture. The element of novelty in the lamp was the floating electrode applied to the type of lamp specified in the patent. He was of the opinion that the claim was restricted to the use of a particular form of horizontal feed mechanism, and did not cover the use of any form of horizontal feed mechanism in the specified type of lamp. The question was whether such a combination was good subject matter for letters patent. On the point of anticipation, the Crosby specification could be dismissed, as the carbons were not clipped firmly. As a matter of fact, they were loose in their holders, and the downward feeding was due to the diminution of pressure on the side of the carbons, and therefore depended on the friction between them and their holders. This was an essential feature of the Crosby specification, and not a detail, as had been argued. This lamp did not come within the claim of the Bremer specification, and could in no way lead up to Bremer's invention. With regard to the Graham specification, which had been chiefly relied upon both on the point of subject matter and also anticipation, there was a pivoted electrode and downward feed working simultaneously, but there was no indication of any adjustments taking place in the intervals between feeding by reason of the varying resistance of the arc, and he was satisfied that the patentee had no idea of introducing such an adjustment. Nor did he think anyone making a lamp according to this specification would have produced one having such an adjustment, or, in other words, having a "floating feed." No evidence had been produced on behalf of Mr. Braulik as to the performances of this lamp, and it was against him that he had been unable to prove the suggestion that a lamp made according to the specification would work. It could not, therefore, be regarded as an anticipation. With regard to want of subject matter, he viewed with suspicion arguments to the effect that a new combination of known principles, bringing with it new and important consequences, in the shape of practical machines, was not invention. This was unfair to inventors, and in his opinion was not countenanced by English law. In none of the cases in which a floating feed was used was there any adjustment otherwise than in the line of the carbons, and the natural application of that would be to draw the carbon along the line of the electrode, an arrangement which would be different to and immeasurably inferior to Bremer's device, and was certainly not included in Graham's. He was, therefore, of opinion that there was good subject matter in giving to a lamp of the type mentioned in the claim of Bremer's specification a floating feed in the manner proposed. No one reading Graham's specification could read into it a floating feed, but arguments had been made that this was the intention, although not expressly stated. The English courts, however, had always been against this sort of argument. In his opinion the judgment of the Court below proceeded on too wide an interpretation of the claim of the Bremer's patent. It did not cover every mode of effecting the object, but was for a horizontal feeding mechanism of a certain definite type. In his opinion, therefore, the patent was valid.

The Master of the Rolls and Lord Justice Buckley concurred.

On the application of Mr. Walter, K.C., for the British Westinghouse Co., an injunction was granted restraining the defendant from selling the infringing lamp, and an inquiry was ordered as to damages. The latter was stayed for a month with a view to an appeal to the House of Lords.

GLARE

AT a meeting of the Illuminating Engineering Society on Tuesday the subject of glare in relation to artificial illumination was discussed. At the January meeting of the society the subject was discussed from a physiological point of view, but on Tuesday the engineering aspect was dealt with.

MR. A. P. TROTTER (Electrical Adviser to the Board of Trade) expressed the opinion that sources of light within the range of vision should be eliminated, although he admitted that indirect illumination was rather an expensive matter, especially for domestic lighting. It was convenient that the intrinsic brilliancy should not exceed one candle per square inch or thereabouts. The ordinary 16-c.p. metal filament lamp, he said, gave about 4½ c.p. per square inch, which was too bright, and in his own house he could not use such lamps without shades. He thought it was a mistake to measure the intrinsic brilliancy of a lamp by multiplying the length of the filament by its diameter and dividing the candle-power by the number of square inches obtained. He showed a specimen of a globe on the Holophane principle, which he had designed thirty years ago.

MR. J. S. DOW (Assistant Secretary to the Illuminating Engineering Society) read a large number of communications from foreign correspondents, and among these was one from Dr. Karl Stockhausen, of Dresden, in which he recommended the appointment of an International Committee to consider the question of glare from modern illuminants, and to collect evidence and prepare a report upon the subject.

MR. W. R. COOPER said he did not agree that glare depended simply upon intrinsic brilliancy. The question of contrast also came in. The eye had a difficulty in adapting itself to heavy contrasts between the source of light and its immediate surroundings. He regarded the tendency to use metal filament lamps completely unshaded as a great mistake. An example of bad illumination was at the Patent Office Library, where metal filament lamps had originally been placed upon the tables below the edge of the shades. This had, however, been remedied.

MR. W. M. MORDEY said a great deal of consideration had been given to the question of lighting the new building of the Institution of Electrical Engineers, and the Council had come to the conclusion that they must at all costs avoid the terrible whip-lash upon the eye of exposed lighting, viz., lamps without any form of shade. Perhaps by doing this they might give the appearance of having reduced the amount of light, but it would be one much more pleasant to read and work by. He thought makers of electric lamps and fittings might turn their attention to the development of methods of lighting, and applying lamps in a sense which he called comfortable seeing rather than brilliant illumination. It seemed to him that nature did not support the suggestion of Mr. Trotter that all forms of direct lighting should be dispensed with.

MR. HAYDN HARRISON also spoke on the question of contrast as an important factor in the question of glare. He had experience of this in connection with street lighting, and had greatly improved the effect by proper shades. With lights having a dark surface behind them the sensation of glare was very marked.

MR. L. GASTER referred to the recent regulation of the City Police that all lamps outside shops must, in the interests of street traffic, be shaded. He deprecated the tendency, which was very marked in London, of placing unshaded flame arc lamps outside shop windows. The society would be doing good work by taking examples of bad illumination and demonstrating their disadvantages to the people concerned.

MR. MACKINNEY exhibited a globe of the Holophane type constructed by Professor Blondel, in which the prisms were arranged in two distinct sections, one being totally reflecting and the other refracting.

DR. W. ETTLES thought that the first thing the society should do was to come to some unanimity of opinion as to the physiological principles involved before taking up the practical side of the question.

DR. SILVANUS P. THOMPSON, who was in the chair, said the council would take into serious consideration the suggestion of Dr. Stockhausen that an International Committee should be formed to gather information from all parts of the world, and also the suggestion of Dr. Ettles that an effort should be made to come to some general agreement upon the physiological principles.

Illuminating Engineering Society.—Prof. A. G. Vernon-Harcourt, Sir William Preece, K.C.B., F.R.S., and Sir Joseph Swan have been elected honorary members of the Illuminating Engineering Society.

CORRESPONDENCE

METAL FILAMENT LAMPS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—We are greatly obliged for the notice you gave us on our metal filament lamps on page 87 of the current issue, but we wish to point out a sentence which we consider might lead your readers to think that our high-voltage lamp is not of the highest efficiency.

If you will kindly refer to our letter of the 18th ult. you will see in the latter part that we advocate the use of low-voltage lamps, in preference to high-voltage, as 25- or 50-volt lamps have a better efficiency than high-voltage lamps. This, of course you are aware, applies to lamps of all makes, and not to our lamps in particular. Foster metal filament lamps are made with the utmost care, and most severe tests are enforced before lamps are sent out from the factory. In this way, both high- and low-voltage lamps are as perfect as human ingenuity and modern appliances can make them.

We sincerely trust you will mention the above fact in your next issue, and so dissipate any erroneous impression which may exist concerning Foster metal filament lamps.

Yours faithfully,

THE FOSTER ARC LAMP AND ENGINEERING CO., LTD.

THE INSTITUTION LIBRARY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Your correspondent "Associate Member" has voiced a subject which of late has exercised the minds of provincial members of the Institution of Electrical Engineers, and, taking into consideration the large amount of money which is being expended in the new building (a sum voted without any provincial member having the opportunity to protest), there is grave cause for complaint amongst those members who are not fortunate enough to live near London. After a struggle some years ago, local sections were granted, and these are only kept going by strenuous efforts on the part of the local officials. To show how little consideration is given to local sections, it is only necessary to turn up the balance sheet of any section. One of them shows a list of members as follows : 28 members, 85 associate members, 30 associates, and 60 students. These members' subscriptions amount to no less than £369 12s. The grant from the parent institution amounted to £54. Out of this princely sum have to be provided clerical service, printing, &c., postage, and refreshments. As the local University grant the use of the room, nothing is charged to this head.

I should like to suggest to the committee that they be a little more liberal with local sections, and that each local section centre should have a room of their own where a reference library, occasionally circulated from London, could be kept, together with useful technical journals. This should not be a difficult matter to arrange, and would be a great boon to all country members. More freedom might also be given to local sections with regard to Papers, and any Paper of peculiar local interest should be given every opportunity to be read and published.

It would be interesting to know what provincial members, as a whole, think of the question of the benefit of the Institute to themselves, for, beyond receiving the journal, a few months after all the contents have been published and commented upon, in the technical Press, and the right to use the title of the Institution, country members have little or no return for their heavy subscription.

"PROVINCIAL."

LOCAL NOTES

ACTON: *Electricity Undertaking.*—For the quarter ending December 31st there was a gross profit of £1,903, and after providing for loans and interest there was a net profit of £679. This is the first time a net profit has been made upon the undertaking.

ARGENTINA: *Electric Traction.*—Messrs. Colson, Brookhouse & Pyne have applied to the Santa Fé municipality for a concession for electric tramways. The Public Works Committee of the Uruguayan Chamber of Deputies will, says the *Review of the River Plate*, report favourably on the project for an electric railway from Colonia to Montevideo. It is anticipated that the scheme, which is promoted by Mr. W. P. Steer, will take four years to complete.

Buenos Ayres: Tax on Telephone Revenue.—The City Council have, says the *Review of the River Plate*, imposed a tax of six per cent. on the gross revenue of telephone companies working in the city.

BISHOP'S STORTFORD: *Electric Lighting.*—A ratepayers' meeting has passed a resolution urging the Council to proceed with the electric lighting order, and to carry out the work themselves.

BURY ST. EDMUNDS: *Hiring Metal Filament Lamps.*—The Council have adopted a suggestion of the Borough Electrical Engineer to hire out metal filament lamps for exterior shop lighting where these are preferred to small arc lamps. A charge of £1 per annum per 300 c.p. lamp, which will include supply, fixing, and maintenance, is to be made, in addition to the usual charge of 6d. per unit for current.

CANADA: *Toronto Electric Tramways.*—H.M. Trade Commissioner at Toronto reports that the Board of Control have submitted to the City Council a recommendation that application be made to the Legislature for power to expropriate the Toronto Street Railway Co., and also authority to construct a further system of service and underground tramways.

CARDIFF: *Electric Lighting Loan.*—The Corporation is taking up a loan of £7,900 from the Croydon Corporation for electrical extensions.

DUBLIN: *Electrical Extensions.*—With reference to the recent application of the Council for a loan of £103,000, the Local Government Board have sanctioned £75,000. In a report, the Electric Lighting Committee state that this amount will fairly cover all immediate requirements, but they disagree with the recommendation of the Local Government Board that in future the amounts which it is proposed to expend upon particular works should be specified. This, they point out, is very difficult in connection with sundry mains extensions, and they are communicating with the Local Government Board on the matter.

Hire of Motors.—Owing to the general reduction in the price of motors, the Committee have entered into negotiations with the General Electric Company with regard to the scale of prices fixed in the hire purchase contract, which still has 12 months to run. The company have agreed to a revised list of rates, which give very substantial all-round reductions in the list. It has also been arranged with the company to extend the agreement to cover the hire purchase of electric ovens, radiators, and other domestic appliances. This class of apparatus is to be loaned on one month's trial.

DUNDEE: *New Electricity Works.*—Professor J. A. Ewing, F.R.S., has consented to open the new Carolina Port generating station of the Corporation on Wednesday, February 23rd, Professor Ewing is a native of Dundee.

Electric Driving.—Two more works were changed over last week to electric driving—those of the Sycamore Saw Mills, and the Pearl Steam Laundry Co., Ltd. The latter is now completely driven and lit by electricity, the old boiler still being retained for heating purposes.

HALESOWEN: *Light Railway Order.*—An inquiry was held by the Light Railway Commissioners last week into an application by the Halesowen Light Railway Co. for various extensions of their powers in Birmingham, Smethwick, Oldbury, Rowley Regis, and Lye. The company obtained its original powers in 1901 and 1902. There was considerable opposition to the proposed extensions, and the inquiry was adjourned.

HANWELL: *Electric Supply.*—The Metropolitan Electric Supply Co. have written that the company confidently anticipates that the electric lighting arrangements will be completed by the agreed time, viz., June next.

HONDURAS: *Electric Lighting.*—A twenty-year concession has been granted to the Puerto Cortez & Baracoa Electric Company, for supplying electrical energy in these districts. The concession includes the construction of telephone and telegraph lines. A similar concession has been granted to San Pedro Sula. The company will operate under the name of "Empress De Luz Eléctrica de San Pedro-Sula."

INDIA: *Lucknow: Electric Lighting.*—The *Times* of India states that the invitation of the Council for tenders for a scheme of electric supply have failed in the absence of a thorough survey of the district. The Council have now arranged for an expert to prepare a scheme, and a poll of the residents will be taken in order to ascertain whether the Council shall undertake the management of the undertaking, or hand over the concession to a company.

ISLE OF WIGHT: *Electrification of Railways.*—The conference of local authorities regarding a scheme for converting the Isle of Wight railways to electric traction, or, alternatively, the construction of electric tramways, has now been concluded. The railway companies expressed the opinion that the advantages of electric traction have not been demonstrated sufficiently to warrant its adoption. The representatives of the local authorities are therefore unable to recommend any definite course of action.

JAPAN: *Electric Railway.*—An electric railway between Shinagawa and Akabane, a distance of 20 miles, has been completed. The line is the property of the Tokyo Electric Railway Co.

LIVERPOOL: *Cathedral Lighting.*—Liverpool Cathedral is being wired for electric lighting by Messrs. John Hunter & Co., on the British Insulated & Helsby Cables, Ltd., lead-covered system.

Digitized by Google

LONDON: *London County Council: Tramway Conciliation Board.*—Mr. H. M. Hooke, of the Clerks' Department of the Council, and Mr. H. F. Auger, of the Tramways Department, have been appointed Council's and employees' representatives respectively upon the Tramway Conciliation Board.

Marylebone: Electric Cooking.—Several cooking equipments have been installed by consumers, and, as it was found that instruction was necessary in order that the consumers' cooks shall handle the apparatus as efficiently as possible and with the least waste of current, a lady instructress has been engaged to give instruction to the cooks or consumers at 5s. per demonstration.

Westminster: Street Lighting.—In reference to the experimental installation of improved gas lighting in Victoria Street, the Westminster Electric Supply Corporation are to be allowed to put in a competitive installation for electric light. This will consist of twelve metallic filament lamps erected at the west end of Victoria Street, and four flame arc lamps erected at the east end of the street, the whole cost being borne by the Supply Co. The St. James's & Pall Mall Electric Light Co., Ltd., are to be allowed to erect an experimental installation of flame arc lamps in Sackville Street, which is now lighted by incandescent gas lamps, subject to their bearing the whole cost of the installation.

PERTH: *Tramways Undertaking.*—Further details from Mr. Peter Fisher's report upon the local tramway system have been published. He comes to the conclusion that the tramways are being overcharged for electrical energy to the advantage of the lighting consumers. He also directs attention to the question of Sunday trams, which would, he says, modify his remarks as to the department being overstaffed. In the event of Sunday cars being run, all the present staff will be required.

TAVISTOCK: *Electric Lighting.*—A resolution that Messrs. Drake & Gorham, Ltd., should advise the Council upon a scheme of electric lighting was lost at the last meeting of the Council after some discussion.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRIDLINGTON.—Extensions at an estimated cost of £2,699 are contemplated.

CARLISLE.—Application is to be made for a loan of £14,000 for electrical extensions.

Tenders are invited for two 500-kw. steam-driven generating sets with ejector condensers. Particulars from the City Electrical Engineer, and tenders by March 1st.

CORNWALL.—The Consolidated Mines, Ltd., St. Ives, propose to install additional generating plant.

DUNDEE.—It has been decided to apply for borrowing powers to the extent of £60,000 in connection with the electrical undertaking.

GILLINGHAM.—Tenders are invited for the supply of cables, house-service cut-outs, joint boxes, metal filament lamps, meters, &c. Particulars from the Borough Electrical Engineer, and tenders by February 28th.

NUNEATON.—Application is to be made for a loan of £2,105 for extensions to cables, &c.

WATFORD.—Tenders are invited for a year's supply of H.-T. and L.-T. paper-insulated cables. Particulars from the Borough Electrical Engineer, and tenders by March 1st.

Miscellaneous

BIRMINGHAM.—The Birmingham Tame & Rea District Drainage Board require electrical accessories for the year to March 31st, 1911. Particulars from Mr. J. D. Watson, Drainage Board Offices, Tyburn, near Birmingham, and tenders by March 8th.

BRAZIL.—The Ministry of Justice and Home Office Affairs is authorised to expend the sum of £25,000 upon electric lighting, &c., for the new police building in the Federal District.

BRISTOL.—The Electrical Committee require (*a*) yellow flame and white open type arc lamp carbons; (*b*) A.-C. house-service meters; (*c*) arc lamp globes; (*d*) joint, junction, and fuse-boxes. Particulars from Mr. H. Faraday Proctor. (See an advertisement on another page.)

DUBLIN.—The Corporation require arc lamp carbons. Particulars from the Town Clerk's Office. (Seen an advertisement on another page.)

SERVIA.—A Belgian Consular report states that there is an increasing demand in Servia for electrical apparatus.

SWINDON.—Tenders are invited for the supply of electrical and tramway stores and accessories. Particulars from the Tramways Manager, and tenders by February 26th.

TURKEY.—The Ministry of Public Works invites tenders by February 28th for the construction and working of an electric tramway in Niaousta.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

London County Council.—Tenders are invited for the wiring and fitting of the Barnsbury Park (Barnsbury), Lauriston Road (South Hackney), Manor Lane (Lee), and the Reay (Brixton) Elementary Schools. Particulars from the Chief Engineer to the Council, and tenders by February 23rd.

W.—Trade school for girls at Hammersmith School of Arts and Crafts, W. (£1,084). Builders, G. Munday & Sons, Muscovy House, Trinity Square, E.C.

E.—Coroner's Court, Poplar (£3,000). Builder, Gathercole Bros., Norbury, S.E.

S.W.—Electric Theatre, Garratt Lane, Earlsfield. Architects, Emden, Egan & Co., 2 Lancaster Place, W.C.

PROVINCES.

BOOTLE.—Tenders are invited for an electric light installation at the new girls' secondary schools. Particulars from the Borough Electrical Engineer, and tenders by March 1st.

CHATHAM.—Proposed school for girls (200 places). Architect, Education Committee, Kent County Council.

CROYDON.—Electric theatre, Portland Road. Builder, J. Watt, The Lodge, Bromley Road, S.E.

Proposed new handicraft centre (£950). J. Smyth, Sec., Croydon Education Committee.

DARTFORD.—School (£8,500). W. H. Robinson, architect to Kent Education Committee.

HULL.—Theatre. Architects, Freeman, Son & Gaskell, Hull.

LANCASTER.—Extension, County Asylum. Architect, H. Aspinall, 36 Dale Street, Liverpool.

MANCHESTER.—Tenders are invited for the wiring, &c., of the Exhibition Buildings, Old Hall Lane, Rusholme, Manchester. Particulars from Mr. W. Davenport, Ridler Place, Holland Street, Blackfriars, London, and tenders by February 28th.

NORTHAMPTON.—Church (£4,000). Trustees, Abington Avenue, Congregational Church, Northampton.

NORTHFLEET.—Additions to school (£3,699). Builders, G. Baker & Son, 133A High Street, Strood.

ST. ALBANS.—Isolation Hospital, Folly Mead (£3,320). Surveyor, St. Albans Rural District Council.

STOCKPORT.—Premises, Reddish Road. Stockport Co-operative Society.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The Melbourne City Council have accepted the tender of the Sloan Electrical Co., Ltd., for the supply of 40,500 flame arc lamp carbons at £1,946.

BRIDLINGTON.—The Corporation have placed an order for a 350-kw. Willans-Impulse "disc and drum" type turbine with Messrs. Willans & Robinson, Ltd.

CLACTON.—The Council have accepted the tender of the Electrical Apparatus Co. for the supply of ordinary and prepayment meters.

EAST HAM.—The Council have accepted the tender of Messrs. Dick, Kerr & Co., for a balancing machine at £320.

INDIA.—The Calcutta Electric Supply Co., Ltd., have, on the recommendation of their consulting engineers, Messrs. Kennedy & Jenkin, placed an order for a 1,000-kw. Willans-Impulse "disc and drum" type turbine with Messrs. Willans & Robinson, Ltd.

LONDON: *London County Council.*—The tender of Messrs. Bolckow, Vaughan & Co., Ltd., has been accepted for the supply of track rails and fastenings at £21,065.

The tender of Messrs. P. & W. Maclellan, Ltd., has been accepted for the supply of slot rails and conductor tees at £12,386 5s.

An offer by Messrs. Hurst, Nelson & Co., Ltd., at £3,550 for ten double-deck car bodies has been accepted. Another offer by the same firm at £1,137 10s. for ten sets of four-wheeled swing bolster trucks has also been accepted.

An offer by the British Westinghouse Co. at £3,322 10s. for electrical equipments for ten cars, and another offer at £570 for ten sets of magnetic-brake equipment have been accepted.

An offer of Messrs. Hadfield's Steel Foundry & Co., Ltd., at £14,432 10s., for special track work has been accepted.

An existing contract with Messrs. Spagnoletti, Ltd., for low- and high-tension switchgear at the Elephant and Castle substation has been extended to include an additional switch at £120.

The following tenders have been received for the supply of test-room instruments for the second section of the Central Car

Digitized by Google

Repair Depôt :—Messrs. Everett, Edgcumbe & Co., Ltd., £108 (accepted); India Rubber, Gutta Percha Telegraph Works Co., Ltd., £111; Messrs. Evershed & Vignoles, Ltd., £116; Messrs. Nalder Bros. & Thompson, Ltd., £119 9s.

Bermondsey.—The Council received the following tenders for feeder panels :—British Thomson-Houston Co., Ltd., £70 7s. 6d.; Crompton & Co., Ltd., £105 5s.; General Electric Co., Ltd., £68 17s. 6d.; Siemens Bros. (accepted), £91.

Hampstead.—The Council has accepted the tender of Messrs. Pryke & Palmer for the annual supply of engineer's stores for the electric lighting station.

LOWESTOFT.—The Tramways Committee have accepted the tender of the National Tramway Appliance Co. for apparatus to be fitted to tramcars for removing rail corrugations at £25 a set.

METROPOLITAN RAILWAY CO.—The tender of the General Electric Co., Ltd., has been accepted for the annual supply of Osram lamps for the current year to the Metropolitan Railway Co.

APPOINTMENTS AND PERSONAL NOTES

Mr. G. A. Sekon, the editor of the "Railway Magazine," has severed his connection with that journal.

Mr. H. Clifford Palmer has rejoined the General Electric Co., and will take over the management of the publication department.

Mr. Patrick Hendry has been appointed Assistant Lecturer and Demonstrator in the Engineering Electro-Technics Department of the Transvaal University College, Johannesburg.

Mr. C. Hobson has been appointed junior charge engineer at Woolwich at a salary of £100 a year, rising to £140.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 10s. to £62 5s. per ton (last week, £61 15s. to £62 5s.).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—Notice is given of an intended dividend in the bankruptcy of Robert Foster, and Walter Baker, trading as the Nelson Electrical Co., Stott Street, Nelson. The trustee is Mr. C. H. Plant, Official Receiver, 13 Winckley Street, Preston, and the last day for receiving proofs is February 12th.

The Mitcham Electric Fan Co., Ltd., is to be wound up voluntarily for the purpose of the transfer of the business to the Dynamic Syndicate, Ltd.

Mr. Harold Mather, Acresfield, Bolton, has been appointed trustee in the bankruptcy of Messrs. Platt & Bleasdale, electrical engineers, Victoria Square, Bolton.

Meetings of La Capital Tramways Co., Ltd.; La Capital (Extensions) Tramways Co., Ltd.; La Capital Traction & Electric Co., Buenos Ayres; and the Buenos Ayres New Tramways, Ltd., will be held at the offices of the liquidators, Messrs. Lazarus and Thursby, 62 London Wall, London, E.C., on February 22nd, at twelve noon, for the purpose of hearing the liquidators' account of the winding up.

Creditors of the Himalaya Electric Railway, Ltd., are requested to send particulars of their claims to the liquidator, W. W. Turner, 28 Chapel Street, Liverpool, by February 23rd.

A meeting of the Santoni Arc Lamps and Engineering Co., Ltd., will be held at the offices of Messrs. McIntosh, Whyte & Co., 11 Queen Victoria Street, London, E.C., for the purpose of hearing the liquidator's account of the winding up.

J. Platt and R. Bleasdale, electrical engineers, of Bolton, have been adjudicated bankrupt.

The Chipping Norton & District Light & Power Co., Ltd., is to be wound up voluntarily. Mr. C. T. Butcher, 25 Balloch Road, Catford, is liquidator. A meeting of creditors will be held at 1 West Street, Finsbury Circus, London, on February 2nd, at 12 noon.

The public examination of Peter Smith, electrical engineer, 18 Mill Street, Warrington, took place last week. His debts amount to £210, and the bankruptcy is attributed to bad trade.

In the Manchester County Court last week, on the motion of the British Westinghouse Co., a compulsory winding-up order was made against Messrs. E. Russell & Sons, Ltd., electrical engineers and contractors, Cross Street, Manchester.

A first and final dividend of 2s. 3½d. in the £1 will be paid in the bankruptcy of W. T. Harris, electrical engineer, 460 Commercial Road, Portsmouth. Payment will be made by Messrs. Whittaker & Bailey, on February 10th, at 3 Portland Street, Southampton.

A receiving order has been issued against Messrs. Felgate & Storey, electrical engineers, 10 Queen Victoria Street, Reading.

DISSOLUTION OF PARTNERSHIP.—The partnership between U. Horsfall, J. Crowther, and E. O. Coulthard, trading as Willis & Co., electrical and mechanical engineers, 2 Commercial Street, Knott Mill, Manchester, has been dissolved.

B.T.-H. METERS.—It has been brought to the attention of the British Thomson-Houston Co., Ltd., that certain statements are being made to the effect that the B.T.-H. type M.H. Mercury Meter for continuous-current circuits, and types A.C.T. and R.H. for alternating-current circuits, are manufactured abroad. They desire to state that these are manufactured at their works at Rugby, and any report to the contrary is false.

PLANT FOR SALE.—The Leeds Corporation have some modern central station or sub-station switchgear for sale. For particulars see an advertisement on another page.

CANADIAN AGENCIES WANTED.—A Cheshire firm manufacturing electric overhead travelling cranes, electric pulley blocks, electric hoists, electric transporters, and electric runways, desires to appoint Canadian agents.

A firm of architectural metal workers in the English Midlands making electric lighting fittings, &c., wishes to enter into correspondence with prospective agents or buyers in Canada.

Particulars, &c., may be obtained at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Oxford Electric Co., 9 per cent. per annum for the December half-year. Northampton Electric Light & Power Co., 6½ per cent. per annum for the December half-year. Mather & Platt, 10 per cent. per annum, with a bonus of 2 per cent. for 1909.

NATIONAL ELECTRIC CONSTRUCTION CO.—Dr. G. T. Moody has been elected a director in place of Mr. W. H. Fowler, who has resigned.

ROSARIO ELECTRIC CO.—It is announced that the Board have signed an agreement with the Société Financière de Transports et d'Entreprises Industrielles of Brussels, under which the Brussels Co. have an option up to July 1st next of acquiring the company's concession.

Digitized by Google

COMPANIES' MEETINGS AND REPORTS

ANGLO-AMERICAN TELEGRAPH CO., LTD.—The report for the December half-year shows a net profit of £150,644, after setting aside £10,000 to the renewal fund.

At the meeting last week the report and accounts were adopted.

LANARKSHIRE TRAMWAYS CO.—The report for the half-year shows a balance of £19,426. The sum of £8,500 has been placed to reserve for depreciation, and a dividend of 5½ per cent. per annum for the half-year is recommended, carrying forward £1,328.

At the meeting on Thursday the report and accounts were adopted.

GIANT'S CAUSEWAY & PORTRUSH ELECTRIC TRAMWAYS CO.—At the annual meeting on Friday the report and accounts were adopted. The profit for 1908 amounted to £1,485, and, after meeting debenture and mortgage interest, a balance of £389 is carried forward.

CITY & SOUTH LONDON RAILWAY CO.—At the meeting last week, the report and accounts given in our issue for January 27th were adopted. Mr. C. B. Stuart Wortley, chairman of the company, who presided, said that their reduced fares had been amply justified by results, for whilst the receipts per train-mile had increased, the expenditure had decreased owing to the trains being far better filled. The number of passengers during the past half-year was the largest in the history of the company.

METROPOLITAN DISTRICT RAILWAY CO.—The report for the December half-year shows a net revenue of £25,942 after providing for interest and other charges, and setting aside £10,000 as reserve for renewals. The full dividend is recommended on the 4 per cent. guaranteed stock. The gross receipts increased by £17,737, and the working expenses decreased by £1,195. Arrears of dividend on the guaranteed stock now amounts to £246,754, and this is to be dealt with under a capitalisation scheme.

Sir George Gibb presided at the meeting on Wednesday last week, when the report and accounts were adopted. The chairman dealt at length with the scheme for capitalising the arrears of dividends on the 4 per cent. guaranteed stock, details of which were given in our columns some time ago. Dealing with the working expenses, he stated that the figures for January showed a decrease in the works costs at the Lot's Road power-house of no less than 27 per cent., and he believed that the efficiency of working there compared very favourably with any large power-house in the world. The present position was such that there was every indication of the full dividend on the 4 per cent. guaranteed stock being maintained in the future.

PROVINCIAL TRAMWAYS CO.—Extraordinary general meetings were held on Friday sanctioning the reduction of the company's capital from £400,000 to £275,440.

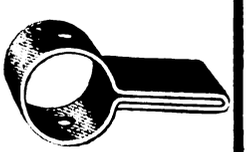
BRITISH ALUMINIUM CO., LTD.—The necessary meetings of the various classes of shareholders were held on Friday, when the scheme of reconstruction outlined in our last issue was agreed to.

Instruments & Machinery Tested

THE ELECTRICAL STANDARDIZING, TESTING AND TRAINING INSTITUTION.

FARADAY HOUSE,

62-70, SOUTHAMPTON ROW, LONDON, W.C.



Telephone No.: 9999 Central. Telegr. Address: "Standardising, London."

Tests every kind of Electrical Instrument, Apparatus, and Material.

A Scale of Fees will be sent on application to the SECRETARY.

STAMPINGS

Digitized by Google

CENTRAL ELECTRIC SUPPLY CO.—There is a net profit of £5,036 for the year 1909, and, after paying 5 per cent. on the ordinary shares, the sum of £36 was carried forward. The output during the year was 17,282,370 units. The extensions at Grove Road Works have now been completed, making the total capacity 12,830 kw.

REES ROTURBO MANUFACTURING CO.—The net profit for the 11 months to October 31st, 1909, was £8,111. After meeting the 5 per cent. preference dividends, £2,000 have been placed to depreciation, and £2,978 carried forward.

DUBLIN UNITED TRAMWAYS CO.—The net revenue for the December half-year amounted to £58,167. Dividends at the rate of 6 per cent. per annum on both preference and ordinary shares are recommended, and £15,000 are set aside towards renewal of permanent way. The sum of £9,267 is carried forward. At the meeting last week the report and accounts were adopted. A feature of the accounts is the sum of £8,150 repaid to the company in respect of income tax overpaid during the past six years.

THE CITY OF BUENOS AIRES TRAMWAYS CO. (1904).—The net revenue for 1909 was £69,842, and after meeting a dividend of 5s. per share on the ordinary shares, and transferring £3.700 to amortisation fund, the sum of £142 is carried forward.

BLACKPOOL & FLEETWOOD TRAMROAD CO.—The report for the December half-year shows a balance of £11,577, after meeting debenture interest. The directors recommend a dividend of 9 per cent. per annum on the ordinary shares, carrying forward £2,577.

DUBLIN & LUCAN ELECTRIC RAILWAY CO.—The report for the December half-year shows an available balance of £1,240, and after meeting the 5 per cent. preference dividends a balance of £415 is carried forward.

BRISTOL TRAMWAYS & CARRIAGE CO.—The gross revenue for 1909 was £285,564, and the working expenses £199,371. After meeting mortgage interest, preference dividends, and a 6 per cent. dividend on the ordinary shares, the balance is transferred towards reconstruction of permanent way. The number of passengers carried during the year shows a decrease of 812,651 compared with 1908.

BAKER STREET & WATERLOO RAILWAY CO.—The revenue for the December half-year amounted to £88,578, an increase of £2,222, whilst the working expenses have decreased by £2,019. After providing for interest, rents, and preference dividends, a dividend of 3 per cent. per annum is recommended on the ordinary shares, except those held by the Underground Electric Railways Co. of London, upon which the dividend is 1½ per cent.

GREAT NORTHERN, PICCADILLY & BROMPTON RAILWAY CO.—The receipts during the December half-year were £152,341, an increase of £9,106, whilst the working expenses decreased by £2,326. After meeting preference dividend and setting aside £3,000 for contingencies, a dividend of 1¼ per cent. per annum is recommended on the ordinary shares, carrying forward £6,024.

CHARING CROSS, EUSTON & HAMPSTEAD RAILWAY CO.—The receipts for the December half-year were £105,138, an increase of £11,072, whilst the working expenses increased by £1,046. A dividend of ¾ per cent. per annum is recommended on the ordinary shares.

NEW COMPANIES

G. H. SCHOLES & CO., 27 Blantyre Street, Chester Road, Manchester. Capital, £8,000 in £1 shares (5,000 preference shares). To acquire the business of electrical and mechanical engineers carried on by G. H. Scholes.

G. PEARSON & SONS, 154 Abbot Road, Poplar, London, N. Capital, £2,000. Makers of electrical accumulators, &c.

REID BROS., ENGINEERS, 12 Wharf Road, City Road, London, N. Capital, £30,000. To acquire the business of electrical, telegraph, and telephone engineers now carried on by J. Reid & E. J. Reid.

BRADFORD ELECTRICAL CO., 56 Manningham Lane, Bradford. Capital, £1,000. Electrical engineers, &c.

EBRO LIGHT & POWER CONSTRUCTION CO.—Registered by Messrs. Slaughter & May, 18 Austin Friars, London, E.C. Capital, £100,000. To carry on the business of electrical engineers, promoters of and workers of tramways, railways, electric, hydraulic, and other works, &c., and to adopt an agreement with A. Parrish.

STAR ELECTRIC LIGHT CO.—6 St. Swithin's Lane, London, E.C. Capital, £1,000. To acquire business of electrical enginers and contractors, carried on by Star Electric Light Co.

TRACKLESS TROLLEY.—15-16 Cockspur Street, London. Capital £100. To acquire inventions relating to trackless trolley systems, whether Stoll's System or otherwise, and to equip trackless trolleys, tramways, light railways, omnibuses, and other vehicles. The subscribers are G. F. Underwood and C. P. Wenzel, of 14 and 15 Cockspur Street, London.

VERA CRUZ TELEPHONE CONSTRUCTION SYNDICATE.—Registered by Linklater & Co., 2 Bond Court, London, E.C. Capital, £10,000. Telephone, telegraph, and electrical engineers, and to adopt agreements with Messrs. W. T. Henley's Telegraph Works, Co., Ltd., J. Sitzenstatter and R. B. Bumeller.

ELECTRIC TIMEKEEPERS.—Registered by Messrs. Christopher & Son, 5 Argyle Street Place, London. Capital £1,000 (£300 twenty per cent. cumulative preference shares). To take over certain inventions relating to electric clocks, &c., and to adopt an agreement with C. Haunz.

"FLOAT" ELECTRIC CO.—Registered by Mayo, Elder & Co., 10 Drapers Gardens, London, E.C. Capital £10,000. Electrical engineers and manufacturers.

UNDERHILL & RITCHIE, 79 Bath Street, Glasgow. Capital £5,000. To acquire business of electrical and general engineers, now carried on.

RURAL ELECTRICITY SUPPLY CO., 11 Victoria Street, London. Capital £10,000 (10,000 deferred shares 1s. each). Electrical engineers, suppliers of electricity, &c. Subscribers:—B. P. Gibbons, Dingley, Tilehurst, Berks, company director; G. B. Crockatt, The Knoll, Kidmore Road, Caversham, electrical engineer; H. T. Harrison, 11 Victoria Street, S.W., engineer; S. I. Pettit, Hurley, West Tarring, Sussex, engineer; J. D. Dymond, 16 Davies Street, W., engineer; E. S. New, 11 Victoria Street, S.W., engineer; H. Dixon, 11 Victoria Street, S.W., secretary.

TRAFFIC INDICATORS, 385 City Road, London. Capital £5,000. Electrical engineers, manufacturers of indicating instruments.

ELLIS & WARD, Edmund Street, Birmingham. Capital £10,000. Electrical engineers and contractors.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

ROENTGEN RAY APPARATUS.—A very complete new catalogue of Roentgen-ray electro-therapic apparatus has just been issued by Messrs. W. Watson & Sons, Ltd. (313 High Holborn), together with a booklet entitled "Hints on the Use of X-ray Apparatus." A full description of Messrs. Watson's special design of intensified induction coil is included, together with various forms of their "moto-magnetic" mercury jet and other interruptors. Complete outfits are listed of high-frequency, as well as Roentgen-ray apparatus, together with many useful accessories and electro-medical apparatus generally.

ELECTRICALLY-DRIVEN PRINTING MACHINERY.—A well-illustrated handbook, entitled "Electric Control of Printing Machinery," has just been published at the price of one shilling by the Adams Manufacturing Co., Ltd. (106 New Bond Street, London, W.). This is of the nature of a technical treatise on the subject, with special reference to the "Igranic" switchgear manufactured by this firm. Photographs of a large number of important installations and of the automatic and other switchgear employed are included in the handbook. A push-button system for the control of large rotary presses is also described and illustrated.

ROLLER BEARINGS.—The Empire Roller-Bearings Co., Ltd. (15 Victoria Street, Westminster, S.W.) have issued a new leaflet giving particulars and prices of two standard patterns of roller bearings for trucks and wagons. One pattern is suitable for works trucks, mine tubs, and wagons for heavy duty. The other is adapted to railway trollies and inspection cars or trucks which have to be dismounted quickly from their axles; in this pattern the cages and rollers are made self-contained for convenience in dismounting.

SMALL MOTORS.—Two new leaflets from the Edison & Swan United Electric Light Co. deal with electric motors. In one of these small motors from 1/50 to 1/7 h.p. for both continuous and alternating current are described, the latter including both single-phase commutator type and single- and three-phase induction motors. The other leaflet deals with continuous-current motors from ½ to 20 h.p., made under the Zone patents, with specially arranged field distribution giving exceptionally good commutation. These are listed in the open protected, enclosed ventilated, and totally enclosed patterns.

MOTORS, SWITCHGEAR, AND ACCESSORIES.—A new abridged price list of installation materials for electric light and power has been issued by the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London, W.C.). This is a book of about 150 pages, giving a *résumé* of all this company's electrical apparatus and fittings, with lists of sizes and prices. The first 30 pages are devoted to photographs of electrical installations put down by the company, turbo-generators, large machines, transformers, and special applications of electric power. This is followed by abridged lists of all the company's specialities, including motors of all types, fans, wiring fittings, switchgear, instruments and meters, arc lamps, metal filament lamps, special carbon filament lamps, &c. An index is provided.

ELECTRIC TYRE PUMP.—We have received a leaflet from Messrs. E. E. Coy (77 St. John's Road, Bootle) describing a self-contained set consisting of a small motor driving an air-pump through gearing for use in garages for inflating motor-car tyres.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 10th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

15,605/09. **Enclosed Flame Arc Lamp.** SIEMENS-SCHUCKERTWERKE-GES. A metallic receptacle comprising an inner cylinder and an outer annular chamber communicating with the cylinder at top and bottom is placed above the lamp globe, and a transparent cylinder enclosing the arc projects up into the inner cylinder. The fumes from the arc are sucked up into the latter, and a circulation is kept up in the receptacle so that the particles of chemical material are deposited on the cool inner surface of the annular chamber. Five claims, one figure.

19,393/09. **Radial Commutators.** F. W. LE TALL (*Westinghouse Electric & Manufacturing Co., U.S.A.*). To prevent overheating at the working surfaces of radial commutators, sets of bars are assembled radially round a ribbed sleeve on the shaft so that passages are left between the several sets and the shaft. The like bars of the several sets are connected by thin lugs so as to leave spaces for the air to pass up radially from the shaft along the working faces. A forced circulation is obtained due to the centrifugal effect. One claim, four figures.

19,466/09. **Arc Furnace for Treating Gases.** SALPETERSÄURE INDUSTRIE-GES. Between the main electrodes are two auxiliary electrodes, connected by a resistance. Each of the auxiliary electrodes forms with its adjacent main electrode an arc expanding device of the horn pattern. Should the main arc be blown out, two arcs are formed at the two horn devices, and expand out until they meet and thus restrike, the main arc. One claim, two figures.

20,246/09. **Motor Control.** BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) In order to reverse two or four motors of a traction equipment when they are working in parallel for the purpose of exerting a braking effect, the fields of the motors are short-circuited, and the connections between each field and its armature are reversed. Four claims, two figures.

Opposition to Grant of Patents

17,349/08. **Wireless Telegraphy.** E. VON LEPEL. Opposition has been entered to the grant of this patent. The specification, abstracted in ELECTRICAL ENGINEERING, December 23rd, page 1086, describes the discharger used in the Lepel system of wireless telegraphy, in which the metal discs are separated by a thin piece of paper.

6,424/09. **Wireless Telegraphy.** W. P. THOMPSON (*Ges. für Drahtlose Telegraphie*). Opposition has been entered to the grant of this patent, which covers apparatus for producing slightly damped oscillations by the Wien "shock excitation" method. The spark-gap comprises two parallel metal plates with a ring of insulating material between them to enclose the sparking area.

8,146/09. **Metal Filaments.** R. HOPFELT. The grant of this patent is opposed. It covers a process for removing hydrocarbons by sintering the filaments in an atmosphere of a halogen compound such as phosphorus tri-chloride.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Manufacture of electrodes] 2,027/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: TANNER and CLAREMONT [Cables and distribution system] 27,859/08; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Insulating material] 2,127/09; BURTON [Insulators] 25,259/09.

Dynamos, Motors, and Transformers: ALLGEMEINE ELEKTRICITÄTS-GES. [A.-C. commutator machines] 1,705/09; MAVOR and MAVOR & COULSON, LTD. [Control of speed of A.-C. motors] 12,917/09.

Electric Ignition: HOPPS [Engine ignition] 5,210/09; ISAACSON [Magneto apparatus] 23,177/09; R. BOSCH [Brush-holders for distributors] 27,103/09.

Electrometallurgy and Electrochemistry: SOC. FRANÇAISE ELECTROLYTIQUE [Extraction of copper from ores and alloys] 4,574/09; FULLER [Dry batteries] 17,824/09.

Heating and Cooking: BERRY [Heating apparatus] 4,672/09.

Storage Batteries: TATE [Bifunctional plates] 7,097/09.

Switchgear, Fuses, and Fittings: READ [Motor Starters] 2,383/09; JOHNSTONE [Plug fuses and fuse-boxes] 2,779/09; BRITISH THOMSON-HOUSTON CO. and WEDMORE [Protective devices for H.T. systems] 3,192/09; JOEL [Portable lamps] 9,693/09; SIEMENS BROS. & CO. and FERREIRA [Mercury switch for railway signalling] 15,854/09; HOWE and TAYLOR [Switches] 22,385/09.

Telephony and Telegraphy: SIMPSON [Wireless telegraphy] 27,746/08; MONASCH [Production of phase-displaced oscillations] 9,427/09; PICKFORD [Telephone transmitters] 14,209/09; FOSS [Sound intensifier for telephones] 17,137/09; KINGSBURY (*Western Electric Co., U.S.A.*) [Telephone selector switch] 20,841/09; MOLONEY and ROSS [Telephone transmitters] 25,028/09.

Traction: FRASER, and TUDOR ACCUMULATOR CO. [Train-lighting system] 1,820/09; MARDON and HUDSON [Signalling] 2,382/09; BROCK [Rail joint] 9,996/09.

Miscellaneous: ELECTROMOTORS, LTD., and HAMILTON [Machine tools] 1,575/09; TRENTMANN [Electrically lighted life-buoys] 19,424/09; ALLGEMEINE ELEKTRICITÄTS GES. [Centrifugal pumps] 21,763/09; SIEMENS & HALSKE AKT.-GES. [Fire alarm systems] 24,185/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: JACKSON and SCHEIBE [Control of mercury vapour rectifiers] 1,482/10; SCHEIBE [Control of mercury vapour rectifiers] 1,483/10.

Distributing Systems, &c.: SATTLER [Cable-making machinery] 1,290/10.

Dynamos, &c.: AKT.-GES. BROWN BOVERI ET CIE [Machines for starting purposes] 20,827/09.

Electric Ignition: ELEKTRISKA AKTIEBOLAGET A.E.G. [Control system for submarine mines] 1,206/10.

Telephony, &c.: STEINACKER and PLISINER [Heavy current microphone] 13,922/09; FESSENDEN [Wireless telegraphy] 187/10.

Miscellaneous: FELTEN & GUILLEAUME LAHMEYERWERKE AKT.-GES. [Transporting mechanism] 25,590/09; DELON [Apparatus for generating direct current at high pressure] 847/10.

Application for Restoration of Lapsed Patent

17,879/04. **Terminals.** J. SCHADE. The Fahnestock Electric Co. have applied for the restoration of this patent, which expired in 1907, owing to non-payment of renewal fees. It covers a spring-clip terminal, comprising a slotted strip of metal folded over so that the wire is gripped between the upper end and a hooked projection from the lower end.

Amendment Allowed.

12,739/02. **Lamp Cap.** A. SWAN (General Electric Co., U.S.A.) Leave has been granted to amend further this specification, which describes a lamp cap with a glass button uniting the contacts and interlocked with the shell. See ELECTRICAL ENGINEERING, December 30th, 1909, Vol. V., p. 1,104.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Lamp with electrodes of magnesia and magnetite] 21,931/05.

Distribution Systems, &c.: T. L. BOYDEN [Pressure regulation] 23,110/03; W. M. MORDEY and G. C. FRICKER [House service box] 21,850/05.

Dynamos, &c.: F. J. and R. CHAPLIN [Wire brushes] 22,966/04; E. BOLTON [A.C. motor with automatic rotor resistance control] 21,583/05; H. H. LAKE (*International Holding Co., U.S.A.*) [Electro-magnetic drive] 21,652/05; A. VEDRINE and R. DE QUELEN [Field system] 21,658/05; S. VON AMMON [Homo-polar machines] 21,947-7A/05.

Electric Ignition: J. S. FOLEY [Sparking-plug] 23,323/02; H. C. HOLDEN [Commutator] 21,480/05; S. J. WILLIAMS [Interrupter] 21,521/05.

Electrometallurgy, &c.: P. GARUTI and R. POMPILI [Electrolytic production of oxygen and hydrogen] 23,663/96; H. KOLLER and P. ASKENASY [Electrolytic apparatus] 23,151/03.

Incandescent Lamps: C. L. MENGES [Filaments of non-conducting oxides and carbon or refractory metals] 10,815/99.

Instruments, &c.: J. ROUTIN and C. E. L. BROWN [Meter] 24,833/97; F. H. MERRITT [Repayment meter] 21,683/05; V. ARCIONI [Meter] 21,855/05.

Storage Batteries: J. BIJUR [Planté plates] 23,120/03; O. IMRAY (*C. Potter, U.S.A.*) [Casting plates] 23,490/03.

Switchgear, &c.: C. H. OFFORD [Time-switches] 21,253/01; ELECTRIC & ORDNANCE ACCESSORIES CO. and R. F. HALL [Switch contacts] 21,485/05; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Silicon resistances] 21,753/05; A. A. LINES [Terminal] 21,870/05.

Telephony, &c.: C. M. JACOBS and A. H. NICHOLSON [Relays for selective signalling] 23,255/02; J. D. ANDREWS [Selective signalling] 21,565/05.

Traction: L. T. ALLEN and R. E. SHARPLES [Trolley wire hanger] 23,032/04; A. E. HACKING and J. PYCROFT [Operating points and switches] 23,135/04; A. VEDRINE and R. DE QUELEN [Control of electric vehicles] 21,659/05; E. A. HEATH [Side-conduit points and switches] 21,821/05; E. TYER [Signalling] 21,927/05.

Miscellaneous: A. PRODAM and A. KERETZ [Discharging torpedoes] 21,558/05; F. KUHN [Alarm clock] 21,752/05; J. C. BOWIE and J. H. PHELPS [X-ray tube] 21,804/05.

SUMMARY

An interesting example of the difficulties that can be successfully overcome when applying electric drive to a textile mill designed originally for belt drive is afforded by the installation at the Broughton Flax Mills, Manchester. The spinning frames are driven in groups of from fifteen to twenty by 60 h.p. direct-current motors suspended from the ceiling and driving through chain-gear. The latter was adopted after an unsuccessful trial with spur-gearing, there being no space for a rope or belt drive. The motors are of a special construction, which permits of easy erection even under the unfavourable conditions of the case in question. (Page 131.)

A letter has been addressed by Mr. W. M. Mordey, as Chairman of the Electrical Engineering Committee of the Japan-British Exhibition, to the electrical manufacturers of the United Kingdom, drawing their attention to the advisability of a thoroughly representative exhibit of the products of the industry. (Page 132.)

A most complete water-cooling plant has just been erected for the Salford Electricity Works at a total cost of over £12,000. The hot water from the condensers is pumped out of the hot well by four turbine pumps driven by 60 h.p. direct-current motors into a common pressure main, from which it is distributed to four cooling towers of the natural draught chimney pattern. In these towers the water is reduced some 35° Fahr. in temperature, and flows from the tanks below into a common suction tank. The plant has been designed to deal with 750,000 gallons of water per hour, and has several interesting features. (Page 133.)

In a Paper read before the Institution of Electrical Engineers, Mr. F. Hope-Jones described the working of several different systems of electric time services with dials electrically operated by current impulses sent out at intervals from a master clock. He also showed a number of oscillograms demonstrating the smooth current-wave obtained with his own, the Synchronome system, and pointed out how the self-induction of the circuit was beneficial in enabling the necessary current to operate the dials to be obtained, with a longer duration of contact, even if the cell-voltage falls off considerably. Among the points brought up in the discussion were the avoidance of sparking at the contacts, current consumption, and the synchronising of master clocks. (Page 135.)

The action by the "Z" Electric Lamp Manufacturing Co., Ltd., against Messrs. Marples, Leach & Co., Ltd. (now Adnil Electric Co., Ltd.), for infringement of their patent No. 21,654 of 1906, was concluded before Mr. Justice Parker on Thursday, judgment being reserved. In his speech for the defendants Mr. Terrell, K.C., argued that phospham was used by the Bergmann Co. for a totally different purpose than by the plaintiffs, and that therefore there was no infringement. Mr. Walter, K.C., for the plaintiffs, said the patent was for improvements in electric lamps, and therefore the defendants did infringe. (Page 136.)

Digitized by Google

MR. A. ANGOLD read a Paper before the Association of Engineers-in-Charge recently, in which he described some of the phenomena of the electric arc and the development of the arc lamp. Thin carbons were essential for steady burning, and to get long burning hours without long and expensive coppered carbons the magazine type had been evolved. High candle-power metal filament lamps were compared unfavourably with small enclosed arc lamps. (Page 137.)

MR. H. E. YERBURY'S Paper on equitable charges for tramway supply has been further discussed by the Birmingham Section of the Institution of Electrical Engineers, and some interesting figures of costs and load factors were given. (Page 138.)

AN illustration is given of some tantalum lamps which survived the effects of an explosion. (Page 138.)

TESTS have been carried out with the Edison storage battery in America on a small-sized tramcar. We give some particulars of latest forms of the cell. (Page 139.)

MR. A. P. TROTTER writes on the recent discussion on glare before the Institution of Illuminating Engineers. The correspondence is also continued on the library of the Institution of Electrical Engineers. (Page 139.)

A NEW process has been introduced for the plumbing of lead-covered cables and other lead joints. A low-temperature weld of the two surfaces to be jointed is produced by inserting a piece of prepared tin-foil between them and heating with a blow-lamp. (Page 140.)

THE Publicity Committee appointed by the London Electric Supply Companies and Local Authorities owning electricity works has commenced its publications, and is inviting the co-operation of provincial authorities. (Page 140.)

THE Joint Committee of London Electric Supply Companies and Local Authorities owning electricity works has appointed two engineers on either side to report on the question of linking up the London undertakings. (Page 140.)

THE twentieth annual dinner of the General Electric Co., Ltd., took place on Saturday, and in the course of a speech, Mr. Hugo Hirst, the Managing Director, complained of the indifference of the Government to the manufacturing industries of this country. (Page 141.)

AMONG the specifications published by the Patent Office on Thursday last was one by A. E. Tanner and E. A. Claremont for a method of equalising the dielectric stress in H.-T. cables by inserting at intervals metal wrappings connected to resistances or choking coils, so as to make equal the total conductance of successive layers.—A patent by P. L. Fraser and the Tudor Accumulator Co. relates to the T.A.C. train-lighting system.—E. B. Wedmore covers a protective device for cable systems, in which the switch trip-coil is operated from a potential transformer in the case of small faults, and by a current transformer in cases where the potential is reduced as the result of a heavy fault.—A hot-plate for A.-C. systems, containing both a resistance heating spiral in close contact with the plate, and a disc for eddy-current heating, is protected by A. F. Berry.—H. A. Mavor describes a three-phase induction motor with several windings, which are supplied at different periodicities in several combinations to obtain variable speed.—A patent for a special shape of former-wound armature coil, affording a neat arrangement at the ends of the armature, expires tomorrow after a life of fourteen years, and on Thursday next a patent expires covering a magnetic separator for minerals of slight magnetic susceptibility. (Page 142.)

THERE was a net profit of £1,040 upon the Hull municipal telephone system for 1909.—Further experiments are to be carried out in the City of London with electricity for street lighting.—A 2,000-h.p. Curtis turbine has been installed in the power-house of the Fife Electric Power Co.—A scheme of public electric lighting has been prepared at Harrogate.—The Islington Electricity Committee recommend current being supplied for power purposes to a large consumer at 0·9d. per unit.—An agreement will probably be entered into by the Woolwich Council for the West Ham Corporation to supply electricity in North Woolwich. (Page 143.)

LOCAL GOVERNMENT BOARD inquiries have been held as follows:—Bolton, £4,608; Shrewsbury, £6,328; Worcester, £656. A loan of £5,180 is proposed at Rugby, and new generating plant at an estimated cost of £31,000 is proposed at Newport (Mon.). Loans have been sanctioned as follows in London:—Poplar, £20,900; Southwark, £3,330; Woolwich, £3,600. Telephone instruments are required at Hull, and electric cranes by the Secretary of State for India and the Buenos Aires municipality. A large number of municipalities require electrical stores. (Page 146.)

A DIVIDEND of 10 per cent., in addition to a bonus of 2 per cent., is recommended on the ordinary shares of Messrs. Mather & Platt for 1909. The report for 1909 of the London Electric Supply Corporation states that a new contract for further power supply is being negotiated with the L.B. & S.C. Rly. Co. Dividends are recommended by a large number of the London Electric Supply Companies. (Page 146.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 24TH.

Royal Institution.

3 p.m. Afternoon Lecture II., "Illumination: Natural and Artificial," by Prof. S. P. Thompson, F.R.S.

Institution of Mining Electrical Engineers: London Branch.

8 p.m. At the Institution of Junior Engineers, 39 Victoria Street, London, S.W.

FRIDAY, FEBRUARY 25TH.

Institution of Electrical Engineers: Manchester Section.

6.45 for 7.15 p.m. Annual Dinner at the Midland Hotel.

SATURDAY, FEBRUARY 26TH.

Royal Institution.

3 p.m. Afternoon Lecture III., "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

Institution of Mining Electrical Engineers: Midland Branch.

3.30 p.m. At University College, Nottingham. "Electric Shocks," by W. Maurice.

Institution of Mining Electrical Engineers: Cumberland Branch.

4 p.m. At Grand Hotel, Whitehaven.

Institution of Mining Electrical Engineers: Yorkshire Branch.

6 p.m. At Royal Victoria Hotel, Sheffield, "Electric Shocks," by W. Maurice.

TUESDAY, MARCH 1ST.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology, "The Commercial Side of the Electrical Industry," by J. I. Law Brooks.

WEDNESDAY, MARCH 2ND.

Dynamicables.

7.30 p.m. Dinner at the Trocadero.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "Insulating Materials," by T. J. Sack.

THURSDAY, MARCH 3RD.

Royal Institution.

3 p.m. Afternoon Lecture III., "Illumination: Natural and Artificial," by Prof. S. P. Thompson, F.R.S.

Rontgen Society.

8.15 p.m. At 20 Hanover Square, London. (1) "Dental X-ray Technique," by C. A. Clark; (2) "Radium Collector for Atmospheric Electricity," by F. H. Glew.

SATURDAY, MARCH 5TH.

Royal Institution.

3 p.m. Afternoon Lecture IV., "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

The Duties of the Institution of Electrical Engineers to the Electrical Industry.—In reply to Mr. E. Garcke's suggestion (see ELECTRICAL ENGINEERING, February 10th, page 97), that the Council of the Institution of Electrical Engineers should provide an organisation to enable steps to be taken with a view to improving the general industrial conditions under which electrical undertakers, manufacturers, and contractors are working, the Secretary has stated that the Council are of opinion that this is not within the proper scope of the Institution.

ELECTRIC DRIVING OF A LARGE FLAX SPINNING MILL

ONE of the most important of the many textile mills in the Manchester district which have been or are being converted to electric drive is the Broughton Flax Mills, Broughton, owned by Messrs. Wm. Renshaw and Co., Ltd. These mills are the oldest established in England, if not in the United Kingdom, and employ from 900 to 1,000 hands. Apart from the various auxiliary machines, the mills contain 30,000 spinning spindles, and it must be remembered that for a flax-spinning mill the machinery is much heavier and more costly than for a cotton-spinning mill, the cost working out at about £5 per spindle in the former, as against £1 per spindle in the latter case.

The raw flax used in this mill comes principally from Belgium, and is collected from the farmers in the flax-growing districts in the neighbourhood of Courtrai, where the finest and best qualities are procured by steeping in the River Lys. At the mills it first goes through the process of hackling by being passed through very long machines of the most modern description. The tow made in this process is carded before going through the preparing process. The dressed flax, however, is not carded, but goes through a similar process of preparation as the carded tow, and for these processes there is an enormous number of machines, which turn the flax out in the form of rovings. These rovings are then taken to the spinning rooms, of which there are several, and there the rove is spun into yarn through hot water. The yarn is then passed on to the reeling rooms, and is wound into hanks or on to rolls and pirns, ready for weaving, and is shipped abroad to all parts of the world.

The main building is five stories high, and is divided into two parts. On the ground floor are two large steam engines, driving respectively two vertical shafts, one in each half of the building. These shafts are coupled through bevel gearing to the horizontal shafting on each floor. A year or so ago, however, it was decided to convert the whole to electric driving if a suitable and commercially practicable method could be devised, and the shafting of two floors has already been disconnected from the vertical driving shafts and

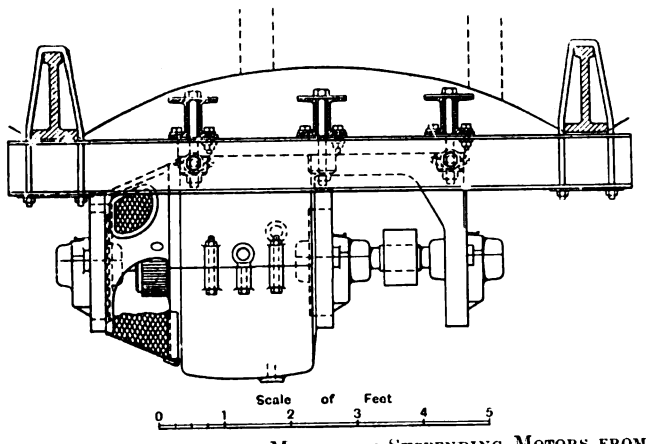

Fig. 1.—Sketch showing Method of Suspending Motors from Cast-iron Joists.

coupled to motors. It is not easy to appreciate the difficulties which have been encountered without visiting the building itself. From considerations of space it was not practicable to place the motors on the floor, and so it was necessary to suspend them from the ceiling. The latter, however, consists of a series of brick arches supported on cast-iron joists, and consequently the distribution of the weight of the motors and the avoidance of vibration were most important factors for consideration. As an initial trial, the shafting driving two large groups of machines was disconnected from the main system, and each group was driven by a separate motor coupled to the shafting through spur gear with raw-hide pinions. The adoption of spur gearing was rendered necessary in view of the fact that there was not space for a belt or rope drive. It must be remembered that it is necessary in flax spinning to have a steady drive just as in cotton spinning, as the steadier the drive the better the work. As there was much vibration with this arrangement, however, another system had to be tried.

The problem appears to have been solved with com-

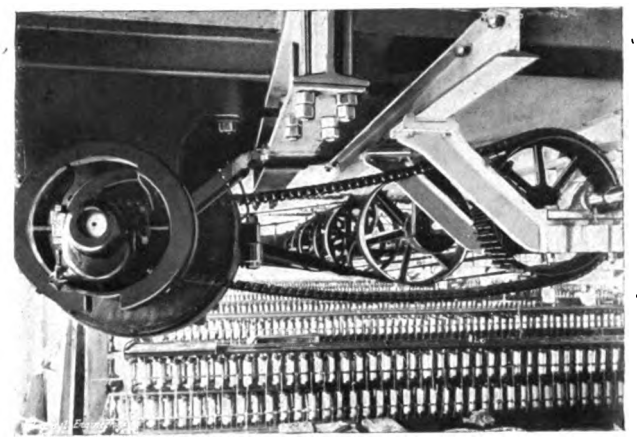

Fig. 2.—Chain-drive with Gear-case removed.

plete success by the application of chain drive, which gives the necessary flexibility without requiring a great length between the centres of the pulleys as in a belt or rope drive. Already four drives have been installed on this plan by Messrs. Hans Renold, Ltd., of Manchester, and run entirely without vibration. In two of the large spinning rooms the shafting has been disconnected from the vertical driving shaft, and has been divided in the centre of the room, so that each half of the room, comprising from fifteen to twenty spinning frames, is driven by a separate motor. Fig. 1 shows the method of suspending the motors from the cast-iron joists, and Fig. 2 is a photograph showing one of the chains with the case removed.

It will be noticed that two 10 in. by 8 in. wrought-iron girders were suspended from the cast-iron joists by means of iron straps, and the motor suspended from three channel girders laid across and bolted to the suspended girders. Layers of felt were interposed between the joists and the main girders, and between the latter and the cross girders to prevent the transfer of vibration to the cast-iron joists. For taking up any wear in the chain, a small movement of the motor is allowed for by means of slides and forcing screws.

The drives have ratios varying between 2·3 to 1 and 3·9 to 1. The chains run at a speed of 1,245 ft. per min., are enclosed in sheet-metal gear cases, and run practically silently. The two chain wheels are approximately 9 in. and 28 in. in diameter. Three drives have a centre distance of 6 ft. 6 in., and the fourth is 7 ft. 3 in. Three out of the four drives have chains 8 in. wide and 1·5 in. pitch, with a breaking load of 62,800 lbs., while the fourth is only 6 in. wide, and has a breaking load of 47,090 lbs. In the former cases the load is estimated to reach over 70 h.p., but in the latter case the maximum load is estimated never to exceed 60 h.p.

The motors were supplied by the Rees Roturbo Manufacturing Co., Ltd. (Wolverhampton), and are each rated at 60 h.p., 440 volts, 525 r.p.m. They are interpole compound-wound motors capable of a 25 per cent. overload for ten hours, or 75 per cent. overload for half an hour, and run sparklessly at all loads with fixed brush position. The guaranteed maximum temperature rise is 70° Fahr. on normal load, and 80° Fahr.

D

Digitized by Google

on the 25 per cent. overload. As shown in Fig. 1, the motors are provided with the Rees-Parker patent gapped frame. This construction, which among other advantages permits of easy removal of the armature, is illustrated in Fig. 3.

The field-magnet yoke is cut across the horizontal diameter just above the interpoles, and the bearings are mounted in circular seatings in an extension at each end of the frame, bored out with the magnet-poles, thus ensuring perfect alignment and allowing the bearings to be rotated so that the motors may be adapted for belting to a wall or in an inverted position to a ceiling, as in the present case. To ensure a rigid construction, each motor is arranged with three bearings, each automatically lubricated by means of two oil rings. The gapped frame permits of the armatures being lowered vertically for inspection or removal; this is a great advantage with the motor suspended from the ceiling in a cramped position, when there is always considerable difficulty in erection or removal if the armature has to be threaded in endways. In the present case, suitable holes were made in the ceiling, and to erect the motors slings were threaded from the story above for lifting the various parts into position. The motors are arranged for a variation in speed by shunt resistance in order to increase the speed of the line shafting by 25 per cent. if necessary. Suitable starting panels are provided with enclosed type switchgear, consisting of an Adams starter with shunt rheostat, a Berry-Skinner double-pole switch-fuse, and an ammeter.

Current is supplied at 440 volts from the Salford Corporation mains, the service cables being brought into a special switch-

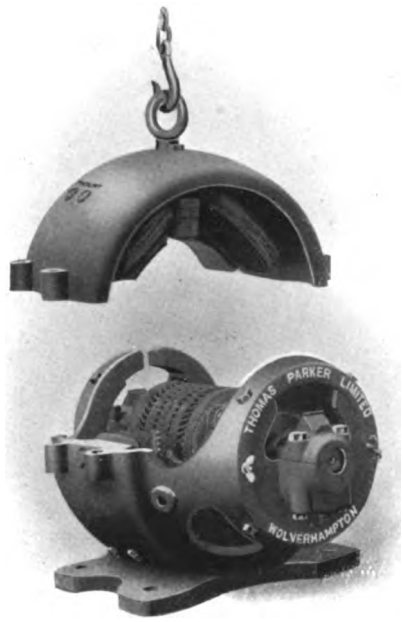

FIG. 3.—REES-PARKER GAPPED FRAME MOTOR.

house built on to the main building. The switchgear comprises two main circuit breakers by Eckstein, Heap & Co., and a large board. The latter is already fitted up for the whole installation, namely, four motors for each of the five floors, there being six 500 amp. circuits in all, including that for the mechanics' shop. Each circuit is controlled by a Bertram-Thomas circuit breaker with a switch in one pole, and a Bertram-Thomas ventilated multiple-wire fuse in the other. There is an Aron meter and a recording ammeter registering the total supply, and a separate ammeter in each circuit. Braided, rubber-covered 0·5 sq. in. cables are strung on insulators outside the building up to a four-way fuse-board on each floor. The fuse carriers are of slate with porcelain handles, and were supplied by Messrs. Bertram-Thomas.

Much credit is due to Mr. V. A. H. M'Cowen, Borough Electrical Engineer of Salford, for the successful application of electric drive under such difficult conditions, and we should like to express our thanks to him, to Mr. H. M. Girdwood, Managing Director of the mills, and to the firms above mentioned for assistance in preparing this article. Mr. Girdwood was kind enough personally to conduct our representative over the mills and to explain the nature of the work.

THE JAPAN-BRITISH EXHIBITION

THE Electrical Engineering Committee of this Exhibition consists of the following members:—

W. M. Mordey (*Chairman*), Dr. Gisbert Kapp (*Vice-Chairman*), S. W. Baynes, G. H. Bowden, C. S. Colton, S. Cowper-Coles, Col. R. E. Crompton, E. Garcke, T E. Gatehouse, Albert Gay, Robert Hammond, K. Hedges, Dr. Edward Hopkinson, W. L. Madgen, W. C. Mountain, Sir W. H. Preece, W. R. Rawlings, C. P. Sparks, A A. Campbell Swinton, and C. S. Thomson.

Mr. Mordey has addressed the following letter to the electrical manufacturers of the United Kingdom:—

DEAR SIR,

On behalf of the Electrical Engineering Committee for the forthcoming Japan-British Exhibition at the White City - the names of which are given above—I shall be glad if you will allow me to call the special attention of electrical engineers to the advisability of making a thoroughly representative exhibit of the products of our industry. The Exhibition—which will be open during the whole of the summer—will, no doubt, be visited by a large number of influential people from Japan, and will attract the attention of the very numerous tourists from all parts of the world who visit London during the summer. Our enterprising ally, Japan, is very much alive to the advantages to be derived from the use of electrical engineering appliances of all sorts, and presents a large and growing field for such work. It is very important that our visitors should realise that this country occupies a leading position in all matters connected with electrical engineering, and there can be no better way of bringing this result about than by a good representative exhibit in all important sections of electrical engineering, particularly those dealing with power and lighting.

Yours faithfully,

W. M. MORDEY,

Chairman of the Electrical Engineering Committee.

Electric Traction in Switzerland.—The Swiss State Railway authorities are engaged in securing water power all over the country for the purpose of electric power supply for the railways. The power secured in Canton Tessin now amounts to 30,000 h.p., and in Canton Uri to 17,000 h.p. The total amount already secured is about 70,000 h.p.

Theory of the Single-phase Induction Motor.—A Paper by Mr. C. F. Smith, joint author with Mr. W. Cramp, of the recently published work, "Vectors and Vector Diagrams," has been accepted for publication as an original communication in the *Journal* of the Institution of Electrical Engineers. The Paper is entitled "The Relation between the Stator and Rotor Circuits of the Single-phase Induction Motor." A number of formulæ expressing the connection between the current and voltage in the stator, and in the rotor of a single-phase induction motor are deduced from theoretical considerations, and the relations obtained are illustrated in the form of curves obtained experimentally on a standard three-phase 5-h.p., 220-volt, 50-cycle, 4-pole, A.E.-G. motor. Experiments were made with two of the three-phase stator windings in series, and also with only one phase supplied. The conclusion is arrived at that the ratios of voltage and current transformation in a single-phase motor must be considered to have each two definite values—one value with the rotor stationary and in the position for maximum mutual induction, and one value when the rotor is in rotation. There is no gradual change from one ratio to the other. The Paper concludes with a table giving the voltage, current, and impedance ratios for the two cases of a stator winding, embracing two-thirds of the stator circumference, and for a winding of half this width.

The Preparation of Papers to be Read before Societies.—Speaking at the annual dinner of the Physical Society recently, Dr. C. Chree, F.R.S., who was in the chair, said that the number of Papers read before the Society had become much larger of recent years, but he thought there might be some improvement in the presentation of such Papers. Generally speaking, there were three ways in which an author might be congratulated:—Firstly, on producing valuable results: secondly, on the form in which he had put them; and, thirdly, both author and audience might be congratulated that the reading had been accomplished. Of these three the second was the most rare. Papers usually consisted of 25 per cent. due to the author, and 75 per cent. of material that preceded the Paper. Authors were apt to neglect the 75 per cent., and to assume that the audience knew all about it. Also, if any mathematics appeared in a Paper, the author generally proceeded to put it upon the blackboard. This was not desirable, because a physicist's knowledge of mathematics was usually not good, and mathematical results were frequently not of great value. In some ways it might be better for authors to read each other's Papers instead of their own. He also thought it would be of great advantage occasionally if the Society could have a general discussion of a subject by a physicist well acquainted with that special branch of knowledge.

WATER-COOLING PLANT AT THE SALFORD ELECTRICITY WORKS

WHEN there is no river or other natural source of supply of water for condensing purposes, the means for cooling the condensing water is an extremely important part of a central station system. We have recently had an opportunity of inspecting the plant put down at the Salford Electricity Works for this purpose (at a cost of some £12,000), which is undoubtedly one of the largest of its kind in this country, and possesses several new features of interest. The pumps for raising the hot water to the top of the cooling towers are installed in a separate building adjacent to the towers themselves, and the whole plant shows evidence of most careful design and forethought for all possible emergencies. The works is situated at Pendleton, Salford, between two locks about a couple of miles apart on the Manchester, Bolton & Bury Canal, and for some years has been using the canal water for both condensing purposes and for the feed water. There are other smaller works using the water along the same reach, and a year or so ago it was discovered that the water was being taken in at a temperature of over 80° Fahr., which sometimes reached even 100° Fahr., and discharged at 140° Fahr., whereas the figure for the discharge temperature according to the agreement with the Lancashire & Yorkshire Railway Co., the owners of the canal, was 90° Fahr. Further, the railway company and the large owners began to complain, as in certain weathers the steam on the surface of the water extended for about a mile along the canal, and the water was so hot that it brought out the pitch from the seams of the barges. The canal water is also dirty.

It was therefore decided to drop the contract with the canal company and to erect a cooling-tower plant to deal with the condensing water, and as 750,000 gallons of water has to be circulated per hour at full load, it will be seen that the pumping plant, as well as the cooling towers themselves, is of considerable magnitude.

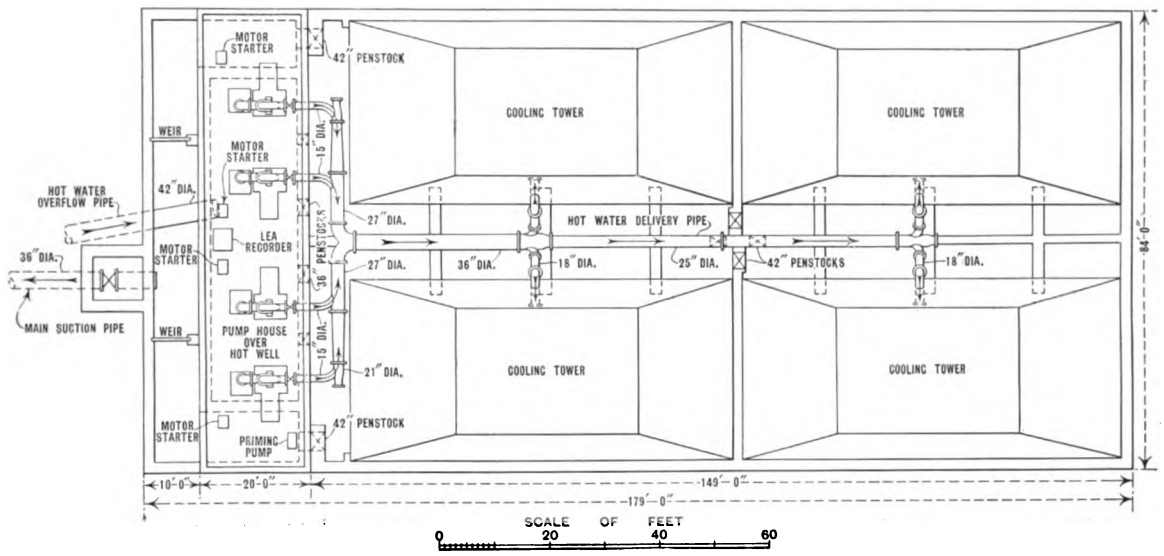

FIG. 1.—BLOCK PLAN SHOWING GENERAL ARRANGEMENT OF SALFORD WATER-COOLING PLANT.

The general arrangement of the new cooling plant, the main contractors for which were Messrs. Balcke & Co., Ltd. (27 Clements Lane, London, E.C.), is shown in Fig. 1. A 40-inch diam. discharge pipe from the nine condensers (eight of which are jet, and one surface) is led into a hot-well tank under the pump-house by the towers, and the water is pumped from there by four motor-driven centrifugal pumps up to the distributing troughs in the four cooling towers. The towers themselves are illustrated in Fig. 2, and are of Messrs. Balcke & Co.'s natural draft chimney type, each tower being capable of dealing with 187,500 gallons of water per hour. They are constructed entirely of wood, and consist of tapering rectangular towers built on concrete foundations with tanks below for receiving the cooled water.

The cooling apparatus proper is built into the lower part of the tower, and consists of wooden distribution troughs, splash plates and cooling hurdles, by which the incoming warm water is divided up into minute drops and brought into the closest possible contact with the air entering from below. The cooling effect is obtained partly by evaporation and partly by conduction of heat to the air. Each tower is 75 feet in height, and the water is delivered into the tower at a point some 22 feet above the top of the tank, the remaining 53 feet of chimney providing the necessary draught.

Under the present conditions, the water enters at a temperature from 90° to 100° Fahr., and is cooled by its passage through the tower to 65° Fahr. The result of these better water temperature conditions is an appreciable rise in vacuum which naturally results in economy in fuel. The towers are unusually wide, about 33 feet at the bottom, and, to ensure that the incoming cold air reaches the water in the centre, the lower part of the tower is divided into four, instead of two, vertical sections, and a supply of cold air into the inner sections is effected by means of spec... diverting plates in the air duct below. The outer structure is of pitch pine encased with red deal boards, both creosoted under pressure, but the distributing troughs and cooling baths are of red deal uncreosoted. All steel and iron parts, such as the splash plates, washers, bolts, and nails are galvanised. The four towers are guaranteed to be able to cool 750,000 gallons per hour continuously from 115°

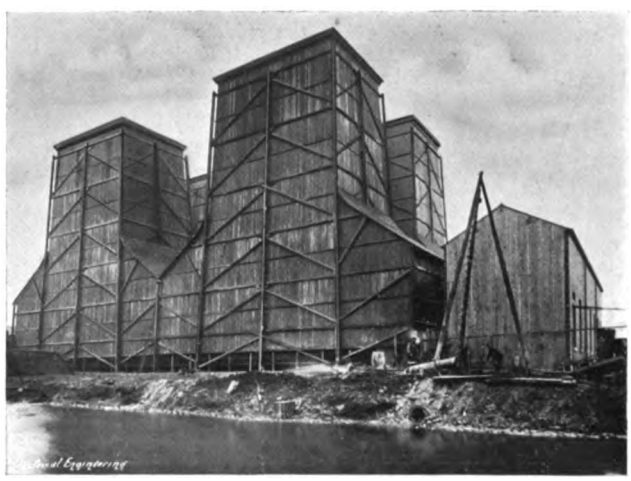

FIG. 2.—GENERAL VIEW OF COOLING TOWERS AND PUMP-HOUSE.

Digitized by Google

Fahr. to 80° Fahr., with an air temperature of 55° Fahr., and a humidity of 75 per cent.

Between each two of the four concrete tanks below the towers is a hand-operated 36-inch penstock, so that any one tank can be isolated for cleaning. The water runs away through two 42-inch penstocks into the suction tanks, and from these over two weirs into the 36-inch cast-iron pipe to the condensers. The main valve in this pipe is situated in a concrete pocket at the suction tank end, and is operated by worm gearing. There are two pipes with 42-inch penstocks between the hot-well and the cold water tanks for "short circuiting" the pumps and towers should that be necessary. The weirs in the suction tanks are also provided with bye-passes controlled by 24-inch penstocks.

The four pumps are of Messrs. Mather & Platt's patent high lift turbine pattern, with specially designed guides on the cast-iron body, allowing the water to leave the impellor and to enter the whirlpool without shock. The impellor is of the double suction type keyed to a manganese bronze spindle. Each pump is designed to deliver 250,000 gallons per hour, against a total head (including the 10 feet suction and the calculated friction in piping) of 30 feet, when running at a speed of from 450 to 500 r.p.m. The bearings are exceptionally long. Water-sealed glands are fitted where the spindle passes through the pump covers to prevent air leakage. Each pump is driven through a leather flexible coupling by a Mather & Platt 60 h.p. 460-volt D.C. 4-pole shunt motor. The couplings prevent any strain on the shafts should they come slightly out of alignment. The general arrangement of the pumps and pipework is illustrated by Fig. 3, which is a section and a portion of an elevation through the pump house. A general view of the pumps is given in Fig. 4.

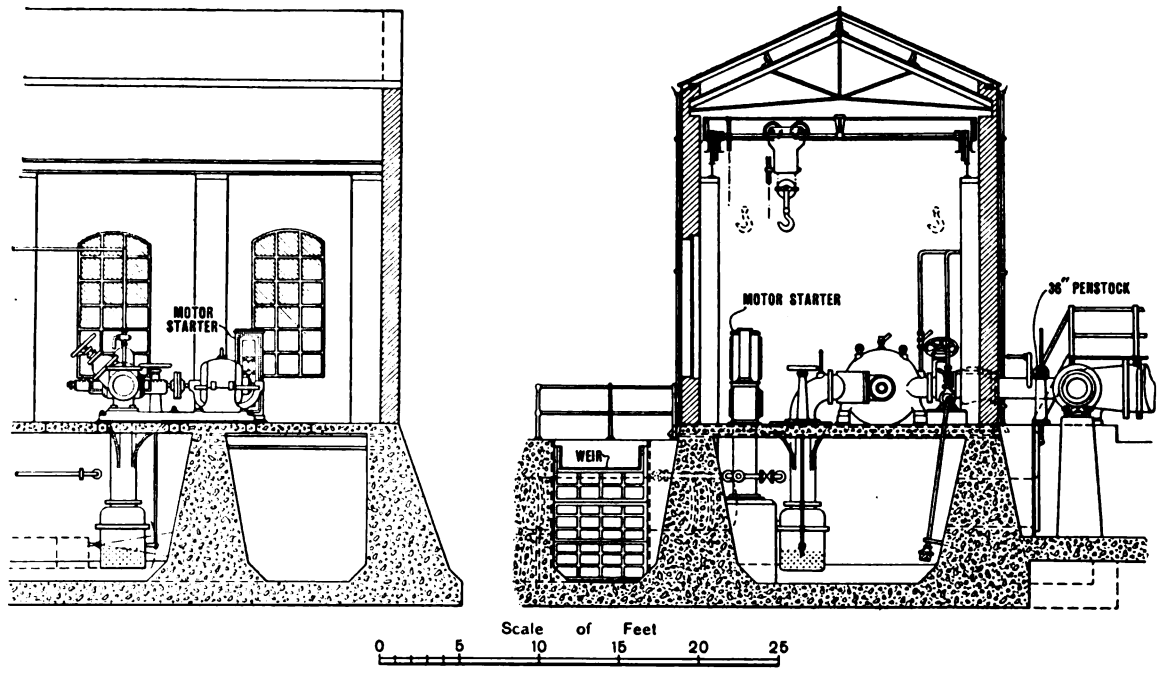

FIG. 3.—PARTIAL ELEVATION AND SECTION OF PUMP-HOUSE.

The motors are supplied through one of two independent circuits from the main switchboard which lead to a link change-over board in the pump-house. From this board the leads are taken in steel conduit under the concrete floor to the motors and starting pillars. Each of the latter comprise a starter with an interlocked shunt field rheostat, a double pole switch with overload release, and an ammeter, all enclosed in a glass-fronted cast-iron pillar. These and also the motor frames are earthed to the conduit. The meters for registering the consumption of the pumping plant are on the main works power board. The surface wiring is carried out in steel conduit, and a wall plug with a length of protected cable and a hand lamp is provided for each set. An 8-ton manually-operated overhead crane travels the whole length of the house, and is employed for lifting the bend, foot-valve, and rose on the suction side for cleaning. The height of the crane is such that the rose can be raised 10 inches above the floor of the pump house. These parts are not fixed to the floor in any way, but are bolted only to the pump case. The 18-inch foot valve is closed when priming the pumps previous to starting up. For priming, a small Mather & Platt low lift turbine pump, coupled to a ½ h.p. Matthews & Yates motor, is provided. This runs at 1,400 r.p.m., and can deliver 33 gallons per minute against a head of 16 feet. It is connected to the main pumps as shown in Fig. 2 by a 2-inch pipe.

The two weirs shown in Fig. 1 are in parallel, and either can be connected by means of 3-inch valves with the float chamber of a Lea (rectangular notch) Recorder which is situated in the pump house, and measures and records the rate of flow over either or both. The pumps deliver into a common riveted mild-steel pressure main with bends and tees of cast iron. Between each pump and the mains are a double flange 15-inch sluice valve and an automatic back pressure valve for preventing the water returning to the hot-well and running the pump as a turbine should the motor fail. The back pressure valves also have hand-wheels for manual operation. Between each tower and the delivery main is a cast-iron pipe with two 18-inch sluice-valves. The total amount of make-up water required is about 80,000 gallons per day. At present this is taken from the canal, and is treated with soda-ash and lime in a softening tank which also acts as a settling tank for the mud, &c. As has already been mentioned, however, the canal water is very dirty, and an artesian well is therefore being sunk to supply the make-up water instead. The boring arrangements can be seen in Fig. 2. The pump for the make-up water will be electrically driven. It will be placed at the end of the pump house, the temporary end of which will be removed and the house extended. The lifting capacity of the pump will be 15,000 gallons per hour from a depth of 500 feet.

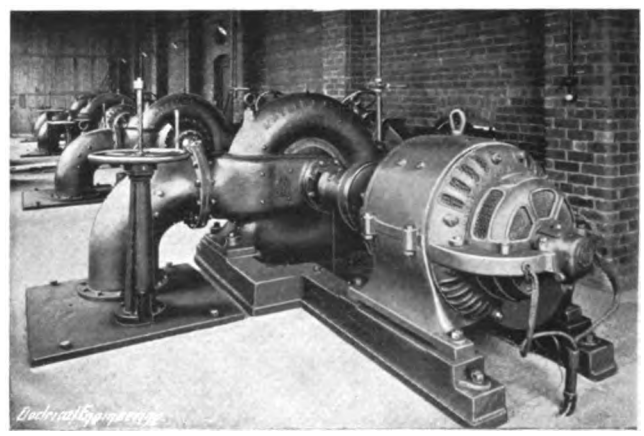

FIG. 4.—60-H.P. PUMPING SETS.

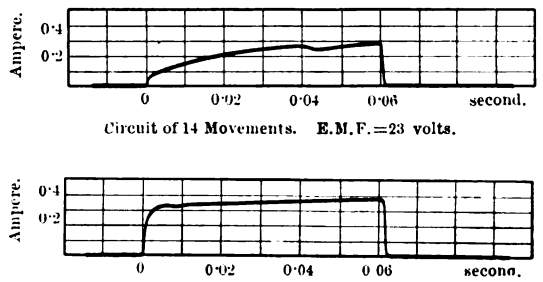
The generating plant of the station consists of eight Browett, Lindley compound tandem vertical engines, driving Mather & Platt 750 kw. continuous-current generators and one Brown-

Digitized by Google

Boveri—Willans-Parsons 1,000 kw. D.C. turbo-generator running at 1,250 r.p.m. The traction load is dealt with by some of the slow-speed vertical sets, while the lighting and power load is taken by the remaining slow-speed sets and the turbo-generator. The total capacity of the station, excluding some small motor-driven alternators for a separate supply, is 7,000 kw. There is a small battery and balancer for equalising the three-wire distribution systems, and a larger battery to assist with both lighting and traction loads with a capacity of 3,200 amp. on a one-hour rating is now being installed.

The whole of the work was entrusted to Messrs. Balcke & Co., Ltd., and was carried out to the plans of Mr. V. A. H. M'Cowen, Borough Electrical Engineer, Salford. In conclusion, we should like to express our thanks to Mr. H. J. Hawkins, Deputy Borough Electrical Engineer at Salford, for assistance in preparing this article, and to Mr. W. Maudsley, Clerk of Works for the above new works, who kindly showed our representative over the plant.



MODERN ELECTRIC TIME SERVICE

A PAPER with the above title was read on Thursday last before the Institution of Electrical Engineers in London by Mr. F. Hope-Jones, of the Synchronome Co. The subject could, said the author, be divided into three sections :—(1) Independent self-wound clocks driven by electricity, (2) synchronising systems in which a standard clock sends out electrical impulses to correct independently driven clocks, and (3) circuits of dials actually driven by electrical impulses sent out at short intervals by a master clock. Included in the first division are the Hipp, Scott, Aron, Synchronome, Eureka, Fery, and the Brooklyn Self-winding Clock Co.'s clocks. The latest, the Eureka clock, was fully described in ELECTRICAL ENGINEERING, June 17th, 1909, Vol. V., p. 563. The Brooklyn clocks are fitted with a synchronising device, and represent class two; these clocks are in use in the London underground railway stations.

The author then described the mechanism of several systems of electrical impulse dials introduced in the year 1905, after the Synchronome system had held the field alone for five years. In the LOWNE master clock, a magnet is energised every fifteenth swing of the seconds pendulum, and is caused to put in tension a spring which is released, and its energy imparted to the pendulum in the course of the next swing. The secondary dials are of the simple step-by-step type with series magnets operating the pawls, and a low-resistance coil is shunted across each main coil directly it has operated its pawl, thus leaving a greater E.M.F. across the magnets which have not yet worked. The pendulum is never free; it does work at the end of its swing, and all the energy for contact making is derived from it, but fine design and workmanship have resulted in excellent time-keeping performances. The ARON system is based upon the self-winding action of the well-known meters of that name, and is typical of Continental practice. The movement is used to wind what may be described as an ordinary striking clock, in which the striking part turns a commutator every minute, sending an impulse to the dials and reversing the polarity of the battery every time. With the polarised dial movements used in this and other German systems, every impulse may be a group of splashes instead of a smooth-topped wave without a single dial getting out of step. In the PERRET system, the energy for contact is derived from the hour-hand wheel, and, as only a weak contact is obtained, this is limited to small currents and low voltage. Relays are used for circuits of dials, and the system needs more than usual expert handling.

In the SYNCHRONOME system, the power required to work the contacts is not taken from the pendulum nor from the escapement which drives it. Contact is made every half-second by a lever detached from the pendulum. This lever is lifted again above a catch and the circuit broken by an electromagnet in series with the dial magnets. A roller on the lever falls on a curved pallet on the pendulum when the lever is released, and runs down it, giving an impulse to the pendulum at the moment when it passes through its zero position. Thus the pendulum is free at all times except in the middle of its swing. Should the battery current fall below a certain value, the pendulum assists the magnet to lift the lever. The dial movements are of the simple reciprocating armature type. The GENT time transmitter is very similar, in that a roller on a weighted lever descends on to an impulse surface on the pendulum, giving it an impulse in the centre of its swing.

A number of oscillograph records of the impulses sent out from a master clock of the Synchronome type were then shown by the author. Two of these are illustrated in the accompanying figure. The first represents that sent out into a circuit comprising twelve small movements and two large ones, having a total resistance of 61·8 ohms. The E.M.F. was 23 volts and the maximum current 0·37 amperes. The area of the curve is 0·012 coulomb = 3·5 ampere-hours per annum. The dials operate at 0·25 ampere in 0·045 second, and the switch breaks at 0·27 ampere in 0·06 second. The voltage might drop 30 per cent. or the resistance increase 42 per cent. before the magnet would refuse to reset the gravity arm, but the duration of the impulse would be two or three times as long. The precision of the make is worthy of notice. This is due to the switch arm "sailing" into contact at the speed of the moving pendulum. The slight depression in the current curve when the dials operate is due to the back E.M.F. generated when the armatures fly up to the magnets. A leather buffer is provided to receive the switch arm when it makes contact. If this is taken away the curve has a slight jump at the beginning, as the switch arm rebounds off the contact. The break is practically instantaneous. On account of the self-induction in the circuit, the dials are operated and the circuit is broken before the current has time to rise to its full value. By varying the self-induction in the circuit and the tension of the dial springs, the duration of contact necessary for

Circuit of 14 Movements. E.M.F.=23 volts.

Circuit of 12 Movements and Carbon Filament Lamp. E.M.F.=204 volts.

IMPULSE WAVE-FORMS OF SYNCHRONOME CLOCK CIRCUITS.

the current to rise to a sufficient value to operate the dials can be varied at will, and this reserve of current ensures that the system will operate with heavy drop of voltage or rise of cell resistance. That the inertia of the dial armatures cannot be ignored is demonstrated in the second oscillogram, for which the circuit comprised the switch and twelve small dials, the current being taken from the lighting mains at 204 volts with a 32-c.p. 200-volt carbon filament lamp in series. The beginning of the curve is steep owing to the voltage being high and the self-induction trivial compared with the resistance. Though the dials will work on 0·25 ampere if they have 0·02 of a second to do it in, the current has to rise to above 0·3 to accomplish the work in half the time, and any attempt to work them more quickly would involve a much higher voltage, and it would be undesirable on account of the noisy action of the dials that it would cause.

The author then described briefly the two systems which have appeared since 1905, viz., BOWELL'S and MURDAY'S. The vibrations of the pendulums of the master clocks in each of these systems are maintained by the Foucault-Hipp electric "Butterfly" escapement. In Bowell's system (made by the Silent Electric Clock Co.) the pendulum charges into contact springs at the end of its swing, making a comparatively long contact to operate dial movements with rotary armatures in a permanent magnetic field. In Murday's system (made by the Reason Manufacturing Co., Ltd.), the contact is a passing one made at zero, and the dial movements have reciprocating armatures pivoted between the poles. Finally the author gave a few notes on heavy motor-operated turret clocks.

DISCUSSION.

Mr. H. R. KEMPE (General Post Office) referred to the system at the General Post Office, where electrical synchronising was adopted. There were a large number of independent hand-wound clocks in various offices, and it would hardly be economical to scrap them in order to put in electrically driven clocks. Synchronisation was very simple, and cost very little. With electrically-driven clocks the impulse was once every minute or half-minute, and it was impossible to tell exactly to

Digitized by Google

a few seconds what the actual time was. He regarded the use of non-inductive shunts as the salvation of electrical time service, as they completely prevented sparking, and ensured clean contacts. A good deal too much might be made of the cost of current. The total current cost for an installation of 100 clocks hardly exceeded 2s. 6d. per annum; it was quite possible that the interest on the increase in cost of apparatus with reduced current consumption, would exceed the cost of the current saved.

Mr. A. C. BROWN urged electric clock makers to dispense with the three-degree pendulum. Clocks kept better time when the arc of oscillation was very much more. Generally, a great deal too much power was put into pendulums, and had to be taken out again, and they very often neglected to take precautions to get rid of this surplus. Pendulums could be separated from the clocks, but they were greatly influenced by the surrounding local gravitational influences, and should be placed in the basement, as near the earth as possible.

Mr. E. T. COOK (East London Technical College), said a number of his students had worked out a pendulum of the Murday type, in conjunction with a Hipp trip switch, and in spite of Mr. Hope-Jones' condemnation of this form of switch, it had worked for four years without any stoppage. With regard to the kick at making contact, this, he believed, was due to the pad (which took up the normal vibration due to the switch arm falling downwards) becoming hard. In the course of time it seemed that the kick would become very much greater, and he had known kicks of this kind to operate one of the dials and set it in advance of the others.

Mr. J. N. ALTY, referring to the oscillogram, which showed a very sudden rise of current on 200-volt mains with a 32 c.p. lamp in series, asked if this could not be avoided by using an inductive resistance instead of a lamp to increase the time constant. It would be interesting to have diagrams of dials connected in parallel. He knew this would mean doubling the wiring, but one dial failing would not then affect all the others. It might also be more economical for the batteries.

Mr. W. DUDDELL said the question of trouble with batteries largely depended on how many there were in series. With a large number working a large number of dials, the leakage current would be very much greater than the ampere hours per annum required to work the dials. He suggested that if Mr. Kempe capitalised the cost of winding the Post Office clocks, it would not seem so uneconomical to substitute electrically-driven clocks.

Mr. A. E. MCCLOSKEY suggested the desirability of synchronising all master clocks from Greenwich, or some other observatory, as from Mr. Brown's remarks it seemed that the master clock was very easily upset, and with it all the others in the circuit.

Mr. HOPE-JONES, in reply to the discussion, entirely agreed with the use of non-inductive shunts; they were an additional safeguard against breakdown, as they afforded alternative paths to the coils. There were very good reasons why the three-degree pendulum should not be abandoned, but he would reply to this point in writing. There were also reasons against putting the dials in parallel. The suggestion of putting in inductive resistance in 200-volt circuits, instead of lamps, was a very good one, and might be applied.

Birmingham and District Electric Club.—This club held its first annual dinner last Saturday at the Colonnade Hotel, New Street, Birmingham, Mr. G. O. Donovan (president) in the chair. An excellent musical programme was provided, interspersed between the speeches.

Obituary.—We regret to announce the death, on the 6th inst., at the age of 72, of Mr. W. R. Green, who has been associated with the firm of R. Waygood & Co., Ltd., lift and crane manufacturers (Falmouth Road, London, S.E.), for over fifty years, some time as director, and latterly as consulting engineer. Mr. Green was a nephew of the late Richard Waygood, and prior to the commencement of his connection with the firm founded by his uncle, he served four years as engineer in the Royal Navy, after an apprenticeship with Messrs. Gourlay Brothers, marine engineers, of Dundee.

On Saturday night Mr. Ernest White, managing director of the New Brotherton Tube & Conduit Co., Ltd., shot himself in his room at the company's offices at Wolverhampton.

Thury A.-C. Clock System.—A system of electric time service, a development of the Wheatstone A.-C. system, is described in the *Elektrotechnischer Anzeiger*. The new system has been designed by Mons. R. Thury, and consists of a master clock operated from a direct-current source, and generating three-phase alternating current of a perfectly steady frequency, which is supplied to synchronous motors on the secondary dials. The three-phase current is generated in a horizontal stationary armature, within which oscillates an inductor about a vertical axis. Fixed to the inductor spindle is a pendulum of the conical type with crossed arms. Current is supplied to the main winding on the inductor by slip-rings, and a second winding under the control of the pendulum is provided to regulate the speed of oscillation. The secondary dial movement consists of a permanent magnet which rotates synchronously in a field produced by means of two coils supplied with the three-phase currents.

THE "Z" METAL FILAMENT LAMP PATENT

Action for Infringement

THE action of the "Z" Electric Lamp Manufacturing Co., Ltd., against Messrs. Marples, Leach & Co. (now Adnil Electric Co., Ltd.), for infringement of their patent No. 21,654 of 1906, was concluded before Mr. Justice Parker on Thursday, judgment being reserved. It will be remembered that the patent claims, by the use of phospham or other compound, to remove the last traces of carbon in tungsten filaments, either by painting phospham on the stems of the lamps or by embodying it in the tungsten paste before squirting. The main defence to the action is that phospham is used in the Bergmann lamps (which are those alleged to be infringements) as an inert vehicle for carrying red phosphorus, the gases given off from which improve the vacuum of the lamps and so prevents blackening. Our report last week dealt with the case up to Tuesday, Feb 15th, upon which day the case for the defendants was opened.

On Wednesday, Feb. 16th, further evidence was called on behalf of Messrs. Marples, Leach & Co.

Mr. E. BEVAN confirmed the evidence of Mr. Hehner on the previous day that phospham did not remove carbon in filaments, inasmuch as it did not give off ammonia at the temperatures inside incandescent lamps.

Dr. HARRY BRESLER, chemist at the Bergmann works in Berlin, spoke of experiments which he had made, in which lamps blackened when treated with phospham alone, but did not blacken when red phosphorous was added. Dr. Felix Paul Manfroni, works manager at Messrs. Bergmann's lamps works, gave similar evidence.

Speeches were delivered on Thursday. Mr. Terrell, K.C., for the defendants, submitted that it was impossible to construe the patent into one for the prevention of blackening metal filament lamps, as was suggested. If this were the intention, then the patentee had concealed his intention very cleverly, and the patent was not a good one, for it was the duty of a patentee to be quite frank to the public. His contention was that the patent merely intended to produce a stronger filament by preventing the tungsten being attacked by the carbon. Messrs. Bergmann claimed that their object in using phospham was not to remove carbon, and before the plaintiffs could succeed on the question of infringement they must prove the defendants had actually removed carbon. His own evidence was that phospham hopelessly failed to bring about such a result. His interpretation of the law of the subject was this: if he had used phospham with the intention of removing carbon and had not succeeded in doing so, then he had not infringed. If, on the other hand, he had used phospham with no intention of removing carbon, and it did in fact remove carbon, then he had infringed.

Mr. JUSTICE PARKER said that presumably the alleged infringing lamps were the same as those in respect of which Messrs. Bergmann had paid royalties to the German "Z" Co.

Mr. TERRELL replied that this was the prejudice with which he had to contend. He had been prevented by Mr. Walter from showing what the German patent contained; as a matter of fact there were totally different claims in the German patent. Continuing, Mr. Terrell said the patent claimed to remove carbon by means of ammonia in the lamp. The Bergmann Co. treated their filaments in an ammonia atmosphere before they were put into globes, and removed the carbon in that way. Therefore, how could it be said that they removed carbon by means of phospham in the globes? Further, he claimed that the amount of carbon remaining in the Bergmann filaments after sintering was so infinitesimal that phospham would have no effect upon it. What was alleged was a theoretical infringement, but there must be an actual infringement before the case against him could succeed. The mere use of phospham must not be taken as evidence of infringement.

During some discussion, Mr. Justice Parker agreed that it was a proper conclusion to be drawn from the evidence for the defendants that phosphorous vapour in the lamps prevented decomposition of the filaments. The point was whether it was necessary to use phospham for this purpose. If the defendants had not removed carbon, then they had not infringed.

Mr. TERRELL said that, following out the specification literally, they had found it impossible to make a filament a quarter of an inch long. There was no indication of the proportion of phospham to be used, and they had taken it as the same percentage as the amount of carbon in the filament. In other words, they had had to experiment, and if this had to be done with any specification then the patent was bad.

Mr. WALTER, K.C., for the plaintiffs, claimed that his evidence proved conclusively that phospham did remove carbon, and that the defendants had used it for this purpose. He admitted that the evidence of the experts on either side was in direct conflict, and the court would have to decide between the two. The specification was one for effecting improvements in metal filament lamps by the use of phospham, and it was clear, on this reading of it, that the defendants had infringed.

As mentioned above, judgment was reserved.

MODERN ARC LAMPS

In a Paper read before the Association of Engineers-in-Charge on Wednesday, February 9th, Mr. A. Angold, of the General Electric Co., described the development of the modern arc lamp and its application. When an arc is struck between two electrodes, commenced the author, the conductor in the gap is made up of the material of the positive electrode in a gaseous or a finely divided state, though it is asserted that if the positive electrode is kept cool enough, the material in the gap will be supplied by the negative electrode as in the case of magnetite arcs. The resistance of an arc of definite length diminishes as the current increases, and so, to obtain a steady arc, an external resistance or choking coil is connected in series. Long series of arcs will work with less resistance, as fluctuations in the separate arcs tend to balance one another. The composition of the electrodes has a marked effect on the steadiness of the arc, as, if the material has a large increase of resistance as it cools down, the arc is difficult to maintain, especially with alternating current. An enclosed arc lamp with two solid carbons, and running off a 40-cycle A.C. circuit, will have an apparent power-factor of 0·7, not because the current lags, but because the arc is not restruck at each half cycle until the voltage has risen to a considerable amount. For this reason, carbons for A.C. lamps are cored with a material with the smallest negative temperature coefficient possible, and by this means the apparent power factor is brought up to 0·9 or nearly unity. With cored carbons, whether the cores are for steadying the arc or increasing the light, as in flame arc lamps, it is most important that the arc should be kept to the core, and thus be fed constantly with the chemicals of the core, and for this reason it has become usual to employ small diameter carbons. Other methods, such as multi-core carbons and carbons with very large cores, are employed, but do not appear to meet with great success, due to variations of temperature as the arc travels over the large carbon surface.

For flame lamps, continued the author, the materials used in the carbon cores are generally compounds of calcium and titanium, the former for a golden, and the latter for a white light. The slags which are produced by the combustion of these materials at the carbon ends cause the supply of material to the arc to vary considerably, and for this reason the flame arc will probably never be quite as steady as the old open-type arc. The enclosed flame arc is at a greater disadvantage than the open flame arc in this respect, as there is less air to carry the disturbing material away from the arc. Besides the above compounds, substances are added to secure steady running. The method most largely adopted to ensure steadiness of burning is to employ small diameter carbons, but this necessitates a great length to obtain a reasonable life, and the carbons must be coppered or provided with additional cores of metal, or contact must be made near the burning end, owing to their high resistance. Enclosing the arc has the same bad effects as increasing the diameter of the carbon, and so the long thin carbon lamp has been most favoured, in spite of its disadvantages. The author next described the Angold magazine lamp in which a number of comparatively short thin carbons are automatically brought into action successively. This lamp was described and illustrated in Electrical Engineering, February 4th, 1909, Vol. V., p. 109.

Mr. Angold then passed on to consider automatic cut-outs. The true differential cut-out has great advantages over the plain series or shunt cut-outs, as there is always a closed circuit at the instant of switching on, which prevents excess voltage across the lamp and cut-out terminals; further, there is less chance of the equivalent resistance remaining in parallel with the arc. Mr. Angold then described the twin-arc enclosed lamp, pointing out, however, that it was better to run two 6-amp. single-arc lamps in series on 200 volts than two 3-amp. double arcs in parallel, so far as light is concerned, though the convenience of separate units in the latter case sometimes outweighs the lower efficiency. Auto-transformers, distributing coils, and compensating coils for A.C. lamps were then briefly described and their advantages compared.

Turning again to the flame arc lamp, the author described the various methods of supporting and feeding the carbons, including those in which one carbon is supported on a refractory abutment. The author considers that in the latter types there is bound to be some interference with the regular burning of the carbon, and that the ideal arrangement is one in which the carbons have no obstruction near their burning ends. The following specific consumptions per hemispherical British candle-power are given in the Paper as typical, including a 20 per cent. resistance loss. (1) Single-enclosure with opaline globe 0·91 watt; (2) open-type with opaline globe 0·77 watt; (3) vertical carbon *flame using* heavily mineralised carbon and opaline globe 0·3 watt; (4) inclined-carbon flame with opaline globe 0·3 watt. The angles of maximum candle-power below the horizontal are given as 30°, 42°, 38°, and 70° respectively.

Finally, the author makes some comparisons between high candle-power metal filament lamps and small arc lamps. Taking the consumption of the former as 1·25 watts per horizontal Hefner candle-power, the consumption per mean hemispherical British candle-power works out at 1·7 watts, *i.e.*, considerably above that of the single-enclosure arc lamp. As to comparitive costs, taking a 600 hemispherical c.p. metal filament lamp at 16s. 6d., and allowing a life of 1,500 hours, lamp renewals cost 1s. 1d. per 100 hours, as against 1d. per 100 hours for carbons for an enclosed lamp.

Discussion.

Mr. H. W. Handcock, who was in the chair, drew attention to the urgent necessity for uniformity in candle-power ratings. At present arc lamps were rated in hemispherical c.p., but incandescent lamps were rated in horizontal c.p., in some cases in British c.p., and in other cases Hefner c.p. There was great room for improvement in the basis of rating arc lamps. It would be interesting to have the results of experience as to the relative penetrative power of the light from various kinds of arcs and metal filament lamps. The present year was really the centenary of the electric arc, as it was in 1810 that Humphry Davy first exhibited the arc at the Royal Institution. The author had not referred to the manufacture of arc lamp carbons; there was only one works in this country for this purpose, and it was satisfactory to know that the British Admiralty were supporting these works.

Mr. L. Gaster spoke upon the necessity for providing plenty of light in workshops and factories, and referred to a report of the Fidelity & Casualty Co. of New York, dealing with the prevention of industrial accidents. This found that bad illumination was responsible for the largest number of accidents in workshops and factories. He would like to see a legal limit fixed for the amount of illumination per worker, as had been done in Holland, and urged manufacturers to give attention to this matter in the interests of the output from the works. He did not think the author's comparison with metal filament lamps should be taken too seriously, as arc lamps could never be made in sufficiently small sizes for ordinary illuminating purposes. The question of marking and standardising metal filament lamps was now engaging the attention of the Engineering Standards Committee.

Mr. F. Broadbent referred to the prevention of shunt coils from burning out by means of a cut-out. Nothing was said, however, about preventing the coil of the cut-out from burning out. When the Middlesbrough Docks were lighted many years ago, an automatic switch was devised, which cut in a resistance when the voltage of the lamp, viz., 60, was exceeded. He also suggested the use of inverted flame arc lamps.

Mr. Angold, in reply, agreed that the rating of arc lamps was at present very much too high. Personally, he never specified c.p. if he could avoid it, but the buyers were to blame in this matter. If there were not a demand for high figures, arc lamp makers would not give them of their own accord. He had got over the difficulty of shunt coils of cut-outs burning out by the use of a differential cut-out. In this he switched on to the equivalent resistance in the first place, and if everything was in order the cut-out opened, but if something was wrong, then it remained in. He had experimented with inverted flame arc lamps with three carbons, having their points uppermost. The arc in this case was lifted by the draught, and very good results had been obtained.

Universal Electrical Directory, 1910.—The 1910 Universal Electrical Directory, published by our contemporary, *The Electrical Review*, has now been issued. As usual, it bears evidence of careful elimination of unimportant entries. The arrangement has not been altered from that of last year, there being British, Colonial and general, Continental, and United States sections, each subdivided into an alphabetical and a geographical section.

Electrical Exhibition.—An International Electrical Exhibition is to be held at Dordrecht from April 30th to May 16th next. All articles intended for the exhibition will be allowed to enter duty free, provided they are not eventually sold in the country. Electrical energy will also be supplied to exhibitors free of charge. Inquiries concerning this exhibition should be sent to the Secretaris der Technische sub-Commissie der Tentoonstelling van Electriciteit, Steegoversloot 37, Dordrecht.

The Kearney High-Speed Railway.—It is stated that a proposal to deposit a Bill for the construction of an electric railway on the Kearney high-speed system, between Norfolk Street, Strand, and the Crystal Palace, is under consideration by the Kearney High-Speed Railway Co. By this system it is claimed that a speed of 90 miles per hour can be obtained on the surface and 50 miles per hour in the tunnel. The cars run upon one rail, but an overhead guard rail is employed. The cost of construction is said to be only £250,000 per mile.

EQUITABLE CHARGES FOR TRAMWAY SUPPLY

THE Paper on this subject, by H. E. Yerbury (Chief Electrical Engineer, Sheffield Corporation Tramways), on which we have already reported discussions by the Institution of Electrical Engineers in Manchester, Sheffield, London, and Glasgow (see ELECTRICAL ENGINEERING, Jan. 27th, page 64, Feb. 3rd, page 73, and Feb. 17th, page 118), was further discussed at Birmingham on Wednesday, Feb. 16th.

In the Paper, Mr. Yerbury had criticised the usual methods of allocating the relative proportions of generating costs in combined lighting, power, and tramway stations when determining the charge to be made for energy supplied to tramways. He contrasted the figures of 0·865d. charged at Manchester, with the 0·371d. obtained at the Sheffield independent station, and denied that the difference was justified by the expense of extra plant for the peak and conversion. He would base the charge on capital and running costs for the tramway plant only with a profit of from 3 to 5 per cent.

Mr. R. A. CHATTOCK (City Electrical Engineer, Birmingham) opened the discussion, and remarked that it was evident that the Paper was written by a tramway manager, not by a supply engineer. According to Mr. Yerbury, the engineers of combined stations charged exorbitantly for supply to tramways, and sold millions of units elsewhere much below cost price. Committees, as a rule, were composed of hard-headed business men, who would be extremely unlikely to sell below cost price, and the fact that the price charged to the Tramway Committee was thoroughly criticised by that committee was a sufficient justification of that price. Mr. Yerbury admitted that the load factor largely affected the cost per unit, and assumed that in the case of tramways, it was better than in the case of power. In Birmingham the load factors were as follows :— Lighting, 10·75 per cent.; power, 34·0 per cent., and traction, 27·5 per cent. The costs of distribution were very different in the case of power and traction. These two considerations, the lower load factor and the greater cost of the distribution system in the case of tramway supply, justified, in his opinion, charging a higher price for traction than for power. With regard to the figures under "fixed charges," viz., interest at 3·13 per cent., and sinking fund at 2·05 per cent., he considered these very low, and thought something must have been omitted. Possibly the cost of the distribution system had not been taken into account. This figure per unit generated was given as 0·241d., whereas in Manchester it was 0·441d., and in Birmingham 0·378d. It should be borne in mind that tramways loans had a longer life than those for light and power supply. The figures given in the tables at the end of the Paper, included in the case of the combined stations, every charge, and, in addition 5 per cent. profit on the total cost, whereas the figures for separate tramway stations did not include depreciation or any profit.

Mr. A. M. TAYLOR (Birmingham Corporation) commented on the questions of works costs, and maintained that these should be divided into running costs and stand-by charges. He showed a series of curves compiled from the records of the Manchester station, which gave the coal, oil, wages, repair, and management, as compared with the kw. output of the station, and pointed out that several of these items, such as oil, repairs, &c., were a fixed quantity, and did not increase in proportion to the kw. He also gave a table of the fixed charges at Manchester, which was as follows :—

	Power.	Traction.
Standby Coal	0·74	0·47
Oil	0·18	0·04
Wages	1·11	0·75
Repairs	1·20	0·70
Rates	1·02	0·95
Management	0·46	0·39
Interest and S.F.	5·12	4·82
Reserve and Depreciation	2·09	1·32
	£11·92	£9·44 per k.w. per annum.

MR. JACKSON commented on the fact that the law of supply and demand appeared to be thrown over by Mr. Yerbury. A company would have to earn 5 per cent. on its total capital cost instead of 5 per cent. on the running costs. No account of the risk was taken in the running costs.

MR. YERBURY, in reply, said that Mr. Chattock appeared to shelter himself behind his committee. His loans were originally for 30 years, but had latterly been reduced to 25. In Manchester the large sinking fund determined the high price to the tramway department. As regards profit, interest and sinking fund set aside would be declared by a company as dividend. At Bradford and Manchester, 3 per cent. on the works cost was considered an equitable profit. With regard to Mr. Taylor's suggestion to separate out the fixed charges in the works cost, he thought it would be very difficult to determine the amount of coal used to compensate for radiation losses. He adopted the standard tramway form of account, in which coal, oil, waste, and water were classed as running charges. With reference to Mr. Jackson's remarks, he pointed out that the acquisition of a traction load at once brought down the works cost of a combined station, and as regards risk from accidents, this was covered by the ordinary insurance policy.

"TANTALUM" LAMPS IN AN EXPLOSION

THE accompanying illustration shows a two-light fitting with "tantalum" lamps, which were found amongst the debris after a serious explosion at Salford of a large still containing carbolic acid. The fitting, which was on the outside brickwork of the still, was connected to overhead wires on insulators, the whole of the front of which was blown out. Some of the brickwork was hurled a distance of 20 or 30 yards, and, being soaked in the liquid, at the same time caught fire. The wires connecting the fitting, however, did not break, and pulled the

TANTALUM LAMPS FOUND IN DEBRIS OF EXPLOSION.

insulators, fittings, &c., back into the debris, where it was found after the fire. Though the fitting was badly damaged and had been under water for two hours, with the thick outer globe broken, both of the "tantalum" lamps were found to be intact, although after the still front blew out they must have fallen approximately 15 ft. They had been in use since June, 1909, and the occurrence is an excellent illustration of the extraordinary strength of the tantalum filament.

Illumination.—On Thursday last, at the Royal Institution, Prof. S. P. Thompson delivered the first of three afternoon lectures on "Illumination, Natural and Artificial." After pointing out the necessity for a unit of light, the lecturer described the various standards and the attempts to arrive at uniformity. The present international candle was not really a physical unit, but was a physiological unit, as it could not be expressed in terms of any physical units. The eye could only estimate equality, and was incapable of making quantitative comparisons. The lecturer then described several forms of photometer, including the Trotter grating, in which a white screen illuminated at an angle by one source is viewed through another screen with a series of vertical slots illuminated at an angle from the other source. When the illumination of the portion of card round a slot was equal to that of the portion of the other card seen through the slot, the slot disappeared. Another simple and useful photometer screen consisted of two thin slabs of translucent wax stuck face to face with a piece of tin-foil between. The two slabs were illuminated respectively by the two sources to be compared, which were shifted until the slabs were equally bright when viewed on edge. The Lummer-Brodhun photometer was really a development of the Bunsen grease-spot photometer, as, by means of a system of prisms, the two sides of a white screen illuminated respectively by the two sources were viewed simultaneously, and the distances altered until the illumination was equal. Finally, the lecturer described the Trotter Universal photometer for measuring illumination (see ELECTRICAL ENGINEERING, Vol. I., page 849). Turning to the influence of colour, Prof. Thompson referred to the division of any given light into percentage proportions of the three so-called primary colours. Thus, according to Abney, sunlight contained 19 per cent. red, 37 per cent. green, and 44 per cent. blue-violet; and light from an ordinary open arc lamp contained nearly the same proportions, viz., 22 per cent. red, 36 per cent. green, and 42 per cent. blue-violet. The eye was most sensitive to green light, and in a feeble light the sensitiveness increased for blue-green rays. The lecture this afternoon will be devoted to sources of light, black-body radiation, modern illuminators, and luminous efficiency

THE EDISON BATTERY FOR TRAMWAY TRACTION

SOME particulars are given in the *Electrical World* (New York) of the tests which, as we have already announced, have been made in America with a tramcar propelled by the Edison alkaline secondary battery. The tests in question were made at West Orange, New Jersey, with a special car seating only 26 passengers, and driven through silent chains of two 110-volt motors rated at 5 h.p. each. The whole car is stated to weigh under 5 tons, so that it is obvious that nothing like full-sized tramway conditions were attempted.

The battery equipment of the car consists of 200 cells of Edison A4 type for driving, and 10 similar cells for lighting. All the cells are placed under the seats.

During the trials it was found that the motors gave the car a maximum speed of 15 miles per hour, and with 14 stops per mile enabled a schedule of eight miles per hour to be maintained. The power consumption in accelerating is said to be about 3½ kw., and in running about 1½ kw. The consumption is, of course, variable, and depends very much upon road conditions. The controllers are arranged to give the following three combinations: First step, batteries in parallel at 50 volts, and motors in series; second step, batteries in parallel at 100 volts, and motors in series; third step, batteries at 100 volts, and motors in multiple. The body of the car weighs 3,500 lb., the truck and electric equipment 3,500 lb., and the battery 3,000 lb., giving a complete car of 10,000 lb. The battery equipment is said to be capable of supplying energy for 150 miles on a single charger.

The construction of what is stated to be the latest form of the Edison battery differs somewhat from that of the original cell. The iron element has an excess capacity over the nickel element, and does not differ much from the iron electrode formerly used. Much time has been spent in perfecting the nickel element. The former positive plate was made up of flat rectangular pockets containing nickel oxide and graphite. It was found that the graphite oxidised, and that mechanically the structure could not resist the swelling action of the nickel oxide. In the new plate round tubes 4 in. long and about the diameter of an ordinary pencil are used to retain the nickel oxide. The tube is made of thin perforated steel, which, when filled with the active material and properly bound by eight steel rings, makes expansion of the active material impossible, and insures perfect internal contact. Instead of the graphite formerly employed, electrochemically prepared flakes of pure nickel are interspersed in the oxide to increase the conductivity of the active mass, because nickel oxide of itself is a poor conductor. Each positive plate consists of a grid of nickel-plated steel holding 30 of these tubes. The negative plate comprises 24 flat rectangular pockets supported in three horizontal rows in a nickel-plated grid. The pockets are made of thin nickel-plated steel perforated with fine holes, each pocket being filled with an oxide of iron, and afterward subjected to very heavy pressure.

The plates of each group are hung on a connecting rod perpendicular to, but integral, with the pole. They are held apart by nickel-plated steel washers, and held firmly in contact by nuts screwed on both ends. The two outside plates are negative, and are insulated from the retaining can by sheets of hard rubber. Hard rubber pieces are also fixed between the steel-containing vessel and the side and bottom edges of the plates. The electrolyte consists of potassium hydrate (21 per cent. solution), to which has been added a small amount of lithium hydrate. The function of the lithium hydrate is not clearly defined. The normal specific gravity of the solution is 1·210, which does not change during charge or discharge. The efficiency and capacity of the cell, however, are not affected to any extent if the specific gravity of the solution is as low as 1·160. Below this a temporary effect is noticeable in the output of the cell. The following are details of two standard types of cell:—

	Type A-4.	Type A-6.
Rated ampere-hour output	150	225
Average discharge voltage per cell	1·2	1·2
Normal rates of charge and discharge in amperes	30	45
Weights (in pounds) of cell complete	13·5	19·2
Width of can (inches)	2 9/16	3¾
Breadth of can	5	5
Height of can	13⅜	12⅜
Height of cell to top of pole (not assembled)	15⅜	13⅜
Required height of battery compartment	15	15

It is stated that charging may be done at double the above rates for one hour if the temperature is kept from rising much above 100° F. It is also permissible, though not recommended, to discharge a battery continuously at rates up to 25 per cent. above normal, and for occasional short intervals of time as in hill climbing or starting on heavy roads, no harm is said to result if the rate be increased to three or four times normal. The capacity of the battery increases after it has been placed in service. It also possesses considerable reserve capacity. The highest practical limit of output is reached when a battery is charged 10 hours at the normal rate, and its value will be, for a fully formed battery, perhaps 30 per cent. more than the rated output. Efficiency is sacrificed somewhat, of course, when the highest available capacity of the battery is utilised. A seven-hour charge at normal rate is considered a normal charge.

It has been found in testing the battery under severe conditions that with a rated discharge three times normal the voltage drops 0·03 volt for every 10 amp. increase. On returning to normal discharge, the voltage comes up to a value a trifle higher than normal, owing to the heat generated at the heavy discharge rate. Heat on discharge increases the output, while heat on charge diminishes it; but excessive heating at all times impairs the life of the battery, and should be avoided. The watt-hour efficiency of the cell is given as from 60 per cent. to 65 per cent. The smaller battery gives about 14 watt-hours per pound of cell, and the larger cell 16 watt-hours.

CORRESPONDENCE

GLARE.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—May I correct one or two mistakes in the report of my remarks at the recent meeting of the Illuminating Engineering Society? Concealed lighting, where the lamps are hidden by a cornice, is generally an expensive mode of lighting. A shaded lamp within range of vision is a different matter. The intrinsic brilliance of the shade should not, I think, exceed one or two candle-power per square inch. I showed a specimen of a clear glass shade designed by me thirty years ago, not on the Holophane principle, but on the principle on which the Holophane system was based some twelve years later. With a 16 c.p. lamp in such a shade the brilliance is spread over about 7½ square inches, and is therefore (allowing for loss) about 4 c.p. per square inch. This is unpleasant at close quarters. The Holophane globes are better in this respect. I said that it is a mistake to use the actual measured diameter of a filament in estimating the intrinsic brilliance. The apparent diameter which is increased some ten times by irradiation should be used.

Feb. 18th, 1910. Yours faithfully,
A. P. TROTTER.

THE INSTITUTION LIBRARY.

To the Editor of "ELECTRICAL ENGINEERING."

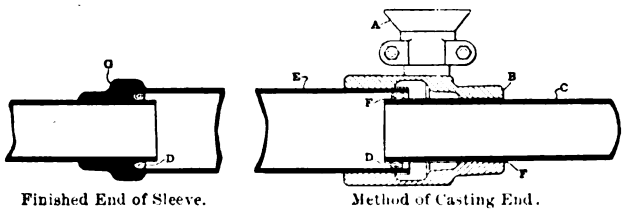
SIR,—In answer to "Provincial" and "Associate Member," it would, perhaps, surprise them to know how few London members of the I.E.E. really avail themselves of the opportunity of consulting the most complete library of electrical science in England. I happened, whilst visiting the Institution Library, to read the letters of "Provincial" and "Associate Member," so out of curiosity I looked at the visitors' book to see how many members used the Library. I was astonished to find that for the present month the average number of readers was only 1·5 per day. The total number for January was 44, or an average of 1·7 per day! From July to December of last year there was an average of 1·6 per day. I have not included Sundays or holidays in the averages.

There is still another figure to be taken into account, and that is the number of members residing within the postal district of London; I think there are nearly 2,000, of whom an average of only 1·6 per day use the Library. How does this figure compare with the 200 members of the Local Section mentioned by "Provincial"? Would a reference library be worth maintaining for the benefit of one member per week, calculating the figure on the basis of the London returns?

I find in the last annual report of the I.E.E. that 862 members of all classes had visited the Library during the 12 months ending May 20th, 1909. This is an average of 18 per week, or three per day. That year appears to be a record, but this year the number has gone down nearly 50 per cent., for what reason I know not.

I believe I am right in saying that most provincial public libraries receive the more important technical papers, and not a few of them have a small collection of standard engineering works; if not, it is open for the public to suggest such standard technical books as they consider ought to be in a public library. Even if the Library Committee did not agree to the suggestion, the request might be carried a little further in the form of a petition to the Library Committee with a list of, say, a dozen or so local supporters, which would probably have the desired effect.

I might mention that the figures can easily be checked.



Yours faithfully,
Feb. 21st, 1910. LONDONER.

CABLE JOINTS AND BOXES

New System of Lead Jointing

A NEW process for the jointing of lead in pipe or other form, the invention of Mr. T. Harden, late of the British Insulated & Helsby Cables, Ltd., is being introduced by the Metal Jointing Co., Ltd. (Adelphi House, 71 Strand, London, W.C.). The lead surfaces to be joined are cleaned in the usual way, and a thin sheet of specially prepared tin is inserted between them. The joint is then heated with a blow-lamp, and the melting of the tin causes the lead surfaces on either side of it to melt at a lower temperature than the normal melting point of lead. An actual weld is thus formed between the two surfaces to be joined. The tin strip for this purpose is supplied by the company under the name of "Amalgaline," and consists of a ribbon of pure tin 0·05 mm. in thickness, treated with a patent composition to prevent the formation of oxides during heating In the case of a joint in an ordinary lead-covered cable, after the conductors have been jointed and insulated, the lead sleeve is drawn over the joint, a strip of "Amalgaline" is wrapped round the lead covering of the cable at each end, and the sleeve is dressed down to this. Sufficient heat is then applied to the outside of the sleeve over the "Amalgaline," and the joint is complete. In telephone, telegraph, and other large dry-core cables, it is not always desirable to dress down the heavy lead used for sleeves, and so for such work a mould is used as illustrated in the accompanying figure. The sleeve is passed along the cable in the

SKETCH ILLUSTRATING METHOD OF JOINTING LARGE LEAD-COVERED CABLES WITH AMALGALINE.

usual way before the conductors are jointed and the jointing is proceeded with; when completed, the sleeve is scraped clean inside for a short distance, the outer surface of the lead of the cable being similarly treated. A piece of "Amalgaline" is placed on the cleaned part in the interior of the sleeve, and another piece, *F*, is wrapped round the lead sheathing of the cable. The sleeve *E* is then drawn into position, and a piece of ordinary engine packing, *D*, is driven between the cable and the sleeve. The mould *B* is then placed in position and molten lead poured in. An important feature is that the mould is so constructed that the hot metal runs direct from the pouring gate to the space beneath the cable, and then wells up round the cable, so that there is no risk of the lead being burned through by the metal being poured direct on to it. The time for plumbing a large telephone cable is said to be reduced by about 30 min.

The system is also advocated for making tee joints in lead-covered cables, and the company has already supplied a number of small house-service boxes made entirely of lead. These are divided in the usual way, but require no packing. When the joint is complete, "Amalgaline" is placed between the flanges and round the cables where they enter the box, and the whole heated up and welded water-tight. Of course, no supplementary bonding is required.

We understand that a large number of sleeve joints have been made by this process by the Fulham Electricity Department, and that during a period of over two years they have in no single instance needed the slightest attention.

Electric Power at the G.W.R. Works.—In our article describing the electrical equipment of the G.W.R. carriage and wagon works, Swindon, brief reference was made to the older power station at the locomotive works, which is quite separate from the carriage and wagon works. It may interest our readers to know that in this station, which has been running some three or four years, there are three generators of the Phœnix Dynamo Manufacturing Co.'s make, each having an output of 165 kw. at 200 r.p.m., and coupled to Westinghouse gas engines. The company supplied a number of the motors in use at the locomotive works, and in addition recently supplied the G.W.R. with a 75-kw. generator coupled to a high-speed engine, which is working at the Didcot Provender Store. They have also lately delivered a 75-kw. generator, which is coupled to a Fielding & Platt gas engine at the G.W.R. Tyseley generating station.

ADVERTISING ELECTRICITY IN LONDON AND THE PROVINCES

THE Electric Supply Publicity Committee of London and District, which has been formed by the local authorities in London and Greater London owning electricity works, in conjunction with the electric supply companies, has now got seriously to work. This scheme, unlike the linking-up scheme referred to in an article below, includes all the London companies. The scheme of co-operative publicity originated with the publication of the quarterly *Electrical Bulletin* by the West End London companies, which was started some years ago, but this, we are informed, has now ceased to exist, and the idea is now being carried out on a much larger scale by the Joint Committee. In order to extend the scope of the committee, provincial electricity committees and companies are being asked to co-operate in the purchase of literature in order to enable this to be published on broad lines and printed in large quantities, thus reducing the cost to the individual undertakings. The first production consists of a poster 40 in. by 25 in., depicting a bird's-eye view of a portion of London illuminated by a metal filament lamp, which will be printed in five colours, and has a space at the foot for the full name and address of the individual undertakings to be inserted. The Joint Committee have also prepared a "spring-cleaning" circular, which is especially suitable for this season of the year.

LINKING UP LONDON ELECTRICITY WORKS

IN our issue for May 20th, 1909 (ELECTRICAL ENGINEERING, Vol. V., Page 467), we published an article describing the efforts which were then being made by the London electricity supply companies and local authorities owning electricity works to take advantage of the "linking up" provisions of the London Electric Supply Act, 1908. This Act, for the first time in the history of the electrical industry, legalised "association" between various electric supply authorities. A Committee was formed consisting of six representatives of the companies, and six representatives of local authorities, to consider a scheme for linking up the various undertakings in London and Greater London. The basis of the scheme was the laying of a ring main, and the use of a pressure of 10,000 volts three-phase and 50 periods with an agreed unit of converting plant throughout, namely, 500 kw., which could be used singly, or two or more in parallel, as circumstances might demand.

The Joint Committee have appointed engineers on either side as follows: Mr. C. P. Sparks (County of London Electric Supply Co.), Mr. Frank Bailey (City of London Electric Lighting Co.), Mr. W. C. P. Tapper (Stepney), and Mr. C. Newton Russell (Shoreditch). The scheme for linking up only includes those companies scheduled in the London Electric Supply Act, 1908, viz., all the London companies with the exception of the St. James & Pall Mall; Westminster; Kensington & Knightsbridge, Notting Hill & Central Electric Supply Companies; and the London municipal electric undertakings (with a few exceptions, such as the Hackney Borough Council) are also taking part in it. The sub-committee of electrical engineers is preparing a report giving more definite recommendations, in addition to the technical points which we have mentioned as already having been agreed upon, but it is improbable that this report will be ready for publication until late in April.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Associate Members:* A. S. Angwin, J. E. Barnes, E. Barrs, H. G. Brown, J. Brown, C. Crompton, R. Cunningham, P. T. Davies, R. N. Duncan, F. A. Gaby, W. L. Gundry, E. Harlow, F. W. H. Hayes, F. S. G. Hinings, A. Imbery, W. Ireland, E. J. Ivison, G. C. Jefferyes, F. H. MacHugh, T. H. Matthewman, A. J. Murray, J. H. Murray, F. F. O'Hagan, J. Patrick, F. C. Poulton, T. E. Scharffetter, E. Slader, W. A. Talbot, C. E. Tattersall, J. Waddell, R. Wheeler. *Associate:* L. H. Sharp. *Students:* F. W. Adcock, J. Allan, F. G. Allen, A. C. Bowman, H. Clark, R. H. Dryden, H. C. Hannam-Clark, C. H. Hill, K. G. Maxwell, R. F. Niven, T. R. Parry, T. D. Todd.

Telegraph Traffic and Movements of Cable Ships.—The c.s. *Pouyer Quertier* repaired the cable between Paramaribo and Cayenne on the 15th inst.—The recent storms are responsible for a lot of damage to land wires all over the British Isles.—The Saigan-Bangkok line ceased working on the 19th inst., but was restored on the 20th. The line between Bagdad and Bassorah became interrupted on the latter date.—The *Minia* was engaged off Newfoundland during the early part of the month, and the c.s. *Amiral Caubet* spent some considerable period on the Cape Cod-St. Pierre section, which was in need of attention. During these operations the weather was stormy, and the vessel was damaged and gear was lost. The c.s. *Mackay-Bennett*, of the Commercial Cable Co., which has had during recent times so much to do with the diversion of that company's cables to Newfoundland, was recently instructed by wireless telegraphy to proceed to the States, where the section between Rockfort and Cauco was in need of attention.

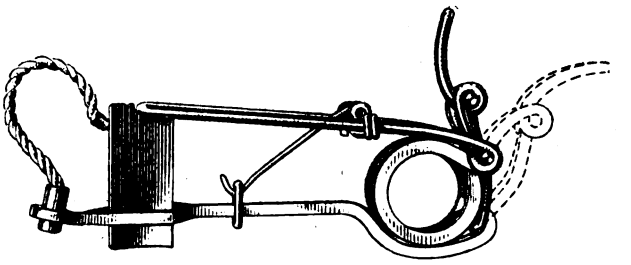
THE GENERAL ELECTRIC CO.'S DINNER

THE twentieth annual dinner of the General Electric Co., Ltd., was held on Saturday at the Trocadero Restaurant, and was, as usual, a great success. Numbers of the staff were present from the provinces, as well as London, and there were many distinguished guests.

The toast of "British Industry" was proposed by Mr. Hugo Hirst, managing director of the company, who occupied the chair in the absence through ill-health of Mr. Gustav Byng, the chairman of the company. Mr. Hirst ventilated some of the grievances of the manufacturer against those in authority. In a "confession of faith," he said, by the Institution of Electrical Engineers, which had recently been published, they said that the Institution existed principally for promoting science and applied science, but it was not yet quite clear whether the manufacturer came within the definition. For politicians, he continued, the manufacturer only exists as a subject for taxation. When we beat Napoleon about 100 years ago, and sent him to St. Helena, he called us a nation of shopkeepers, and since then we had been doing our best to show that he was wrong. It was extraordinary how the Board of Trade ignored manufacturers. For instance, neither he himself nor any of his managers, nor a manufacturers' association to which he belonged, had received any notification of the Government's intention to start the Labour Exchanges, although the General Electric Co. employs over 6,000 men, and the members of the manufacturers' association together employ hundreds of thousands. "In this country," Mr. Hirst continued, "disorganised capital flows into industry, capital from pockets not interested in the industry except as speculative dividend makers, not necessarily into the industry which wants it, but into the industry which is fashionable at the moment. The result has been that money has flowed too readily into the hands of the manufacturer, who, not being used to handle large sums of money, was, unconsciously in most cases, led into trouble and misfortune, and it also easily led to over-production. In Germany money, though coming from small investors, flows through the channels which are generally known as industrial banks, or through some financier who brings his brain, knowledge, and vast experience in matters of finance to the assistance of the undertaking, and is thus not an embarrassment, but a tower of strength to the industry. They use their money wisely. By some means they get rid of the incapable elements in each industry, and bring the capable to the front. Through the assistance of the Government, which secures them the home market, they can gauge and regulate the supply according to the demand. By such scientific control and direction of capital they have raised their industries to a state of efficiency which is the envy and admiration of all countries." America, France, and Germany gave manufacturers their proper positions. When America and Germany made up their minds to challenge us industrially, they had taken up matters where we left off, while we had remained stationary. In these countries the manufacturers had the assistance of their Governments; in Great Britain it was not so. Here we were each strong individually, and could handle an oar or paddle a canoe with the best, but on such small craft it was not possible to fight against the Dreadnoughts which the organisation of other countries represented.

The toast was responded to by the Hon. Sir John Taverner (Agent-General for Victoria), and Mr. Faithfull Begg. Other speakers were Mr. Max Railing, Mr. W. Duddell, F.R.S., Mr. R. K. Morcom, Mr. Ernest G. Byng, who proposed the "Engineering Press" in an excellent maiden speech, and Mr. Arthur Colefax, M.P.

CATALOGUES AND PAMPHLETS, &c., RECEIVED



[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

THE "O.S." WIRING SYSTEM.—A pamphlet from Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), contains a reprint of an article on the lighting installation of Rossall School, which has been wired throughout on the "O.S." system with Stannos wires and fittings.

CABLES.—A new catalogue of underground cables is being issued by Messrs. Aubert, Grenier & Co. (68A Lincoln's Inn Fields, W.C.). Full particulars are given of each class of cable dealt with, among which are the following:—Paper-insulated, lead-covered, aluminium single cables, copper concentric, triple concentric, twin three-core paper-insulated cables up to 660 volts, and various patterns of high-tension cables for pressures up to 11,000 volts. Vulcanised bitumen cables are also included, up to 660 volts.

ELECTRIC POWER IN LAND RECLAMATION.—A leaflet has been published by the Allgemeine Elektricitäts-Ges., of Berlin, whose agents in this country are the A.E.G. Electrical Co. (121 Charing Cross Road, London, W.C.), describing the application of automatic electric pumping in connection with the reclaiming by the Dutch Government of large tracts of land at the estuary of the river Maas. Twenty-two pumping stations containing three-phase motors with automatic motor-driven starters were employed. The motor switchgear was controlled automatically by floats. Current was supplied at 3,000 volts from a special central station.

MOTORS AND DYNAMOS.—We have received a list of standard continuous-current dynamos and motors up to about 70 h.p., of the protected, enclosed, ventilated, and enclosed patterns, from Messrs. H. T. Boothroyd, Ltd. (Bootle, Liverpool). Particular attention may be drawn to the brush-holder used (Wooliscrofts Patent), which is shown in the accompanying illustration. This can be immediately fixed without tools, and

THE "AGILE" BRUSH-HOLDER.

is extremely light and flexible. A powerful toggle clip secures the holder to the rocker spindle, and a long carbon feed, with adjustable range of pressure, and a hold off position are provided. This holder is aptly named "The Agile."

ALTERNATING-CURRENT POWER MEASUREMENTS.—Messrs. Everett, Edgcumbe & Co. Ltd. (117 Victoria Street, Westminster), have issued an interesting pamphlet on technical considerations in connection with alternating-current power measurements, treating the whole matter from the ordinary engineer's standpoint. The conditions which are met with in practice, involving the use of wattmeters, power factor indicators, and idle-current indicators, are dealt with fully, and a particularly clear explanation is given of the reason why, in the two wattmeter method of power measurement on a three-phase circuit, one instrument reverses its reading if the power factor be below 0·5. A useful curve is also given from which the power factor can be determined from the two readings.

The Metal Filament Lamp Trade in Germany.—In a note in our last issue we mentioned that in consequence of the inconvenience caused to lamp dealers in Germany by the sudden reduction in prices by the Allgemeine Elektricitäts Gesellschaft, a temporary agreement had been come to among other manufacturers not to reduce prices without previous arrangements with the dealers and other parties concerned. A meeting was held last week, and was attended by all the German manufacturers of metal filament lamps (with the exception of the A.E.G.), the larger Austrian and Dutch manufacturers, the Westinghouse Co.'s representatives, and representatives of the German contracting firms and dealers. After discussion, it was decided that no manufacturing firm should reduce their prices before March 10th next, but that after that date the individual manufacturers should be free to alter their list prices when and how they thought fit. It is thought in Berlin that on this date all manufacturers will reduce their list prices to the level of those of the A.E.G. An agreement has also been come to between the Siemens and Halske A.G. (who, it is said, are about to manufacture tungsten lamps) and the other parties, whereby the former will further reduce the price of tantalum lamps only in proportion to the reduction made on tungsten lamps.

Electric Supply for Madras Tramways.—An action is pending between the Madras Electric Tramways Co. and the Madras Electric Supply Corporation for breach of contract to supply electrical energy. An agreement was entered into between the parties whereby the Supply Corporation were to supply electrical energy to the Tramways Company from January 1st, 1909, at one penny per unit. For various reasons the supply was not given until a later date, and the Tramways Company were compelled to continue generating at their own power station, where the works costs are said to be 1·65d. per unit. The action is to recover the sum of £3,546 18s. 2d., which is the difference in cost between the price which the Tramways Company would have paid the Supply Corporation and the extra cost of generation at the tramway station during the period from January 1st, 1909, to the date when the new supply was actually given. Before Mr. Justice Hamilton on Monday an application was made by the Tramway Company for the action to be transferred to the list of commercial cases, but the Supply Corporation opposed on the ground that evidence of a very technical nature would have to be given, thus rendering the case quite unsuitable for the commercial court. Mr. Justice Hamilton refused to transfer the action. Mr. C. C. Hutchinson, who appeared for the Supply Corporation, mentioned incidentally that in their opinion the case should be dealt with under the arbitration clause of the agreement to supply.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 17th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,859/08. **Equalising the Stress in H.-T. Cables.** A. E. TANNER and E. A. CLAREMONT. It is known that if the conductance of each successive layer of equal thickness of insulation of cable is equal, the potential gradient will be a straight line and the dielectric stress equal all through. To produce this condition in H.-T. direct-current cables, a number of concentric metal wrappings are embedded at equal distances in the insulation and are connected to each other and to the core by resistances such that the total resistance between core and first wrapping and between any two adjacent wrappings is equal. For A.-C. working, the successive wrappings and the core are connected to choking coils or to separate points on a compensating coil. Three claims, two figures.

1,820/09. **Train-Lighting System.** P. L. R. FRASER and TUDOR ACCUMULATOR CO., LTD. This is one of the patents covering the T.A.C. train-lighting system described in ELECTRICAL ENGINEERING, Dec. 9th, 1909, p. 1034. The dynamo is connected in parallel with accumulators through an automatic switch. The dynamo field circuit contains iron-wire resistances which give constant current within considerable limits of voltage. The field is reduced by the automatic switch when the battery is charged. Two claims, one figure.

3,192/09. **Protection of Cable Systems.** BRITISH THOMSON-HOUSTON CO. and E. B. WEDMORE. This patent covers a combination of current and potential transformers, and a closed circuit relay controlling the switch tripping contacts. So long as the fault is small and the voltage normal, the trip coil is operated by the potential transformer when the relay works, but should a heavy fault bring the voltage down, the necessary energy to operate the trip is supplied by the current transformer. The relay is caused to throw the current transformer into parallel with the potential transformer in the latter case. With this system it is said to be possible to set reverse-current relays for feeder protection to operate at much less than one-tenth load. Three claims, one figure.

4,574/09. **Electrolytic Extraction of Copper.** SOCIÉTÉ FRANÇAISE ELECTROLYTIQUE. The alloy or ore from which the copper is to be extracted forms the anode, and is placed in a basket suspended in an aqueous ($\frac{1}{10}$) solution of per-sulphuric acid saturated with pure sulphate of copper. The ore need not be subjected to any preliminary treatment. The copper in the ore dissolves in the form of sulphate without liberating hydrogen, and the electrolysis of the cupriferous solution imparts a deposit of pure copper to the cathode. Any other metals present in the anode do not dissolve, but are precipitated in the form of per-oxides. One claim.

4,672/09. **A.-C. Hot-plate.** A. F. BERRY. The heating winding consists of a nickel strip, a thin oxide film on which forms a good heat conducting insulation for low pressures. The strip is wound flat in a spiral on the under surface of the hot-plate, and the convolutions are unequally spaced by insulating distance pieces to compensate for heat-disturbing factors and to produce a uniform temperature over the plate. A disc of brass or other good conductor may be placed over the spiral, the eddy-currents induced in it assisting to heat the plate. A bottom plate is placed over the whole. Thin mica is interposed between the nickel strip and the top plate. Five claims, two figures.

12,917/09. **Variable Speed A.-C. Motors.** H. A. MAVOR and MAVOR & COULSON, LTD. In a previous patent, a system was described in which a number of motors, each possessing a different number of poles and mounted on one shaft, were supplied with currents of various frequencies from a number of independent generators, the machines being connected in several different combinations to obtain different speeds of the shaft. According to this invention, the motors are combined in one machine, the stator of which has several independent windings producing different number of poles. Three claims, three figures.

25,028/09. **Telephone Transmitter.** M. MOLONEY and J. ROSS. This is a microphone transmitter for long-distance work. The casing contains a carbon cup, with a number of radially arranged carbon pencils with pointed ends fitting into a groove in a carbon centre stud. The latter has a point which passes through the centre of two carbon washers, between which is small shot. The metal diaphragm just clears the centre stud and is pressed against the carbon washers. Seven claims, six figures.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

4,238 of Feb. 25th, 1896. **Armature Winding.** J. DEVONSHIRE (*W. H. Knight, General Electric Co., U.S.A.*). This patent covers former wound coils in which the two sides of the coil are joined at each end by two straight portions with a double twist at the angle, so that the two halves of the coil are in different but parallel planes.

4,805 of March 3rd, 1896. **Magnetic Separators.** J. P. WETHERILL. A separator for minerals of low magnetic susceptibility, such as limonite, siderite, and rutile, is described. The finely powdered ore is fed on to travelling bands, which pass over the tapering poles of two adjacent electromagnets. The gangue falls off immediately the bands pass over the pole ends, but the mineral is carried a little farther to the other sides of dividing screens under each pole.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: BRITISH THOMSON-HOUSTON CO. (*A. B. Everest, U.S.A.*) [Constant-current transformer with floating coils] 21,670/99; BRITISH THOMSON-HOUSTON CO. (*J. A. Essberger, Berlin*) [Motor control by pressure variation] 22,031/01; H. WRIGHT [Train-lighting system] 22,334/05.

Electric Ignition: F. REICHENBACH [Driving magnetos] 22,113/05; C. A. DAY (*Fabrik Elektrischer Zunder Ges.*) [Commutator] 22,198/05; ELECTRIC IGNITION CO. and F. H. HALL [Switch] 22,585/05.

Electrometallurgy, &c.: P. M. JUSTICE (*C. Davis, U.S.A.*) [Hardening surfaces of plates, &c.] 22,233/01; F. H. LORING [Arc furnace for treating air] 22,101/05.

Instruments and Meters: E. DUBOIS and REASON MANUFACTURING CO. [Electrolytic meter] 23,853/03; SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Indicating instrument] 23,972/04.

Switchgear, &c.: C. H. OFFORD and S. JEVONS [Time switches] 19,386/00; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Connections of mercury-vapour rectifiers] 22,261/05; H. PIERSON [Trip-gear for switches] 22,419/05.

Telephony, &c.: H. OPPENHEIMER (*A.-G. Mix. & Genest*) [Portable loud-speaking telephone] 22,061/05.

Traction: A. GARDINER [Automatic signalling] 22,357/05; M. P. McLAREN [Trolley-head with grinding arms] 22,578/05.

Miscellaneous: J. Y. JOHNSON (*A. Wolf & Co., Frankfurt*) [Thermo-electric cell] 23,858/02; L. B. MILLER [Interrupter] 22,317/05.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: WEINERT [Carbons] 20,832/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: HEYLAND [Regulation of A.-C. systems] 2,520/09.

Dynamos, Motors, and Transformers: MOSER [Synchronous A.-C. generator with automatic pressure regulation] 7,106/09; DE DAILLENS and JORIS [Portable drilling machines] 7,410/09; BRITISH THOMSON-HOUSTON CO. and DAWSON [Current collectors for machines] 15,421/09; HUNT and SANDYCROFT FOUNDRY CO. [A.-C. machines] 16,170/09.

Electric Ignition: GRIFFIN, 2,411/09; HINDLEY and STANFORD, 15,389/09.

Electrometallurgy and Electrochemistry: COWPER-COLES [Manufacture of reflectors] 2,396/09; NEWLANDS and PARKINSON [Electrolyte for primary cells] 11,926/09; BUNET and BADIN [Electrical manufacture of oxides of nitrogen] 16,224/09.

Incandescent Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Manufacture of metal filaments] 4,164/09.

Storage Batteries: SCHMELTZ [Method of charging] 23,863/09.

Switchgear, Fuses, and Fittings: BRÜLL [Resistances] 1,998/09; TERREY, PEATEY, and HUNT [Automatic transformer switch] 2,144/09; WEEKES [Switch-fuse] 2,287/09; SPAGNOLETTI [Small circuit-breakers] 2,733/09; CURTIS and ADAMS MANUFACTURING CO. [Resistances] 3,191/09; MUIR and CHAMEN [Electric lanterns] 9,760/09; A.-G. BROWN, BOVERI ET CIE. [Control of lighting installations with accumulators] 16,631/09; WALL [Signal lamp] 16,878/09; EDWARDS (*German*) [Fuses] 19,263/09.

Telephony and Telegraphy: PICKERING [Antiseptic devices for telephones] 14,012/09.

Traction: MASCORD, LANGE, and CHITTY [Motors and transmission gear for petrol-electric vehicles] 2,285/09; DAWBARN [Trolley-wire collector] 2,311/09; SHAW [Signalling] 11,968/09; DE SAINTE-CLAIRE [Clutches for electric vehicles] 13,234/09; KOZESNIK [Third-rail system] 15,032/09.

Miscellaneous: HOVLAND [Signalling] 2,272/09; HURRY [Combined bell-push and fire-alarm] 5,337/09; KELVIN & JAMES WHITE, LTD., CHETWYND and CLARK [Compass] 19,057/09, and 29,719/09; HARRISON (*Baker*) [Influence machine] 25,106/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Traction: ANGUS [Preventing collisions] 756/10.

Miscellaneous: SIEMENS & HALSKE AKT.-GES. [Signalling] 23,029/09; EMERY [Signalling] 1,536/10; SIEVERT [Electromagnetic carriers for glass bodies] 1,710/10; LUTH and ROSENS ELEKTRISKA AKTIEBOLAG [Clocks] 1,793/10.

LOCAL NOTES

BUSHEY (Herts): *Electric Supply.*—Mr. J. F. C. Snell has been retained by the Council in connection with negotiations with the Watford District Council for a supply of electricity in bulk.

CLITHEROE: *Electric Lighting.*—The Council have asked the Board of Trade for an extension of time in which to carry out the terms of their Electric Lighting Order.

COOMBE: *Electric Supply.*—The Kingston Corporation have suggested supplying in Coombe when asked to do so by residents there under the powers of the Electric Lighting Act, 1909, relating to supply to premises in contiguous areas. The Council appear to regard this proposal as dealing with the question in a piecemeal manner, and that the supply would never be under the control of the Council.

DUBLIN: *Trolley Rope Accident.*—Damages to the extent of £30 were awarded against the Dublin United Tramways Co. last week in respect of a passenger who was injured through a loose trolley rope striking him and injuring the muscles of his neck. It was stated that the trolley rope caught the passenger round the neck and lifted him off his feet.

FIFE: *New Tramway Plant.*—A 2,000-h.p. B.T.H. Curtis turbine has been installed in the power-house of the Fife Electric Power Co., at Townhill, Dunfermline, for the purpose of supply to the West Fife tramways.

HARROGATE: *Street Lighting.*—Mr. G. Wilkinson, the Borough Electrical Engineer, has prepared a scheme of public electric lighting.

HULL: *Municipal Telephone Undertaking.*—The net profit on the municipal telephone undertaking for 1909 was £1,040, which brings the reserve fund up to £3,000, independently of the repayment of loans.

LIMERICK: *Stealing Electricity.*—A curious condition of affairs was revealed at the Limerick City Petty Sessions last week, when a local wiring contractor was charged with connecting up certain lamps at the Catholic Literary Institute in such a manner that the energy was not registered by the meter. The magistrates came to the conclusion that notice of connecting the additional lamps was given to the Corporation supply department, and called attention to certain evidence that it was more or less the custom to allow additional temporary lamps to be connected on the supply side of the meter. If this were so, then neglect was going on in some department, and should be inquired into.

CITY OF LONDON: *Street Lighting Experiments.*—At the last meeting of the Corporation an offer was received from the City of London Electric Lighting Co. to make further experiments in street lighting at an approximate cost of £525 per annum, and this was agreed to. The Gas, Light & Coke Co. are also to make similar experiments.

LONDON: *Islington: Power Charges.*—The Electricity Committee have been in negotiation with a firm who are at present large consumers of electricity, and who propose to abandon their steam plant, and to instal electric motors (which will increase their consumption of electricity for power to over 200,000 units per annum), provided the Council make a reduction in the price. At present the rate is 1d. per unit up to 50,000 units per quarter, and 0·8d. per unit for all consumption over 50,000 units. In future the rate of 1d. per unit is to be charged, less 10 per cent. when the consumption amounts to 200,000 units or more per annum, provided a three years' agreement is entered into. This will bring the charge to 0·9d. per unit.

Poplar: Street Lighting.—The charge for public lighting from April 1st is to be £13 per kw. per annum, *plus* ½d. per unit, which, upon the present consumption, is approximately equal to 1½d. per unit. The present charge is 1½d. per unit.

LOWESTOFT: *Supply Outside Borough.*—The Council is considering the question of extending the electric supply mains into Pakefield and Kessingland.

NEWPORT (Mon.): *Electricity Charges.*—Acting on the recommendation contained in the recent report upon the electricity undertaking by Mr. C. P. Sparks, the Electricity Committee recommend an increase in the charges for electricity for all purposes of ½d. per unit, with a 5 per cent. discount instead of 2½ per cent. for prompt payment. New plant is to be installed. (See "Tenders Invited" columns.)

PERTH: *Sunday Trams.*—The Corporation have, apparently as a consequence of the recent report of Mr. Peter Fisher, tramway manager at Dundee, decided to run the tramcars on Sundays.

PINNER: *Electric Lighting.*—The Pinner, Stanmore, Harrow Weald, and Edgware Electric Lighting Order granted to the Northwood Electric Light & Power Co. in 1906 has been revoked by the Board of Trade.

PWLLHELI: *Electric Lighting.*—The Council have agreed to transfer their Electric Lighting Order to a private company, one of the conditions being a maximum price of 6d. per unit for lighting and 3d. per unit for power. The promoters are to refund to the Council the costs of obtaining the Order.

WALSALL: *Electricity Accounts.*—The accounts of the electricity department for the year to December 31st, 1909, show a gross profit of £6,784, and after meeting capital charges, a balance of £653 is carried forward. The number of units sold was 1,690,753, and the maximum demand was 1,026 kw.

WEST HAM: *Supply in North Woolwich.*—With reference to the supply of current to the Port of London Authority for use in a portion of the Royal Albert Docks, outside the borough, a deputation waited upon Woolwich Borough Council this month. The following proposals were considered at subsequent interviews:—(1) The Council to supply current for the whole of the requirements within the dock area under control of the Port of London Authority. (2) The Council to supply current in bulk to the Woolwich Council for distribution by them in their North Woolwich district. (3) The Council to supply and distribute current in the North Woolwich district. The Electricity Committee of West Ham, having considered the opinions of their Electrical Engineer upon these proposals, have agreed to supply current in bulk to the Woolwich Council for distribution by them in their North Woolwich area on certain terms, on condition that Woolwich consent to West Ham supplying current for the requirements within the Dock area under the control of the Port of London Authority, subject to an agreement being executed by the two authorities to contain, among other things, the following stipulations asked for by Woolwich:—(*a*) A supply from duplicate mains. (*b*) The price quoted to be revised should the West Ham Corporation supply any other consumer under similar circumstances at a lower price.

WILLESDEN: *Bulk Supply.*—The agreement with the North Metropolitan Electric Power Supply Co., embodying the new terms upon which electricity in bulk is to be supplied, is to commence from March 31st, 1911, instead of February 8th, but the revised rates for bulk supply are to date back from December 31st, 1910.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BOLTON.—A Local Government Board inquiry was held last week, concerning a loan of £4,608 for the purchase of land, &c., in connection with the electricity undertaking.

BRUMBY AND FRODINGHAM.—A scheme of public lighting, at an estimated cost of £2,500, is under consideration.

CANADA.—A Canadian correspondent of the High Commissioner for Canada, 17 Victoria Street, London, asks to be placed in touch with a United Kingdom financial house open to interest itself in an electric railway in the Niagara Peninsula.

DUBLIN.—Tenders are invited for extra high-pressure and low-pressure cables, delivered at the Fleet Street stores, or laid complete. Particulars from the City Electrical Engineer, and tenders to the Chairman of the Lighting Committee by March 2nd.

LONDON: *Hammersmith.*—Tenders are to be invited for the supply of 8 transformers for delivery in April. One is to be 250 kw., one is to be 200 kw., and six are to be 100 kw.

Marylebone.—The Finance Committee of the L.C.C. sanctioned a loan of £20,900 for street electric lighting. The Committee, however, accede to the application with great reluctance, as in their opinion the streets proposed to be dealt with appear to be sufficiently lighted by gas at present. It does not seem, they state, that apart from street lighting, any appreciable revenue will be forthcoming from the mains to be laid, but on the other hand they are unable to say that the scheme will involve any charge on the rates.

Poplar.—The Finance Committee of the L.C.C. have sanctioned a loan of £3,516 for electric lighting.

Southwark.—The Finance Committee of the L.C.C. have sanctioned a loan of £3,330 for electric lighting.

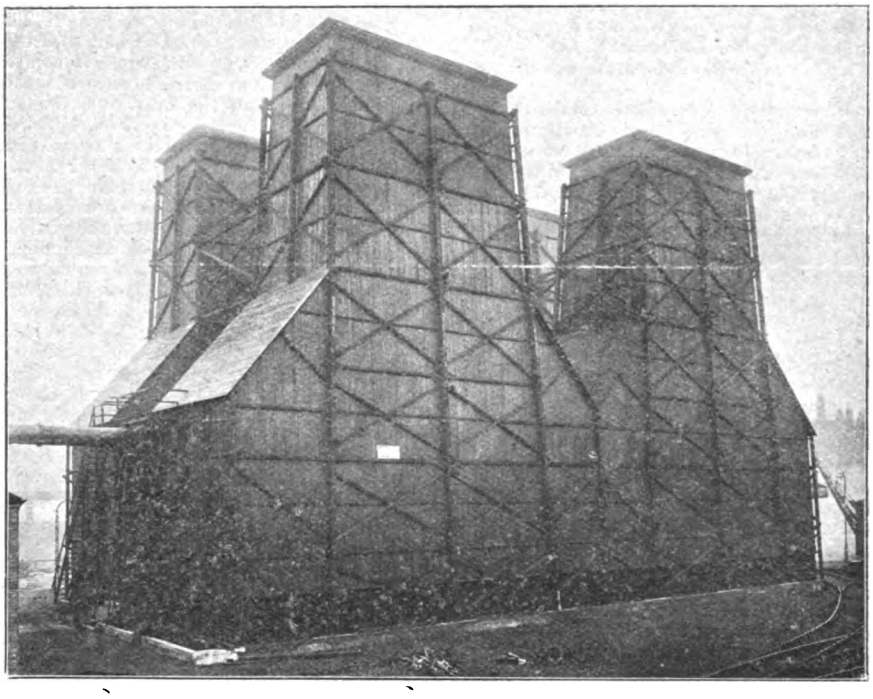
Woolwich.—The Finance Committee of the L.C.C. have sanctioned a loan of £3,600 for electric lighting.

MANSFIELD.—The Electricity Committee have in view further extensions of the electrical plant. No estimates have yet been prepared, however.

MORECAMBE.—The recommendations of the consulting engineers to rearrange the superheaters and water-softening plant, and bring the batteries up to their fuel capacity, in addition to extending the cables, have been adopted by the Council. A further recommendation is the improvement of the incandescent electric street lighting.

NEWPORT (Mon.).—New generating plant is to be installed at an estimated cost of £31,000.

RUGBY.—A loan of £5,180 for new generating plant is proposed.



SHREWSBURY.—A Local Government Board inquiry was held last week concerning a loan of £6,328 for electric lighting.

WOLVERHAMPTON.—A local paper states that large extensions are contemplated at the Commercial Road Electricity Works. The recent fire in the power-house of Messrs. Bayliss,

Jones & Bayliss's works has brought the matter to a head more rapidly than would have otherwise been the case.

WORCESTER.—A loan of £656 for electricity purposes was the subject of a Local Government Board inquiry last week.

Miscellaneous

BOLTON.—The Tramways Committee require general stores, including lighting materials, trolley-poles sundries, and overhead materials. Particulars from the General Manager, and tenders by March 5th.

BUENOS AYRES.—The Government will shortly call for tenders for the supply of twenty one-ton electric cranes for the Port of Buenos Ayres.

CAPE COLONY.—Tenders are invited by March 15th by the Chairman of the Tender Board, Control and Audit Office, Parliament Street, Cape Town, for the supply of electric motors. Forms of tender may be seen at 73 Basinghall Street, London, E.C.

CARDIFF.—A report by the Borough Surveyor, recommending an expenditure of £8,000 in repairing the tramway track, has been adopted by the Lighting and Tramways Committee.

EDINBURGH.—The Council have agreed to the construction of an electric tramway to the new markets at Gorgie.

HESTON AND ISLEWORTH.—The Electricity Committee require electrical stores. Tenders to the Clerk by March 1st.

HULL.—Tenders are invited by March 10th for the supply of telephone instruments. Particulars from the Clerk.

INDIA.—The Secretary of State for India invites tenders by March 8th for overhead electric travelling cranes. Particulars from the Director General of Stores, India Office, Whitehall, S.W.

LONDON: *London County Council.*—The reconstruction of the horse tramways from Tooley Street to Deptford and the construction of tramways from Evelyn Street, Greenwich, at an estimated cost of £110,000, is recommended.

Battersea.—The Electricity Committee require electrical stores, including arc lamp carbons, meters, Nernst lamps, incandescent lamps, &c. Tenders to the Clerk by February 28th.

Fulham.—Tenders are invited for electrical stores. Particulars from the Clerk, and tenders by March 2nd.

PONTYPRIDD.—Tenders are invited by March 7th for electric lamps and stores and paper- and rubber-insulated wires and cables. Particulars from the Borough Electrical Engineer.

SALFORD.—Tenders are invited for miscellaneous electrical stores, including cable, ammeters, circuit-breakers, carbon filament lamps, &c. Particulars from the Borough Electrical Engineer, and tenders by February 28th.

TASMANIA.—Tenders are invited by March 28th, by the Deputy Postmaster-General, at Hobart, for the supply of 17 cordless switchboards. Copies of the specifications may be seen at the Board of Trade Branch, 73 Basinghall Street, London, E.C.

WREXHAM.—Tenders are invited for electrical stores, including cables, meters, cut-outs, incandescent lamps, arc lamp carbons, &c. Particulars from the Borough Electrical Engineer, and tenders by March 15th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.W.—Structural improvements at Great College Street School, St. Pancras (£4,541). Builders, C. F. Kearley, Great Marlborough Street.

Secondary school for 450 girls, Highgate Road, St. Pancras, N.W. Architect, L.C.C. Education Committee, Victoria Embankment.

E.—Factory, Fairfield Road, Poplar, E., for Bryant & May. Architects, Holman & Goodrham, 6 King's Bench Walk, Temple, E.C.

S.W.—Theatre, Mitcham Road, Tooting, S.W., for Picture Palaces, Ltd.

PROVINCES.

AYR.—Additions, tanning works, Mill Street (£1,000). Architect, A. Stevenson, Cathcart Street, Ayr.

Church Hall, St. Leonards (£3,000). Architect, P. McGregor Chalmers, 95 Bath Street, Glasgow.

BELFAST.—Warehouse and shops, York Street (£8,000). Architect, A. Stevenson, 83 Royal Avenue, Belfast.

BOOTLE.—Schools. Architects, Medcalfe & Medcalfe, Moorfields, Liverpool.

DARWEN.—School, Ross Street (£6,700). Architect, H. Littler, Ribblesdale Place, Preston.

DUMFRIES.—Scottish Borderers' Drill Hall (£1,550). Architect, W. F. Crombie, Union Chambers, Dumfries.

ILFORD.—Hospital (£6,920). Builder, H. J. Carter, Grays.

KEIGHLEY.—School (£5,000). Architect, A. P. Harrison, 136 Highfield Lane, Keighley.

LAINDON.—School (£1,700). Architect, C. M. Shiner, 10 John Street, Adelphi, W.C. Builder, G. Brown, Grays.

LARNE.—Carnegie Library (£4,000). Architect, W. P. Clarke, Castle Street, Liverpool.

LEEK.—Territorial buildings (£2,890). Architect, G. C. Cowlishaw, Hanley. Builder, T. Godwin, Hanley.

LEVENSHULME.—Primitive Methodist Church (£1,200). P. M. Trustees, Levenshulme.

LUDLOW.—School (£2,130). Builder, T. Vaughan, Hereford.

Fire Station. Surveyor to Town Council.

NUNEATON.—Library. Borough Surveyor.

PENGE.—Extensions to Council Offices (£3,500). Surveyor, U.D.C.

SUNDERLAND.—Boys' Industrial School (£2,000). Architect, G. W. Bain, John Street, Sunderland.

SWANSEA.—Girls' Intermediate School. A. W. Halden, Secretary, Swansea Education Committee.

WEST HAM.—The Clarkson Street school is to be fitted for electric lighting at an estimated cost of £300.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—The New South Wales Government Railways, Sydney, have provisionally accepted a tender for a 6,000-kw. turbo-alternator and condensing plant from Messrs. Willans & Robinson, Ltd., Rugby.

BELFAST.—The tender of Messrs. Babcock, Wilcox & Co. has been accepted for two water-tube boilers, economisers, and stokers.

DEVONPORT DOCKYARD.—The Admiralty have accepted a tender for two 1,200-kw. direct-current turbo-dynamos and condensing plant from Messrs. Willans & Robinson, Ltd., Rugby.

LONDON: *London County Council.*—The tender of Messrs. Johnson & Phillips, Ltd., has been accepted for the electric lighting at the Cow Lane School, Rotherhithe.

The tender of Messrs. P. & W. Maclellan at £12,386 for the supply of slot rails and conductor tees having been withdrawn, the tender of the Frodingham Iron & Steel Co., Ltd., at £12,798 17s., is now recommended for acceptance by the Highways Committee.

The tender of the British Electric Transformer Co., Ltd., has been accepted for the supply of two static transformers for tramway sub-stations at £429 10s.

Shoreditch.—The Guardians have accepted the tender of the James Keith & Blackman Co., Ltd., at £55, for an electric fan with hoods in the laundry.

GOVERNMENT CONTRACTS.—The following tenders have been accepted by the Government departments named:—War Office: Incandescent electric lamps, British Tungsten Lamp Co., Ltd., Cryselco, Ltd., General Electric Co., Ltd.; installation of electric light at Stanhope and Marlborough lines, Aldershot, J. B. Saunders & Co. General Post Office: Paper-core cable, Callender's Cable & Construction Co., Ltd., Henley's Telegraph Works Co., Ltd., Johnson & Phillips, Ltd., Western Electric Co.; glow lamps, Edison & Swan, United Electric Light Co., Ltd.; twelve electric lifts at new G.P.O., King Edward Street, E.C., and five electric lifts at head P.O., Bristol, R. Waygood & Co., Ltd.; electric lighting of Sheffield new head P.O., W. S. Vaughton; electric lighting of block B of Postal Telegraph Stores Depôt, Cherrywood Road, Bordesley Green, Birmingham, Beaven & Sons, Ltd.; electric storage battery at G.P.O. (West), E.C., the Electrical Power Storage Co., Ltd.; electrical Switchgear at King Edward Building, G.P.O. (West), and G.P.O. (South), E.C., British Thomson-Houston Co., Ltd.; motor converters, &c., at G.P.O. (West), E.C., Bruce Peebles & Co., Ltd.; steam exhaust, feed, &c., pipework at P.O. Central Power Station, Upper Ground Street, S.E., Aiton & Co.

Glasgow Telephone System.—An arrangement has been arrived at between the Post Office and the National Telephone Co., as a result of which there will be no active competition between these concerns in Glasgow so far as canvassing for new subscribers is concerned. A number of the Post Office canvassers have been transferred to the company, who will do all the canvassing that may be required up till the end of 1911, when the Post Office will take over the system.

Interruption to Supply at Bristol.—Through the breakdown of a selector switch on a switchboard in the Avonbank station of the Bristol Corporation Electricity Department, a large section of the single-phase lighting supply in the City and Clifton districts was interrupted on Friday evening last for nearly an hour. The offical report issued by Mr. H. Faraday Proctor (City Electrical Engineer) states that this particular board is divided into two sections, and that selector switches are provided so that any machine can be connected to either section. One of these switches broke down and put the bus-bars to earth, and it was not until this was localised and the switch was isolated that the whole supply could be restored. No damage was done apart from that to this switch, and the whole of the trouble consisted in the inconvenience and annoyance caused to the consumers. The street-lighting, which is fed from another section of the plant, was unaffected, but several business premises, hotels, and theatres suffered considerable inconvenience.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 15s. to £62 5s. per ton (last week, £61 10s. to £62 5s.).

B.T.-H. CARDIFF BRANCH.—The British Thomson-Houston Co., Ltd., Rugby, have opened a branch office at Royal Chambers, Cardiff, to care for their business interests in the South Wales district.

LONDON OFFICE.—Messrs. Nortons (Tividale), Ltd., colliery equipment specialists, have opened a London office at 145 Cannon Street, E.C., which will be in charge of Mr. C. J. Seaman, who recently resigned the position of general manager and managing director of Messrs. Heenan & Froude.

CANADIAN AGENCIES WANTED.—A London firm manufacturing electrical frequency indicators and vibration tachometers wish to open up Canadian business.

A London firm of engineers manufacturing a trolley standard earthing device, two-blade rail cleaners, tangential suspension gear for overhead lines, suspension gear for E.H.T. transmission lines, block signalling apparatus, switchgear, &c., for street railways, &c., desire to appoint Canadian representatives.

Inquiry is made by a firm at Manchester manufacturing electric light and power machinery and accessories, main switches and switchboards, &c., for the names of Canadian firms open to take up their agency.

A London engineer with Colonial experience asks to be placed in touch with United Kingdom manufacturers of machinery, cranes, electrical goods, &c., requiring a representative at Toronto, to which city he is shortly proceeding.

Full particulars of these inquiries may be obtained from the offices of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

A London company manufacturing electric twinkling signs wishes to be placed in communication with Canadian importers.

A firm covering British Columbia and Western Canada seek the sole agency of United Kingdom manufacturers of electric light fittings, lamps, &c.

Full particulars from Board of Trade, City Trade Branch, 73 Basinghall Street, London, E.C.

PLANT FOR SALE.—Brighton Corporation have a quantity of second-hand electrical plant for sale. (See an advertisement on another page.)

AGENCY.—Messrs. Nalder Bros. & Thompson, Ltd., have appointed Mr. Arthur P. Haslam, of Suffolk House, Laurence Pountney Hill, London, their representative for the sale of limiters, telethermometers, etc., in the London district.

COMPANIES' MEETINGS AND REPORTS

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS CO.—The accounts for last year show a profit of £40,470. After meeting debenture interest, sundry reserves, and reserve against Lofthouse Park, Ltd., a balance of £9,654 is carried forward.

At the meeting last week, Mr. H. S. Leon said the directors were considering the adoption of trolley omnibuses, but as the Sheffield Corporation had applied for Parliamentary powers to do this, they thought it best to wait and judge by Sheffield's experience in the matter.

ST. JAMES & PALL MALL ELECTRIC LIGHT CO.—The net profit for 1909 was £29,025, and after meeting the 7 per cent preference dividends and 10 per cent. on the ordinary shares, there is a balance of £2,025 to be carried forward. The company generated 5,587,351 units, and purchased 5,764,690 units from the Central Electric Supply Co.

At the meeting last week, Mr. Walter Leaf said it was estimated by their officials that about half their consumers had changed over to metal filament lamps, and that it would take two years for the process of changing over to be completed.

BRUCE PEEBLES & CO.—There is a loss of £5,683 for the period from December 5th, 1908, to December 31st, 1909, to which has to be added the interest on first and second debentures, making a debit balance of £12,981. The directors are of the opinion that great progress has been made in obtaining licences and developing new manufactures, and certain arrangements have been completed which it is anticipated will materialise in the near future.

Mr. F. E. Andrews, who presided at the meeting last week, said the cash position of the company was strong. They had pushed their foreign trade on the spot, which the directors thought was better than sitting at home and grumbling and waiting for legislative reforms which, although doubtless would help the electrical industry, would probably, after all, not prove a panacea for all the evils of cut-throat competition, insensate jealousy, and excess of productive capacity, from which electrical engineering works were at present suffering.

YORKSHIRE ELECTRIC POWER CO.—The report and accounts given in our issue for February 3rd were adopted at the meeting last week. Mr. A. G. Lupton, who presided, said that the most satisfactory feature of the year was the increase of the motors connected by firms already on the mains, quite apart from new consumers. He was pleased to say that the promoters of a number of Bills which affected the company's interests had agreed to modifications which would render it unnecessary to oppose any of them.

BRISTOL TRAMWAYS & CARRIAGE CO.—At the meeting last week, Sir George White said the absolute lack of expansion of the company's traffic indicated that they were practically at the limit of tramway riding in Bristol. He then mentioned that himself and his brother intended to develop aviation in Bristol, and had already ordered several aeroplanes. It was their hope to establish the manufacture of these machines in Bristol, but in the first place it was proposed to hold demonstrations which would undoubtedly attract people from all parts and add to the tramway traffic.

LONDON UNDERGROUND ELECTRIC RAILWAYS.—The half-yearly meetings of the Baker Street & Waterloo, Great Northern, Piccadilly & Brompton, and Charing Cross, Euston & Hampstead Railways were held on Thursday, when the reports and accounts given in our last issue were adopted. The scheme for amalgamating the three companies was approved.

NATIONAL TELEPHONE CO.—The gross profit for the December half-year, after deducting Post Office royalties amounting to £153,857, was £523,440, an increase of £27,802 compared with the corresponding period of 1908. The following dividends are recommended:—First and second preference shares, 6 per cent. per annum; third preference shares, 5 per cent. per annum; preferred stock and deferred stock, 6 per cent. per annum, less tax in all cases.

SOUTH METROPOLITAN ELECTRIC LIGHT & POWER CO.—The sum of £1,106 is carried forward from 1909 after meeting debenture interest, full dividends on the 7 per cent. and 6 per cent. preference shares, adding £6,500 to depreciation and writing £1,500 off preliminary expenses. In spite of an increase in the number of consumers, the revenue of the year was less owing to the use of metal filament lamps. In order to meet the requirements for supply in an adjoining district the West Kent Electric Co., Ltd., was registered, and has taken over certain of the powers of the Kent Electric Power Co., Ltd., for an area between Northfleet, Sevenoaks, and London. An agreement has been entered into to give a bulk supply, and arrangements have been made for the Company to work the undertaking and to subscribe £10,000 share capital of the West Kent Electric Co., Ltd., one half of which will be for laying mains for the supply of electricity in the Bromley Rural district, where a number of orders have already been obtained.

REES ROTURBO MANUFACTURING CO.—At the meeting last week, when the report and accounts given in our last issue were adopted, the chairman stated that there was no intention—as had been suggested—of the company abandoning the electrical portion of their business.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—W. T. Henley's Telegraph Works Co., 15 per cent. for 1909. Charing Cross, West End & City Electricity Supply Co., 5 per cent. for 1909.

London Electric Wire Co. and Smiths; 10 per cent. for 1909. Newcastle & District Electric Lighting Co., 3 per cent. for 1909, carrying forward £2,938. W. T. Glover & Co., 5 per cent. on the ordinary shares for 1909. Adelaide Electric Supply Co., 6 per cent. on the preference shares for half-year to Feb. 28th.

Bournemouth & Poole Electricity Supply Co., 5½ per cent. for 1909.

BRITISH COLUMBIA ELECTRIC RAILWAY CO.—Subscriptions are invited for £530,000 4¼ per cent. perpetuated consolidated debenture stock.

EVERSHED & VIGNOLES.—Mr. A. Schneider, M.A., who has been associated with the management of this company since its commencement, has been appointed a managing director.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. R. Chapman, chief electrical engineer to the Underground Electric Railways Co., of London, Ltd., has resigned, and intends to return to America.

The salary of Mr. W. E. Ireland, rolling stock superintendent to the L.C.C. tramways, is recommended to be increased from £450 to £500 per annum.

Mr. E. W. Dickinson, superintendent of the L.C.C. generating station at Greenwich, is recommended for an increase in salary from £400 to £450 per annum.

Mr. T. L. Horn, resident electrical superintendent for the northern section of the L.C.C. tramways, is recommended for an increase in his maximum salary from £350 to £375 per annum.

Mr. J. R. Walker, charge engineer at the L.C.C. Greenwich power house, is recommended for promotion as senior charge engineer with a salary of £280 per annum, rising to £300 in April, 1911. Mr. Walker's present salary is £250 per annum.

It is recommended that the salaries of Messrs. J. P. Dudin, O. A. Pilcher, and E. W. L. Nichol, charge engineers at the L.C.C. Greenwich power house, shall be increased from £250 to £270 per annum

Mr. A. A. Voysey, the electrical engineer and inspector of the City of London Corporation, is seriously ill and has been granted twelve months leave of absence. If at the end of that period he is unable to resume his duties he is to be granted a retiring allowance of £100 per annum during the pleasure of the Corporation.

SUMMARY

Our monthly supplement on "Electrical Engineering in Mines" is included in this issue. After some correspondence relating to the novelty of a recently described leakage device and on the fixing of shaft cables, an account is given of a series of experiments on electricity and coal dust explosions. The formation of a Cumberland branch of the Institution of Mining Electrical Engineers is recorded, and a new design of enclosed air-cooled mining motor is described and illustrated. Other novelties, of which particulars are given, include a new shot-firing generator, and a watertight magneto mining telephone. Discussions on electric shocks at six of the branches of the Institution of Mining Electrical Engineers are reported, and a summary is given of electrical mining patents which have been published during February.

A new set of regulations has been issued by the Home Office under the Cinematograph Act, which remove the cause for misunderstanding of the clause as to the maximum voltage inside the enclosure. The 110-volt limit is only to hold when the lamp is at work, and does not apply to open circuit voltage. (Page 149.)

A useful handbook to the Home Office Regulations regarding the generation and use of electricity in premises coming under the Factory Acts, has been issued, in which explanatory notes and recommendations as to how the requirements may be met are given, together with valuable advice as to the avoidance of danger, founded on the experience of H.M. Electrical Inspector of Factories. (Page 149.)

A fire on Tuesday night damaged a portion of Messrs. Johnson & Phillips works at Charlton. (Page 150.)

We publish two letters from correspondents regarding the usefulness of the library of the Institution of Electrical Engineers. (Page 150.)

Accounts are given of inquiries into several accidents in mines attributed to electrical causes. (Page 151.)

The annual dinner of the Manchester Local Section of the Institution of Electrical Engineers was held on Friday last. Dr. Kapp emphasised the importance of the Council refraining from interfering unduly in business or political matters. The Chairman, Mr. S. J. Watson, suggested that each Local Section should have four, instead of only one, representative on the Council, and announced that the Manchester Section was considering the holding of a conversazione in that town. (Page 152.)

The second festival dinner in connection with the Electrical Trades' Benevolent Institution was held on Wednesday of last week. The funds now amount to £2,089 invested and over £300 in cash. A sum of £63, or somewhat less than the interest on the funds, was spent during the year in relieving five necessitous cases. The general opinion of those who spoke was that it would not be desirable to amalgamate this In-

Digitized by Google

stitution with the Benevolent Fund of the Institution of Electrical Engineers. (Page 152.)

ON Monday last Mr. Justice Parker delivered judgment in the action brought by the Donnersmarckhütte against the Electric Construction Co., Ltd., for alleged infringement of the Ilgner Patent of 1902, for the electrical driving of reversing rolling mills. His Lordship considered that the defendants had applied the idea expressed in the Ilgner specification, but held that the patent was invalid. He considered the combination of a flywheel with the motor-generator of the Ward-Leonard system fairly obvious, and conversely suggested that Ferranti would have naturally applied the Ward-Leonard system of control in conjunction with his flywheel motor-generator, patented in 1895, had be desired to apply it to the driving of reversing rolling mills. He therefore concluded that the patent was invalid for want of subject matter, and the action for infringement failed. (Page 153.)

THE appeal of "Dr." Walford Bodie against the judgment of Mr. Justice Darling, ordering him to repay the sum of £1,000 which he received from a pupil, was dismissed on Thursday, after some strong remarks by the Master of the Rolls and Lords Justices Fletcher Moulton, and Buckley. (Page 153.)

AMONG the specifications published by the Patent Office on Thursday last was one by A. H. Curtis and the Adams Manufacturing Co. for a resistance unit in which the zig-zag metal strip is under tension.—The British Thomson-Houston Co. describe a process of producing a tungsten powder mixture for manufacturing filaments. No baking treatment is required, as the squirted threads are conductive.—The same firm has a specification for a method of constructing commutators for high-speed machines. The air is expelled radially between the segments.—L. J. Hunt and the Sandycroft Foundry Co. describe a form of cascade induction motor in which two economical speeds are obtained by employing slip-rings on the rotor which are short-circuited for the high speed.—A patent for a load-equaliser, comprising a flywheel coupled to an induction motor automatically controlled by a commutator motor, has been granted to the A. G. Brown, Boveri & Cie., in spite of opposition. The grant of a patent to C. H. Weber for a process for treating tungsten powder with pyridine before squirting into filaments, is opposed. A patent by A. Smith and T. Deakin for an electroplating apparatus for obtaining a bright deposit in one operation expires on Wednesday next after the full life of fourteen years. (Page 154.)

IT is stated that a saving of £2 16s. per lamp per annum has been arrived at by replacing the arc lamps in the Grove, Hammersmith, with 400 c.p. Osram lamps fitted in the same lanterns. (Page 155.)

UNDER Electrometallurgy and Electrochemistry are some notes from a Paper by A. Grönwall, dealing with the occasional non-homogeneity of electric steel. This is attributed to unequal heating, and the relative possibility of this effect in the different types of furnace are discussed. A new two-phase furnace, for which a good circulation and homogeneous mixing are claimed, is also described. (Page 155.)

THE Guernsey State Telephone accounts show a net profit of £436 for last year.—The Halifax Corporation will shortly have placed before it important recommendations relating to the management of the tramways and electricity undertakings.—Mr. A. H. Dykes, late chairman of the Beckenham Electricity Committee, refers to the large loss which is being made on the "free" wiring scheme of the Council.—A trolley omnibus company has made a proposal to instal electricity works and to run cars at Macclesfield.—Leicester tramway accounts show a net profit of £10,699 for last year.—The Hampstead Borough Council contemplate converting all their street gas lamps to metal filament lamps. (Page 156.)

EXTENSIONS are contemplated as follows:—Falkirk, £12,000; Londonderry, £9,000; Fulham, £6,880; Rhyl, £4,000; Stepney, £16,300; Shoreditch, £2,234; Islington, £4,778; Hackney, £7,137; Walthamstow, £1,210. New generating plant is to be installed at Heston and Isleworth, and Warrington. The Belfast Harbour Commissioners require 22 arc lamps. (Page 156.)

AT the meeting of the British Electric Transformer Co. last week a scheme of co-operation between transformer makers was referred to.—The Rosario Electric Company's shareholders have sanctioned a scheme for purchasing the undertaking at a large premium.—Negotiations for purchasing the National Telephone Company's undertaking before 1911 have fallen through.—A dividend at the rate of 15 per cent. is recommended on the ordinary shares of W. T. Henley's Telegraph Works Co. (Page 157.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 3RD.

Royal Institution

3 p.m. Afternoon Lecture III., "Illumination: Natural and Artificial," by Prof. S. P. Thompson, F.R.S.

Rontgen Society.

8.15 p.m. At 20 Hanover Square, London. (1) "Dental X-ray Technique," by C. A. Clark; (2) "Radium Collector for Atmospheric Electricity," by F. H. Glew.

FRIDAY, MARCH 4TH.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "D.-C. Liquid Starters," by J. K. Hwoo.

Electro-Harmonic Society.

8 p.m. Last Smoking Concert of the season at Holborn Restaurant.

SATURDAY, MARCH 5TH.

Royal Institution.

3 p.m. Afternoon Lecture IV., "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

P. and O. Batti-Wallahs Society.

6.30 for 7 p.m. Annual Dinner at Holborn Restaurant.

TUESDAY, MARCH 8TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee Meeting at Balfour House, Finsbury Pavement, London.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "The Short-Circuiting of Large Electric Generators and the Resulting Forces on Armature Windings," by Miles Walker.

WEDNESDAY, MARCH 9TH.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. At the University. "Some Notes on Standardisation of Electrical Machines," by R. Orsettich.

THURSDAY, MARCH 10TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. (1) "Short-Circuiting of Large Electric Generators and the Resulting Forces on Armature Windings." (2) "The Design of Turbo-Field Magnets for A.-C. Generators, with Special Reference to Large Units at High Speeds," by Miles Walker.

FRIDAY, MARCH 11TH.

Physical Society.

8 p.m. At Imperial College of Science. (1) "On Coherers," by Dr. W. H. Eccles. (2) "Earth-air Electric Currents," by G. C. Simpson.

SATURDAY, MARCH 12TH.

Royal Institution.

3 p.m. Afternoon Lecture V., on "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

The Society of Engineers.—We have received a detailed statement with regard to the amalgamation of the Society of Engineers and the Civil and Mechanical Engineers' Society. The new body is called The Society of Engineers (Incorporated), and a Memorandum and Articles of Association, together with a new set of bye laws, have been drawn up, which embody several reforms. Reports of the discussions are also to be published in the *Journal* much more promptly than heretofore. Mr. A. S. E. Ackermann, who was secretary of both constituent bodies, continues in that capacity to the new society.

NEW CINEMATOGRAPH REGULATIONS

A NEW series of regulations (dated February 18th) has been issued by the Home Office under the Cinematograph Act, and will be welcomed by supply authorities as clearing up the much-discussed point of the voltage permissible inside the fireproof enclosure containing the apparatus. The former regulations (dated December, 1909), which are now superseded, contained the clause: "No current at a higher pressure than 110 volts shall be used inside the enclosure," and, interpreted literally, would entail (as Mr. S. J. Watson pointed out at a recent meeting of the Manchester Local Section of the Institution of Electrical Engineers) the use of a motor generator when the lamps were worked from a 440-volt or even a 220-volt supply. It was held by many, however, that the real object of the rule was to exclude large series resistances from the enclosure, and that it was not intended to apply to open circuit voltages, but to actual potential differences when the lamp was alight. That this was the correct interpretation of the rule is shown by the new clause reading as follows: "When the cinematograph lamp is working, the pressure of the current across the terminals of the double pole switch inside the enclosure shall not exceed 110 volts." There may, of course, be cases in which the use of a motor-generator may be justified on the score of economy of power, but its use is not in any way compulsory.

The earlier part of the rules has been slightly rearranged, and extended mainly as regards general precautions to be taken against fire, and the section regarding electric lighting enters into greater detail and is in several ways more explicit, besides imposing further responsibility as regards the state of the electrical apparatus upon the operator.

The new section on lighting, so far as it relates to electric lighting, is given in full below.

Where the general lighting of the auditorium and exits can be controlled from within the enclosure, there shall also be separate and independent means of control outside and away from the enclosure.

Within the enclosure the insulating material of all electric cables, including "leads" to lamps, shall be covered with fire-resisting material.

There shall be no unnecessary slack electric cable within the enclosure. The "leads" to the cinematograph lamp shall, unless conveyed within a metal pipe, or other suitable casing, be kept well apart both within and without the enclosure, and shall run so that the course of each may be readily traced.

Cables for cinematograph lamps shall be taken as separate circuits from the source of supply and from the supply side of the main fuses in the general lighting circuit, and there shall be efficient switches and fuses inserted at the point where the supply is taken, and in addition, an efficient double-pole switch shall be fitted in the cinematograph lamp circuit inside the enclosure. When the cinematograph lamp is working, the pressure of the current across the terminals of the double-pole switch inside the enclosure shall not exceed 110 volts.

Resistances shall be made entirely of fire-resisting material, and shall be so constructed and maintained that no coil or other part shall at any time become unduly heated (*e.g.*, they should not become so heated that a piece of newspaper placed in contact with any part of the resistance would readily ignite). All resistances, with the exception of a resistance for regulating purposes, shall be placed outside the enclosure, and, if reasonably practicable, outside the auditorium. If inside the auditorium they shall be adequately protected by a wire guard or other efficient means of preventing accidental contact.

The operator shall satisfy himself before the commencement of each performance that all cables, leads, connections, and resistances are in proper working order. The resistances, if not under constant observation, shall be inspected at least once during each performance. If any fault is detected, current shall be immediately switched off, and shall remain switched off until the fault has been remedied.

Royal Meteorological Society.—This Society held its first meeting out of London on Wednesday, February 23rd, at the Physical Laboratory of the Manchester University. The Vice-Chancellor of the University welcomed the Society. Among the papers read was one by Mr. A. J. Makower and Miss Margaret White on the "Investigation of the Electrical State of the Upper Atmosphere," made at the Howard Estate Observatory, Glossop.

THE HOME OFFICE REGULATIONS FOR FACTORIES AND WORKSHOPS

A USEFUL handbook to the Home Office regulations for the generation, transformation, distribution, and use of electrical energy in premises under the Factory Acts has been issued in the form of a "memorandum," by Mr. G. Scott Ram, H.M. Electrical Inspector of Factories. This booklet deals with the regulations paragraph by paragraph, and is intended to assist occupiers and others in complying with the regulations by explaining in detail what precautions are required in the case of various types of installations, and in what circumstances exemption may be claimed. It will probably also be of considerable use in the education of factory inspectors without previous electrical experience, upon whom the enforcement of the regulations devolves. Incidentally, the publication is of interest as showing the official view taken as to the objects and interpretation of some of the clauses about which there has been a good deal of discussion.

It will be remembered that when a draft of the complete code of proposed regulations was put forward by the Home Office as a basis for discussion in August, 1907, much opposition was aroused, and in consequence Mr. James Swinburne, F.R.S., was appointed commissioner to conduct an inquiry, at which an opportunity of expressing their views was given to objectors. This inquiry, of which a full report was given at the time in ELECTRICAL ENGINEERING, continued for 10 days during March and April, 1908, and a provisional code was agreed upon as a sort of compromise between the different objectors. Mr. Swinburne issued his report in the following January, putting forward a further revised code, and this was adopted without alteration by the Home Office and came into force on July 1st, 1909, except as regards such parts of stations as were constructed before July 1st, 1908, in respect of which the provisions took effect at the beginning of the year. The regulations were given in full in ELECTRICAL ENGINEERING, Vol. V., page 57 (Jan. 21st, 1909).

The regulations apply to all premises coming under the Factory Acts, and thus embrace all generating stations supplying electricity "by way of trade," or giving a supply to any factory, but do not apply to railway and tramway stations generating electricity for power purposes only. If a lighting supply, however, is given, the station comes within the scope of the regulations. Generally speaking, they do not apply to street mains or transmission lines or to transforming pits other than actual sub-stations, or to inspection boxes on the line of such mains.

It appears to be required by the Factory Act that printed copies of the regulations should be posted up in all premises affected, and abridged copies of the regulations, containing all that apply in particular cases, can be obtained from factory inspectors. The exemptions are gone into at some length in the handbook, and it is shown how the applicability of some of the more important sections depends in certain cases practically on whether part of the system is earthed or not. This is of particular importance in connection with 25- or 50-volt auto-transformers for metal filament lamps. Subsequently to the issue of the regulations, an order has been made (under Exemption 3) which gives complete exemption to rooms in which electricity is used for lighting only at "low" pressure (*i.e.*, not exceeding 250 volts).

Many very practical notes are given under each individual regulation, throwing light on questions as to what methods will be especially regarded as "necessary to prevent danger," "efficient means," "reasonably practicable," or "adequate," and here, as is done annually in his report, the inspector places much of his valuable experience as to the causes of accidents at the disposal of those in charge of installations. Dangerous designs of switches and fuses are described, so that they may be avoided, and advice is given as to the rating of fuses and sub-divisions of circuits. In the same way, the regulation requiring means for switching off motors and stopping machines in case of danger is dealt with, and means are suggested which may be adopted to effect this. No recommendation is made, however, as to the provision of no-voltage releases to alternating-current motors, a requirement which, it will be remembered, was to have been compulsory under the original draft regulations. The section on portable apparatus connected to flexible leads is particularly worth reading. The danger of the ordinary patterns of wall plugs, except for lighting circuits, is insisted upon, and hints are given as to the construction of a satisfactory plug,

Digitized by Google

which in Mr. Ram's opinion should be made for the leads to enter from below and not at the side, and should be provided with a guard disc between the handle and the contact pieces. In the cases where earthing the portable apparatus is required, the importance of arranging that, in plugging in and out, the earth connection is made before and broken after the circuit connections is emphasised, but methods of construction for hand lamps, switch lampholders, &c., with no exposed metal work are suggested, which obviate the necessity for such earthing.

The much-discussed switchboard regulations are commented on and explained in like manner, and it is made quite clear to what cases the limiting breadths of passage-way specified apply. In connection with Regulation 21, which requires adequate precautions to be taken either by earthing "or by other suitable means" to prevent any metal other than the conductor from becoming electrically charged, it is admitted that earthing has generally to be resorted to, as "other suitable means" are not often practicable. Various hints are given as to suitable methods of earthing in different circumstances, and considerable detail is gone into, as, for example, the recommendation that the rails of travelling cranes should be bonded. The remaining sections are treated in a similar manner, and a useful index of the subject-matter is provided. The memorandum is obtainable from Messrs. Wyman & Sons, Fetter Lane, E.C., or the usual agents, at the price of 3d.

FIRE AT MESSRS. JOHNSON AND PHILLIPS' WORKS

WE are glad to be able to inform our readers that the reports which appeared in the daily Press yesterday morning of a disastrous fire at the Victoria Works of Messrs. Johnson & Phillips, Ltd., of Charlton, were of a much exaggerated nature. From a personal inspection of the works yesterday we can state that the damage is confined to the top floor of the new two-storey building erected on the site of the fire some four years ago. On this floor are a large number of wire-braiding machines, and these have been completely destroyed, but as they represent only a portion of the plant of this nature, the fire will have no effect on the business of the firm.

The ground floor of the building in question is devoted to the braiding of large cables, and though this is littered with the débris of the floor and roof, men were actively engaged yesterday morning in removing this and cleaning the machinery, and it is expected that work will be resumed with these machines some time to-day. The steel and brickwork of the building are practically undamaged, but it will be necessary to reconstruct entirely the roof and the wood floor, and to install new wire-braiding machinery. When the fire broke out (about 8 o'clock on Tuesday evening) there was no one on the top floor, but men were working below. Had they had a sufficient pressure of water they could have easily extinguished the fire before any serious damage was done, but as water could not be carried up in sufficient quantities the fire had obtained a firm hold before the local brigade arrived. There were two or three drums of completed cable on the ground floor, but these have suffered no damage whatever. The wire-braiding machines are attended to by girls, and as only one girl is required for several machines, some twenty girls only will be throw out of employment. The cause of the fire has not been ascertained. Both the motors and lamps on the upper floor were switched off at the time of the outbreak, and the wiring was of the most modern description in steel conduit.

New System of Lead Jointing.—In our article describing the Metal Jointing Co.'s new system of jointing for lead-covered cables on p. 140 of our last issue, we said that the time for plumbing a large telephone cable is said to be reduced *by* about 30 minutes. This should have been "reduced *to* about 30 minutes."

Electrical Control of Ordnance.—In reply to a question by Lord C. Beresford in the House of Commons on Wednesday of last week, Mr. McKenna stated that H.M.S. *Invincible* was fitted with electrically-worked turrets, as an experiment. Two turrets were so equipped by different firms, but whilst working up for gunlayers tests last year numerous failures occurred with one of the gears, and in June certain modifications were decided upon by arrangement with the makers. In November last it was found that these modifications did not meet all the defects, and further alterations were made during December. As, however, the ship was an experimental one so far as the working of the turrets was concerned, the Government thought it very important that ample time should be given in order to get a fair comparison with the hydraulic system.

CORRESPONDENCE

THE INSTITUTION LIBRARY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I have read with considerable interest "Londoner's" letter on above subject, and venture to submit the opinion that the statistics which he gives are a remarkable vindication of the urgent need that exists for increasing the usefulness of the Institution Library. At present the library is a reference library pure and simple, and the fact mentioned by "Londoner" that only 1·5 members per day use it as such is eloquent testimony that an alteration is desirable.

The suggestion offered was that the Council should take steps to alter its character and make it a Lending Library for all members. There is no reason to doubt that if this concession were granted, a much freer use would be made of the "most complete library of electrical science in England," not only by provincial members, but by London members as well.

I would point out that the recently formed Institution of Post Office Telegraph Engineers have such a lending library, and the members are encouraged to, and do, make considerable use of it.

In reply to "Londoner's" last paragraph, what is the benefit of being connected with the Institution of Electrical Engineers if you have to apply to a public library to grant facilities which the Institution ought to grant?

Yours faithfully,
Feb. 28th, 1910. ASSOCIATE MEMBER.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I am afraid that the figures given by your correspondent "Londoner" in your last issue, *re* the above, completely spoils his own case, because if they prove anything at all they simply prove that the library is not specially needed by Londoners, and is indeed neglected by them.

This is, of course, only what one might reasonably expect, seeing that within the environs of the metropolis there are so many and varied means of consulting the latest technical literature without having recourse to the Institution Library, but the ridiculously small number of readers who at present avail themselves of the Institution Library, as given by your correspondent, really makes it all the more difficult to understand on what grounds the present Lhassa-like seclusion of the library can be justified.

The remarks of "Londoner" advising provincial members to petition library committees in their respective towns to procure them any technical literature which might be required, is delightfully simple and delightfully absurd, and beside the question. The points as raised by your correspondents, "Associate Member" and "Provincial," and to which "Londoner" objects, is: Why should not all members of the Institution within the postal limits of the United Kingdom, who pay precisely the same annual subscriptions, have precisely the same facilities with regard to the Institution Library, subject, of course, to certain safeguards as to deposits, &c., which are merely a matter of detail, and I think that there can only be one answer to that question by any unbiassed person.

If the Institution Library was thrown open to all members alike, it would remove a sore point with a good many provincial members and prospective members, and at the same time the Institution would of a verity be carrying out its Articles of Association in "assisting in the advancement of electrical and telegraphic science and its application."

Yours truly,
Feb. 28th, 1910. J. E. D.

Message Recording Attachment for Telephones.—Three Danish engineers, MM. Dessau, Nyrop, and Thomsen, recently made public in Copenhagen a new invention by which any telephone subscriber can, in the absence of the called subscriber, send a telegraphic communication. The apparatus at the transmitting end comprises a keyboard like that of an ordinary typewriter, and the message is received at the other end on a tape printed in ordinary characters. It is stated that M. Johansen, manager of the Copenhagen Telephone Co., was very favourably impressed with the working of the device.

Competition *re* Method of Earthing.—Further particulars are to hand with regard to the £400 prize offered by the Italian Minister of Agriculture, Industry, and Commerce, referred to in our issue of Feb. 3rd, for an essay on efficient methods of earthing. Both the theoretical and the practical aspects of the subject must be dealt with, and the following points must be considered:—(1) The phenomena which occur when an electric circuit is earthed at any point; (2) the influence of the nature and composition of the ground at the earthing point; (3) the influence of the pressure and nature of the current; (4) the result and effectiveness of an earth, whether intentional and permanent or due to pressure rise; and (5) means of maintaining and testing earthing connections. The study, which must be written in either French or Italian, and must contain experimental data, must be submitted on or before December 31st, 1910.

ELECTRICAL ENGINEERING
IN
MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "The Editor, Electrical Engineering, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

CORRESPONDENCE

A SAFETY GATE-END SWITCH FOR MINES.

To the Editor Electrical Engineering.

Sir,—May I draw your attention to the description of Mr. Fisher's switch contained in your paper of February 3rd? A full description of the leakage device marked D is contained in Patent No. 17161/08, entitled "Leakage Indicator for Mines" (See Electrical Engineering, July 22nd, 1909, page 678). This arrangement, adapted to an ordinary mining switch, has been in use since March, 1908.

This may be of use or interest, seeing that many are putting forward these arrangements as something new.

Yours truly,

T. McKie.

Ashington, Northumberland.
February 3rd, 1910.

CABLES IN SHAFTS AND MAIN HAULAGE WAYS.

To the Editor of Electrical Engineering.

Sir,—I read with interest the discussion on my article on the above. In reply to the first contribution, I may say I am quite aware of the corrosive waters met with in some shafts, but this does not refer to all shafts. If such waters exist in a shaft, the cables must be frequently coated with some preservative compound.

The eating away of the armouring of the cable mentioned may have been caused by corrosive effects due to chemical action, but it could also have been caused by electrolytic action, due to stray currents flowing between different points of the earth. Serious damage is known to have been caused to the armouring of cables from this source. It is well to remember that this action is much more pronounced in D.-C. cables.

I am rather surprised to find "One who has had experience" suggest the use of a 3 ft. 6 in. wood clamp in preference to the 1 ft. clamp, because there will be more cable surface covered, hence the greater action. In the latter part of the discussion he mentions the importance of insulation tests. I quite agree with him, for these are very important, but I must remind him of the difference he will find in the results at varying temperatures.

In reply to Mr. Preece's discussion, the steel tape armoured cable referred to was meant to be the well-known lock-coil armouring.

I may say I have not had any experience with the solid three-core bitumen cable, neither have I had any trouble, such as Mr. Preece mentions, with the jute-filled cables. I don't say that what he says is impossible, but I know that the same quality of cable is working under severe conditions; some of it is lying in the bed of a river.

I admit that Mr. Preece's cable will have a higher insulation resistance and dielectric strength, owing to the increased (insulation) distance between the cores and armouring; the only drawback is that this cable will have a larger electrostatic capacity.

Feb. 28th, 1910. J. P. Simpson.

Revision of the Special Rules.—The Departmental Committee appointed by the Home Secretary to inquire into the working of the existing special rules for the use of electricity in mines will commence hearing evidence on Tuesday next, March 8th. The committee is composed of three members, Mr. R. A. S. Redmayne, H.M. Chief Inspector of Mines, Mr. C. H. Merz, and Mr. Robert Nelson, H.M. Electrical Inspector of Mines, and will meet at the Home Office, Whitehall; the proceedings will be strictly private.

ELECTRICITY AND COAL-DUST EXPLOSIONS

On Monday, the 21st ult., at an informal meeting of the members of the Newcastle Local Section of the Institution of Electrical Engineers, Prof. W. M. Thornton (Armstrong College) gave a demonstration upon explosions of coal-dust caused by electricity, a subject which is to form the basis of a further communication at a later date.

Dr. Thornton proposed to show a series of experiments which might give answers to the following questions:—How do direct currents and alternating currents compare for safety; what are the values of voltage and current at which danger begins; how do dry and wet dusts differ under electrification; and is there a law of volumes? Many years ago Dr. Bedson showed that coal-dust explosion depended on the density of cloud and the temperature of ignition. The latter for inflammable dust he fixed at about 143° C. His experiments were, however, conducted by means of a continuous source of heat, whereas in the present demonstration the ignitions were to take place by momentary flashes.

Dr. Thornton then showed by placing dry coal-dust between two terminals ¼ in. apart at 480 volts P.D., that dry dust was practically an insulator, and said that solid coal was actually a better insulator than stone. Wet coal-dust was then placed between the same terminals and tested on D.-C. pressure. The mass warmed up, steamed, and ignited with violence. In order to determine if it was the moisture which formed the arc, wet sand was tried instead. This only steamed slightly. Dr. Thornton suggested that the ignition was due to a fine stream of sparks passing along the wet dust, which either carbonised the dust or caused gas to be evolved forming an inflammable mixture. Next, powdered coke (dry) was placed between the terminals. When loose there was no effect, but when pressed slightly ignition occurred. The same experiments were repeated with A.-C., the explosions being if anything a little worse. In order to see if it is the flame itself which short-circuited the terminals, a lighted taper was placed in the ¼-in. gap at 480 volts, and although flame has a good conductivity, no flash-over occurred. This was then tried on a "horn" lightning arrester placed in a 1,500-volt A.-C. circuit, and the flame of the taper was sufficient to cause a flash-over so long as the copper horns were clean.

In contrast to the last two experiments, a pair of terminals 1¼ in. apart were given 480 volts P.D. and a small fuse melted

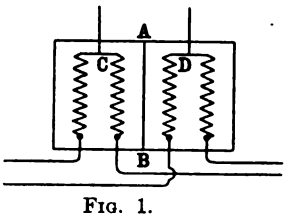

Fig. 1.

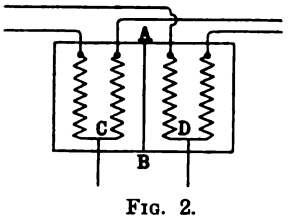

Fig. 2.

immediately beneath them. The metal vapour of the fuse was sufficient to cause a flash-over between the terminals. Hence if a flame contains metal vapour it can cause an arc across large distances. Although this is, or should be, well known, switchgear is yet manufactured which is badly designed in this respect.

Dr. Thornton drew attention to a common error in mine installations where it was a temptation to bring leading-in wires to a switch-box from the roof, as shown in Fig. 1. In the event of the dividing fin *AB* separating the compartments becoming broken, metal vapour in the breaking arc might cause a flash-over between *C* and *D*, which might easily cause an explosion. The correct way of leading in is as shown in Fig. 2.

A series of experiments was then conducted, showing the ignition of a mixture of coal-dust and air by the fusing of an electric circuit, and the opening of a quick-break switch, under varying conditions. In the apparatus used the terminals were about 2¾ in. apart, and for the fusing experiments 5-amp. lead

Digitized by Google

fuse-wire was used. The coal-dust used was ordinary pit dust containing a good deal of heavy matter and sand. The duration of the flash was in the nature of one-tenth of a second, and ignition of the mixture in the enclosing box was marked by a tongue of flame in a long glass tube projecting from the box. The current was regulated by means of series resistances. Ignitions commenced with 480 volts D.-C. at about 10 amps., and became more certain at 15 amps. Ignitions were also obtained with the quick-break switch at the same currents, showing that there is not entire safety in using such switches in such an atmosphere.

Alternating current was then tried, but the results were not so consistent, as the effect depends on the part of the wave where the current is broken. As the result, however, of experiment it appeared that from this standpoint A.-C. was safer than D.-C. by about two to one, voltages and currents being equal. Fig. 3 summarises some results :—

Dr. Bedson had found out that the volume of the spark undoubtedly entered into the question, a fat spark igniting the mixture, while a thin, streaky spark, although higher in temperature, failed to effect ignition.

The effect of a very small current at 1,500 volts alternating was then investigated, and it was shown that whereas on lower voltages the fuse, to effect ignition, should blow in excess currents, with the high voltages a fuse blowing on its normal

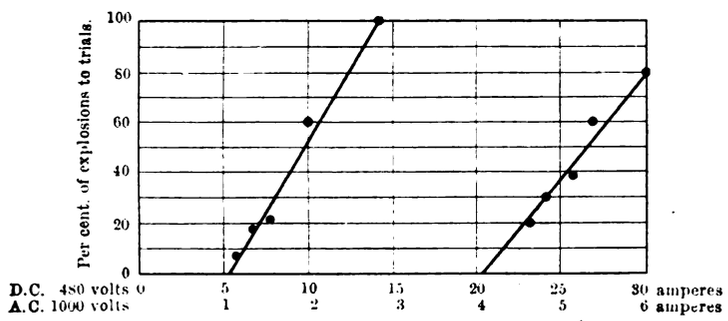

FIG. 3.

fusing current would give ignition. The experiment on trial with a 1-amp. fuse on 1,500 volts A.-C. showed instant ignition. A 100-volt supply was then taken, and it was shown that about 150 amperes were necessary to produce ignition, demonstrating that the lower voltages are immensely safer than the higher ones from the point of view of ignition. The experiment was repeated with A.-C. current at 40 ~. The explosions, though occurring, were not so violent as with D.-C. From experiment, Dr. Thornton deduces that 5-kilovolt amperes is about the lowest limit at which dust can be ignited.

In the ensuing discussion. Mr. FARADAY PROCTOR suggested that the reason that dry coke fired was that it contained carbonised tar, which was a very good conductor.

Mr. CLOTHIER (Messrs. Reyrolle & Co.) said that the demonstration had shown the danger of coal-dust explosions; there was equal if not greater danger in explosions of gas. He had arranged an experiment with two boxes to show the principle of proper enclosure of switchgear and accessories. Many colliery engineers ascribe explosions as due primarily to the ignition of gas, and secondly to the ignition of coal-dust from the flame of the gas. It was therefore important to prevent the flame of a gas explosion from reaching beyond the box in which a flash might have occurred. The first box had a rubber-ring joint, which was still common in mines, and sometimes described as "gas-tight." It was easy to get the ring cut, as in the example, and if a mixture of gas and air inside the box were fired by a spark a sheet of flame shot out which could ignite surrounding coal-dust. Where, as in many cases, there was an ordinary hinge on one side of the cover and cramping bolts on the other, it was still more difficult to get gas-tightness. The other box had a wide flange on cover and box, machined fairly roughly, and having a special hinge, which, together with the cramps used, secured equal contact all round. It was possible to fire a mixture of gas and air in this box without getting any flame or heat outside, due to the cooling action of the flange. (The relative properties of the two types of box were then demonstrated, and to indicate the force and instantaneous nature of the explosion in the box one charge was fired without the lid being bolted down. The lid jumped up slightly, but a vacuum, instantly formed, drew it down again.)

Mr. HODGE (British Westinghouse Co.) said that his own company had had for five years a box in a very fiery mine in this area which was practically the same construction, and which gave complete satisfaction.

Mr. RUTHERFORD, a colliery engineer, said that one question which was a subject of great discussion was the safety or otherwise of protective devices on cables in a colliery, and he thought that if experiments on a grand scale, with protective apparatus on the end of a cable 700 yards long and opened in an explosive atmosphere, could be undertaken they would go far to set the minds of colliery engineers at rest.

INSTITUTION OF MINING ELECTRICAL ENGINEERS

Formation of a Cumberland Branch

THE formation of a Cumberland Branch of the Institution of Mining Electrical Engineers was agreed upon at a meeting held on Saturday, February 26th, at the Grand Hotel, Whitehaven. About twenty-three gentlemen were present, and Mr. W. Leek (H.M. Inspector of Mines, West Cumberland District) took the chair. In his introductory remarks the chairman referred to the rapidly increasing adoption of electrical working, especially in the metalliferous mines in the district, and instanced the installation at the Lindle Moor mines.

So far as his own experience in electricity was concerned, he was very glad to say he had only investigated two accidents due to this cause, and he found both accidents were due to the carelessness of the injured persons.

The organising secretary, Mr. J. Glynn Williams, gave some details of the proposed arrangements, and stated that already they had some thirty members and prospective members in the district. The proposal for the formation of a branch was seconded by Mr. A. C. Scoular, and carried. The following officials, who will continue in office till the annual meeting in July, were then elected :

President: Mr. T. P. Martin (Workington). *Vice-President:* Mr. Robert Blair (Whitehaven). *Treasurer and Secretary:* Mr. J. Glynn Williams, 3 Moresby Parks, Whitehaven. *Council:* Messrs. W. H. Borlase (Threlkeld), A. C. Scoular (Workington), W. Leek (H.M. Inspector of Mines, West Cumberland Metalliferous Mines), Neville G. Barraclough (Workington), S. Turner (Whitehaven Collieries), A. Thom, Jun. (Moresby Collieries), R. Steele (Whitehaven Collieries). *Auditor:* Mr. Louis Darley (Frizington).

The meeting then proceeded to a brief discussion of Mr. Maurice's Paper on "Electric Shocks," a report of which appears on another page with that of the discussions before the other branches.

The National Association of Colliery Managers.—At a meeting of the Lancashire Branch of the Association on Feb. 4th, Mr. A. Tonge was asked to represent the branch by giving evidence before the committee on the revision of the special rules. The question of co-operation with the Institution of Mining Electrical Engineers in their inquiry into the causes and prevention of electrical accidents in mines was also discussed, but it was decided that, in the absence of any definite proposal, no action could be taken, although they were anxious to carry out any inquiry that would help the point at issue.

The National Electrical Manufacturers' Association and Electricity in Mines.—A meeting of manufacturers of motors and switches for use in mines was convened by this association on Thursday, the 17th ult., for the purpose of appointing witnesses to appear on behalf of the association as representing the manufacturing industry at the inquiry which is to be held by the Home Office for the purpose of modifying, if necessary, the rules for the installation and use of electricity in mines. A number of makers of this class of machinery were present, and six witnesses were provisionally appointed and various resolutions passed for the purpose of guiding them as to the evidence which is desirable.

Alleged Electrical Fatality at Auckland Park Colliery.—An inquest was held on February 12th on the body of W. H. Proud, a haulage-motor man, who was found dead in a haulage motor-house at Bolckow, Vaughan & Co.'s Auckland Park Colliery, on February 10th. Evidence was given to the effect that there was no exposed live metal near where the deceased was found, and Messrs. Bolckow, Vaughan & Co.'s electrical engineer stated that it had been found that it was impossible to get a shock off the machinery or near it. However, five doctors expressed the opinion that the symptoms were partly though not entirely those produced by electric shock. They admitted that not one of them could speak authoritatively on the point, but the jury found that the man died from an electric shock.

A VISIT TO MESSRS. MAVOR AND COULSONS' WORKS

ON February 9th a large number of members of the Mining Institute of Scotland paid a visit to Messrs. Mavor & Coulsons' works (47 Broad Street, Mile End, Glasgow.) Most of our readers will be aware that this firm have for many years specialised in electrically driven mining plant of all kinds. Some new developments of both electrical and mechanical mining equipment of considerable interest were shown.

Of these, Messrs. Mavor & Coulsons' explosion-proof ventilated motor is an interesting example. All the firm's safety mining motors, whether A.C. or D.C., are provided with specially heavy ribbed carcases, designed on the lines of a gas-engine cylinder, to withstand an internal pressure of 100 lbs. per sq. in. In order to prevent flames from passing from the carcase, all joints, whether for the end cover or for access doors, are formed with wide machined flanges, and the arrangement and size of studs are designed for the pressure already mentioned. An additional precaution lies in the provision of a small leather liner "L" shaped in section (see Fig. 1) on the inner end of each bearing. The liners are just an easy fit for the shaft, and in the event of an explosion are forced on to it, so preventing flames from passing along the bearing joints or between the shaft and bearing. In the A.-C. slip-ring type of machine the slip-rings are enclosed in a special case made in two halves, bolted together with wide flanges. The ventilation is effected by means of a nest of brass tubes placed between the poles in the case of D.-C. machines, as shown in Fig. 2, and by single brass tubes spaced at intervals around the circumference of the outer portion of the carcase in the case of A.-C. motors. In the D.-C. machine each nest ends in a header. These headers, or, in the case of the A.-C. machines, the single tubes, on the one side communicate with an air chamber formed by the use of a supplementary cover made of sheet iron or a thin casting, and on the other with the outer atmosphere. The air chambers have small openings at the outer end, which openings form the inlet ports on to the blades of a small fan. The fan is attached direct to the motor shaft, and impels a current of air through the tubes during the whole period of working. When the warm air in the machine is not sufficiently agitated by the armature or rotor to give the best cooling effect, an additional fan is fitted inside the motor casing.

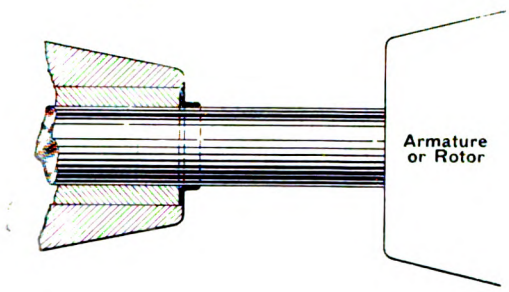

FIG. 1.—LEATHER PACKING TO SHAFT.

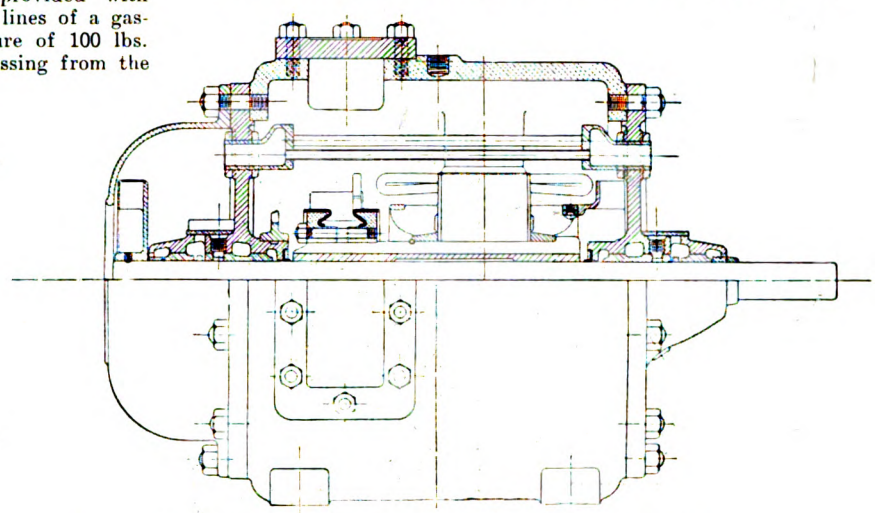

FIG. 2.—SECTION OF AN AIR-COOLED ENCLOSED MOTOR.

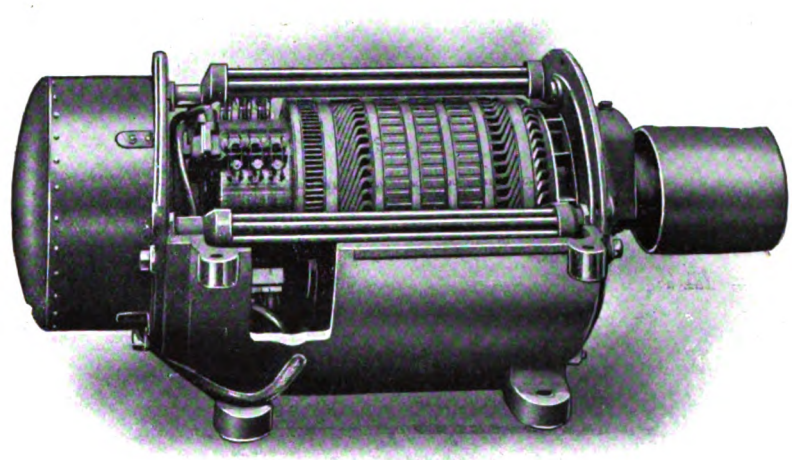
Mr. Mavor's "spinner" motor was shown driving a variable-speed fan, and this attracted a good deal of attention, the ease of reversal and the wide variation in speed given by the three-phase motor being of great interest.

The several forms of Pick-Quick bar coal-cutter, long and short wall types, and the Samson disc coal-cutter also were much discussed, but do not call for much description here, as the principal electrical features were the special explosion-proof motors already described. It may be of interest to mention that the "short wall" type of machine referred to is a new machine specially designed for use in pillar and stall workings. It is extremely compact and handy, and promises to fill a decided want in modern mining work.

The gate-end boxes made by the firm are of cast-iron with closed back and wide machined flanges, with heavy hinges and wing nuts. A special feature is the firm's safety plug, which is fitted in the cover of each box, and which consists of a brass ring containing several discs of lamp gauze, spaced a little apart from each other. A strong grid protects the gauze, and dust is excluded by a sheet metal cover, which is detached by a slight pressure from within, so allowing the products of combustion to escape. A simple but effective mechanical interlocking device prevents the opening of the box or the withdrawal of plug unless the switch is off, and it also prevents the switch from being closed until the lid is closed and the terminal plug of the trailing cable inserted.

The feature that attracted a good deal of attention was the "Gibb" underground conveyor, which consists of a train of long low jointed trucks, combined with a scraper conveyor travelling along the floor of the train and giving end discharge. The train can be made up in different lengths, and it consists of a discharging end section, a back end section, and as many intermediate sections as are convenient.

An advantage of this type of conveyor, from the colliery electrician's point of view, is that as the haulage gear and motor are placed apart from the conveyor and are only infrequently moved, they can be made with an ample margin of power and without any sacrifice of strength or cutting down of the size of wearing parts. This reduces the amount of jointing to be done or the number of boxes to be provided, and obviates the use of long trailing cables in awkward positions.



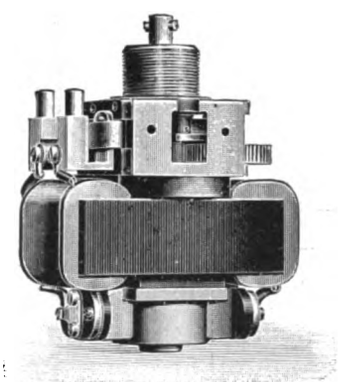


FIG. 3.—AIR-COOLED ENCLOSED MINING MOTOR.

Mining Legislation.—At the recent meeting of the Labour Congress at Newport, Monmouth, a resolution was passed advocating the registration of electricians employed in mines, the Glasgow representative, Mr. D. D. Gilmour, asserting that a number of recent accidents in mines could be attributed to the appointment of men who had not sufficient technical and practical knowledge to keep the electrical plant in proper order.

ELECTRIC SHOT-FIRING

ELECTRIC shot-firing is rapidly becoming universal, not only in coal mines, but also in metalliferous mines and quarries, and its superiority over safety-fuse firing for shaft-sinking cannot be denied. There are two systems of electric shot-firing, the so-called "high-tension" and "low tension" systems respectively. In the former the igniting medium consists of a chemical mixture offering a fairly high resistance, and exploding when raised to a high temperature by the passage of the current through it. In the "low tension" system, a short piece of fine wire, called the fuse head, and embedded in gunpowder or other explosive material, is raised to a red heat by the passage of the current, and explodes the gunpowder. The latter is made up with the fuse head in the form of a small paper or metal tube, about 1½ in. by $\frac{5}{16}$ in., and is inserted into the cartridge proper. When explosives other than gunpowder, such as those of the nitro-glycerine, gelatine, and ammonium nitrate groups, are used, it is necessary to use a detonator to fire them. This consists of a metal capsule containing generally about 15 grains of fulminate of mercury, made up with an electric fuse.

INTERNAL CONSTRUCTION OF STERLING "DYNAMO" BLASTING MACHINE.

The Sterling Telephone & Electric Co., Ltd. (200 Upper Thames Street, London, E.C.), supply a number of different patterns of blasting machines for generating current to explode such electric fuses. Chief among these are the "dynamo" patterns for low-tension fuses. These machines are practically small series dynamos. A simple half-turn of the handle is all that is necessary to fire the shot. The machine is short-circuited until the end of the stroke, when the handle strikes against a stop, breaks a contact, and current is allowed to pass to the fuse. The armature slips the gearing, and continues to revolve by its own momentum. The machine has a detachable handle, which is kept by the shot-firer. The new 1910 pattern gives a current of two amperes at 20 volts, and will fire ten shots in series. It measures 5⅞ by 4⅝ by 2½ in. in its brass case, and weights only 6 lb. 2 oz. The internal construction is illustrated in the accompanying figure. The two series field coils are wound on a core of laminated iron, ensuring instant excitation.

A NEW MINING TELEPHONE

THE accompanying illustration represents a new design of magneto mining telephone which has been brought out by British Insulated & Helsby Cables, Ltd. The arrangement of the parts in the substantial gas- and water-tight case is such as to combine strength and accessibility with high insulation. The case is fitted with an oiled teak base, on which the terminals, wires, and induction coil are mounted. The generator is mounted on a separate teak base, which is screwed to the metal plate, while the bell magnets are fixed to the other side of this plate. This arrangement permits of a removal of the generator, bell, and inter-wiring without any trouble. The case is moisture-proof, and has a heavy door fitted with special linen-flax stuffed rubber tube packing, securely fixed in place on the door by thin metal strips and screws. Every connection and fixing screw is arranged within easy reach of a screwdriver. The wiring is of No. 18, S.W.G., D.C.C., vulcanised and taped copper wire, run in wax-filled grooves cut in the under side of the teak bases, on which the parts are mounted, thus giving an exceptionally high insulation resistance, no part of the cast-iron case forming part of the circuit. The magneto bell gongs are protected from possible injury by an apron cast as part of the door.

The generator has five magnets, and will ring thirty 1,000 ohm bells in parallel with a line resistance of 1,000 ohms. An extra heavy cast brass handle is provided and insulated from the frame of the generator. The magneto bell movement is mounted in a separate cast gunmetal box, having a machined face for the oiled leather packing. The coils and yoke-piece are held in position by a centrally-fitted screw, which permits adjustment from without, since by turning the screw the position of the electromagnet is altered. The armature is fixed to a steel spindle, a polished shoulder of which is truly ground and seated on the gunmetal, the other end being pivoted on a hardened steel screw inside the case. The shouldered end of the spindle is carried outside the case, and squared for the reception of the boss, which carries the striker. This boss is recessed into the gunmetal case, a good means thus being employed for the protection of the seating and spindle shoulder from moisture. Double-pole Post Office pattern receivers are used, fitted in heavy cast gunmetal cases. The cords are protected by a covering of durable pigskin leather, and are securely anchored within the instrument. The transmitter is of a solid back type (Patent No. 27178/06), the flexible leads being carried to their connecting points within the instrument by a special knuckle-joint fitting, which protects them from injury or strain. The switch hook is of a strong simple design, and the switch springs have platinum contacts. Four stuffing glands are provided, one for each receiver, and one each for the battery and line leads respectively.

WATERTIGHT MAGNETO MINING TELEPHONE.

Electricity in American Mines.—The *Electrical World* (New York) states that at a recent miners' convention in Indianapolis the opposition of mine workers to electric power, the introduction of which they consider against their interests, was manifested in a resolution declaring that the use of electricity in mines is hazardous, as the leakage from poorly insulated wires has a tendency to ignite mine gases, and frequently causes explosions.

Dispute re South Wales Colliery Plant.—The action by the Electrical Co., Ltd., against Oliver H. Thomas Son & Co., proprietors of the Llynvi Valley Colliery, near Maesteg, for the recovery of £2.707 for electrical plant delivered at the colliery, which commenced in December, is still being heard by Mr. E. J. Pollock, an official referee. The facts of the case, which have already been given, are that a counter-claim has been entered by the defendants for £30.100. The Electrical Co. contracted to supply certain electrically driven pumps for unwatering of the Llynvi Valley Colliery, which the proprietors allege were unsuitable and defective. The terms as regards payment were that 60 per cent. was to be paid on delivery, 30 per cent. on starting, and 10 per cent. in three months later. The amount of the claim, namely, £2.707, was balance of account. The counter-claim is on account of the alleged inability of the defendants to enter certain workings owing to obstruction by the machinery installed, and also for unreasonable delay in supplying one of the centrifugal pumps. The evidence for the plaintiffs has been concluded, and the case for the defendants is now being proceeded with. The hearing of the action has again been adjourned for a short time.

PREVENTION OF ELECTRICAL ACCIDENTS IN MINES

THE Institution of Mining Electrical Engineers has discussed further at its various branches Mr. W. Maurice's Paper on "Electric Shocks," which forms the introduction to the first part of that Institution's inquiry into the causes and prevention of electrical accidents in mines (see ELECTRICAL ENGINEERING IN MINES, Feb. 3rd, page XXI.).

Newcastle Discussion

At the resumed discussion on Feb. 9th :

Mr. H. J. FISHER (Electrical Engineer to the Lambton Collieries) gave a summary of the experiments of Messrs. Siemens & Halske leading to the conclusion that a current of 0·03 amps. should be regarded as dangerous, and 0·10 amp. as deadly. Mr. Fisher gave the results of some tests taken by himself, showing resistances of the body measured from hand to hand under normal conditions varying from 9,000 to 110,000 ohms; from hand to feet, standing on damp ground under normal working conditions, from 11,000 to 30,000 ohms; and from hand to feet on damp ground with the hands damp, from 5,500 to 24,000 ohms.

Mr. H. W. CLOTHIER (of Messrs. A. Reyrolle & Co., Ltd.) referred to methods for the treatment of shock, drawing special attention to the preference given to the method of laying the patient on his face, and mentioning the use of traction of the tongue.

Mr. W. C. MOUNTAIN (Messrs. Ernest Scott & Mountain) had prepared figures from the Mines Inspectors' Reports of all electrical accidents in collieries since the introduction of the new rules (*i.e.*, from 1903-8 inclusive). There had been 39 total deaths underground : six due to gross carelessness, six from armoured cables, five from unarmoured cables, eleven from faulty earthing of other apparatus than cables, seven were pure accidents, and three were from improper or defective protection of live parts.

Mr. CLOTHIER, from records in the *Colliery Guardian*, found a total of 48 accidents up to June last year. Since proper investigations had been made the deaths due to electricity appear to have increased, owing either to previous faulty records or to the deterioration of electrical apparatus installed years ago. The total number of deaths in mines in 12 years was 12,500, or 1,041 per year. There had been in seven years 90 electrical deaths, or 12·8 per year. This gave an annual percentage of electrical to total deaths of about 1·2.

Dr. W. M. THORNTON (Armstrong College, Newcastle) suggested that in view of the danger in touching trailing cables, these should be supported from the pit props and boxed in some temporary manner.

Mr. FISHER thought this would be difficult, because machines working on a face are frequently moved; but he had used an insulating grooved bobbin running loosely on a support on the face pit-props, and carrying the cable, which was very good. He thought that no trailing cable should be armoured, but that mains and distributors should be. In the collieries he was connected with there had been no accident with 72,000 yards of such cables in operation. Copper bonds should be used with brass bolts and washers. Bitumen cables eight or nine years ago were sometimes poor in quality, and trouble had been caused. At Lambton Colliery double wire-armoured paper-insulated lead-covered cables were working at 5,750 volts, one cable going 1,800 yards inbye. The accidents they had had were entirely in the sub-stations, and not on the cables, in spite of falls of stone. One or two breakdowns on the cable had happened, due to shot-firing too near the cable. Trouble had occurred with lead-covered cables owing to the lead being unprotected just at the joint boxes. He recommended a type of box in which the armouring was carried right into the box. Sagging of the cables coming away from the boxes should also be avoided. With bitumen cables, trouble occurred either because the bitumen was too hard, the packing of jute not sufficiently impregnated, or insufficient compounding had been given to the cable.

Mr. W. R. MORTON (Messrs. W. T. Glover & Co., Ltd.) advised armoured cables. There should be a good earth and reliable joint boxes, and a little extra slack in the cable should be left near the boxes. The armouring of a cable was in some cases equal in conductivity to one of the cores. An armoured cable offered the opportunity of using selective protective devices, such as the Fisher device. Unarmoured cables did not show up their faults on test, as low resistance is often masked by the low insulation of the board to which they are connected, and a fault can go undetected till either an accident or another fault on another phase brings more trouble. He supported Mr. Nelson's recommendation that, except perhaps in pits containing corrosive water, armoured cables should be used; moreover, when a cable was fed from more than one point, protective devices could be used to isolate the danger zone.

Mr. W. W. WOOD said that shocks were due to three main causes; firstly, live terminals, to be cured by efficient protection; secondly, metal-work with a leak on it, to be cured by efficiently earthing all metal parts; thirdly, defective insulation on cables. Many collieries had at present unarmoured cables, and were not going to pull them out. How was it possible to protect these efficiently?

Mr. MOUNTAIN gave some data regarding the life of a cable in a mine from his own experience. He had installed some vulcanised bitumen cable twenty years ago which was still working without trouble. In another case a vulcanised bitumen cable, installed in place of a vulcanised rubber cable which had failed in twelve months, had lasted for seventeen years. He did not recommend lead-covered cables for continuous-current work. In wet shafts the cables should be coated every six months with a mixture of pitch and tar. The corrosion of lead-covered cables in one instance had led to a fire.

Dr. THORNTON pointed out the danger of bad dielectric in a three-core cable, in condensing the lines of static pressure between the cables upon a small area of the dielectric. Such lines chose the weakest path, and when this lay directly between the two cores there was great danger of puncture of the insulation.

Mr. FISHER recommended the burying of cables where they were likely to be caught by runaway tubs, as at curves and banks. They should be laid solid in the ground. Trailing cables should not be armoured, as the armouring was crushed beyond remedy if a fall of stone occurred, and any attempt to make a repair by binding over with galvanised iron wire usually resulted in puncturing the insulation of the cable with the ends of the wire. The trailing cables used by him, and described in his article in ELECTRICAL ENGINEERING IN MINES of Nov. 4th, 1909, were then mentioned. In reply to a question, Mr. Fisher said that in the Lambton Collieries every pump and haulage attendant had a daily report to fill in which indicated the behaviour of the electrical gear, including any unusual kicks, flashes, &c., and the daily indications of the leakage instruments. He also had to measure the gap between stator and rotor of his machine. The electrician of each colliery had to report weekly on the condition of the electrical gear, dangerous portions of the mine, falls of stone, &c., and in addition a monthly inspection of a very thorough nature was held. High-tension switching instructions were placed in each sub-station, and every man had to sign and carry a card with similar instructions. No man was allowed to work on a high-tension cable without a written assurance by the chief electrical engineer that the cable was isolated.

The question of earthing was next discussed, Mr. MOUNTAIN pointing out the difficulty of getting a really good earth, especially inbye.

Mr. FISHER stated that, in his group of collieries, each pit had its earth-plate buried in coke breeze, and all the colliery earth-plates were interlinked by copper conductors carried from pit to pit.

Sheffield Discussion

At Sheffield a meeting of the local members was held at the Victoria Hotel on Saturday evening, Mr. R. Holiday (Acton Hall Collieries, Featherstone) in the chair. Among those present were Mr. R. J. Frost (Branch Hon. Sec.), Mr. C. Henson (Dinnington Main Colliery), Mr. F. Marsland (Barrow Colliery), Mr. E. S. Shaw (Messrs. W. T. Henley's Telegraph Works Co.), Mr. J. N. Towell (Silwell), and others. With regard to methods of resusitation, several members expressed a preference for a "one-man" method, such as the Schaefer. The opinion was also freely expressed that the electrical engineer of a colliery should be a qualified man, and should have complete control over the electrical apparatus. One member who had had considerable experience expressed a preference for unarmoured cables when working with direct-current, and the Chairman emphasised the difficulty of maintaining a continuous earth to bank. It was most difficult to make an electrically continuous joint in the armouring, and thus it might happen that the armouring on the in-bye side of a fracture would be alive and not earthed. Some earthed the armouring at bank only, others also in the sump at the bottom of the pit. Another member suggested that the earthing of apparatus or armouring to rails should be prohibited, as they often laid on insulating strata, and dangerous conditions might arise. The Chairman stated that they had had armoured cables in the Acton Hall pits, but had taken them out, as they gave so much trouble. It was a very damp mine. He admitted that an armoured system was safer at first, but he had experienced frequent cases of leakage with armoured cables, which caused charring and eventually fire. Mr. Shaw stated that he was in favour of unarmoured bitumen cables for main ways and armoured cables for shafts. In hot pits, however, bitumen cables were liable to harden and crack, leaving the core exposed. He warned members from covering armoured cables with gas-tar; in one case the acid in the tar worked through the braiding and destroyed the wire armouring. Another member, describing an armoured cable system, said that he used an old haulage rope in the sump for the main earth below, and, further, he earthed the armouring to water-pipes at two or three places in every way. It was a three-phase system with neutral not earthed. The Chairman referred to a large mine in Cumberland where they had double-

Digitized by Google

armoured cables, and, it was said, had experienced no trouble in spite of heavy falls. With regard to the nature of the armouring, one member preferred wire to tape, as after being pinched it sprung back; further, it was easier to attach earthing wires to wire. Mr. Shaw, however, preferred tape, as wire got worked into the bitumen. The Chairman pointed out that for perfect safety, when a section of cable was being worked on, the armouring as well as the conductors should be isolated from the main system. Recent statistics had shown that cable accidents were pretty equally divided between armoured and unarmoured cables, in spite of the fact that there were hundreds of miles more of unarmoured cables in use. It would seem, therefore, that armoured cables were more dangerous. Turning to the question of the effects of shocks, several members expressed the opinion that they would rather have a direct-current than an alternating-current shock for equal voltages. The general opinion was that coal-cutters were the greatest source of danger, and that D.-C. coal-cutters were more dangerous than A.-C. machines, as there were no loose connections in the latter case. A cause of breakdown in these machines was lowering of the armature by wearing down of the bearings; this caused the rotor laminations in some cases to be driven into the stator windings, which would result in the whole machine becoming alive. The only really safe way to work any apparatus, in one member's opinion, was to use a well-earthed system with loose-handle circuit-breakers. When a section of a system was being worked on, a danger-board was not sufficient; it was necessary to have fuses or links which could be taken out or locked up.

Nottingham Discussion

At the meeting of the Derbyshire & Nottinghamshire Branch at the University College, on Saturday, the chair was occupied by Mr. S. C. WARDELL, Colliery Engineer, Alfreton. Mr. F. CUSWORTH (East Kirkby, Hon. Sec.) said that the majority of electrical accidents in mines were due to cables, and that only a very small proportion could be traced to coal-cutting machines. It appeared that there were more accidents with low-tension than with high-tension cables. Mr. L. G. ROUTLEDGE (Eastwood) described an accident, fortunately without any fatal result, in which a trailing cable (unarmoured) got entangled in a coal-cutter chain and was cut right in two. It was a three-phase cable, but there was only a slight arc, because the trip-switch operated immediately. In their system the neutral was not earthed, and in consequence it was possible to go on working (under pressing circumstances) with one phase in contact with the earthed armouring, but this was, of course, not to be recommended. Discussing the armouring of cables, one member said that he preferred wire to tape, as the latter cut into the insulation. Some members preferred unarmoured cables. Mr. E. E. BEARDSMOORE (Tibshelf Colliery) thought that armoured cables increased the risk of stoppage, as it was often necessary to go on working in spite of a leak, and this was not safe when armoured cables were used, as the fault developed so quickly. One member suggested that the armouring should always be earthed frequently at wet places. Mr. R. LEE (Shirland, Alfreton) described how an earth-plate sunk 3 ft. deep in ashes had proved entirely ineffective; ashes were not so good as coke breeze. Mr. E. A. WILBRATAM (Ripley) said one could not have too many earths; he clamped on earthing wires at every wet place. There was, he thought, less danger with armoured cables if well earthed. Mr. CUSWORTH mentioned the case of a colliery using armoured cables, in which the stoppages due to electrical causes totalled only 3 hrs. 25 mins. in 1908, and 1 hr. 30 mins. in 1909. Mr. J. HIGHTON (Elkester) described the circumstances under which he received a bad static shock from a length of concentric cable which had been disconnected from the system by opening a double-pole switch. It was only 98 yards in length, a 19/16 cable working at 220 volts D.-C., but the shock was very considerable. Other speakers contributed to the discussion, and it was resolved that meetings should be held on the last Saturday of every month at the University, Nottingham, at 3.30 p.m. On account of the Easter holidays, however, the next meeting will be held on Saturday, March 19th.

Manchester Discussion

On Saturday, January 29th, a meeting of the Lancashire Branch was held at Manchester, with Mr. G. H. WINSTANLEY in the chair. After a few words from the Chairman, calling the attention of the members to the object of the discussion, Mr. W. B. SHAW pointed out with regard to the "limits of risk" of shock, that no limits could be fixed, as so much depended on the moisture of the skin, the strength of the constitution, the state of the ground, and whether the man receiving the shock gripped the live wire. In the latter case the man could not let go, as the muscles of his hand contracted. It was safest, he thought, to work with wire-armoured cables, which should be carefully bonded throughout and earthed. He urged that coal-cutter trailing cables should not be given too long a period of service, and should not be repaired underground, but by competent men on the surface. Mr. S. LEE thought that the limit of pressure for shaft cables should be 3,500 volts, and 500 volts for cables taken beyond the pit bottom. Mr. R. R. SMITH suggested that all earthing wires should be stranded, and that copper should be avoided in damp places; iron wire was preferable. Care should be taken that lighting wires did not rub against girders; it was best to run them on insulators. Mr. S. LEE thought that it was best to run an earth wire from bank to in-bye. Mr. W. B. SHAW thought that cables should be hung up with thongs, but that lighting wires should be supported on insulators. Mr. G. H. WINSTANLEY expressed approval for concentric cables. His experience with these extended over six or seven years, and they had had no accidents at all due to shock from these. Mr. J. H. BROOKING expressed a preference for braided unarmoured cables; canvas tape was even better than braiding.

Whitehaven Discussion

At the meeting at Whitehaven on Saturday, which was convened to consider the formation of a Cumberland Section of the Institution, and is referred to elsewhere in this issue, Mr. Barraclough opened the discussion by referring to the fact that the conditions under which a shock was received were of more importance than the pressure. Eighty volts had been known to kill, while men had survived shocks of 3,000 volts. The Chairman, Mr. Leek (H.M. Inspector of Metalliferous Mines, West Cumberland District) spoke of the importance of miners knowing how to deal with cases of electric shock, pointing out that good work was being done in Cumberland in this respect in connection with the St. John's Ambulance Association. Messrs. Blair, Rook, and Scoular also took part in the discussion.

Cardiff Discussion

The discussion of the Paper by the South Wales Section was resumed on Saturday at the Park Hotel, Cardiff. Mr. F. S. WALKER took the chair. The resignation of the Secretary, Mr. E. IVOR DAVIES, who is leaving the district, was accepted, and a resolution passed expressing the section's thanks for his work. Mr. GEORGE HUMPHRY was elected Local Secretary in his place. His address is 113 Clive Road, Canton, Cardiff. In opening the discussion on Mr. Maurice's Paper, Mr. RICHARDS said that the question of resuscitation from shock might more profitably be discussed by members of the medical profession. With regard to the question of earthing the system, he thought that could only be done by using a good continuous earth wire with the apparatus well bonded, as in tramway systems. Though the percentage of accidents attributable to the use of electricity in mines was low, it could be very much decreased by a properly organised system of inspection, and a properly trained staff of ambulance men.

Mr. STONE (Mountain Ash) thought that an efficient and positive acting earthing device was badly required. In the collieries of which he was in charge, he maintained a systematic daily logging of all the apparatus in work, and also a thorough examination and overhauling at different periods during each month. They generated at 3,500 volts, three-phase, but before entering the pit it was transformed down to a pressure of 550 volts. He advocated a centralised earth plate at the surface near the power station, and the connection of all apparatus to this. He found this was the most satisfactory method to adopt, and up to the present he had not yet had an accident of any kind due to leakage.

Mr. JAMES PHILLIPS (Tredegar Co.) supported the views set forth by Mr. Stone. With regard to earthing, at Tredegar they used three earth plates with isolating links, which enabled them to make periodical tests when required. Other members took part in the discussion, which was adjourned to March 19th.

ELECTRICAL MINING PATENTS OF FEBRUARY

AMONG the Patent Specifications published during February was one (No. 5,617 of 1909) by Messrs. Mavor & Coulson, Ltd., and R. C. Anderson for an improved driving gear for use in connection with disc coal-cutters. The construction described includes a special gear-casing providing extensive bearings for the working parts and giving facility for the removal of the gear from the casing, while, at the same time, providing a casing of narrow dimensions. A bevel driving wheel is mounted at the rear of the casing upon a longitudinally arranged shaft. The transverse driven shaft is driven through spur gearing on transverse spindles, and is furnished with a pinion at the head of the casing for driving the disc cutter and haulage gear. Patent No. 3,106 of 1909, taken out by Messrs. Simplex Conduits, Ltd., L. M. Waterhouse, and E. Sheppard, describes a water-tight switch suitable for lighting circuits in mines. This comprises a tumbler switch enclosed in a water-tight cover. The spindle of the operating handle passes centrally through the cover, and is provided with an L-shaped cam, which operates directly on the dolly-head of the switch. No. 7,714 of 1909, by C. Stuart-Bailey and H. L. Storey, covers a cartridge for mining purposes, which operates by the action of hot water on quick-lime, the lime being contained in a gas-tight casing. The lime and water are separated by a diaphragm, which ceases to be water-tight above the boiling point of water, and the water is heated electrically. An apparatus for igniting miners' lamps electrically underground is described by P. Buckley in Specification No. 8,112 of 1909. It comprises a stationary casing with an inner casing adapted to rotate within it. Both casings have openings, and the lamp is inserted when these coincide. Contact is made when the inner casing is swung round.

RECENT ACCIDENTS IN MINES

On October 22nd last, an explosion of fire-damp in the Cadean Pit, Trimsaran, near Llanelly, South Wales, resulted in the death of four men, and at the inquest held on December 14th, evidence was given which showed that the gas had been ignited by the sparking of a semi-enclosed direct-current motor. It appears that a heading was being driven in advance of the air current, and in the neighbourhood of some old workings which were under water. As the water was percolating through and rapidly rising it was found necessary to have a pump running continuously, and a turbine pump coupled to a 25-h.p. 500-volt semi-enclosed D.-C. motor was set up at the entrance to the heading. The work had proceeded some 25 yards, and was nearly completed, when traces of fire-damp were detected by the fireman, who fetched a hand fan in order to keep the atmosphere clear while the last yard or two of the heading was being cut. The fan was stopped for a short time, however, in order to repair the handle, and the explosion followed almost immediately after it had been restarted. At the inquest it was elicited that the motor was in the habit of sparking badly, but that gas had not been observed in that part of the mine previous to the evening of the explosion, and that no official of the mine was aware of the presence of gas that evening. The inquest was attended by Mr. J. Dyer Lewis, H.M. Inspector of Mines, and Mr. R. Nelson, H.M. Electrical Inspector of Mines, and it was decided that sparks from the motor had ignited the gas. Apparently the fireman had made a grave error in continuing to run the motor after fire-damp had been observed coming away from the working-face, in view of the fact that the motor was in the return air current. As a result of a subsequent prosecution, the fireman, Evan Davies, was fined £2 for contravention of Electricity Special Rule 38, which provides for the cutting off of current from any electrical apparatus immediately on the appearance of fire-damp, and the manager of the mine, Mr. T. W. Evans, was fined £10 for providing inadequate ventilating arrangements, which made the explosion possible.

An electrician of the name of W. P. Silkstone, working at the Sutton Colliery, the property of the Blackwell Colliery Co., Stanton Hill, was killed by electric shock on February 2nd last. At the inquest, which was attended by Mr. Walker, Inspector of Mines, evidence was given to the effect that the deceased and a senior assistant, A. Slaney, were told off by the chief electrician to disconnect a certain 20-h.p. motor in a pump-house, and to remove it, together with its starter, &c., to another part of the mine. It appears that there was a gate-end switch, some 100 yards from the pump-house, and that this should have been opened before the work was commenced. It was left closed by the two men in order that they might use the lamps which were connected by loose cable to the live side of a double-pole switch on a board in the pump-house. This switch controlled the motor circuit, and was open. The starter which they were lifting off the board when the shock was received should therefore not have been alive, but it was suggested at the inquest that a lighting cable, bare at one point, was in contact with the frame of the starter. So long as the frame was in metallic contact with the board (which was earthed), nothing, of course, would be noticed, but directly the frame was lifted from the board, both men received a shock. Though this explanation is feasible, it would seem to be improbable that the men would allow the lighting wires to be entangled with the starter they were removing. It is possible that the bare place on the lighting wire came in contact with the iron frame of the board, and that this was ineffectively earthed. The deceased was standing on a wet plank, and death was instantaneous, but the other assistant, though standing on an iron plate, had wooden clogs on. The latter was rendered unconscious, however, and was badly burnt. The jury returned a verdict of death by electric shock. The coroner expressed the opinion that due precautions had not been taken, as the gate-end switch should have been opened.

On December 16th, a miner of the name of John McNaught was killed as the result of a shock received from an electric coal-cutter in the Hartley seam of No. 2 Pit at the Polmaise Colliery, near Stirling, owned by Messrs. Archibald Russell & Co. McNaught received the shock when leaning over the frame of the machine to regulate the travel. Power is distributed in the mine at 500 volts, three-phase, and the neutral of the system is earthed at the generating station at bank. It appears that the insulation of the auto-transformer starter of the machine in question had broken down some days before the accident, but had been repaired in the mine, as it turned out, inefficiently, with the result that it again broke down, causing the accident. The breaking down of the insulation caused the frame to become alive. Had the frame been effectively earthed, there would have been no danger, but it appears that though the frame was apparently connected to the wire armouring of the trailing cable, and that armouring to the gate-end switch-box cover, the latter was earthed by being connected to an old haulage rope laid along the roadway, but not connected to an earth-plate. This defect has since been remedied, and the haulage rope connected to the armouring of the shaft cables, which is earthed at bank. The cables running from the shaft bottom inbye are not armoured. The evidence at the fatal accident inquiry on February 11th showed that shocks from the coal-cutter had been frequent, but this obvious warning appears to have been neglected.

A serious fire, resulting in the death of a miner, J. Gainard, and injury to many others, occurred on February 1st last in the underground workings of the Easton Colliery, Bristol, and a report was circulated and published in the daily papers that it had been caused by the fusing of an electric wire. At the inquest on February 4th, however, it was conclusively proved that it was not originated electrically. The fire broke out on the evening of February 1st in an engine-house containing an electrically-driven haulage gear. Beyond this house is an incline which leads to workings below, in which some sixteen men were at work at the time of the fire. As the smoke was carried into these workings by the air current, the men had much difficulty in escaping, and Gainard was afterwards found dead in one of the passages leading out from the main incline. At the inquest it was elicited that the fire was started by the fall of a candle into a heap of cotton fluff. It appears that the haulage gear has a rope drive, and that some six weeks before the fire the cotton ropes had been renewed. An amount of fluff had worn off these and had collected in the race. The attendant had noticed that a holding-down bolt of the middle bearing of the haulage gear was slack and had switched off his motor to tighten it up. In order to see to do this he had placed a candle (the mine is a naked light one) on a bearing at the side, and this fell into the fluff and ignited it. The flames immediately spread to the timber supports, and the attendant left the house, and, after spreading an alarm, managed to escape. The fire was not under control until early the next morning. A verdict of accidental death was returned, the jury adding a rider that the engine-room should have been kept cleaner, and that a lamp should be used in future instead of a naked light.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during February.

February 3rd.—Supplement on electrical engineering in mines, opening with some correspondence on shaft cables. Abstracts of Papers recently read on "Machine Mining," by Mr. S. Mavor, and on "Electricity in Coal Mines," by Mr. R. Nelson, are given, and some practical notes are contributed by Mr. S. Skirrow. Illustrated descriptions appear of the Electric Construction Co.'s new coal cutter and a safety gate-end switch-box designed by Mr. H. J. Fisher. Special reports are given of the discussion at the Newcastle and Cardiff sectional meetings of the Institution of Mining Electrical Engineers on Mr. W. Maurice's Paper on "Electric Shocks," which forms the introduction to the first part of the inquiry into the causes and prevention of electrical accidents in mines being conducted by that Institution. A summary is also included of electrical mining patents published in January.

February 10th.—A special article on the leading makes of metal filament lamps. Descriptions of a number of novelties, including a new waterproof electric bell.

February 17th.—Description of an electric power station driven by suction gas. An illustrated article on the Dick-Kerr-Bergmann steam turbine.

February 24th.—An illustrated description of a large water-cooling plant in connection with a generating station. A new system of lead cable jointing.

Telegraph Traffic.—The Comoro Islands, off Madagascar, can now be reached telegraphically, offices having been opened at Mayotte, Mohéli, Grand Comoro, and Anjouan. Telegrams for places in Colombia, except Buenaventura, for any place in the Comoro Islands, in Costa Rica, Ecuador (except Guayaquil and Sta Elena) can only be forwarded at sender's risk. During the recent storms the superiority of underground lines was amply demonstrated, for the Commercial Cable offered uninterrupted service without delay.—The Perein-Obock cable was down on the 22nd ult., and telegrams were sent from Aden for Djibouti by boat.—Communication with Tangier Rabat, Casablanca, and Mogador is again interrupted.—The *viâ* Hanekin route ceased working on the 23rd ult., and on the next day direct working between Saigon and Bangkok was suspended, with consequent delay to telegrams. On the 25th ult. Moroccan communications were in working order again. On the 26th ult. the Bagdad and Bassorah line was in need of repair, but the *viâ* Hanekin route was again open to receive messages. The Saigon-Bangkok line was restored on the 27th ult. On Sunday last the Paramaribo-Cayenne cable failed again.—Negotiations between the Norwegian and British telegraph departments have resulted in an agreement concerning the cables between the two countries, the British Government making the necessary agreement with the Great Northern Telegraph Co. for the sale of the cable at value.—Reduction of the word rate to 2d. per word is to follow.—The Mackay Companies are said to have sold their entire holdings of stock in the American Telephone & Telegraph Co.—Mr. G. Ward, General Manager of the Commercial Cable Co., has announced that the Company will proceed immediately to lay an additional Transatlantic cable. This will be the sixth cable between Europe and America owned by the Company.

Digitized by Google

ANNUAL DINNER OF THE MANCHESTER LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE annual dinner of the Manchester Local Section of the Institution of Electrical Engineers was held at the Midland Hotel, Manchester, on Friday last. The chair was occupied by Mr. S. J. Watson (Borough Electrical Engineer, Bury), Chairman of the Section, and the gathering included some 180 members and guests. Among those present and besides those who spoke were Dr. E. Hopkinson, Messrs. S. L. Pearce (City Electrical Engineer, Manchester), M. B. Field, T. L. Miller, W. Cramp, C. D. Taite, A. P. Wood, Dr. E. Rosenberg, and others.

After the loyal toasts, MR. HUGO HIRST (Managing Director of the General Electric Co.) proposed the toast of the Corporations of Manchester and Salford. He spoke of Manchester as the Mecca of the electrical and other industries, and paid a high tribute to the business capacity and wise government of the municipal authorities. Their electrical enterprise was the finest in this country, and its head, Mr. Pearce, was an ornament to the profession. In speaking of Salford, he referred to his own company's works, and acknowledged the assistance which they had derived from the municipality. In responding to this toast, the MAYOR OF SALFORD first expressed sympathy with Mr. V. A. H. M'Cowen (Borough Electrical Engineer of Salford), who had recently suffered a family bereavement, and had also been very seriously ill. After thanking Mr. Hirst for his kind appreciation of the work of the municipal authorities, he put in a plea for fair criticism of their work and expenditure, and complained that petty incidents were made much of while important and heavy expenditure was left uncriticised. Responding for Manchester in the absence of the Lord Mayor, MR. COUNCILLOR HOWARTH (Chairman of the Electricity Committee) praised the work of the staff of the Electricity Department. Manchester had reason to be proud of its undertaking, and was showing what could be done in that direction.

The toast of the Institution was proposed by MR. A. HOPKINSON, K.C. (Vice-Chancellor of the University of Manchester), who gave some amusing reminiscences of the early days of electricity, and referred to the astounding progress made by the industry. Responding to this toast, DR. GISBERT KAPP enlarged upon the aims of the Institution, referring to its charter, according to which it was formed to advance electrical science and its application. Some wished, he said, that the Institution should widen its activities, and correspondence had appeared in the electrical Press urging that the Council should assist a certain class. But the Institution could not be made a fighting machine for particular class interests. They could not deal with questions such as municipal trading nor tariff reform; the country and the members of the Institution were divided about these questions, and whatever action was taken would be bound to offend one section. Further, the Institution at present enjoyed the confidence of the Home Office and the Board of Trade, and any attempt to interfere in business or political matters would mean the loss of that confidence. There were many ways in which the Institution could further the interests of the industry, and he looked to the Manchester Section particularly with regard to the electrical driving of textile mills. The very unnecessary and unsatisfactory report of the Bradford Engineering Society should be counterbalanced by an investigation made by the Manchester Section, which should be a collection of reliable data and evidence of electrical working of textile mills.

The toast of the Local Sections was proposed by MR. W. M. MORDEY, who referred to the innovation during his period of office as President, whereby the Papers offered to Local Sections were submitted to the editing committee at headquarters. Some liked the old system better, but he thought that it prevented the reading of Papers either unsuitable or not up to the standard of the Institution. It was better that a few Papers by the best men only should be read and discussed all over the country, and he asked that the new system should be given a fair trial. Finally, he emphasised Dr. Kapp's remarks to the effect that it was necessary to resist all efforts to make the Institution of the nature of either a Masters' Association or a Trade Union. In replying to this toast, MR. S. J. WATSON said that Manchester might be looked upon as the eldest and heaviest child of the Institution. He would like to see the Local Sections having a larger representation on the Council of the Institution, and suggested that the Chairman, the Hon. Secretary, and two past Chairmen should represent each Section. Referring to the new Institution building in London, Mr. Watson pointed out that those in the provinces would have little share in it, and suggested that the library should be made of use to country members. Some people in Manchester were a little jealous of the London Conversazione, and he hoped that the Council would give its co-operation if they proposed to hold a similar function in Manchester.

The toast of the visitors was proposed by Mr. J. S. PECK (British Westinghouse Co.), and responded to by MR. W. T. STUBBS, President of the Manchester Chamber of Commerce.

THE ELECTRICAL TRADES' BENEVOLENT INSTITUTION

THE second festival dinner in connection with the Electrical Trades' Benevolent Institution was held on Wednesday of last week at the Hotel Metropole, London. The president, Dr. Gisbert Kapp, was in the chair, and among those present were Messrs. Justus Eck, H. Bevis, Hugo Hirst, H. H. Berry, J. S. Highfield, C. S. Northcote, F. H. Nalder, H. W. Butler, W. Davenport, L. G. Tate, W. Schmahl, W. B. Esson, G. Burney, E. Russell Clark, P. A. and G. C. Lundberg, C. Wilson, and others.

Before proposing the toast of "The Electrical Trades' Benevolent Institution," Dr. KAPP read a letter from Sir William Preece, in which he regretted his absence through ill-health, and assured the Institution of his continued support. He then announced that the secretary had received up to that evening a total sum of £262 in connection with the present festival dinner, and further donations amounting to over £45 had been received during the evening. The Institution, started in 1905, now had funds to the amount of £2,089 invested, and over £300 in cash. The income from regular subscriptions was a little over £100, and the donations last year amounted to £578, excluding a sum of £364 from the proceeds of the Manchester Exhibition. They had dealt with five necessitous cases during the year, the total amount spent being £63, or nearly all the interest from the invested funds. He thought it wise of the management not to spend the whole of the insured income, but to assist only urgent cases at present and build up a substantial fund in order that they might give pensions later. He admired the progress they had made, and thought they had outstripped the Benevolent Fund of the Institution of Electrical Engineers, in that they were increasing their funds at a faster rate. Many of the donors were firms who had funds for their own employees, and he admired their generosity in supporting this fund also. It had been suggested that this Institution and the Benevolent Fund of the Institution of Electrical Engineers should pool their funds and make one society, but he saw no reason for doing this; they would not increase the total receipts and they could not reduce the expenses, as there were none, owing to the voluntary work of the management. Again, the latter fund was only for members of the Institution, while this one was not so restricted. He thought it better that they should preserve a healthy rivalry.

Sir IRVING COURTENAY (Vice-Chairman), in response, said that with regard to the need of the Institution, the remarks of the Chairman were quite conclusive, as he hoped that the aid of the Institution would be extended to all those who had attempted to earn a livelihood in the electrical trades and needed help, irrespective of their class or whether they had been subscribers or not. It would be a misfortune if there were any idea of amalgamating.

Mr. HUGO HIRST also spoke in reply to the toast of the Institution and referred to the strenuous nature of competition in the industry, commenting how few in the electrical industry had reached a position of safety financially. He urged the importance of obtaining a large number of small subscribers. In his own firm (the General Electric Co.) they had a special sick fund for the staff only, and each member subscribed an annual sum, working out at ½d. per week. They paid out over £100 per year, and the funds now amounted to between £4,000 and £5,000.

Mr. JUSTUS ECK (Union Electric Co.) rose to propose the health of the President, and stated that they had already commenced to secure small regular subscriptions, a number of voluntary collectors having commenced work amongst the various electrical undertakings.

In response to this toast, Dr. KAPP said that he was fully in sympathy with the objects of the Institution, and was glad to see that the electrical Press were also in sympathy. He further emphasised the importance of obtaining a large number of small but regular subscribers.

Mr. GUY BURNEY (Sterling Telephone & Electric Co.) paid a tribute to the labours of Mr. Eck and the Secretary, Mr. W. Davenport, and these gentlemen briefly replied.

Indian Electricity Bill.—The bill to amend the law in India relating to the supply and use of electrical energy has been referred to a select committee, consisting of the Hon. Mr. S. P. Sinha, the Hon. Sir T. R. Wynne, the Hon. Mr. Jacob, the Hon. Mr. Kesteven, the Hon. Sir Vithaldas Thackersey, the Hon. Maung, the Hon. Mr. Graham, and the Hon. Mr. Miller. Mr. Frank Rawson, Manager of the Calcutta Electric Supply Corporation, has been appointed expert adviser to the Committee.

Faraday House.—An examination for a Faraday Entrance Scholarship, value 50 guineas per annum, and tenable for three years, will be held at the Electrical Standardising Testing and Training Institution, Southampton Row, London, on Wednesday, March 30th, and Thursday, March 31st, from 10 a.m. to 5 p.m., and on Friday, April 1st, from 10 a.m. to 4 p.m. Notice of intention to compete should be sent to the Secretary not later than March 21st.

ELECTRIC DRIVING OF REVERSING ROLLING MILLS

Ilgner Patent Declared Invalid

IN the Chancery Division of the High Courts on Monday, Mr. Justice Parker delivered judgment in the action brought by the Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke Akt.-Ges., of Zabcze, Germany, against the Electric Construction Co., Ltd., of London and Wolverhampton, for alleged infringement of the fundamental patent No. 7,188 of 1902, for the Ilgner system of electrically driving reversing rolling mills. We reported the evidence and proceedings in our issues of Feb. 3rd and 10th.

Mr. Justice Parker said the object of the patent in question was the protection of the source of supply from sudden demands entailed in starting the rolling-mill motor, and economy in controlling the motor, the latter being obtained by dispensing with rheostatic control. The particulars in the specification relating to the excitation of the dynamo meant, in his opinion, controlling the working motor by varying the field of the dynamo, and suggested the Ward-Leonard system, involving, although it was not stated, separate excitation of the fields of both dynamo and working motor. With regard to the claim, a good deal of difficulty arose from the expression "on starting." It might mean simply when the rolling mill is started and the motor switched on, and this seemed to correspond with what the inventor stated in the specification was his first object. On the other hand, it was obvious that the same result would follow whenever there was an increase of load, so that the inventor might mean that whenever work, or extra work, was thrown upon the rolling mill, the corresponding current was never demanded from the source of supply at the same moment, but that the demand on the source was only gradually increased. Although clumsily framed, he thought the specification might fairly be construed to mean that the Ward-Leonard system should be adopted for the sake of economy, with the addition of a flywheel on the motor-generator set, in order that any extra demand on the source of supply might be met gradually, the extra power required meantime being supplied by the flywheel. This was the essential feature of the specification, the only practical direction being that the motor should be so constructed as to slow up with the increased load, which was an obvious necessity if the flywheel were to act at all. The question of infringement depended upon whether the advantages of this combination had been taken and used by the defendants, and also whether invention was necessary to arrive at the idea. The defendants had taken the Ward-Leonard system with the flywheel, but they did not secure a drop of speed in the flywheel motor by winding the field-magnets in any particular way. They had, however, an automatic regulator in the field circuit of that motor which came into operation when the demand reached a predetermined maximum. Then the regulator automatically increased the strength of the field, causing the motor to slow up. The resistance was so arranged that there was no demand on the source in excess of the predetermined maximum. In other words, the extra demand was not thrown gradually on the source of supply, but was prevented from coming on it at all, the power required beyond the predetermined maximum being supplied by the flywheel. He was of opinion, however, that if Ilgner's patent were valid, the defendants had taken the substance of it, and had therefore infringed.

On the question of whether Ilgner's patent was valid, Mr. Justice Parker said the principle of this had been applied before 1902. The introduction of the motor-generator set for dealing with variable loads was Ward-Leonard's idea, and he did not think that any invention was involved in recognising that it was possible to use a flywheel in the case of certain loads. This must have been fairly obvious. In 1895 Ferranti patented a system in which he interposed a motor-generator between the working motor and the source of supply with a heavy flywheel which stored up energy. Ferranti, it was true, did not specify how his working motor was controlled, but he did not think this was necessary. This patent could be used for any circuits where the demand was sudden, and where it was undesirable to interfere with the source of supply, and there seemed no reason why it should not have been applied to a reversing rolling mill. It would then have been necessary to arrive at some system of control for the working motor, but he thought Mr. Ferranti would have used the same thing as described in the Ilgner specification, viz., the Ward-Leonard system. Indeed, in his opinion, it was the obvious system to apply. It had been said, quite truly, that the combination of the well-known principle of the flywheel with the well-known Ward-Leonard system of control was a new combination, though both its elements were old, and that this was sufficient to afford subject-matter if there were invention in the idea of carrying the combination into effect, or if the combination led to a new result. In his opinion, however, it could not be contended that there was any invention in carrying this idea into effect, and he did not think the combination led to any new result. It had been said that the idea of combining a flywheel with the Ward-Leonard system had rendered possible what would otherwise be impossible, viz., the working of reversible rolling mills by electricity when the current used was drawn from a central station. He was inclined to think that the real reason why reversing rolling mills were not run electrically until after Ilgner's patent was because electrical plant heavy enough for the purpose had not been brought to the requisite state of perfection. When this stage was eventually reached, it seemed to him that any competent electrical engineer would, without any aid from Ilgner, have said the only practical system of control was the Ward-Leonard, and that a flywheel was desirable. No invention was required to see that any falling off in speed in the working motor could be counteracted by varying the field of the intermediate dynamo. He therefore came to the conclusion that the patent was invalid for want of subject-matter, and the action failed.

MUSIC-HALL ELECTRICITY

IN the Appeal Court on Thursday, before the Master of the Rolls and Lords Justices Fletcher-Moulton and Buckley, the appeal of Samuel Murphy Bodie, known on the music hall stage as "Dr." Walford Bodie, against a judgment of Mr. Justice Darling, was heard. We gave full details of the case in ELECTRICAL ENGINEERING, Vol. V., pp. 953 and 970. "Dr." Bodie describes himself as a hypnotist and mesmerist, a bloodless surgeon, and a medical electrician, although he is not a qualified medical man in this or any other country. In 1903 he became acquainted with a young man named Irving, who signed an agreement to pay him £1,000 to serve as his pupil for three years at a salary of £2 10s. per week. In his performances upon the music hall stage "Dr." Bodie claimed to cure persons of paralysis and similar complaints, whilst under hypnotic influence, and also presented certain spectacular electrical effects. He also claimed to be able to withstand a higher voltage than any other person living. The whole of the performance, however, the plaintiff declared to be a fraud, and he claimed for the return of his £1,000. In this he was successful. All three Appeal judges expressed strong opinions upon the case, referring to the appeal as a hopeless one, and dismissing it without calling upon counsel for Mr. Irving. The Master of the Rolls said "Dr." Bodie was an ignorant, unscrupulous quack at the time he received the £1,000, and there was no doubt that the plaintiff had been swindled.

Advertising Electricity in London.—In connection with our article on this subject last week we omitted to state that the sub-committee appointed to deal with the details of the publicity scheme of the London Companies and Borough Councils is as follows:—Mr. H. B. Renwick (Chairman), County of London Electric Supply Co.; Mr. E. Cunliffe Owen, Metropolitan Electric Supply Co.; Mr. A. C. Cramb, Croydon Corporation; and Mr. E. Sayer, Hampstead Borough Council. We have just been informed that the proposal that provincial authorities should join the scheme has received very considerable support. The following is a list of those places who have so far signified their intention of doing so:—Loughborough, Harrogate, Nuneaton, Lowestoft, Midland Co. (Leamington), Aberdeen, Blackpool, Gosport, Leatherhead, Newmarket, Weymouth, Wolverhampton, Dundee, Derby, Devonport, National Electric Supply Co. (Preston), Mansfield, Grimsby, Tunbridge Wells, Ipswich, Northampton, Southampton, Hanley, Ross, Bournemouth, and Coatbridge.

Illumination.—In the second of the three Thursday afternoon lectures on this subject at the Royal Institution, London, Prof. S. P. Thompson dealt with the subject of sources of light. After referring to the work of Tyndall and the later researches of Langley on the distribution of radiant energy in the spectrum, the lecturer pointed out that for every temperature of the radiating source there was a dominant wave-length of radiation. The sun, at an estimated temperature of 5,880° C., gave a dominant wave-length of 50-centimetres, just the wave-length to which the eye was most sensitive. The dominant wave-length from the arc crater, at a temperature of 3,800° C., was 72 mcm.; that from the Nernst blower was 128 mcm. The visible region was between 40–80 mcm. The dominant wave-length radiated from a perfectly black body was inversely proportional to its absolute temperature. All bodies radiated less than a perfect black body, but gave out a greater proportion of rays within the visible region, and were therefore more efficient as illuminants. There were two ways of increasing the light emitted from a hot body. One was to increase its temperature, and the other was to use a body which gave out specific radiations, that is light rays of one or more definite wave-lengths. An example of the former was the substitution of tantalum and tungsten for carbon in filament lamps, as the former could be run at a much higher temperature without disintegrating, and an example of the latter was the use of salts in arc-lamp carbons, where an increase in the amount of light given off in the visible spectrum was obtained without an increase of temperature. This was demonstrated by projecting a flame arc-lamp spectrum on the screen showing the bright lines produced from the glowing gases. The salts used for this purpose were those of barium, sodium, and calcium, according to the colour desired.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 24th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

2,733/09. **Circuit-breaker.** J. E. SPAGNOLETTI. The simple circuit-breakers described in ELECTRICAL ENGINEERING, Vol. V., page 1038. Four claims, six figures.

3,191/09. **Resistances.** A. H. CURTIS and ADAMS MANUFACTURING Co. A long strip of resistance metal is stretched zigzag between two insulated heads with radial arms. These heads are carried loosely on a central rod, and forced outwards by springs, thus keeping the strip in tension. The strip is wound so that its flat sides are radial to the rod, thus assisting cooling. Tape of woven metal wire may be used instead of strip. Four claims, fourteen figures.

4,164/09. **Tungsten Filaments.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). Agar-agar is chopped fine and boiled with water to form a solution containing 3 per cent. carbonaceous material and 97 per cent. water. Tungsten powder is added in the proportion of one part tungsten to five parts of solution, and the mixture is kept alkaline by addition of ammonia. The mixture is squirted hot through a water-cooled die at a low pressure. The threads produced are initially conductive, and only require reducing in an atmosphere of H and N. A diamond die is not needed as the mixture is so soft. Four claims.

15,421/09. **Commutators.** BRITISH THOMSON-HOUSTON Co. and W. F. DAWSON. To provide efficient ventilation, and thus obviate expansion of the bars in commutators held together by shrink rings, the latter are supported from rigid rings on the shaft, at either end of the commutator. A space is left between the segments and the boss, holes are provided in the end rings, and the insulation between the bars is omitted, except at the ends. Air drawn in under the bars is forced out between them radially to the commutator. Three claims, one figure.

16,170/09. **Cascade Induction Motor.** L. J. HUNT and THE SANDYCROFT FOUNDRY Co., LTD. This specification describes a modification of the well-known cascade motor, in which there are two windings in stator and rotor, giving two different numbers of poles, and interconnected in such a way that they will work in cascade. Extra windings are inserted in the slots left free by the omission of certain bars which neutralise one another, and these are connected to the rotor windings and to slip rings. When the slip rings are short-circuited, the rotor as a whole produces only one number of poles, and this gives another economical speed. Five claims, sixteen figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: HOLMAN, 3,371/09; MILLAURO, 14,165/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: PECK, FAYE-HANSEN, and LUSTGARTEN [A.-C. distribution system] 3,046/09; MONNIER [Distributing box] 13,129/09.

Dynamos, Motors, and Transformers: SCHULZ [Unipolar turbo-dynamo] 2,755/09; PECK [Motor control] 3,533/09; LANCASHIRE DYNAMO & MOTOR Co. and STELLING [Rotors of A.-C. motors] 6,477/09; HIRST and KRAUSE [Fan motors] 9,706/09; MCLEAN [Brush-holders] 12,774/09; HÖHME [Brush-holders] 24,276/09.

Electric Ignition: MUELLER [H.-T. magnetos] 17,663/09.

Electrometallurgy and Electrochemistry: BACKUS [Electroplating apparatus] 8,734/09; COWPER-COLES [Regenerators for electro-zincing process] 11,842/09.

Heating and Cooking: FENNELL and PERRY [Radiators] 3,554/09; GOLD [Vehicle heating] 3,730/09; BERRY [Heating apparatus] 17,353/09.

Incandescent Lamps: WESTINGHOUSE METAL FILAMENT LAMP Co. (*Lederer*) [Metal filaments] 6,936/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Lamp-making machines] 8,351/09.

Instruments and Meters: DANNATT [Meters] 3,176/09; PALATINE ENGINEERING Co. and ANTHONY [Clocks for recording instruments] 3,296/09.

Storage Batteries: GARDE and ADAMS [Plates] 2,749/09; FRIEDRICH [Regenerating accumulators] 19,111/09.

Switchgear, Fuses, and Fittings: RAWLINGS [Switch] 373/09; BAERLOCKER [Motor controller] 2,715/09; RORKE and RORKE [Switches] 2,754/09; THOMAS [Controller] 2,943/09; SIMPLEX CONDUITS, LTD., and ELLIOTT [Switches and lamp adapters] 3,105/09; DANNATT [Automatic switches] 3,176/09; BOWRON [Lamp-holder locking device] 3,674/09; SEDGWICK [Lamp-holders] 8,077/09; KENNEDY-MCGREGOR [Circuit-closers] 9,094/09; BRAZIL and COOCH [Protective devices for A.-C. systems] 10,663/09; CHARLES H. PUGH, LTD., and BULL [Wiring conduit fittings] 10,739/09; MACDIARMID and BATES [Switches] 12,335/09; DUSSERIS [Switch for electromagnetic clutch] 20,413/09; WATERHOUSE [Coupling] 24,771/09; BRAMPTON and OSBORNE [Conduit fittings] 24,892/09; RAWLINGS [Tumbler switch] 27,446/09.

Telephony and Telegraphy: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Telephone exchanges] 24,812/09.

Traction: WHITELEY [Tramcar lifeguard] 2,787/09.

Miscellaneous: BLAND [Mariners' compass] 2,637/09; CREESE [Clocks] 3,851/09; REASON and REASON MANUFACTURING Co. [Winding devices for time-switches, &c.] 3,854/09; PEARSON [Textile fabrics with electrical properties] 4,677/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: HEIMANN and SCHAFFER [Series burning] 2,362/10.

Dynamos, &c.: MILTON [A.-C. generator] 27,033/09.

Electric Ignition: BRIGGS, 2,438/10.

Instruments, &c.: FELTEN & GUILLEAUME LAHMEYERWERKE A.-G. [Checking consumption of lamps] 2,432/10.

Traction: BEAUDENON [Automatic switch] 2,533/10.

Miscellaneous: SPECIALFABRIK FÜR ALUMINIUM SPULEN UND LEITUNGEN GES. [Production of insulating film of oxides on wires] 2,711/10.

Amended Specification Published

The following amended Specification can now be obtained.

12,739/02. **Lamp Cap.** A. SWAN (General Electric Co., U.S.A.). This specification describes a lamp cap with a glass button uniting the contacts and interlocked with the shell. See ELECTRICAL ENGINEERING, December 30th, 1909, Vol. V., p. 1104.

Opposition to Grant of Patents

21,580/08. **Flywheel Load Equaliser.** AKT.-GES. BROWN, BOVERI & CIE. The grant of this patent has been allowed in spite of opposition. A three-phase commutator motor is connected in cascade with an induction motor coupled to the flywheel, and an automatic regulator is inserted in the field circuit of the commutator motor.

16,328/09. **Tungsten Filaments.** C. H. WEBER. Opposition has been entered to the grant of this patent. The specification was abstracted in ELECTRICAL ENGINEERING, January 6th, 1910, p. 16, and describes a process for treating tungsten powder with pyridine or quinoline to render it less liable to oxidise.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

5,274 of March 9th, 1896. **Electroplating.** A. S., T. A., R. J., and S. SMITH and T. DEAKIN. Apparatus for producing a bright deposit of nickel in one operation. The articles to be plated are put in a rotating drum immersed in the electrolyte. The rotation caused them to rub against each other and against copper cathodes in the drum.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. J. DAVY [Hot-wire mechanism] 24,235/03; A. HESS [Arc with incandescent mantle] 23,035/05.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON Co. (*C. P. Steinmetz, U.S.A.*) [Regulation of three-wire systems] 22,533/99.

Dynamos, &c.: BRITISH THOMSON-HOUSTON Co. (*C. P. Steinmetz, U.S.A.*) [A.-C. generator] 22,534/99; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Regulation of synchronous motor-generator sets] 24,715/02; A. F. HILLS, D. URQUHART and A. E. HONEY [Strip field coils] 24,464/04; A. P. WOOD and LANCASHIRE DYNAMO & MOTOR Co. [Flywheel load equaliser] 22,654/05.

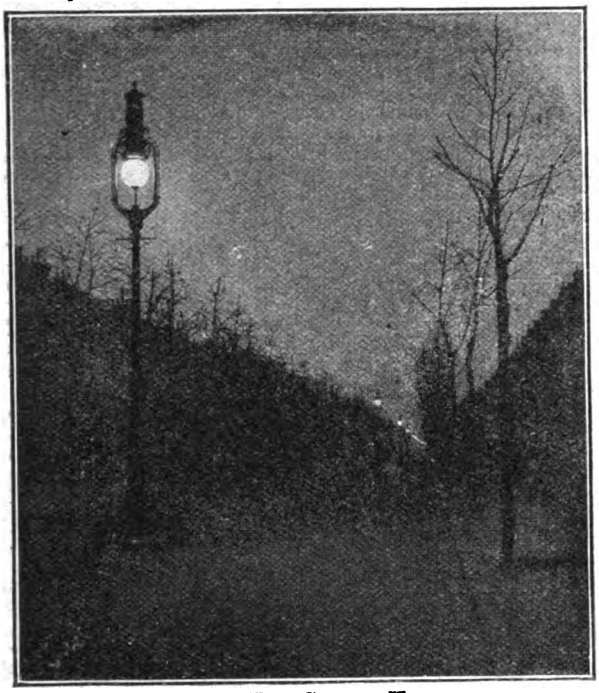
Electric Ignition: F. R. WADE [Commutators] 24,356/03; G. H. SMITH (*A. P. Boulanger*) 22,802/05.

Electrometallurgy, &c.: F. E. ELMORE [Combined unipolar dynamo and electrolytic apparatus] 24,330/02; F. BAGNALL [Electroplating] 22,901/05; W. TISCHNOFF [Making joints by electro-deposition] 23,094/05.

Switchgear, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Loose-handle switch] 22,856/05; D. BACON [Control of lifts and machinery] 22,939/05; A. STEWART [Lifting magnets] 23,016/05.

Telephony, &c.: L. L. HARTVIGSON [Submarine telegraph cable] 23,411/98; L. KAMM [Printing telegraphs] 22,874/05; W. P. THOMPSON (*Ges. für Drahtlose Telegraphie*) 23,211/05.

Traction: W. BRIERLEY [Signalling] 24,841/96; P. R. WILLIS (*G. W. Whitman, U.S.A.*) [Rail-bonds] 22,686/05; E. LAWRENCE [Operating points] 23,083/05.



Miscellaneous: J. WETTER (*Elektrizitäts A.-G.*) [Iris shutter for signalling lamps] 23,399/98; J. Y. JOHNSON (*A. Wolf & Co.*) [Thermo-electric batteries] 24,177-8/04; G. A. GRANSTRÖM [Magnetic separating] 22,731/05; T. HARRISON and A. S. FRAZER [Indicators] 22,741/05; F. H. HADFIELD [Ships' telegraphs] 22,819/05; J. OWEN [Fire-alarm] 22,861/05; C. BRIGHT [Receipt register] 22,897/05; T. H. LARGE [Electromagnetic hammer] 23,075/05; J. MOORES [Fire alarm] 23,194/05.

For Patents relating to Electrical Engineering in Mines, see p. XXV. of Supplement.

OSRAM LAMPS FOR STREET LIGHTING

EVIDENCE is gradually accumulating of the very great value of metal filament lamps for the lighting of streets and other open spaces. In The Grove at Hammersmith, a wide busy thoroughfare, 400-c.p. Osram lamps have been fitted in the arc lanterns, and at a recent meeting of the Hammersmith Borough Council the Electricity and Lighting Committee reported that, by converting the system as indicated, the cost of the electricity department for lighting The Grove has been reduced by no less than £40 per annum, equivalent to a saving

Osram Lamps in The Grove, Hammersmith.
(*Photograph taken at night.*)

of £2 16s. per lamp per annum. This testimony, coming as it does from absolutely independent and unprejudiced sources, confirms the optimistic predictions that were originally made for Osram lamps for street lighting, and there now seems no doubt whatever that its wide adoption for this purpose is assured. With regard to the life of Osram lamps for street lighting, records to hand show that they burn for an average of over 3,000 hours, which entirely disposes of the suggestion that has frequently been made, that these lamps would not withstand the vibration in busy thoroughfares due to heavy traffic.

We hope to give from time to time the cost of using Osram lamps for street lighting in other London districts.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

A RECENT number of *Metallurgical and Chemical Engineering*, which is the new name given to the journal formerly known as *Electrochemical and Metallurgical Industry*, contains an interesting article by Assar Grönwall on why electro-steel is sometimes non-homogeneous. He states that in one and the same ingot, the one end may be of high quality, while the other end may be quite inferior. Most of the high grade steel which is produced in the electric furnace has been made from cold raw material—from pig and scrap iron. The furnaces employed are mainly of the following types:—(1) Single-phase electrode furnaces with two adjustable electrodes (Héroult type); (2) single-phase electrode furnaces, with one adjustable electrode and one bottom electrode (Girod type); (3) induction furnace. The author considers the want of uniformity of the steel produced is due to unequal heating. In the Héroult furnace, for instance, the metal is heated by conduction through the slag; the surface is thus hotter than the metal at the bottom, because the hotter metal is lighter than the cooler. With the Girod type of furnace, where there is one electrode above and one below, this is less likely to happen, but the side portions may not be equally heated. With induction furnaces, if the cross-section of the bath is perfectly uniform, the heating should be uniform, but if after use a part of the lining is eaten away, enlarged cross-section ensues at that point, and less heat is developed just where more heat is required because there is more metal at this point. The Swedish Elektrometal Company have recently patented and placed on the market a new type of electric steel furnace. The furnace contains four electrodes, two at the bottom and two adjustable ones vertically suspended. The electrical energy is supplied in the form of two-phase current. The adjustable electrodes have each one of the terminals of the two-phase supply connected to them; the other two terminals are connected to the bottom electrodes. A rotating magnetic field is produced in the bath, causing a circulation of the metal which it is claimed is sufficient to obtain homogeneous mixing and uniform temperature at all parts of the bath. Finally, Mr. Grönwall remarks, "The attendance of an open hearth furnace is never left to a person with less than one year's experience. . . . The electric furnace has been in practical use for too short a time. There are to-day not yet many men thoroughly familiar with the running of an electric steel furnace for high-grade steels. But after some years' experience the electric furnace will displace the crucible furnaces which are uneconomical."

A works for the production of nitrates by the Pauling process has been at work for some time at Patsch, near Innsbruck, Tyrol. The plant was supplied chiefly by the Felten & Guilleaume-Lahmeyerwerke A.-G., of Frankfort, and consists of 24 furnaces taking 400 kw. each at 4,000 volts, and delivering 60 gms. of nitric acid per kw.-hr. The 1,600 K.V.A. 11,000v./4,000v. single-phase transformers used are of the water-cooled oil pattern. For starting and controlling the arcs, auto-transformers of the same type are employed; these deliver 165 amp. at 2,000 volt. Full details of the process were given in Electrical Engineering, Nov. 11th, 1909, Vol. V., p. 964.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

TELEPHONE SWITCHBOARDS.—A leaflet from British Insulated & Helsby Cables, Ltd. (Prescot), describes a new wall pattern board, with plugs and drop indicators, for private branch exchange up to ten lines. A new magneto mining telephone, of which details are given in our supplement on Electrical Engineering in Mines is also described.

METAL FILAMENT LAMPS.—A price sheet, which supersedes page 5 of the latest lamp catalogue of the Electrical Co., Ltd. (Lamp Department, 121-124 Charing Cross Road, W.C.), gives notice of a general reduction in the list prices of Aegma lamps. The principal reductions are as follow:—16-c.p. 60 to 130 volt lamps, from 2s. 9d. to 2s. 6d.; 25-, 32-, and 50-c.p. 60 to 130 volt lamps, from 3s. to 2s. 6d.; and 50-c.p. 200 to 260 volt lamps, from 4s. to 3s. 6d. The prices of the 16-c.p. low-voltage and 25-c.p. high-voltage lamps remain as before.

TECHNICAL BOOKS.—The latest catalogue from Lewis's Medical and Scientific Circulating Library (136 Gower Street, W.C.) contains a section on electrical and engineering works which has been brought up-to-date by various additions.

PREPAYMENT METERS.—A handsomely got-up catalogue from Messrs. Ferranti, Ltd. (Hollinwood, Lancashire), gives very full particulars of the Ferranti prepayment meter in all its forms. Excellent illustrations are given of the complete prepayment mechanism, as well as its component parts, with particularly clear explanations. The general principle of the prepayment attachment was explained in Electrical Engineering, Oct. 29th, 1908 (supplement, page 40), in connection with the Manchester Electrical Exhibition.

ACCUMULATORS.—An effective showcard, with a boldly drawn representation in black and white of an accumulator cell, is being issued by Messrs. Pritchetts & Gold (58 Victoria Street). A copy will be sent post free upon application to them.

Reduction of Prices of Tantalum Lamps in Germany.—Messrs. Siemens & Halske have decided to reduce the price of all sizes of tantalum lamps in Germany after March 10th. The 25, 32, and 50 c.p. 100-130 volts lamps will be reduced to 2mk. (approx. 2s.) each, and the other sizes proportionately.

Statue of Lord Kelvin.—A meeting of the Executive Committee for the Lord Kelvin Statue Fund was held at the City Chambers, Glasgow, last week. Three models in clay were exhibited for inspection, and in the design accepted Lord Kelvin is seated, and is wearing his professional robes. The consideration of the site upon which the statue is to be erected has been postponed for the present.

Wireless Telegraph Notes.—The Pacific Radio-Telegraph Co. proposes to link up the islands of the Pacific Ocean by wireless telegraphy. It is stated that the British Radio-Telegraph & Telephone Co. propose erecting a wireless telegraph station on the South Wales coast with a radius of 150 miles. At present there is no wireless station on this coast.

The *Times* Vienna correspondent states that the new Austrian wireless telegraph station at Pola was opened on Sunday. The normal range is 500 kilometres.

Marconi's Wireless Telegraph Co. have received instructions to equip ss. *Mesaba, Manitou, Menominee,* and *Morquette,* of the Atlantic Transport Line; the *Samland* and *Gothland,* of the Red Star Line; the *Afric, Medic, Persic, Runic, Suevic, Athenic, Orinthic,* and *Ionic,* of the White Star Line; and four steamers of the Cestrian class in the service of the Leyland Line.

LOCAL NOTES

BECKENHAM: *"Free" Wiring.*—At the last meeting of the Council, Mr. A. H. Dykes, who recently resigned the chairmanship of the Electricity Committee, gave his reasons for so doing. He said he was dissatisfied with the policy of the Committee in continuing their present system of "free" wiring. At present they were spending 23s. 3d. per lamp installed, although the original estimate was 12s. They had £22,613 locked up in "free" wiring and fittings, and so far from the rentals approximately balancing the interest and sinking-fund payments, the rentals last year amounted to only £935, whilst the interest and sinking-fund charges were no less than £2,643, leaving a deficit of £1,708, which was included in the accounts under general repairs. The average cost throughout the country for wiring and fitting of this description was 15s. or 16s. Further, the Committee recently decided to allow such consumers not only to further reduce their bills by putting in transformers and metal filament lamps, but the department was actually bearing the expense of the lamps and the transformers. In conclusion, Mr. Dykes expressed the opinion that it was impossible to manage a highly technical trading department with a board of nineteen members. An Executive Committe of not more than three members seemed to him the best solution of the problem.

BRIGHTON: *"Free" Wiring.*—The proposal of Messrs. Page & Miles, Ltd., to undertake the wiring of small premises, the Corporation charging an additional 1d. per unit, which is to be paid over to the wiring contractors, has been adopted by the Corporation on the understanding that any wiring contractor in Brighton may undertake similar work on similar terms. When the consumption reaches 240 units per point installed, the fixtures become the property of the owners of the premises.

CHICHESTER: *Street Lighting.*—The Chichester Electric Light & Power Co. have asked the Council's permission to tender for the street lighting of the city.

DUNDEE: *Opening of New Power Station.*—The new Carolina Port power-house of the Corporation was opened by Professor J. A. Ewing on Wednesday last week.

GUERNSEY: *Telephone Accounts.*—The accounts of the States Telephone Department for 1909 show a net profit of £436, after setting aside £1,215 to depreciation.

HALIFAX: *Trolley Omnibus.*—The Soyland District Council have petitioned the Tramways Committee for an extension of the tramways on the railless traction system. The communication has been referred to the Tramways Sub-Committee.

Tramways.—It is stated in the local papers that important recommendations in regard to the more effective and complete management of the tramways and electricity works are to be submitted by the Tramways and Electricity Committee to a "Council in Committee" to be held shortly.

INDIA: *Electricity Supply.*—The Punjab Government have granted a licence to the Simla Municipality for the supply of electrical energy for all purposes.

LEICESTER: *Tramway Accounts.*—After meeting all capital charges the accounts of the tramways undertaking for the past year show a net profit of £10,699, which is less than the amount in the previous year by £651. The Council supply power from their tramways station, and as there is every appearance of a greatly increased demand in the present year, extensions to the generating plant are recommended.

LONDON: *London County Council.*—A new tramway route between the "Plough," Clapham, and Queen's Road, Lavender Hill, was inspected last week on behalf of the Board of Trade by Colonel Yorke, and the public service was begun on Saturday.

Highgate Hill Tramway.—Trial cars have been run up and down Highgate Hill over the reconstructed track. The new brake which has been specially designed for this line worked satisfactorily.

Bermondsey: Power Supply.—Having regard to the fact that the Electricity Committee have three strong competitors (the two electric lighting companies and the gas company) ready to take advantage of the publicity given to negotiations about to be undertaken by the Committee in relation to electric supply, it has been decided that the Committee is to have power to make special terms with large consumers, subject to full particulars being reported to the Council. No publication of the information will be made.

Hampstead: Street Lighting.—It has been decided to substitute Oliver magazine flame arc lamps in Finchley Road for the arc lamps at present in use, and to extend the arc lighting of that road to Platts Lane. One hundred and fifty-nine street gas lamps in Cricklewood, Kilburn, and West End districts are to be converted to electricity, each lantern to be fitted with two 35-watt metallic filament lamps. This is the first step towards the conversion of the whole 2,237 street gas lamps in the borough to metallic filament lamps. The Electricity Committee report that this will bring about an immediate saving of £587 per annum, and a saving of £2,749 per annum after the end of eight years.

Marylebone: Telephone System of Charging.—The highest demand allowed for in the Council's telephone system of charging is 200 kw., in respect of which the standing charge is £4 10s. per kw. per annum. The committee have now decided to reduce this charge to £4 for consumers whose demand is over 400 kw.

MACCLESFIELD: *Electric Supply and Tramways.*—In connection with the recent decision of the Council not to put into force its electric lighting powers, a deputation from one of the trolley omnibus companies has visited Macclesfield with the object of putting forward a scheme of railless cars in conjunction with the supply of electricity

SOUTH SHIELDS: *New Electric Plant.*—At the last meeting of the Corporation a resolution was moved to rescind resolutions previously come to by the Corporation empowering the Electrical Committee to accept tenders for new plant at the electricity works, at an estimated cost of £8,500. Councillor Henderson, who moved the resolution, said he did so in consequence of a statement by the Borough Electrical Engineer that, if he had known that a certain prospective consumer would not take power from the Corporation, he would not have recommended the additional plant in question. The Chairman of the Electricity Committee, however, stated that whether this particular consumer did or did not take power from the Corporation, the extensions were absolutely necessary, as at present there was only a spare in the power-house of 7 per cent. The previous decision of the Council was adhered to on a division.

SUNDERLAND: *Supply to Messrs. Laing & Sons.*—In the Chancery Division on Thursday the Corporation appealed from the refusal of the liquidator in the reconstruction of Messrs. James Laing & Sons, Ltd., to admit a claim of the Corporation in respect of electricity. The firm entered into an agreement with the Corporation for the supply of electrical energy for a term of fifteen years at a minimum rent of £1,500 per annum, and the transforming plant which the Corporation installed upon the premises of Messrs. Laing cost £21,000. The firm disputed the agreement on the ground that it did not bear the seal of the Corporation, although the arrangement had been carried through by an official of the Corporation. Mr. Justice Nevill took the view that the Corporation had never expressed its assent to the contract by attaching its seal to it. The liquidator's refusal to admit the claim must stand.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BARKING.—The Electrical Engineer is to prepare a report upon alternative schemes for extending the present plant or removing the works to a riverside site.

FALKIRK.—The Town Council have decided to extend the electricity works at an estimated cost of £12,000.

HESTON AND ISLEWORTH.—The Engineer is to prepare plans to provide for 250 kw. extra in readiness for the next winter.

LONDON: *Fulham.*—Application is to be made to the L.C.C. for sanction to borrow £6,880, made up as follows:—Mains extensions, including transformers, switch-gear and sub-stations, £2,880; electricity meters, £1,000; house connections, £3,000.

Hackney.—The Finance Committee of the L.C.C. recommend a loan of £7,137 for electrical extensions.

Islington.—The Finance Committee of the L.C.C. recommend a loan of £4,778 for electrical extensions.

Shoreditch.—The Finance Committee of the L.C.C. recommend a loan of £2,234 for electrical extensions.

Stepney: The Finance Committee of the L.C.C. recommend a loan of £16,300 for electrical extensions.

LONDONDERRY.—A scheme of the Borough Electrical Engineer for extensions of the electricity undertaking to meet the requirements of the next five years has been approved, as follows:—Steam turbine, piping, &c., £3,950; alternative, reciprocating engine, &c., £3,040; switchboard extension panels, &c., £220; economiser, piping and flues, £571; feeder cable, &c., £530; additional boiler, setting of same and piping, £650—total, with turbine, £9,091; total, with reciprocating engine, £8,181.

NORWAY.—Tenders are invited by the Christiania Electric Works for the supply of cables. Copies of the specifications can be seen at the Board of Trade Office, 73 Basinghall Street, London, E.C.

RHYL.—The Local Government Board have sanctioned a loan of £4,000 for electrical extensions.

SOUTHAMPTON.—A further loan of £3,000 is to be raised for mains and services with regard to a supply for power to Messrs. Day, Summers & Co., Ltd.

WALTHAMSTOW.—Application is to be made to the Local Government Board for sanction to borrow £1,210 for extensions at the electricity works.

WARRINGTON.—Tenders are to be invited for new generating plant.

Digitized by Google

Miscellaneous

BELFAST.—The Harbour Commissioners invite tenders by March 9th for twenty-two electric arc lamps. Particulars from the Harbour Engineer.

POWELL DUFFRYN STEAM COAL CO.—Tenders are invited for the supply of electrical stores for the year to March 31st, 1911. Particulars from the Secretary, 101 Leadenhall Street, London, and tenders by March 14th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.—Tenders are invited by the L.C.C. for the wiring and fitting of the Camden Street Central School. Particulars from the Chief Engineer to the Council, and tenders by March 23rd.

W.—Electric theatre, Praed Street, W. M. S. Ward, architect, 104, Victoria Street, S.W.

Shops, Uxbridge Road, Shepherd's Bush (£6,600). F. H. Witts, architect, 60 Uxbridge Road, W. Builders, Kingerlee & Sons, Oxford.

S.E.—Lecture hall at Horniman Museum, Forest Hill, S.E. (£4,500), for Emslie J. Horniman, Garden Corner, Chelsea Embankment, S.W.

Building, High Street, Peckham, for the Electric Theatres Bureau, Ltd., 18 Charing Cross Road, W.C.

S.W.—Roman Catholic School, Earlsfield, S.W. (500 places). Trustees, St. Gregory's Church.

PROVINCES.

ACTON.—School (£10,000). Architect, Education Committee, Acton.

BARNSTAPLE.—Public baths (£3,500). E. Y. Saunders, Borough Engineer, Barnstaple.

CHESTER.—Baths (£3,000). Architect, W. T. Lockwood, Foregate Street, Chester.

COVENTRY.—Additions, Radford School (£4,000). Builder, A. J. Lord, Wolston.

DARLINGTON.—Additions to workhouse (£3,300). Architects, Palliser & Son, Crook, co. Durham.

Co-operative premises (£3,000). Architects, Clark & Móscrop, Priestgate, Darlington.

School (£4,000). G. Winter, Borough Surveyor, Town Hall, Darlington.

DARTFORD (Kent).—Additions to Darenth Asylum (£5,250). Architect, T. W. Aldwinckle, 20 Denman Street, E.C.

DOVER.—Club, Eythorne (£1,200). Architects, Worsfold & Hayward, Market Square, Dover.

Baptist Sunday Schools (£3,250). Architects, Worsfold & Hayward, Market Square, Dover.

DUNDEE.—Extension, Balfour Street School (£4,500). Architect, J. H. Langlands, 81 Murray Gate, Dundee.

DUNFERMLINE.—Workshops and offices, Woodhead Street (£5,000). Architects, Normand & Thomson, 21 Queen Anne Street, Dunfermline.

EXMOUTH.—Post offices and block of shops (£4,322). Architect, E. E. Ellis, Polslow Road, Exeter. Builder, Mr. Hayman, Exmouth.

SOUTHEND-ON-SEA.—Congregational Hall and school, Crowstone Road (£6,000). Builder, F. B. Woodham, Southend.

SHREWSBURY.—Slaughterhouses. Architect, A. Williams, High Street, Shrewsbury.

SWANSEA.—Theatre. Architect, C. Ruthen, Heathfield Street, Swansea.

WARRINGTON.—School (£14,000). Architect, T. A. Butts, Morley.

WALSALL.—Factory (£6,000). Builders, Brodrick & Son, Walsall.

WEST BROMWICH.—School (£18,000). Wood & Kenwick, High Street, West Bromwich.

WALTON (Liverpool).—Laundry at workhouse (£19,000). Architect, C. H. Lancaster, Brougham Terrace, Liverpool.

TENDERS RECEIVED AND ACCEPTED

ASHTON-UNDER-LYNE.—The following tenders are recommended for acceptance: Condensing plant, Messrs. W. H. Allen, Son & Co., Ltd.; cooling tower, The Blasberg Engineering Co., Ltd.; turbine generator, Messrs. Willans & Robinson, Ltd., Rugby, with Bruce Peebles dynamo; balancer, The Phœnix Dynamo Manufacturing Co., Ltd.

AUSTRALIA.—The tender of the General Electric Co., Ltd., through their Melbourne agents, has been accepted for the equipment of the Hawthorn Telephone Exchange at £14,317.

BRITISH COLUMBIA.—Four 4,000-kw. generators are being supplied to the British Columbia Electric Railway Co. by the Allis-Chalmers Co. These generators will be direct coupled to Doble impulse water-wheels.

LONDON: *London County Council.*—The following tenders have been received for the supply of 880 yards of plough leads for electric cars:—India Rubber, Gutta Percha & Telegraph Works Co. (accepted), £147 5s.; St. Helens Cable & Rubber Co., Ltd., £150; Callender's Cable & Construction Co., Ltd., £155 6s.; Johnson & Phillips, Ltd., £155 6s.; alternative tender, £159 2s.; British Insulated & Helsby Cables Co., Ltd., £155 6s.; alternative tender, £159 2s.; W. T. Henley's Telegraph Works Co., Ltd., £155 6s.; alternative tenders, £159 2s. and £163 6s.; Siemens Bros. & Co., Ltd., £155 5s.; Craigpark Electric Cable Co., Ltd., £163 6s.; W. T. Glover & Co., Ltd., £190.

The tender of Messrs. Kirk & Randall, of Woolwich, has been accepted at £39,883 for the track-work of the tramways from Streatham to Tooting Junction, and also in Wimbledon Road.

MORECAMBE.—The following tenders have been received for the supply of superheaters at the electricity works:—McPhail & Simpson (*recommended*), £135; A. Bolton & Son, £147; Galloway's, Ltd., £150; James Gordon & Co., £154; T. Sugden, Ltd., £155; Tinkers, Ltd., £160; John Thompson, £175; Musgrave & Sons, Ltd., £179; Mechan & Sons, £189; Heenan & Froude, Ltd., £329.

PLYMOUTH.—The tender of Messrs. Walter Scott, Ltd., of Leeds, has been accepted by the Tramways Committee for the supply of 100 tons of tram-rails at £8 per ton, and fish plates at £10 per ton.

SOUTH AFRICA: *Johannesburg.*—The tender of Mr. H. Rainey, of Johannesburg, at £43,408, has been accepted for new tramway trackwork.

SOUTHAMPTON.—The Council have accepted the tender of the United Electric Car Co. for six Brill trucks for the Tramway Department, at £40 each.

SUTTON COLDFIELD.—The tender of Messrs. Callender's Cable & Construction Co. has been accepted at £3,419 for cables for supplying the Wylde Green district.

UXBRIDGE.—The Council have accepted the tender of Glenfield & Kennedy at £50 10s. for an electrical tell-tale apparatus for the waterworks department.

COMPANIES' MEETINGS AND REPORTS

DIRECT UNITED STATES CABLE CO.—The accounts for the half-year to December 31st show a net profit of £35,047, in addition to £3,595 brought forward. After meeting the interim dividends of 4s. per share on the half-year, the sum of £7,500 has been added to reserve fund, and the balance of £6,859 carried forward.

CHATHAM & DISTRICT LIGHT RAILWAYS CO.—The report for the half-year to December 31st shows a balance of £9,358, including £1,730 brought forward. The sum of £4,000 has been transferred to reserve for depreciation, and dividends at the rate of 5 per cent. per annum on the ordinary shares for the year, are recommended. The sum of £298 is carried forward. The traffic receipts show an increase of £763 compared with the corresponding half-year of 1908, whilst there is a reduction of £949 in the expenses.

LIVERPOOL OVERHEAD RAILWAY CO.—The accounts for the December half-year show a net profit of £8,965. The five per cent. preference dividends are recommended, and a balance of £4,514 is carried forward. Although the number of passengers carried during the half-year increased, there was a decrease in the revenue of £380. There was, however, a reduction in working expenses of £1,345.

WESTMINSTER ELECTRIC SUPPLY CORPORATION.—There is a net balance of £55,622 for 1909. The full dividend on the preference shares is recommended, in addition to 10 per per cent. on the ordinary shares, carrying forward a balance of £21,116. The cash award in the arbitration with the L.C.C. in connection with their acquisition of the company's Millbank Street station was, exclusive of the exchange of site, £188,471, and this has been applied to the equipment of the new power-house in Horseferry Road.

TYNESIDE TRAMWAYS & TRAMROADS CO.—There is a net profit of £2,715 for the December half-year. After meeting preference dividends, and 1½ per cent. on the ordinary shares, and placing £600 to reserve for renewal and depreciation, a balance of £521 is carried forward. At the meeting last week the report and accounts were adopted. The passengers carried increased by nearly a quarter of a million compared with a decrease in the previous year of 559,000.

BRITISH ELECTRIC TRANSFORMER CO.—There was a net profit of £11,774 for 1909, in addition to £1,120 brought forward. Depreciation fund is credited with £1,000, and reserve fund with £4,000, and after meeting the dividend on the 6 per cent. preference shares and 5 per cent. on the ordinary shares, a balance of £1,254 is carried forward. At the annual meeting last week, Mr. J. F. Allbright, who presided, said that within the year the company had entered into licences in two very important directions, and had further negotiations of somewhat similar character and effect. Without giving details, he mentioned that these did not tend to the formation of trade ring or pool, or to the inflation of prices, but while they were specific in some directions and general in others, the objects aimed at were to see how makers of transformers could work together instead of against each other.

LONDON ELECTRIC SUPPLY CORPORATION.—There was a profit of £50,686 for 1909, to which has to be added £3,408 brought forward. After meeting interest on temporary loan, debenture interest, the dividend on the 6 per cent. pre-

Digitized by Google

ference shares, 2 per cent. dividend on the ordinary shares, and adding £5,000 to reserve, a balance of £3,418 is carried forward. In spite of the expiration during the year of the contract with the L.C.C. amounting to £16,158, the total decrease in revenue was only £2,523. The supply to the L.B. and S.C. Railway had been maintained without a failure of any kind. A contract was now being negotiated with the railway company for a further supply of power.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO.—The net profit for 1909 was £307, which has been added to depreciation and reserve fund account. There has been a reduction in gross profit due to the use of metal filament lamps, and the Board decided to increase the charge for current from January 1st, 1910. The directors regard the new contract with the City Corporation (Electrical Engineering, November 25th, 1909, Vol. V., p. 1003) as satisfactory. No dividend is recommended.

ISLE OF WIGHT RAILWAYS.—At meetings of the Isle of Wight Central Railway Co. and the Isle of Wight Co. last week, the question of converting the lines to electric traction was referred to. It was stated that no definite scheme has been proposed, and the object of the proposals which had been made seemed to be to throw the whole of the risk upon the railway companies. Their financial position did not warrant this, and in view of the fact that the railways continued to make satisfactory progress, it was not thought that the small extra traffic shown by the proposals in question would justify the expense in fault.

NATIONAL TELEPHONE CO.—At the annual meeting on Thursday, the reports and accounts were adopted. Mr. George Franklin, the President, stated that negotiations with the Government for an earlier purchase of the Company's undertaking than 1911 had not come to anything. The staff had for some time been engaged in the preparation of an inventory of the plant and assets connected with some 1,600 exchanges, in order to prefer the Company's claim in 1911. The Railways and Canals Commissioners will act as arbitrators, if no agreement is arrived at.

WESTMINSTER ELECTRIC SUPPLY CO.—At the annual meeting last week, Mr. W. Hayes Fisher, who was in the chair, said that they had written off the whole of the expenditure connected with the old Millbank Street Station.

APPOINTMENTS AND PERSONAL NOTES

Mr. Charles Bright, F.R.S.E., has been appointed Consulting Electrical Engineer to the Australian Government.

Mr. Ernest Bennett has been appointed assistant engineer at the Dudley Corporation electricity works at a commencing salary of £104 per annum.

The salary of Mr. A. J. Lander, chief-assistant in the tramways department of the Middlesex County Engineer, has been increased from £450 to £475 per annum.

Mr. Archibald Robertson, Manager of the Rothesay Electric Tramways, has been appointed Manager of the Scottish undertakings of the British Electric Traction Co., with the headquarters at Greenock. The Rothesay Tramways will be managed by Mr. Hill, the present Electrical Engineer.

Mr. Frank Rawson, Manager of the Calcutta Electric Supply Corporation, has been appointed an additional member of the Indian Imperial Legislative Council. He will act as expert adviser to the Committee on the Indian Electricity Bill.

Mr. Frank Crooks, Chief Clerk at the Wakefield Electricity Works, has been appointed Chief Clerk at the Bridlington Electricity Works, at the salary of £90 per annum, rising to £120.

At the last meeting of the Bridlington Town Council the proposal that the Borough Electrical Engineer, Mr. A. J. Beckett, should have a commission of 1 per cent. upon all new work exceeding £200 in value was passed. A similar proposal made a short time ago was referred back.

The High Commissioner for Australia, Sir George Reid, has been appointed, says Reuter, to fill the vacancy in the Commonwealth representation on the Pacific Cable Board.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 15s. to £62 5s. per ton (last week, £61 15s. to £62 5s.).

SIEMENS BROS'. TELEPHONE EXTENSION.—Owing to the enormous increase in their Tantalum lamps and fittings business, Messrs. Siemens Bros'. Dynamo Works, Ltd., Tyssen Street, Dalston, have found it necessary to instal an additional telephone line. There are now four lines at this address, viz., 8587, 8388, and 8389 Central, and Dalston 4.

CHANGE OF ADDRESS.—Messrs. Electrical Installations, Ltd., of Bassishaw House, Basinghall Street, London, E.C., are removing to larger premises on March 25th at 27 Martin's Lane, Cannon Street, London, E.C.

DIVIDENDS ANNOUNCED.—Cambridge Electric Supply Co., 4 per cent. on the ordinary shares for 1909.

Newcastle-on-Tyne Electric Supply Co., 4 per cent. on the ordinary shares for 1909, transferring £16,500 to depreciation.

DISSOLUTION OF PARTNERSHIP.—The partnership between C. D. Copland and E. Cardin, consulting electrical engineers, 16 John Dalton Street, Manchester, has been dissolved. E. D. Cardin will continue.

AGENCY.—Messrs. Marryat & Place, of 28 Hatton Garden, London, advise us that they have appointed Messrs. Marshall, Osborne & Co., of 55 Newhall Street, Birmingham, as agents for the sale of their automatic lifts in the Midland district.

CANADIAN AGENCY WANTED.—A Yorkshire manufacturer of electrical and mechanical engineering appliances seeks suitable Canadian representatives.

Particulars, &c., may be obtained from the Office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

Stop-valve Explosion at Londonderry.—A Board of Trade report has been issued regarding the stop-valve explosion which occurred at the Londonderry Corporation Electric Supply station in November last. The explosion is ascribed to water-hammer action, and it is stated that alterations in the drainage of the steam range are to be effected which should prevent the recurrence of an accident of this nature.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of **9d.** per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of **1/-** for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to The Kilowatt Publishing Co., Ltd., 203–6, Temple Chambers, London, E.C.

COUNTY OF LONDON.

THE LONDON COUNTY COUNCIL invites tenders for wiring and fittings for electric lighting at the Camden Street Central School.

Full particulars, and also information as to the conditions to be observed by tenderers, will be given in the London County Council Gazette of 7th and 14th March, 1910. The Gazette, which is published weekly, contains particulars of all the tenders invited by the Council, and can be obtained from Messrs. P. S. King & Sons, 2 and 4, Great Smith Street, Westminster, S.W., price 1d., post free 1½d. an issue, or for the whole year a prepaid subscription of 6s. 6d.

Tenders must be upon the official forms to be obtained on and after 7th March, 1910, from the Chief Engineer of the Council at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £1 for the specification, etc. This deposit fee will only be returned if a *bona fide* tender is submitted. No tender received after 11 a.m. on Wednesday, 23rd March, 1910, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who shall on any previous occasion have withdrawn a tender after the same had been opened, unless the reasons for the withdrawal were satisfactory to the Council.

G. L. GOMME,
Clerk of the London County Council.

County Hall,
Spring Gardens, S.W.
28th February, 1910

ELECTRICAL ENGINEER (young) seeks situation as improver, 4½ years, all-round experience, within distance of Boro' Polytechnic preferred. W. F., 42, Falmouth Road, Boro', S.E.

A FULLY QUALIFIED ELECTRICAL ENGINEER, A.M.I.E.E., Assoc. A.I.E.E. having had varied experience in British Columbia, returning to England for one month, will be glad to communicate with any English firm wishing to do business, Hydro-electric Power plants, etc. Address, W. C. Chappell, c/o H. M. Hobart, Consulting Engineer, Norfolk St., Strand, W.C.

C. JENNINGS & CO. can supply woodwork of any description at short notice, Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support British Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. Jennings & Co., 955, Pennywell Road, Bristol.

ELECTRICAL ENGINEERING BOOKS AT HALF PRICES!! Books on Electrical, Engineering, Technical, *and all* other subjects supplied. Sent on approval. State wants. Catalogue No. 98, Post Free. Books bought. W. & G. Foyle, 135, Charing Cross Road, London, W.C.

GAS RETORT CARBON for Sale. Pitch, Insulating Material, Creosote. We supply the Trade.—V. Dasnieres, 10, St. Mary Axe, London, E.C.

SUMMARY

IN our special monthly article on new electrical supplies and accessories, a number of new fittings by various makers are illustrated. Some designs of hand lamps to comply with the Home Office Regulations are also described, and details are given of a new long burning flame arc lamp without magazine. Other novelties described include a portable electrically-driven air compressor for cleaning electrical machinery, a motor and gear for domestic purposes, a special motor generator for cinematograph installations, and a small alternating to continuous current converter. (Page 161.)

THE wiring of the new offices for the Commissioners of Woods and Forests in Whitehall, which has been carried out in galvanised screwed seamless steel conduit is briefly described on page 164.

A PAPER by Mr. J. Finlay, read recently before the Birmingham and District Electric Club, described in full the manufacture of tungsten filament lamps, giving interesting details of the preparation and mounting of the filament, the methods used for exhausting, which are somewhat different from those employed for carbon lamps, and the procedure for testing the completed lamps. Comparative tables of the cost of lighting by 25-c.p. 220-volt tungsten lamps and 16-c.p. 220-volt carbon lamps are given. (Page 165.)

A PAPER by Mr. R. D. Gifford, read recently before the Birmingham Local Section of the Institution of Electrical Engineers, contains an account of a research on the cooling of transformer plates, leading to the result that the most effective method of cooling transformers is by oil, assisted by water circulation. (Page 167.)

A PHOTOGRAPH, illustrating the damage done to some of the braiding machinery at the cable works of Messrs. Johnson & Phillips, Ltd., is given on page 169.

THE Paper read before the Institution of Electrical Engineers in London in November last, by Messrs. H. W. Handcock and A. H. Dykes, in which the authors suggested a fixed price per lamp per annum for small consumers, and a dusk-to-dawn supply in scattered districts, was again read and discussed in Manchester on February 22nd. Several speakers referred to the growing importance of the power load and the higher standard of lighting, both of which were acting to counterbalance the reduction in revenue due to the use of metal filament lamps. Speakers differed on the subject of free wiring, and several urged the necessity for a simple system of charging which all consumers could understand. Mr. Watson spoke highly of the rateable value basis, and was supported by Mr. Handcock. (Page 169.)

A PROCESS for the manufacture of cast-iron permanent magnets is referred to on page 170.

IN his concluding lecture at the Royal Institution on illumination, Dr. S. P. Thompson considered the relative efficiency and costs of illumination by various

Digitized by Google

means, and emphasised the necessity for adequate lighting in schools. The various means for scattering light and preventing glare by indirect lighting or holophane globes were also described. (Page 170.)

THE first Board of Trade inquiry under the Kitson clause in an electric power company's Act of Parliament, was recently held at West Hartlepool. The result, which is now public, is that the Cleveland & Durham County Electric Power Co. are given authority to supply the Hartlepool Electric Tramway Co., whose lines run into West Hartlepool, where the Corporation at present supplies electrical energy. (Page 171.)

MR. JUSTICE PARKER delivered judgment yesterday morning in the action brought by the "Z" Electric Lamp Manufacturing Co., Ltd., against Messrs. Marples, Leach & Co., Ltd. (now Adnil Electric Co., Ltd.), for infringement of their patent covering the use of phospham to remove the carbon from metal filaments. His Lordship said that it was clear that the carbon combined with the nitrogen in the ammonia liberated on heating the phospham, and that although chemically pure phospham would not give off ammonia at the comparatively low temperature necessary, yet commercially prepared phospham did, and he considered the patent a good one. He also held that it was a useful process, and that the defendants had infringed. (Page 171.)

AMONG the specifications published by the Patent Office on Thursday last was one by the Lancashire Dynamo & Motor Co. and A. R. Stelling, for a short-circuiting device for induction motors, in which the brushes are shifted axially from the slip-rings to stationary brush rests at the same time as the short-circuiting contacts are closed.—The Westinghouse Metal Filament Lamp Co. protect a method of decarbonising tungsten filaments, which consists in heating them to a temperature of 1,200° C. in dry hydrogen.—An automatic machine for sealing the stems and filament-carriers of lamps into the bulbs is described by the British Thomson-Houston Co.—A. F. Berry has protected a heater for rooms, in which the heating coil is supplied with a large current at low pressure from a transformer; special radiating surfaces are provided on the secondary winding.—Opposition has been entered to the grant of three patents. The first is by C. E. Steinweg, for tubular soldering sticks of a cadmium alloy of aluminium for soldering aluminium; the second is a combined lamp and fan standard by J. Keith; the third is by Dick, Kerr & Co., and covers a magnetic track brake, comprising a number of separately excited electromagnets linked together.—A patent by J. O. S. Elmore, for an apparatus for refining copper electrolytically, expires during the current week, after the full life of fourteen years. (Page 172.)

WE are informed that a number of gentlemen have decided to constitute themselves into a provisional committee for the furtherance of the legislative, industrial, and commercial interests of the electrical industry.—A letter from a manufacturer of fire appliances comments on the fire at Messrs. Johnson & Phillips's works. (Page 173.)

THE Aberdeen Suburban Tramways Co. have accepted an offer of the Town Council for a supply of electrical energy at 1¾d. per unit.—It is proposed to run trolley omnibuses in the western suburbs of Berlin.—The Brighton Corporation have rejected a proposed scheme for wiring houses, the capital being found by wiring contractors.—An application has been made to the Board of Trade by the Gateshead & District Tramways Co. for permission to use trailer cars.—A London firm proposing to erect calcium carbide works have asked the Monmouth Corporation for a supply amounting to 500 kw. (Page 174.)

FINCHLEY COUNCIL propose to borrow £10,000 for mains; Burnley Corporation, £5,000; and Wednesbury Council, £2,095. Extensions are proposed at Blackburn, Stretford, Swansea, Goring, and West Ham. Tramway extensions are proposed at Edinburgh, Burnley, and Southampton. Electrical stores are required at Southampton and Bray. (Page 174.)

AT the annual meeting of the Charing Cross, West End & City Electricity Supply Co., the question of purchasing foreign plant was discussed. The large expansion in the foreign and Colonial trade of W. T. Henley's Telegraph Works Co., Ltd., was referred to at the meeting last week. (Page 176.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 10TH.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. (1) "Short-Circuiting of Large Electric Generators and the Resulting Forces on Armature Windings." (2) "The Design of Turbo-Field Magnets for A.-C. Generators, with Special Reference to Large Units at High Speeds," by Miles Walker.

FRIDAY, MARCH 11TH.

Physical Society.

8 p.m. At Imperial College of Science. (1) "On Coherers," by Dr. W. H. Eccles. (2) "Earth-air Electric Currents," by G. C. Simpson.

SATURDAY, MARCH 12TH.

Royal Institution.

3 p.m. Afternoon Lecture V., on "Electric Waves and the Electromagnetic Theory of Light," by Prof. Sir J. J. Thomson, F.R.S.

TUESDAY, MARCH 15TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology. "A Modern Telephone Exchange," by J. P. Garner and R. L. Bell.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. Discussion on "The Measurement of Light and Illumination."

WEDNESDAY, MARCH 16TH.

Institution of Electrical Engineers: Yorkshire Section.

7.15 p.m. At Sheffield University. "Rating and Testing of Motors for Intermittent Working," by Dr. R. Pohl.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At 92 Victoria Street, London. "Isolated Electrical Plants," by R. C. Plowman.

THURSDAY, MARCH 17TH.

Institution of Naval Architects.

7.30 p.m. At Royal Society of Arts. "The Substitution of the Electric Motor for Marine Propulsion," by W. P. Durtnall.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. Adjourned discussion on Mr. Miles Walker's Papers read to-day.

SATURDAY, MARCH 19TH.

Royal Institution.

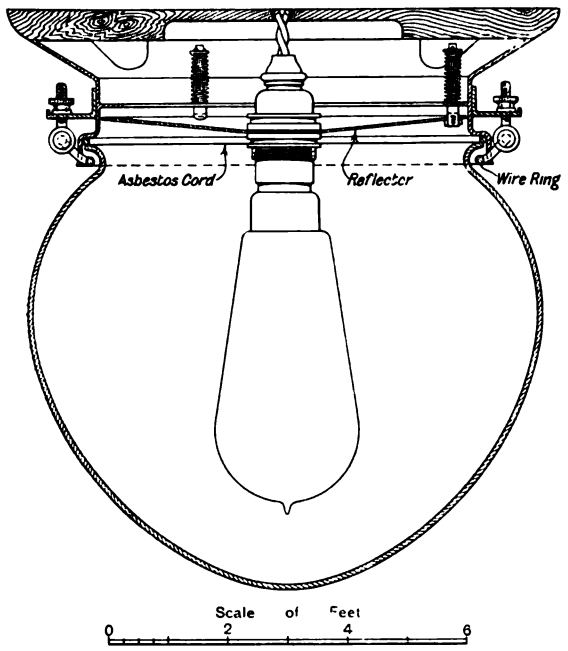
3 p.m. Afternoon Lecture VI., by Sir J. J. Thomson, F.R.S., on "Electric Waves and the Electromagnetic Theory of Light."

Junior Institution of Engineers.

3 p.m. Visit to the new engineering laboratory at Finsbury Technical College, London.

Telegraph Traffic.—The Chief of Telegraphs in Gaboon announces the opening of a new office at Cabinda, in Portuguese territory, which is now connected with Loango.—The Bagdad line was restored on the 2nd inst., only to fail again on the 5th inst.—Censorship on telegrams to Paraguay has been cancelled.—The Perim-Obok cable, interrupted since the 22nd February, was repaired on the 7th inst., and perhaps, now that the repairing steamer is in the neighbourhood, the Assab-Perim cable, interrupted since 8th July last, will be attended to.—The Dukon-Conakry cable, down since 19th August last, continues so, as well as the cable between Tourane and Amoy, which has been in need of attention since 27th December last.—No doubt the *Pouyer Quertier* is now engaged in the restoration of the broken link at French Guiana.—The Telegraph Construction and Maintenance Co.'s steamers are about to proceed with the laying of the Western Telegraph Co.'s cables between the Argentine and St. Helena.

Parliamentary.—The following Bills have been read a second time in the House of Commons:—Bradford Corporation, Middlesbrough Corporation, Middleton Corporation, Rhonnda Council (Tramways Extensions), Warrington Corporation, Devonport and District Tramways, Southampton Corporation, and Warrington Corporation.



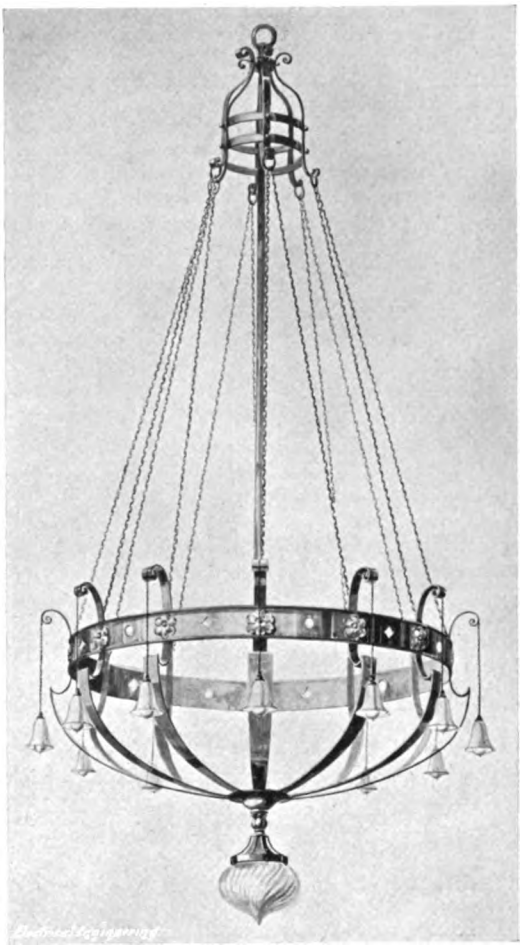
Digitized by Google

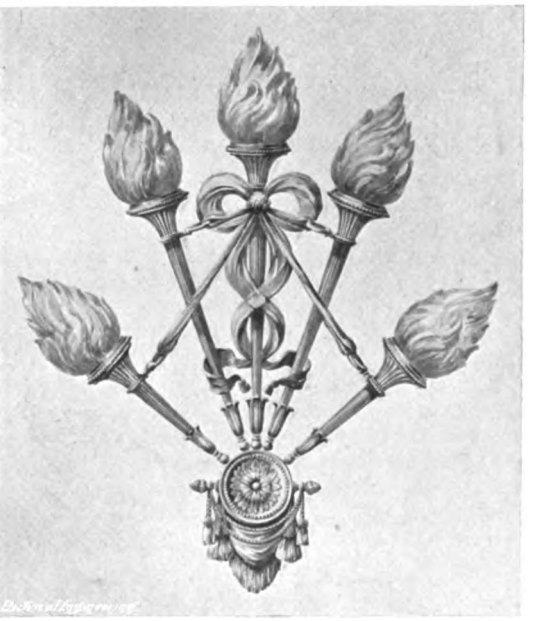
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Fittings, Switches, and Accessories.

Until recently ceiling fittings for electric lighting have been much neglected. The reason may or may not have been a conscious or unconscious knowledge, on the part of the consumer, as well as the contractor and fittings maker, of the law that the illumination on a surface varies inversely with the square of the distance from the source of light. This law, however, takes no account of the fact that the illumination is more effective both for practical purposes, and for comfort if evenly distributed, and in many cases the consumer feels that he has "better light" if the lamps in his room are raised. Another advantage of using ceiling fittings is that lamps of a larger candle-power can be employed, with a consequent reduction of the points to be wired in the case of new work. In some cases the employment of larger units of light in ceiling fittings, instead of a greater number of smaller lamps in pendants and brackets, may result in an increase in the current consumed, but even if this is so, the economy of the metal filament lamp makes the difference of little importance to the consumer.

Mr. J. S. Highfield, of the Metropolitan Electric Supply Co., has recently given much attention to the matter, and has designed a patent ceiling fitting (manufactured by the General





Cross-section showing Spring Suspension, &c., and General View of Highfield Ceiling Fitting.
(General Electric Co.)

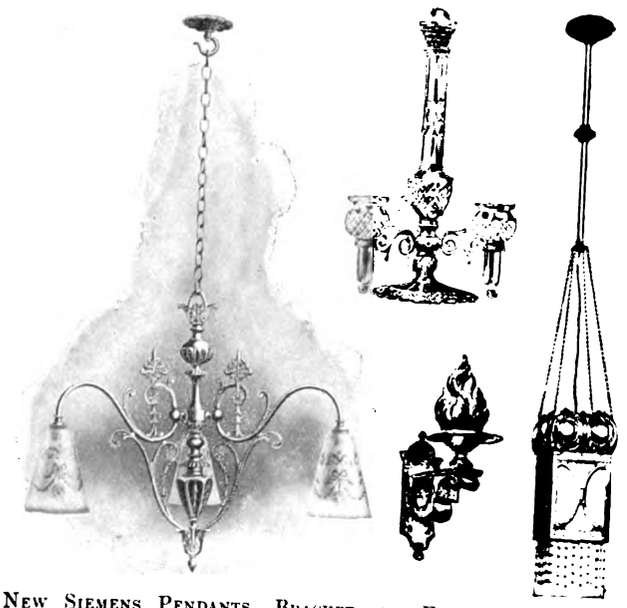
Electric Company, Ltd., 71 Queen Victoria Street, E.C.), which, in addition to being of plain and elegant appearance, and not extravagant in price, has the advantage of embodying a device which protects the lamp from any severe vibration caused by the movement of animate or inanimate objects on the floor above.

One of our illustrations shows the general appearance of one of the fittings, and the other is a section indicating its construction. The silvered reflector attached to the lampholder, and moving in the cylindrical body of the fitting, in conjunction with three helical springs, gives the effect of a slow-acting spring suspension on account of the natural air-damping when the reflector moves. Another point to be noticed is that the base of the fitting has a broad flange to prevent any dust carried upwards by air currents from the warm globe from being deposited on the ceiling. A twisted plain flint glass globe is usually supplied with the fitting, and this is secured

1,200-c.p. Electrolier at the Maida Vale Skating Rink (General Electric Co.).

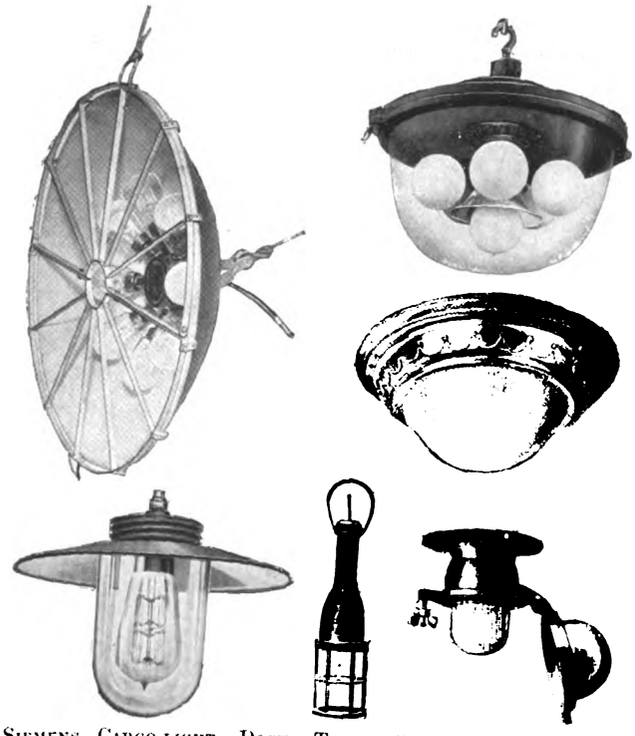
Five-light Torch Bracket (General Electric Co.).

by a two-part metal ring, which holds it against an asbestos cord washer. A modification of the same fitting is made in the form of an outside weather-tight lantern, whose appearance recommends it for the porches of shops, &c.; this is



Digitized by Google

arranged with outside plug terminals for convenience in installing.



The General Electric Co. has supplied some fine electroliers for the new Maida Vale Skating Rink. The rink is 500 ft. long, with a skating floor 375 ft. long, and 106 ft. wide, and is lighted with six large electroliers 7 ft. 6 in. in diameter, placed along the centre line of the hall, and 34 smaller electroliers 3 ft. diameter, 17 down each side. The larger electrolier, which we illustrate, has one 600 c.p. Osram lamp in the clear twisted flint glass globe at the bottom, and 12 50 c.p. Osram lamps in "Lettice" globes. The smaller electroliers are of the same general type as the one illustrated, and have each a 400 c.p. lamp and six 50 c.p. lamps.

We also illustrate a very pleasing design of five-light torch bracket (in what may be called a free interpretation of Empire style), which is a recent addition to the General Electric Co.'s showrooms.

We are able to illustrate a few examples out of a large variety of new fittings specially adapted for tantalum lamps

New Siemens Pendants, Bracket and Flower-glass Table Lamps.

Siemens Cargo-light, Dock, Train, Shop and Cattle-deck Fittings, and Insulated Hand-lamp.

introduced by Messrs. Siemens Brothers' Dynamo Works, Ltd., during the past month, which we have had the pleasure of inspecting at their works at Dalston. The first group shown comprises a particularly artistic brass three-light electrolier, a novel hall-lantern with bead fringe, a very solidly made brass wall-bracket with crinkled shade, and a fine piece of cut glassware in the form of table standard with flower vases. In the second group are shown some fittings of a different character made for special purposes where strength and utility are of more consequence than attractive appearance. The cargo-light cluster on the left can be made for any number of lamps up to twelve, and is arranged so that it can be suspended at any angle. Alongside this is shown a new application of the popular wireless cluster in watertight case, also useful for dock and harbour purposes. Train lighting is represented by the roof-light with small-sized holophane bowl; and three novelties to which special attention should be directed are shown in the lowest row. On the left is a remarkably simple fitting for exterior shop-lighting or similar purposes. The glass is formed with a thread and screws into the substantial iron shade, which is in one piece with the body of the fitting. The lamp-holder, as in many of the new fittings, is of aluminium, and we should mention that the complete article is listed at the low price of 3s. The hand-lamp shown is of special design to meet the Home Office requirements, and, having no exposed metal-work, does not require earthing. The body and handle are of black fibre, while red fibre is used for the cage. The fitting in the right-hand corner is designed for the decks of cattle-boats; it is fully watertight, and a heavy cast-iron cap is provided which can be closed over the lamp when the light is not required. Among other new fittings are some for indirect lighting, with large reflectors and hidden lamps, and a variety of watertight fittings for various purposes. Recently, too, the firm have developed a special series of fittings for use in hospitals, &c.

Among recent developments in the fittings department of Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), which is now under the management of Mr. N. E. Beves (late of the British Prometheus Co.), are several new applications of the

Simplex Rose-bowl with "Spookie" Shade.

company's "Spookie" shades. They were originally introduced about twelve months ago, and are now made of linen and parchment in a variety of designs and colours so as to give an effect of stained glass. Not only are numerous new designs being introduced for the coming season, but improvements have been made in the method of manufacture. We illustrate here an effective combination of one of the shades with a rose-bowl standard.

Among new designs of fittings recently introduced by the Edison & Swan United Electric Light Co. are a series of handsome cast-brass pillar table standards, which are illustrated in a new leaflet. A number of new fancy glass shades have been added to the already long list, some etched designs with satin finish being particularly attractive.

Another novelty of the same firm is the portable hand-lamp here illustrated. This has been designed to meet the Home Office recommendations. The body is of ebonised wood, with an interior cup which totally encloses the lamp-holder and lamp-cap. An earthing terminal for the wire guard is provided. A special flexible with earthing wire is supplied for use with this lamp. This has twin conductors formed of No. 40 S.W.G.

Digitized by Google

plain H.C. copper wires, lapped cotton, one lap of pure Para rubber, one lap of vulcanised rubber (total thickness of dielectric, 23 mils.), and one earthing conductor of same strands, cotton-covered. The three conductors are made circular (wormed) braided overall, and coated with preservative compound. This wire can be supplied braided and compounded, spirally armoured, or armour - braided. An insulated switch lamp-holder with no exposed metal parts is also made. This, of course, dispenses with the necessity of an earthing wire.

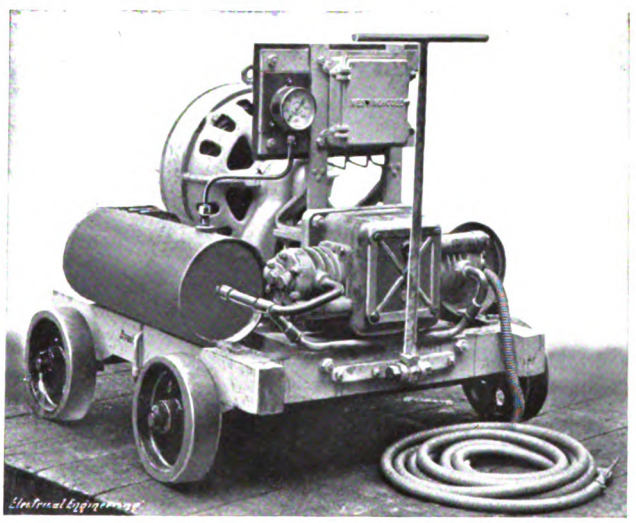
A new pamphlet from Messrs. Falk, Stadelmann & Co. (83 Farringdon Road) describes a series of "Aladdin" lanterns specially designed for groups of metal filament lamps or single lamps of large size for shop-fronts, doorways, railway stations, &c. The larger lanterns are also suitable for general illumination of open spaces and for street lighting.

Ediswan Hand-lamp.

Arc Lamps.

The Globe Electric Co., Ltd. (11 Farringdon Avenue, London, E.C.), have introduced a new multiple-carbon flame arc lamp under the name of the "Multax" lamp. This has been designed to give long burning hours with a short overall length and without resorting to the magazine principle. A special form of multiple carbon is used, consisting of two impregnated cores surrounded by a hard carbon shell of oval section, and joined by a narrow bridge of the soft impregnated material. The arc burns at one core until a certain limiting length is reached, and then travels along the bridge to the other core. The bridge not only ensures that the arc will travel from core to core without flickering, but also prevents any change of colour due to the arc burning from the hard carbon and not being fed with salts. A full-sized sketch of the carbons is shown in the accompanying figure, together with a general view of the mechanism of a lamp for D.-C. circuits. The lamp is made in two sizes. The small size has an overall length of 2 ft. 9 in., takes 16-in. carbons, and gives 18 to 20 burning hours, while the large size, with an overall length of 3 ft. 3 in., takes 24-in. carbons and gives 34 to 36 burning hours. In the direct-current lamp the mechanism comprises a single pulley, over which passes the woven copper cord for supporting the weighted carbon holders. This pulley is attached to a train of wheels, the star-wheel of which engages with a detent fixed to a rocking frame. Attached to the frame at opposite ends are two armatures which float over the poles of the series, and shunt magnets respectively. The vertical lever for adjusting the position of the swinging carbon is also attached to the frame, the movements of the system being controlled by a dash-pot and a spring. In the alternating-current mechanism the detent engaging the star-wheel is fixed to a pivoted lever. This lever is attached at one end to the plunger of a solenoid, comprising both a shunt and a series coil, and at the other end to the dash-pot. The economiser is of cast iron. An automatic carbon switch is provided for breaking the shunt circuit when the carbons are burnt out. A strong current of air up the inner surface of the globe prevents the formation of any deposit. These lamps take from 8 to 10 amperes, the voltage across the lamp being from 45 to 47 volts. An exactly similar lamp, with a triple-core carbon giving 54 burning hours with 24-in. carbons, will shortly be available, and should be especially useful for street lighting.

Interior View of Mechanism.

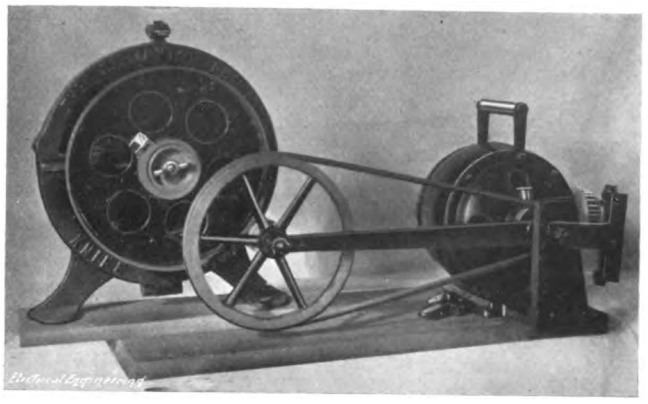


Sections of Double-cored Carbons.

The "Multax" Flame Arc Lamp.

Miscellaneous.

The accompanying illustration shows a small portable air-compressor equipment recently supplied, through Mr. C. J. Wharton, Consulting Engineer, London, to the Rio de Janeiro Flour Mills & Granaries Co., Ltd., by the British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), which firm a short time before carried out the complete electrical equipment of these mills. The set is used for blowing out the 600-h.p. motors and for cleaning the other machinery. It consists of a standard Westinghouse air-brake compressor, driven through single reduction gearing by a 3-h.p.



Portable Westinghouse Electrically-driven Air-Compressor.

three-phase Westinghouse squirrel-cage motor, complete with control panel mounted on a strongly built wooden trolley with rubber tyres, so that it can be easily moved from point to point. The current for operating it is taken from plug-boxes on the walls by means of a flexible cable to a three-pole, double-throw enclosed switch on the control panel, which is constructed of slate and mounted on strap-iron framework; whence the supply is led to the motor through a unit-type fuse-box. The connections are so arranged that when the motor is thrown on the line at starting, the fuses are cut out, and after the motor has attained a fair speed the switch is thrown over to the other side, putting the fuses in circuit.

Mr. R. Borlase Mathews (Bank Buildings, Kingsway, London, W.C.) has called our attention to a novel device for domestic use comprising a small motor combined with a special patented gear for driving domestic appliances. It is intended that the one motor shall be employed to drive all the appliances in the house from a washing or wringing machine to a rotary brush for polishing silver or boot-cleaning, and it is found that a 1/7 h.p. motor is sufficient for any such apparatus. The accompanying illustration shows the motor and the gear which comprises a lever 18 in. in length pivoted at a point in line with the axis of the motor. Springs are fitted at the end of the short arm of the lever, and a large pulley is fitted at the end of the long arm, giving a speed reduction from the pulley

Digitized by Google

on the motor shaft of 1 to 7. The motor runs at about 2,000 r.p.m. A 1¼-in. rubber friction pulley on the spindle of the large pulley is brought to bear against an 8¼-in. driving pulley on the machine to be driven, and this latter is thus driven at a speed of about 60 r.p.m., which is found to be the speed at which most domestic appliances are constructed to work. In order that this driving wheel may be fitted on any appliance, it has a central hole with a fixing screw, and various bosses are provided suitable for the spindles of the different ordinary appliances. When driving a vacuum cleaner or a mangle, the gear is dispensed with, the motor driving direct through a

Domestic Motor driving a Knife-cleaner through Patent Friction Drive.

leather cord. For such comparatively heavy work the motor takes about 120 watts, but when driving a buff wheel (by means of a flexible shaft with a simple attachment for fixing to the spindle of the motor) the consumption is only about 70 watts. The motor has ball bearings, and therefore requires little attention. Among the appliances suitable for driving by this apparatus are knife machines, coffee grinders, meat choppers, dish washers, sewing machines, &c. One or two large firms are already interested in the device.

The Phœnix Dynamo Manufacturing Co., Ltd. (Thornbury Works, Bradford), have brought out a special single-armature double-commutator continuous-current converter to meet the requirements of arc lamps for theatrical and cinematograph work, to which the name of the "Cineconverter" has been given. The machine is of the semi-enclosed type with expanded metal covers and is fitted with ball-bearings. It is specially designed to run without sparking even under the heaviest fluctuations of load. The brush gear is particularly simple, requiring little or no attention, and any risk of flash-over is prevented by the great distance between adjacent brushes. Considering that in the case of a 460-volt circuit a 60-ampere cinematograph arc will only draw 10 amperes from the mains when one of these converters is used, the saving available is obvious. Three stock sizes are listed for 3½, 5, and 9½ kw., the last of which is intended to run stage side arcs at the same time as a cinematograph. Six other sizes have also been designed.

Owing to the success of their 100-watt alternating to continuous-current converter combination, which was introduced about five years ago, the Crypto Electrical Co. (155-159 Bermondsey Street, S.E.), has brought out a larger machine built on the same lines, but with an output of 350 to 400 watts. The continuous- and alternating-current parts are electrically quite distinct, but are arranged with a single shaft with only two bearings in a single case, giving great advantages as to weight, efficiency and size over an ordinary motor-generator. The dimensions of the machine are 28 by 26½ by 17½ inches, and the weight is only 196 lbs.

International Refrigeration Congress.—The second International Refrigeration Congress will be held at Vienna from October 6th to 12th next. Mr. R. M. Leonard, 3 Oxford Court, Cannon Street, London, E.C., is Hon. Secretary for the United Kingdom.

District Railway Rolling Stock.—With regard to the new rolling stock about to be ordered by the Metropolitan District Railway, it is satisfactory to note that, while most of the original rolling stock of the company was built abroad, invitations for tenders for the new stock are being confined to British firms. The company will shortly order 32 motor-cars and 20 trailer cars, and these will be built entirely of steel. All unsightly rivets will be concealed by an outer sheet of steel, giving the exterior a perfectly smooth finish. The new cars, like the older ones, will have electrical equipments by the British Thomson-Houston Co.

WIRING OF NEW GOVERNMENT OFFICES

THE handsome new edifice adjacent to the new War Office building in Whitehall is to be the head office of the Commissioners of Woods and Forests. It has been built to the plans of the architect, Mr. John Murray, and the electrical installation is being carried out by Messrs. Leo. Sunderland & Co. (39 Victoria Street, Westminster), to the plans and specifications of the Office of Works. The supply is taken from the three-wire D.C. system of the Charing Cross, West-End & City Electric Lighting Co., at a pressure of 200 volts across the outers. The service cable terminates at a main switch in the cellar, and from there an armoured lead-covered 0·2 sq. in. concentric cable leads to the main switchboard in a special compartment in the basement. The board consists of two marble panels, and contains, besides a three-pole switch and fuses, two meters and eight double-pole switches with fuses; seven of these are for the 100-volt lighting circuits of the seven floors, and one is spare. A 200-volt power circuit for two ventilating fans and two lift motors is controlled from a separate double-pole switch.

The wiring is carried out in galvanised, seamless, screwed steel conduit, and every pair of cables runs in a separate conduit to a distribution fuse-box on each floor, supplying from 10 to 13 circuits. The pipes are provided with brass bushes at the ends near the board, and with ebonite bushes inside the boxes. Inspecton boxes are provided at all elbows and T-joints. All the ¾-in. pipes for the lighting circuits are bonded together and to the 1½-in. pipes from the board by means of stranded copper wire sweated into thimbles, which are attached to screw clips on each pipe. The 1½-in. pipes are in turn bonded together and to the lead covering of the service cable in the basement in the same way, thus ensuring that the whole system is effectively earthed. The power circuits are in 1-in. pipe.

The passenger lift is operated by an eight h.p. motor, and a five h.p. motor runs the service lift. The ventilation system consists of ducts through the walls, with inlet and exhaust openings, the air being blown in at the bottom by a 1½ h.p. fan, and exhausted by a three h.p. fan on the roof. In all there will be some 350 metal filament lamps, but the fittings are not yet put in. An intercomunication telephone system will be installed, and for this purpose two 1½-in. pipes have been run along under the floors, with a box at the outside of the door to every room; from these boxes two 1-in. pipes run under the flooring into the centres of the rooms.

A Direct Reading Accelerometer.—An electrical accelerometer which has the advantage over inertia instruments of being independent of the effects of gradients, was described in a recent Paper read in America by Mr. C. R. Moore, of Purdue University, and abstracted in the *Electric Railway Journal* (New York). A special continuous-current magneto-generator is driven by the car, and its main terminals are connected through a delicate centre zero milliammeter to a condenser. The machine is constructed to give an E.M.F. proportional to the speed. Assuming no leakage, no current will pass when the speed, and therefore the voltage is constant, but there will be a current into or out of the condenser, whenever the voltage rises or falls, so that the reading of the milliammeter will be a measure of the direction and magnitude of the acceleration. Leakage is compensated for by a current from an auxiliary commutator on the generator, connected through an adjustable resistance to a second moving coil on the milliammeter.

Electrically-driven Ploughs.—In a pamphlet issued recently by the Allgemeine Elektricitäts Gesellschaft of Berlin, some interesting particulars are given of their electric ploughing system. The equipment comprises a heavy motor waggon, a tension waggon, the plough, and two rope carriers. An endless steel rope passes over a drum on the motor waggon and round a horizontal pulley on the tension waggon, the two waggons being placed at opposite sides of the field to be ploughed. The plough is attached to the rope, and is drawn to and fro across the field; the other portion of the rope runs over the carriers. The motor on the waggon is from 38 to 72 h.p., according to requirements, and is used for propelling the waggon as well as driving the drum. When the plough is making the return journey to the motor waggon, the tension waggon moves along a short distance automatically. Power is supplied to the motor waggon by means of a trailing cable carried on a special waggon from the power station or portable transformer station. Only two men are required to work the small equipments, four for the largest. In twelve hours some 45 acres can be ploughed with an 8¾-in. deep furrow, the power consumption being about 12 kw.-hrs. per acre. For a 14½-in. furrow the area ploughed is 34 acres per day, with a current consumption of 21 kw.-hrs. per acre. The total costs are dependent upon a number of circumstances, chief among which is the facility for obtaining power.

Digitized by Google

THE MANUFACTURE OF METAL FILAMENT LAMPS

A PAPER was read by Mr. James Findlay (Managing Director, Rugby Lamp Co., Ltd.), on February 12th before the Birmingham and District Electric Club, in which an interesting description was included of the manufacture of tungsten filament lamps.

Manufacture of the Filament.

The metal tungsten occurs in wolfram or tungstate of iron, and in scheelite or calcium tungstate. The native calcium tungstate is digested in hydrochloric acid, and the soluble calcium salt washed out with water. The resulting tungstic acid may be dissolved in ammonia evaporated to dryness and heated in contact with air. Tungstic oxide is thus obtained. With this yellow powder the work of making the filament for incandescent lamps begins. A common method is to take tungstic oxide, mix it to a stiff paste with glucose or starch or other material to bind the powder together. The paste is put into a mould, in the bottom of which is a diamond die, and pressure is brought to bear on the paste to extrude it through the die. Difficulty is encountered in the first place in getting the tungstic oxide powder into a fine enough state of subdivision. When it is remembered that the aperture of the die is sometimes less than two thousandths of an inch in diameter, it will be readily understood that the powder must be very fine indeed before it can be made into a paste which will pass through. Then it is a comparatively easy matter to mix this powder into a paste, but this paste must be wet enough to pass through the die, and yet dry enough to hang together in thread form after it has passed through. The usual practice is to catch the thread on cardboard or similar material as it comes from the die. The board is passed back and forth beneath the die so as to spread out the thread in long hair-pin form. The filaments or threads are then dried in a gas oven, after which they are placed in boats and put into a furnace tube through which hydrogen gas is allowed to flow. Sometimes the air is exhausted from this tube by means of a vacuum pump before the hydrogen is introduced, but the hydrogen is generally left to displace the air. A considerable heat must be maintained in this furnace for several hours, the result of which is partially to reduce the tungstic oxide to tungsten. The next step completes this reduction.

The filaments are supported under a bell jar which is evacuated—hydrogen gas is admitted and the electric current passed through the filament. A current equal to four or five times that which the filament will take when made into a lamp is passed through the filament, the strength of the current varying with the pressure of the gas under the bell jar. The effect of this strong current is to burn off any remaining portion of the binding material, to complete the reduction of the oxide, and to sinter or melt the particles of metallic tungsten closely and solidly together. In order to give the filament a symmetrical shape, it is customary to hang a small weight on it during this sintering process. The weight pulls the filament straight and makes the bend small, so that the filaments may be placed close together. Care must be observed to have a weight which, while heavy enough to give the desired shape to the filament, is not too heavy, or, while the filament is very hot, the weight will drop through. The weight must also be of a material that will withstand the very high temperature of incandescent tungsten, otherwise the weight will be melted to the filament. The filament is now ready to be attached to the leading-in wires. Owing to tungsten being very soft while incandescent, it is necessary to support the filament at both ends, and to provide such a means of support so that when the filament becomes soft and extends one limb will not come into contact with another limb. This and the low resistance of tungsten renders necessary a much more expensive internal construction for the lamp than is necessary for carbon filaments.

Mounting the Filament in the Bulb.

The various steps in the manufacture of the filament support are as follows :—The leading-in wires consist of a piece of copper wire to which is welded a very short piece of platinum, which again is welded to about half an inch of nickel wire. The purpose of the short piece of platinum wire is, of course, to prevent any air leaking along the wires and so impairing the vacuum. Many substitutes for platinum in this connection have been suggested, and while some of the proposed substitutes equal platinum in having practically the same coefficient of expansion as glass, none of them is quite equal to platinum in freedom from oxidisation in the flame used to melt the glass around the wires. A piece of glass tube is rotated in a gas flame, a carbon pencil is inserted in the end which the flame has softened, and by a slight movement the end is flanged out. The flanged glass tube and the leading-in wires now go to a machine where they are sealed together.

This machine has four heads, which rotate around a common centre so arranged that each head comes in succession opposite the operator who puts the glass tube and wires in place, then into a preliminary fire to heat up the glass, then into a final fire, where the glass is melted, and while in this condition the operator, by means of a foot pedal, pinches the molten glass around the wires. Another movement of the machine brings the part into a position where it may cool down before it comes again in front of the operator, who removes it and puts in position the new parts of another. The central glass rod is placed in position. The enlargement in which the wires are embedded is made by rotating the rod in a pointed flame, at the same time gently pushing the ends together. After the wires are inserted the filaments are secured in place. In a carbon filament lamp the carbon is attached to the leading-in wires by a little carbon cement. This method, however, will not answer with a tungsten filament. Carbon is a very bad thing to have inside a tungsten lamp. The ideal way is to have an all-metal connection. This is very neatly effected as follows :—A paste of nickel oxide is used to hold the filaments to the wires. The mount is pushed up into a bottle through which a stream of hydrogen gas is made to flow. The leading-in wires of the mount are connected to one pole, and a platinum point, which is inserted through the side of the bottle, is connected to the other pole.

Current is supplied through a small step-up transformer, so that when the push-button is touched a high-tension arc is made between the point at which the filament is pasted and the platinum point. The heat of this arc and the hydrogen reduce the nickel oxide to metal, which forms a small globule around the filament, securely welding it to the leading-in wire. The mount is turned around, bringing each joint in front of the platinum point, so that the joints—sometimes over twenty in one lamp—are all made in a few seconds. The mount is now ready to be sealed into a bulb, but some preliminary work must first be done on the bulb. As received from the glass house, the bulb, of course, has no pip and it has a long neck. The first operation on the bulb—after washing it—is to make a small hole in the centre. This is done by playing a very pointed flame against the centre of the bulb, at the same time bringing air pressure to bear inside the bulb, so that when the flame has sufficiently softened the glass the air pressure blows it out into a hole.

A short tube is now sealed on over the hole. This tube is afterwards used to connect the lamp to the exhaust pump. The bulb is now held upright in the centre of a ring of pointed gas flames, arranged so that the flames play on the neck at the point at which it is wished to cut it off. The bulb is slowly rotated so that the neck may be equally melted all around. As the flames soften the glass the neck is pulled down by its own weight, so that in a few seconds it drops off and the thin glass closes over the opening. Air pressure is at once introduced into the bulb, and the thin glass bursts outwards. The bulb and mount are sealed together on a machine which has a spindle to carry the mount and frames to support the bulb.

The mount is first put in position and then the bulb is placed over it, great care being necessary to avoid breaking the very fragile filaments. The mount spindle and bulb frame rotate together as one piece, and the machine consists of four arms with a mount spindle and bulb frame on each arm. This arrangement allows the operator to place the mount and bulb in position, rotate the machine, and thus bring the lamp parts into the fire, at the same time bringing another arm with its mount spindle and bulb frame in front of the operator. When the parts of another lamp have been placed in position the machine is given another quarter revolution, and the original mount and bulb are now brought into a hotter fire, where the sealing of the two together is completed. When the lamp is removed from this machine it is placed in an annealer to prevent it cooling too rapidly, and so obviate as far as possible the danger of cracking. The lamp is now ready to be exhausted.

Exhausting the Bulb.

Different methods are followed in exhausting metal filament lamps from carbon lamps.

A pump which is coming into very general use for this work is the Gaede rotary mercury pump, although some manufacturers prefer to use the old style Sprengel mercury pump. The rough-and-ready means of connecting the lamp to the pump by

Digitized by Google

means of a rubber joint, which is found satisfactory for carbon lamps will not answer for tungsten lamps. The only entirely satisfactory method is to seal the lamps to the pump by means of the torch. Six lamps are generally put on a pump at one time. The lamps are so arranged that in addition to being connected to electric supply they can be enclosed in a heater and brought up to a good heat while they are being pumped. Very few manufacturers use any chemical to assist the exhaustion of tungsten lamps in the way that red phosphorus is used in carbon lamps. The lamps must therefore be left much longer on the pump, and for this reason they are not connected up singly, but in batches of six or more.

A tungsten lamp requires a much more careful exhaustion than a carbon lamp, and it is necessary to use a gauge of some sort to indicate when the vacuum is good enough to permit the lamps to be lit up. For this purpose some manufacturers use a spark gauge. As the exhaustion proceeds the discharge is first ribbon-like, and then spreads into a luminous glow. The glow then disappears and the glass fluoresces, the discharge finally refusing to pass. As the degree of vacuum indicated by these changes varies with the size and condition of the spark coil used, some manufacturers prefer to depend entirely on a McLeod gauge. In this gauge the highly rarefied gas in a bulb which has been connected to the lamps and pump is compressed by allowing mercury to flow in, the compressed gas or air being collected into a carefully calibrated tube over the bulb. The total capacity of this tube and bulb are known, and the pressure in the bulb before the mercury was admitted is calculated. It is good practice to have a vacuum of about 0·0006 mm. of mercury before lighting up the lamps. The lamps are on the pumps about 40 or 50 minutes, and a vacuum equal to about 0·0002 mm. of mercury should be obtained before sealing the lamps off. The test by a spark coil used for carbon lamps is of doubtful value. Tungsten lamps may not show the slightest glow on the coil, and yet not have a good enough vacuum.

Testing and Rating.

All lamps are tested on the photometer for candle-power, and most of them are also read for current consumption. The photometer most used in factory work is the common Bunsen grease-spot. A working standard is set up at one end of the photometer. This should be an incandescent electric lamp burning at an efficiency which will match in colour with the lamps which are to be tested on this photometer in largest quantity. The reference standard is placed in position at the other end of the photometer bar, and is carefully brought up to the voltage necessary to give its rated candle-power. The resistance in series with the working standard is varied until the working standard and the reference standard give a balance on the photometer head, which is placed exactly midway between the two lights. The reference standard is now withdrawn and a lamp to be tested is put in its place. This reference standard is used several times each day to keep the working standard true.

Lamps are tested either at candle-power for voltage or at voltage for candle-power. In the first case—for voltage—the spot box is fastened in place for the candle-power desired, and the voltage over the test lamp is varied until balance is obtained. In the other case—for candle-power—the voltmeter needle is held steady at the voltage desired, and the spot box is moved back and forth until balance is obtained. The photometer is furnished with a scale based on the law of inverse squares, which shows the candle-power of the lamp under test for different points on the photometer bar.

It is impossible to supply tungsten lamps which will all at their marked voltage give exactly their rated candle-power, but it is well known that tungsten lamps do not change so much in candle-power, &c., with change of voltage as do carbon filament lamps, but these figures show that even here the change is considerable.

Table I.

Tungsten Lamps.—25 c.p., 220 v., 35 watts.

Volts.	C.P.	Watts.	Watts per C.P.	Life (Hours).
240	34	40	1·18	500
235	31¾	38¾	1·22	700
230	29½	37½	1·27	900
225	27¼	36¼	1·33	1000
220	25	35	1·40	1000

210	21	32¼	1·54	
205	19	31	1·63	
200	17½	30	1·72	

Of course much longer experience has been had with the carbon lamps than with the tungsten lamps, so that while we can say with tolerable certainty how a batch of carbon lamps will average in performance under different circumstances, we cannot be so precise in out statements regarding tungsten lamps. The figures in Table II. are probably very nearly right.

Table III. gives similar figures for 16 c.p. carbon lamps. A comparison of the figures given shows that while it certainly pays to use tungsten lamps where the current has to be paid for at ordinary lighting rates, it is not clear that any advantage is to be gained by using tungsten lamps where current is cheap—at any rate, not where high-voltage lamps have to be used. On high-voltage direct-current circuits where transformers cannot be used to get lower voltage, lamps are sometimes burned in series to get smaller and cheaper units. This may often be done successfully, but it generally, sooner or later, leads to trouble. Very few people realise how carefully lamps must be matched for current consumption before they will give satisfactory service in series.

Experimental Analysis of Losses in Machines.—The Institution of Electrical Engineers has accepted for publication in the *Journal* an original communication by Dr. Gisbert Kapp on the experimental determination of the moment of inertia of a continuous-current armature. This last is required in order to be able to analyse the frictional and other losses of a machine by the "running-out" test. Dr. Kapp first describes briefly the brake and flywheel methods of determining this factor, and then explains a new electrical method which does not require any special apparatus. The machine is run light as a motor, but while the field excitation is constant, the armature is connected in series with a resistance across a portion of a resistance connected across the mains. If this portion is suddenly reduced to zero, the armature is short-circuited across the other resistance, and will quickly run down, the kinetic energy of the armature being dissipated in friction, iron, and C^2R losses. If, on the other hand, the portion is not entirely reduced to zero, but a small E.M.F. supplied to the armature circuit, the time of running out is prolonged, enabling a series of readings to be taken. Two sets of observations are made, with acceleration and retardation of the armature, and the readings of armature E.M.F. and current are plotted against time in each case. The moment of inertia is deduced by means of a formula, from the difference between the currents for that value of the time at which the two E.M.F. curves cross, and the tangents of the angles made by these curves at that point. Dr. Kapp states that he has tried the method on machines up to 30 kw., and has found the values obtained to agree with those obtained by the brake method. The method would seem to be specially advantageous for large flywheel sets and large machines generally where an extra flywheel or a brake is impracticable.

THE COOLING OF TRANSFORMERS

An experimental research into the influence of various cooling media upon the rise in temperature of soft-iron stampings was described in a Paper by Mr. R. D. Gifford, read on Wednesday, Feb. 16th, before the Birmingham Local Section of the Institution of Electrical Engineers. The experiments were directed to the measurement of the conductivity to heat flow existing between the surface of a cylinder made up of soft iron and such cooling media as air and oil under various conditions. The apparatus is shown in Fig. 1; it consisted of about 300 soft iron discs, and having 32 holes punched near the circumference, and a central hole. The discs were clamped tightly together by four temporary bolts through the small holes. The cylinder was then wound in Gramme-ring fashion—that is to say, up an outer hole and down the centre, the bolts being removed as occasion demanded until all the holes were wound. At the top and bottom of the cylinder, on the circumference, fibre washers were placed, to insulate as far as possible the flow of heat longitudinally, and also to protect the winding from damage by the wooden end discs. The two free ends of the winding were brought out at the top through the disc, and the whole bolted firmly together by means of a ½-in. bolt. The case, in which the tests with air blast and oil cooling were conducted, was made of cast-iron. The energy absorbed was measured by the "three-voltmeter" method, but the same instrument, a Duddell thermo-ammeter, was used with suitable resistances to measure the three voltages and the current.

The temperature rise was measured by thermo couples of Eureka wire and copper at suitable points, and the E.M.F.'s were observed by a new method, in which they were balanced

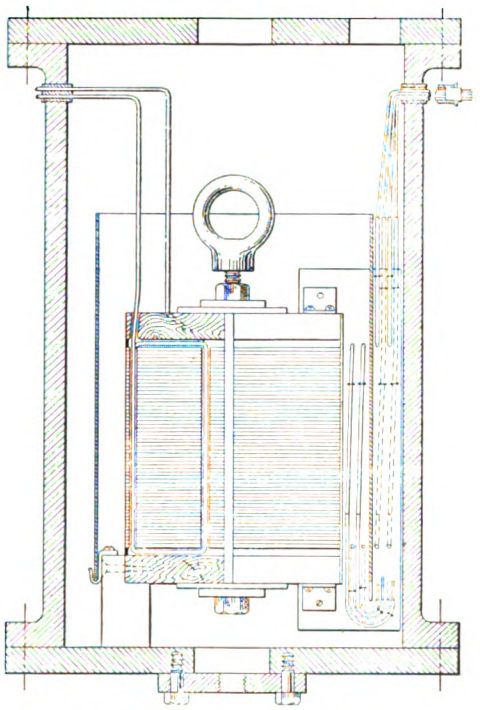

Fig. 1.—Section of Apparatus.

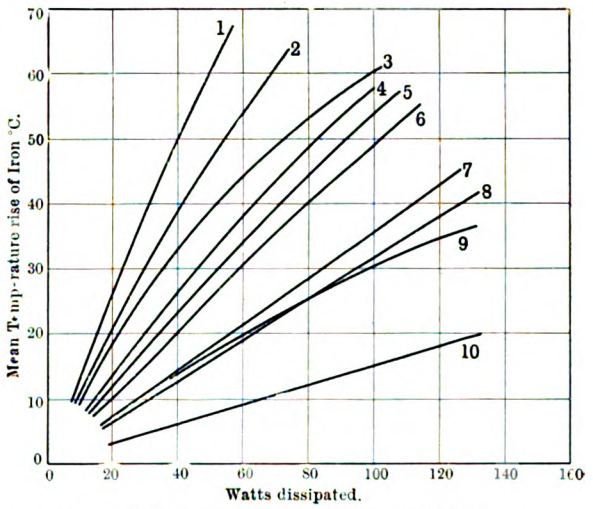
by the drop produced by an adjustable current over a standard resistance. This arrangement avoids errors due to Peltier effect and also effect of the drop in the leads.

The paper passes on to give a full explanation of the method of calculation of the conductivity to heat flow from iron to air. The heat carried away by conduction, convection, and radiation are all considered separately, and a formula for the total coefficient of conductivity, taking account of all three, is worked out.



In the first experiment, the temperature rise of the iron stamps free in air was observed. The iron was heated up quickly by cutting out the main regulator, and when a suitable temperature was reached the watts were adjusted to about the right value to maintain this temperature, and then kept constant, readings being taken at intervals of half an hour until the temperature assumed a final value.

The average temperature rise of the iron and the watts are shown, together with the result of other experiments in Fig. 2 (Curve III.); the calculated coefficients are found in the table.

The apparatus was then placed in an iron case cooled by air, and similar observations were made. The temperature rise in this case shows a large increase over that for the free iron for the same watts dissipated, due, of course, to the fact that there is not a fresh supply of cold air constantly coming in contact with the iron. Also, the difference in temperature between the top and bottom of the iron is very much more marked, as the hot air now collects in the upper part of the case.

Results are given in Curve II., Fig. 2, and the table.

Measurements were also made of the air temperatures, which show a very rapid fall near the iron, becoming less steep as the distance increases. The sudden drop in temperature between the iron and air shows that the heat flow experiences a high resistance in passing from the iron to the air—that is, at the surface of the contact. This is, no doubt, partly due to the relative molecular densities of the iron and air. The number of molecules in a lamina of unit area in the air is very much less than for the iron, so that the heat passes from the iron to the air only with difficulty—that is, there must be a large temperature drop from iron to air. With oil as the cooling medium the contact will be much better than for air, therefore we should expect the temperature drop at the surface to be less than for air. This is actually found to be the case. In a further test the separating sheet was inserted midway between the iron and the case. The object of this sheet is to assist the cooling by aiding convection, the heated air flowing up between the hot iron and sheet, and flowing down between the sheet and cool

Fig. 2.—Curves of Results.

case. The temperature rise is plotted against watts dissipated in Curve I., Fig. 2, and shows a large increase in temperature over those for the last test, instead of a decrease, as was anticipated. This is probably due to the reflection of the radiant heat back on to the iron, and also to a small extent to the resistance at the new surface to the escape of heat by conduction. These results therefore show that the insertion of a separating sheet, although no doubt assisting convection currents, is not, on the whole, a useful cooling agent.

In the next test, blasts of air of different intensities were blown through the case. The central plate at the bottom of the case was removed, and the whole placed upon a box-like structure having a small electric fan in front. The supply of air was measured by an anemometer placed over the hole at the top of case, and the rise in temperature of the blast was measured by thermometers placed at the entrance and exit. The watt-temperature curves for the three tests may be taken as straight lines.

The temperature attained by the iron when cooled by an air blast will depend upon the volume of the blast per unit of time and the velocity of the air. This will depend upon the volume of blast and upon the sectional area of its path, *i.e.*, the dimensions of the apparatus and case. If the area is large and the volume of blast of medium value, then the velocity may be reduced to the order of that of convection currents, in which

Digitized by Google

case the cooling will be similar to that of the test, where the iron was exposed freely to the air. It will also depend on the temperature of the ingoing blast, and the direction of the air blast with respect to the surface of the iron. This will be cooled more effectively if the cold air impinges normally upon its surface than if it flows parallel to the surface, for not only will the contact between the air and iron be better in the former case, but the agitation of the air will be much greater, thus bringing a constant stream of cold air against the iron. For these reasons it is impossible to generalise to any extent upon the results of this test.

Owing to the high value of the coefficient of heat conduction of oil in comparison with that of air, an oil-cooled transformer has a much larger output than that of an air-cooled transformer. Oil cooling is therefore more economical than air cooling, since the amount of material in the transformer is less for the same output. Another advantage attending the use of oil is due to its high specific heat. The energy loss in the transformer is absorbed by the oil, whose temperature rises slowly. Hence when working intermittently, for instance, during the day only, the transformer may never reach its steady final temperature corresponding to the watts lost. The high specific heat of the oil also allows of the transformer being worked at a high overload for a considerable time without overheating. Other advantages of oil over air are :—Its high insulating properties. Its high dielectric strength (about five times that of air). The prevention of particles of dirt and moisture getting into the windings. These have a very detrimental effect upon the insulation of the transformer, especially if working on high-tension circuits.

Tests similar to those already described were therefore made, using oil as the cooling medium. The curves of mean temperature rise of iron and case against watts dissipated were found to be practically straight lines, and the conductivity coefficient worked out at about three times its value for free-air cooling with case, showing the great superiority of oil as a cooling medium The temperatures of the oil show a large temperature drop between the iron and the oil at the surface, although not so marked as in air cooling. The drop in temperature down the oil at the top of the iron is very slight. This is not only due to the good conduction coefficient of the oil, but also to the fact that the hotter oil near the iron is in motion and mixes with the cooler oil at the case, so giving an almost uniform temperature horizontally. At the bottom of the iron the oil temperature near the case is slightly higher than near the iron. This is due to convection, some of the hot oil at the top sinking as it is cooled by the case and displacing cold oil from the bottom. The final mean temperature of the case is proportional to that of the iron, the temperature rise of the iron being roughly 2½ times that of the case. The ratio of the iron temperature at the top to that of the oil in contact with it is about 1·6, and at the bottom is 1·7, or we may say that the ratio of the mean temperature rise of the iron to that of the oil is 1·65.

In a further test a separating sheet was put in as in one of the tests with air cooling. It was found that the curves with and without this sheet was at about 25° C. Below this temperature the effect of the sheet is to increase the temperature rise of the iron. Above 25° C. the sheet exerts a cooling effect upon the iron. This is the result of the additional circulation of the oil, which takes place with the sheet dividing the oil into two separate portions.

The influence of different quantities of oil in the case was investigated. Typical results are given in Fig. 2 and Table I. The final tests dealt with oil cooling assisted by a water worm (see Curve X., Fig. 2), and showed how exceedingly effective this method of cooling is, as the water rapidly absorbs the heat from the oil without rising greatly in temperature, due to its high specific heat.

General Summary of Results.

Condition of Cooling.	Coefficient of Conductivity.	Coefficient of Resistance.
Iron free in air... ..	$1{\cdot}3\times10^{-3}$ to 2×10^{-3} for temperature rises of 20° to 60° C....	770 to 500
Iron enclosed in case.	$1{\cdot}125\times10^{-3}$ to $1{\cdot}35\times10^{-3}$ for rises of 20° to 60° C..	900 to 740
Iron cooled by air blast	$1{\cdot}9\times10^{-3}$ to $2{\cdot}4\times10^{-3}$ depending upon volume of blast	525 to 410
Oil Cooling.		
Iron to oil	$9{\cdot}4\times10^{-3}$	106
Oil to case	$4{\cdot}5\times10^{-3}$	220
Case to air	$1{\cdot}7\times10^{-3}$	600
Oil to water through metal piping ...	$4{\cdot}5\times10^{-3}$	220

In summarising the practical bearing of his results, the author remarks :—

By far the most effective method of cooling transformers is that of oil cooling, assisted by the circulation of cold water through a coil of pipes immersed in the oil. As the water absorbs a high percentage of the total energy loss, it is unnecessary to provide a case with a large cooling surface. This method should, therefore, be adopted for large transformers when there is a good supply of cold water available. If this is not available the same water can be used continuously with the use of an outside cooling arrangement and a circulating pump. If, owing to a temporary breakdown of the pump, the water supply is stopped, no great danger need be apprehended, as the enormous thermal capacity of the oil and the water in the coil prevents any large rise in temperature for a considerable time. On no account should a joint be made in the coils inside the case, as this leads to a liability to leakage, the slightest trace of moisture in the oil reducing its dielectric strength very considerably. With regard to unassisted oil cooling, this is much more effective than any type of air cooling, as the conductivity of iron to oil is so much greater than to air. Dealing with the use of the separating sheet to assist the cooling of the transformer, it is very probable that more satisfactory results would have been obtained if the surface of the sheet had been of a dull black nature instead of the comparatively bright brass used, as a dull black surface is a worse reflector of heat than a bright surface. The cooling by air blast, although effective, necessitates the use of blowers and air filters, and further, if for any reason the blast be stopped, the temperature of the transformer will quickly rise to a dangerous degree. Natural cooling in air is simple and economical, but this method can only be applied to transformers of small size, as the energy loss, for the same induction and frequency, is proportional to the cube of the linear dimensions, whereas the cooling surface is only proportional to the second power, and therefore the heat to be dissipated per sq. cm. of surface rises rapidly with increase in size, producing a higher temperature rise of the transformer.

Discussion.

Mr. R. R. Morcom remarked that the results in the Paper agreed well with experiments of his own on the cooling of high-speed bearings with oil, water, and air blast.

Dr. C. C. Garrard (General Electric Co.) was of the opinion that the improvement effected by the trans-separating sheet was masked by the reflection of the radiant heat from the iron stampings; good cooling could be obtained by arranging ducts in the core, and circulating air through these.

Prof. Kapp (Birmingham University) referred to an arrangement where the oil itself was used as the cooling medium instead of water. The oil worm, when it emerged from the transformer case, was immersed in a tank of water, which was kept cool by adequate circulation. This avoided the risk of escape of water into the oil in the transformer case.

Electric Driving of Reversing Rolling Mills.—A large reversing mill will shortly be erected at the Italian iron and steel works at Terni by Messrs. Schneider & Co., of Le Creusot, France. The electrical equipment will be supplied by the Felten & Guilleaume-Lahmeyerwerke, of Frankfort, and will be on their own patented system. The mill will be capable of dealing with 100-ton ingots, and will be driven by two coupled continuous-current motors, delivering 15,000 h.p. at 90 r.p.m. Current will be supplied from three generators connected in series, and coupled to a 2,600 h.p. water-turbine. A 50-ton flywheel will be provided on the turbo-generator shaft. This will vary in speed between 450 and 360 r.p.m., and thus supply energy to the generators to smooth out the fluctuations in the demand.

Ontario Power Co. Extensions.—Considerable extensions are being made to the generating station of the Ontario Power Co. at the base of the Horseshoe Fall, Niagara. This station was described and illustrated in Electrical Engineering, January 13th, 1910, page 21, and contains at present seven 12,000-kw. three-phase generators coupled to horizontal Francis turbines. Current is supplied at 12,000 volts to a distributing station at the top of the cliff, from which it is distributed at 62,000 volts. A second 18-ft. steel water conduit is now being constructed, and excavations are being made for two more. The recently installed seventh generating set is working satisfactorily, and plans are in hand for another new set. The filling in of the windows overlooking the river, where the water entered a year ago and damaged the machinery, is nearly completed, and no more trouble from that source will be possible. With the completion of the second water conduit, 150,000 h.p. will be available. A bulk supply to the adjacent transforming station of the Hydro-Electric Power Commission of Ontario will be given at 12,000 volts. The cables will be laid in an underground conduit, and a maximum demand of 60,000 h.p. has been arranged for. The current will be transformed up to 110,000 volts for transmission by the Commission.

THE FIRE AT MESSRS. JOHNSON AND PHILLIPS' WORKS

THE accompanying photograph gives a good idea of the extent of the damage done by the fire on Tuesday of last week at the cable works of Messrs. Johnson & Phillips, Ltd., Charlton. As stated in our last issue, the fire was confined to the top floor of the new two-storey building erected on the site of the fire some four years ago. On this floor were a large number of small machines for braiding wires, and as shown in the photograph, these were completely destroyed. It will be necessary to reconstruct entirely the roof and wood floor, and to instal new braiding machinery, but work has already been resumed with the cable braiding machinery on the ground floor which was fortunately not damaged by the fire.

Remains of the Braiding Machines after the Fire.

CHARGING SMALL LIGHTING CONSUMERS

THE Paper by Messrs. H. W. Handcock and A. H. Dykes, entitled "The Present Aspect of Electric Lighting," and read before the Institution of Electrical Engineers in London on November 25th last, was again read and discussed at the Manchester Local Section on February 22nd. An abstract of the Paper and the discussion in London was given in Electrical Engineering, December 2nd, 1909, Vol. V., p. 1025. The Paper again brought up the question of the influence of metal filament lamps upon supply undertakings, and the advisability of altering methods of charging in certain cases. The contract system of a fixed price per lamp per annum was recommended for small lighting consumers, while for scattered districts a H.-T. A.-C. supply, discontinued during the daylight hours except during periods of fog, was suggested. An earthed-neutral three-wire 50- or 100-volt distributing system with house transformers was recommended for outlying consumers.

At Manchester, Mr. C. C. Atchinson (Borough Electrical Engineer, Rochdale) opened the discussion by pointing out that the authors had considered mainly small A.-C. stations chiefly for lighting. In the north they looked forward to the time when there would be a larger income from power than from lighting. He thought the metal filament had done them good in Rochdale. There was no doubt that the standard of illumination had increased remarkably during the last four or five years. Shops especially nearly maintained their old bills, as they had realised that good lighting was an effective advertisement. His large private consumers averaged about 7·6 units per annum per 8-c.p. lamp installed, this corresponding to some 11 units per 12-c.p. lamp, as against the authors' estimated 15·6 units per annum. The return per lamp installed from large houses was poor in comparison with that from small houses. He thought the suggested annual lump sum payment would be a source of trouble, in spite of the low cost charged per unit. With regard to the wiring difficulty in the charge per lamp system, consumers should give the supply undertaking the opportunity of advising them so that they should not be wired with too many points. There was not much to be saved in service costs by reducing the service cable standards. He would like to see rows of buildings wired from a single service. Limited supply-hours were impractical directly a motor was connected.

Mr. R. B. Slacke (Key Engineering Co.) said that millowners do not like substituting electricity for gas for lighting, particularly in weaving sheds, as it warmed the rooms and saved heating by other means. He would like to know the dividing line between a small long-hour consumer and a large consumer to determine who should be charged on the contract system, and who should be charged on a uniform charge per unit.

Mr. P. P. Wheelwright (Borough Electrical Engineer, Blackburn) asked the rent of a house where the contract demand system was likely to be financially successful. His experience with cottage and small property lighting was that the tenants complained that they could not afford to replace the broken lamps. With regard to losing unremunerative consumers, he had found that the loss of a single consumer, whatever the cause, had very far-reaching results. Special lamp-holders to prevent the use of higher c.p. lamps would be impracticable. It was not correct to say that all supply undertakings had suffered so severely by the advent of the metal filament lamp. The use of house transformers ought never to be advised. He was satisfied that the simpler the rate, the more likely one was to get consumers; when his Corporation some six years ago offered a flat rate for lighting as an alternative to the maximum demand system, which had been in force for some eight or ten years, only 40 consumers out of some 1,200 remained on the maximum demand system even when the cost was known to be higher, as they had the satisfaction of knowing how the figures were obtained.

Mr. J. Frith said that he had analysed his lighting bills for the last three years. He had 32 lamps installed, with an average consumption of 36 watts per lamp. His total yearly bill was £6 5s., the units consumed being 400. He thus burnt each lamp on an average 350 hours per annum, and paid 3s. 9d. per lamp per year, equivalent to 3s. 2d. per 30-watt lamp. He would certainly object to 12s. per 30-watt lamp per annum.

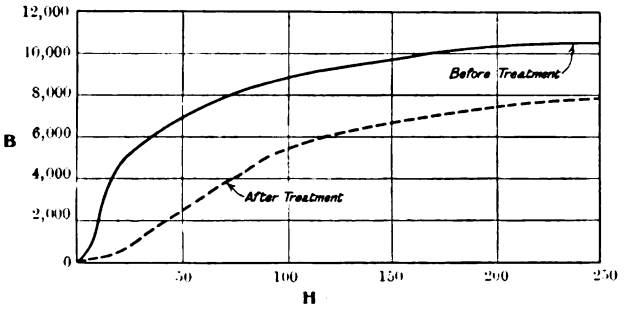
Mr. A. G. Cooper (Borough Electrical Engineer, Colne) said that in some cases they had taken in one service to a block of houses and had run the cables through the cellars, putting in cut-outs at each house.

Mr. C. L. E. Stewart (Borough Electrical Engineer, Rawtenstall) did not approve of the fixed charge per lamp, as it would reduce the number of lamps installed. He thought it was a big mistake if the consumer did not understand the conditions of supply, and his experience was that Lancashire men did not like the flat rate. Cottages did not use 10s. a year in gas, and were not worth connecting up for electric light. There was no doubt that free wiring brought on the consumer, but it also brought on bad consumers. Further, the next tenant invariably wanted the lights in totally different places, and the wiring had to be altered.

Mr. T. H. M. Swinburne thought that supply authorities, whether municipal or companies, would sooner or later have to undertake wiring directly or indirectly.

Mr. A. S. L. Barnes fully agreed with the fixed charge per lamp system, and thought that the author had considerably overestimated the additional consumption caused by people not being so careful as if they had meters. Central station engineers made too much of the loss of a few additional units. On several occasions in Gibraltar the supply had been shut off for a whole day, though steam pressure was kept up, and the coal used amounted to 25 per cent. of the average daily consumption. A fixed rate per lamp charge had been introduced in Gibraltar (with a maximum of five lamps), and it resulted in a large influx of new consumers, while several meter consumers requested to be charged on the new system.

Mr. S. J. Watson (Chief Electrical Engineer, Bury Corporation) said that the great diversity of practice in the methods of charging did the industry harm, and he hoped that soon all undertakings would adopt the same principle, even if not the same scale. The method suggested by the authors did not solve the difficulty of charging for light and heat or power without two meters and special wiring. The only satisfactory system he knew of was that in which a standing charge of from 10 to 15 per cent. on the rateable value was made, with an additional 1d. or 1½d. per unit supplied. In the case of a private house rated at, say, £32, and taking 12½ per cent. and 1d. per unit, the standing charge was £4, and with a consumption of 480 units the total account would be £6 per annum. Such a system would encourage consumers to wire for heating and power as well as lighting. With regard to the effect of metal filament lamps, in the majority of towns the units sold for lighting were again gradually on the increase. It was not desirable to frame the tariffs so as to deliberately keep certain classes off the mains. He had always held the opinion that it was no part of the duty of supply undertakings to instal free wiring. The rate of depreciation was very high, as it was impossible to recover anything if the installation went out of use. Further changes of tenancy and ownership caused much trouble. He did not agree with the "dusk to dawn" supply; a twenty-four hours' supply was essential if the use of electric heating and small domestic appliances was to be encouraged.



In reply, Mr. Handcock said that the cost of renewals of gas mantles and chimneys for a whole year worked out at exactly the same as the renewal of metal filament lamps. It was difficult to say what was the dividing line between those who should be charged on the contract system and those who

Digitized by Google

should be charged on a uniform charge per unit. With regard to house transformers, it was surprising what economies could be effected by their use. A "dusk to dawn" supply was useful when starting a new A.-C. undertaking. The contract system was intended as a weapon to attack the field of small consumers now occupied by gas. He thought very highly of the rateable value basis for charging.

CAST-IRON PERMANENT MAGNETS

An interesting process for the manufacture of permanent magnets for magnetos, instruments, small motors, &c., has been developed by Messrs. F. Burks & Co. (Prospect Works, Manchester), and is in use to the extent of manufacturing some 2,000 magnets per week. The material used is ordinary black cast-iron, and the chief feature of the process is the chemical treatment to which it is subjected. The whole of the machining, &c., on the magnet has to be done prior to its being treated, except, of course, the actual magnetisation. The magnets are raised to a certain temperature in a special furnace and kept at that heat for a specific time, which varies with the shape and size of the magnet. They are then immersed in a chemical bath, after which they are washed for some time to get rid of all superfluous chemicals, which would form crystals on the surface and prevent any

B/H Curves for Burks's Cast-iron Magnets.

paint or enamel adhering properly. After this they are well dried and then magnetised, when they are ready for fitting to the apparatus for which they are intended.

By referring to the curves in the accompanying figure it will at once be seen that the saturation value of this treated iron is about 7,500 C.G.S. units, as compared with about 9,500. Thus it may be taken that these magnets are, roughly speaking, about 20 per cent. less powerful than a corresponding magnet of the best steel, or 10 per cent. less than the average magnet, while they are claimed to be about equal as regards permanence.

An advantage of this magnet is that the poles and the fixing-down lugs can be cast all at once into the shape desired, whereas with a steel magnet separate poles have to be fitted, necessitating the magnet limbs being ground and drilled. Again the fixing down of the steel magnet has always been rather unsatisfactory, and is usually in the form of a clamp. With the cast magnet the designer can choose his method and position of fixing lugs to the best advantage.

That the effect is more than a mere form of case-hardening is shown by the fact that a broken magnet is found to be as hard in the centre as at the outside.

The Kearney Tube Railway System.—A model railway on this system, 200 ft. in length, has been constructed at the Crystal Palace and is open to public inspection. At a Press view on Wednesday of last week, Mr. E. W. Kearney described the system, referring to the Bill it is proposed to deposit for the construction of railways between the Strand and the Crystal Palace, and between Kennington and Cricklewood. It will be remembered that on this system the stations are constructed near the street level, while gradients of 1 in 7 lead to and from the low-level tunnels. There is only one tube, the track being doubled at the stations only. Trains going in opposite directions pass each other at the stations, and automatic switching arrangements are provided to render this safe. The cars run on a single rail, but an overhead guide rail is provided. Grooved guide wheels are pressed up against this. It is proposed to accelerate the cars down the gradients at such a rate that a speed of 50 miles per hour will be attained in 20 seconds. A schedule speed (including 15 sec. stops at the stations) of 30 m.p.h. is said to be possible. The total capital cost is given as £250,000 per mile, as against from £400,000 to £800,000 for the present tube railways. It is asserted that, even with stations five furlongs apart, a 2½ min. service could be given with the single-tube system, and that it is not essential that the stations should be at exactly equal distances apart.

ILLUMINATION

The third and last of the three lectures on this subject by Dr. S. P. Thompson at the Royal Institution, London, was delivered on Thursday last. A magnetite flame arc lamp of the pattern manufactured by the General Electric Co. of America was on view. In this lamp the electrodes are vertically one above the other; the upper electrode is of copper, with special cooling arrangements, and the lower electrode is formed of a compressed mixture of the oxides of chromium and titanium with magnetite, an oxide of iron. The lamp is especially adapted to street lighting, as the light is thrown sideways. (Some photometric results obtained with these lamps for the street-lighting of Boston, U.S.A., were given in Electrical Engineering, November 11th, 1909, Vol. V., p. 972.) The lecturer then called attention to some calculations made by Dr. Drysdale, according to which the maximum efficiency possible for any light source giving out light to which our eyes were most sensitive (58 m.m.) was 27 candles per watt. This figure could only be obtained by the direct conversion of any other form of energy into light energy without any production of heat. According to this standard, the flame arc lamp had an efficiency of only 1 per cent. Dr. Thompson then showed a number of curves of comparative costs of lighting with various illuminants. Of the electrical sources, the quartz lamp was the cheapest, the flame arc lamp coming second with a figure of from 0·5d. to 1d. per 1,000 candle-hours for running costs only. The carbon filament lamp was the most expensive illuminant of all. After comparing the distribution curves of a number of different light sources, Dr. Thompson passed on to consider illumination at a surface. This was not a measure of the brightness of the surface, but of the light received per unit area at the surface. For reading or writing the illumination should never be less than one and a half candle-foot. In factories in Holland, the legal minimum was 0·9 candle-foot. The illumination from a bright sky was from 3 to 6 candle-feet. The lecturer then emphasised the importance of adequate lighting in schools. In Breslau (Germany) it had been found that the percentage of myopia cases (short-sightedness) increased from 6 per cent. in the lower standards to 26 per cent. in the upper standards, and to 59 per cent. in the universities. This was attributed chiefly to bad illumination. In Birmingham the percentage had been found to increase from 5 per cent. in the lower schools to 20 per cent. in the training colleges. The subject was not a new one, as a photometer was in use in schools in Russia over twenty years ago. Another important but different matter was the prevention of glare, or the direct exposure of the eyes to sources of high intrinsic brilliancy. The eye could not look with comfort at a surface having a brilliancy of more than one candle-power per sq. in. By frosting a lamp globe the light could be scattered, so that whereas a tungsten filament had an intrinsic brilliancy of 1,000 c.p. per sq. in., a frosted lamp had only about 5, and did not offend the eye so much. An even better way was to use only the light reflected from a rough white surface, as in indirect lighting by hidden lamps throwing light on to a white ceiling. These were inefficient methods of scattering the light, however, and recently much headway had been made with the so-called holophane globes and shades. These were a development of a "dioptric" globe designed by Mr. A. P. Trotter (Electrical Adviser to the Board of Trade) some twenty-five years ago. This had vertical ribs inside to spread the image of the source sideways, and horizontal ribs outside to spread it lengthways. Further, Mr. Trotter had applied the principle of graduating the slope of the facets in order to obtain a definite distribution. By adjusting the facets the maximum light could be thrown in any desired direction. Finally, Dr. Thompson referred to the necessity for further investigation into the absorption of light by surfaces of different nature and colour, in order that the brightness of a room for any given illumination could be estimated.

Royal Institution.—Among the lecture arrangements after Easter are two "Tyndall" lectures by Prof. J. A. Fleming on "Electrical Heating and Pyrometry.

Arc Lamp Firms in Germany.—The Deutsche Beck-Bogenlampen Gesellschaft, of Frankfurt (German Beck Arc Lamp Co.), have taken over the business and works of the Carbone-Licht-Gesellschaft, of Berlin. The Berlin works of the latter company will continue the manufacture of the Carbone arc lamps under the control of the Beck Co., who manufacture the well-known lamps with supported carbons and no clockwork at Frankfurt. The Carbone-Licht Gesellschaft has gone into liquidation.

Electrical Exhibition at St. Petersburg.—The proposed exhibition at St. Petersburg for demonstrating the application of electricity to railways will be opened on August 27th, and will remain open for two or three months. It will be divided into sections dealing with the application of electricity to steam railways, main lines, local lines, and tramways. A Commission will report to the Russian Government as to the class of exhibits most desired in view of the nature of the exhibition. Full information may be had from the President of the Organising Committee, Mr. N. A. Sitenko, 24 Sadovaia, St. Petersburg.

COMPANY v. LOCAL AUTHORITY FOR TRAMWAY SUPPLY

THE first inquiry under the Kitson clause in an electric power company's Act of Parliament was recently held, and it is now public property that the Board of Trade decision, adverse to the local authority, has been given. The inquiry concerns the Cleveland & Durham County Electric Power Co., the West Hartlepool Corporation, and the Hartlepool Electric Tramways Co. The Kitson clause first made its appearance in connection with the electric power Bills of 1901, and was so called owing to Sir James Kitson (now Lord Airedale) being chairman of the House of Commons Committee which was considering the Bills in question; it subsequently became standardised, and was inserted in all electric power Acts. The clause provides for the case of a power company wishing to supply a consumer in an area in which the local authority is the supply undertaker. The company has to obtain the consent of the Corporation before it may supply; but this consent must not be "unreasonably" withheld, and the company is entitled to appeal to the Board of Trade in any case to say that this refusal is "unreasonable."

In the Cleveland & Durham County Electric Power Co.'s Act of 1901 the Kitson clause is embodied, so that it was necessary for the company to obtain the consent of the West Hartlepool Corporation before it could enter into an agreement to supply energy to the Hartlepool Tramways Co., who wished to buy energy from the power company. The position is as follows :— The tramway company's system is in Hartlepool and West Hartlepool, the power company are authorised distributors in Hartlepool, while the Corporation is the supply authority in West Hartlepool. The tramway company have a power station of their own, but offers were recently made both by the power company and the Corporation to give a supply of electrical energy. The Corporation offered to supply the tramway company on a sliding scale, which worked out, on the company's estimated consumption, to about 1¼d. per unit, which is ¼d. per unit more than the cost at which the company are at present generating for themselves. On the other hand, the power company offered to supply on a basis which would work out to about ¾d. per unit. In both cases the conditions of supply were practically identical, viz., that the tramway company would not be put to the expense of laying any additional feeders.

The offer of the power company being the lower of the two, the tramway company wished to accept it, but the West Hartlepool Corporation refused to give their consent to supply being taken for the West Hartlepool portion of the tramways. The power company thereupon, under the Kitson clause of their Act, appealed to the Board of Trade to decide whether the consent of the Corporation had been unreasonably withheld. An inquiry took place, and under the provisions of the clause the arbitrator had to be guided by the following considerations :—

"The consent shall be deemed to be unreasonably refused or withheld if the authorised distributor is not willing and in a position to give the requisite supply upon reasonable terms and within a reasonable time, and in considering what are reasonable terms and what is a reasonable time, the Board of Trade shall regard all the circumstances of the case, including the capital expenditure incurred in connection with the undertaking of such distributor, and all charges in respect thereof, and the financial position of such distributor and the terms upon which and the time within which the company is willing and in a position to give a supply."

The award of the Board of Trade is very short and to the point, merely stating that after consideration of the arbitrator's report, the decision has been arrived at that the Corporation's consent has been unreasonably withheld.

In the meantime the Corporation have given notice of their intention to purchase two of the company's lines in their area upon the terms of Section 43 of the Tramways Act, 1870, under the tramway company's Provisional Order. The Corporation is entitled to purchase at the expiration of 14 years from the date of the Order, instead of 21 years, as under the Tramways Act of 1870, but upon purchase the company may demand a lease of the lines for seven years. In addition, the Corporation have given notice of their intention to promote a Bill in Parliament to purchase and extend the company's undertaking in West Hartlepool, the purchase to be compulsory where possible, or otherwise by agreement.

Although this is the first time that the Board of Trade have been called upon to interpret the Kitson clause, no moral can be drawn from the result in regard to the future, as each case will undoubtedly present different local features calling for special consideration. Indeed, the circumstances of each particular consumer—in respect of which there has to be a separate inquiry—will probably vary so much that previous decisions under the clause will not apply as conclusive precedents.

THE "Z" METAL FILAMENT LAMP PATENT

MR. JUSTICE PARKER delivered judgment yesterday morning in the action brought by the "Z" Electric Lamp Manufacturing Co., Ltd., against Messrs. Marples, Leach & Co. (now Adnil Electric Co., Ltd.) for infringement of their patent No. 21,654 of 1906. His lordship held that all the objections brought against the patent failed, and that the defendants had infringed.

In delivering judgment, Mr. Justice Parker said that it was agreed that the presence of carbon in metal filaments conduced to blackening, though it was now known that the actual deposit on the globe sometimes consisted of metal particles from the filament only. Removing the carbon tended to prevent blackening, and he thought the patentees meant to prevent blackening by the use of phospham. It was quite clear that the essential idea in the patent was the removal of carbon by combination with gases evolved by heating chemical substances, in order to obtain a stronger filament. With regard to the three objections offered, the patent was not misleading, as it was addressed to manufacturers and not to chemists, and therefore slight errors in chemistry were unimportant. The specification might be taken to imply that free nitrogen was given off on heating the chemicals mentioned, whereas this could not happen except at exceedingly high temperatures. Nitrogen was given off in the form of ammonia by all the substances mentioned, with the exception of pure phospham, and it was possible that the patentees used the word nitrogen meaning nitrogen in the form of ammonia. It would not matter to the manufacturers so long as the carbon was extracted. It had been argued that pure phospham would not give off ammonia when heated, but he was satisfied that pure phospham (PN_2H) could only be obtained with much difficulty, and that the phospham made at the date of the patent, as well as the present commercial phospham, contained a proportion of phosphoramide which was a result of the decomposition of phospham in the presence of moisture. This substance did give off ammonia at a low temperature. This reconciled the apparently contradictory evidence of the experts. Phospham had a high affinity for moisture, and all the commercial samples tested therefore gave off ammonia on being heated. Chemically pure phospham was found at first not to give off ammonia, whereas later tests (after it had had time to absorb moisture) showed an evolution of ammonia. Again, although lamps treated with pure phospham were perfectly satisfactory, alcohol was used in making it into a paste, and it was more than probable that the alcohol contained water. The objection of insufficiency failed because the experts had had no difficulty in carrying out the process described under manufacturing conditions. The suggestion as to inutility had been based on the idea that chemically pure phospham was intended to be used, but it had been proved that the commercial phospham operated to remove the carbon, whether used in the paste or in the bulb. It was remarkable that the known presence of carbon in a filament had been proved not to lead to blackening when phospham was present, whereas without the phospham blackening had taken place. What actually went on in the bulb was not quite clear. He considered, therefore, that the attack on the patent failed.

With regard to infringement, the defendants claimed that they did not use phospham to remove carbon from the filaments, but to prevent blackening. They asserted that their filaments contained only 0·04 per cent. of carbon before sealing the bulbs, but they had not proved this. Further, they had not proved that the phospham did not remove the carbon still in the filament, and thus prevent blackening. The phospham normally operated to remove carbon, and they had used it with a filament containing carbon. He considered, therefore, that they had infringed the patent.

Telephone Facilities in Glasgow.—An official statement has been issued concerning the working of the Post Office and National telephone systems in Glasgow. As stated in our issue for February 24th, the two systems will be worked more or less in co-operation until the purchase by the Government in 1911, and in the meantime arrangements are to be made for the erection of a new Post Office Exchange for 10,000 lines in the Central district, and a new one in the Exchange district. The National Telephone Co. will also commence the construction of a new exchange.

An Emergency Electric Power Installation.—Messrs. Marshall, Kaye, & Marshall, Ltd., fancy tweed and coating manufacturers, who had the misfortune to have a serious breakdown of the main driving engine at one of their Ravensthorpe Mills, bringing the whole of the machinery to a standstill, consisting of nearly 400 i.h.p., have in less than ten days been able to restart practically the whole of their various departments by the aid of the Yorkshire Electric Power Co., who commenced the work of fixing electric motors and putting into operation of the machinery immediately after the breakdown. It is probable that a stoppage of perhaps five or six months would have been occasioned for the necessary repairs to be effected to the engine.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 3rd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

6,477/09. **Short-circuiting Device for Induction Motors.** The Lancashire Dynamo & Motor Co., and A. R. Stelling. A short-circuiting plate rotating with the rotor is pushed axially to engage with contacts on a fixed plate attached to the slip-rings in the usual manner, but the same movement causes the brush gear to move axially and shift the brushes off the slip-rings on to stationary segments adjacent to the rings. Five claims, seven figures.

6,936/09. **Manufacture of Metal Filaments.** The Westinghouse Metal Filament Lamp Co., Ltd. (*A. Lederer, Vienna*). Raw tungsten filaments containing 2·5 per cent. of carbon are decarbonised by raising them to a temperature of from 1,200° to 1,300° C. in the presence of dry hydrogen, when the proportion of carbon is reduced to about 0·04 per cent. The hydrogen combines with the carbon forming methane. The absence of oxygen prevents oxidation of the tungsten with the resultant bright places in the filament. Two claims.

8,351/09. **Lamp Manufacture.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). This patent covers an ingenious machine, in which the various steps of blowing off the neck of a bulb to the proper length, placing the bulb in proper relation to the stem and filament-carrier, and sealing the stem into the bulb are all carried out automatically. Ten claims, eleven figures.

10,663/09. **Protective Devices.** H. Brazil and H. Cooch. When several spark-gaps are used in series for the protection of A.-C. systems against the effects of excess pressure, difficulties sometimes arise owing to the unequal distribution of the potential across the gaps under different conditions. In order to equalise distribution, connections are made from the junctions between the gaps to a transformer or choking coil at points symmetrically arranged, having regard to the arrangement of the gaps with respect to the system. Four claims, four figures.

17,353/09. **Heating Apparatus.** A. F. Berry. An apparatus for heating the air in rooms comprises a transformer, the secondary of which is connected direct to a metal coil or spiral which is raised to a high temperature by the passage of the secondary current. Fan-like arrangements of metal strips are placed round the connections between the coil and winding to take away the heat by conduction and prevent the winding from getting too hot. Four claims, three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Bowden, Anderson, Atchley and Bull [Supports for overhead cables] 843/09; Witzenmann [Armouring cables] 3,917/09; Franz Clouth Rheinische Gummiwarenfabrik [H.-T. insulators] 1,009/10.

Dynamos, Motors, and Transformers: Buchanan [D.-C. machines] 4,374/09; Siemens Bros. Dynamo Works (*Siemens Schuckertwerke-Ges.*) [Adjustable polyphase transformers] 20,003/09.

Electric Ignition: Unterberg & Helmle [Contact-breaker for magnetos] 4,030/09; Gray, 21,858/09.

Electrometallurgy and Electrochemistry: Thwaites & Ralph [Separating copper] 4,167/09; Johnson (*Badische Anilin & Soda Fabrik*) [Manufacture of nitrates] 10,465/09; Levi [Manufacture of phosphatic fertilisers] 18,433/09.

Heating and Cooking: Kolemine [Heating] 3,709/09; Grob [Heating vehicles] 3,848/09; Hosgood [Cooking] 7,029/09.

Instruments and Meters: Justice (*Kunsch & Jaeger*) [Photographic recording apparatus for oscillographs, &c.] 20,922/09.

Switchgear, Fuses, and Fittings: Dick Kerr & Co. (*Thury*) [Regulators] 24,634/08; Crookell [Lamp-shades] 3,195/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Switches] 4,250/09; Allgemeine Elektricitäts-Ges. [Motor-controller] 4,472/09; Hope [Fuse-boards] 6,049/09; Moffett and Rosher [Slow-motion switch lever] 7,053/09; Baker [Switches] 8,025/09; Cottier [Locking lampholder] 9,194/09.

Telephony and Telegraphy: Adams-Randall [Telephones] 3,717/09; Roubanowitsch [Call-signal devices] 3,933/09; Marconi and Marconi's Wireless Telegraph Co. [Transmitters] 8,582/09; Kingsbury (*Western Electric Co., U.S.A.*) [Automatic selective telephone switches] 20,842/09; Skinner [Iron telegraph poles] 21,222/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Telephone exchanges 25,883/09; Siemens & Halske A.-G. [Telephone exchanges] 28,363/09.

Traction: Elinson [Station indicator] 3,512/09; Siemens Bros. Dynamo Works, Ltd., Broadhead and Hawkins [Train-lighting apparatus] 3,906/09; Roubanowitsch [Signalling apparatus] 3,933/09; Chambers [Rails] 10,559/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Braking semaphore arms] 26,103/09.

Miscellaneous: James [Protecting ships' bottoms from barnacles] 279/09; Burks [Cast-iron magnets] 5,360/09; Prior [Electric clocks] 5,687/09; Ireland [Automatic depth recorder] 6,574/09; Geller [Illuminating frame for pictures, &c.] 6,601/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Pumping system] 6,984/09; Prestwich [Miners' lamps] 12,751/09; Electric Boat Co. [Torpedoes] 20,852/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution, &c.: Herbing [Cable-boxes] 2,311/10.

Dynamos, &c.: Siemens Shuckertwerke-Ges. [Commutators] 1,292/10.

Electric Ignition: Etablissements de Dion Bouton Soc. Anon. [Magnetos] 2,883/10, and 3,310/10.

Instruments, &c.: Foster [Pyrometer] 30,478/09.

Storage Batteries: Accumulatoren-Fabrik A.-G. [Plates] 27,221/09.

Telephony, &c.: Fessenden [Wireless signalling] 29,481/09: Siemens & Halske A.-G. [Telephone system] 999/10, and [Telephone exchanges] 2,608/10.

Traction: Compagnie de Signaux Electriques pour Chemins de Fer [Signalling apparatus] 3,199/10.

Opposition to Grant of Patents

6,138/09. **Aluminium Solder.** C. E. Steinweg. Opposition has been entered to the grant of this patent. The specification, abstracted in Electrical Engineering, January 20th, 1910, page 50, describes tubular sticks of a cadmium alloy of aluminium.

12,289/09. **Fan.** J. Keith. Opposition has been entered to the grant of this patent. The specification describes an ornamental standard fitted with electric lamps and a ventilating fan arranged vertically in the interior. It is intended for placing in the centre of a table for circulating the air over the surface.

19,098/09. **Magnetic Track Brakes.** Dick Kerr & Co., Ltd. (*R. Braun*). The grant of this patent, abstracted in Electrical Engineering, January 20th, 1910, page 50, is opposed. A number of separately excited electromagnets are linked together to form a chain which can adjust itself to irregularities in the rail.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

5,673 of March 13th, 1896. **Electrolytic Apparatus.** A. S. Elmore (*J. O. S. Elmore, India*). Apparatus for refining copper and other metals, consists of a number of sheets of lead, copper, and rubber respectively, placed one above the other in succession, with wooden separating frames and clamped together between two boards. The electrolyte is pumped through the whole, and the top plate forms the anode, while the bottom plate is the cathode. Pure copper is deposited upon the undersides of the lead plates, the impurities passing away with the electrolyte.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: C. P. Steinmetz [Quartz vapour lamp] 24,909/03.

Distribution Systems, &c.: E. W. Hill [Junction boxes] 23,756/05.

Dynamos, &c.: A. P. Zani [Transformers] 23,720/05; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Frequency-changer] 23,838/05, and [A.-C. commutator motor winding] 28,839/05.

Electrometallurgy, &c.: T. Parker [Electrolytic preparation of sodium or potassium chlorate] 25,631/96; C. C. Connor [Carbon-lead electrodes] 26,059/96; H. S. Blackmore [Manufacture of aluminium] 24,781/04; I. Ickringill [Sterilising by electrolysis] 23,345/05; J. Asbeck [Electrolytic production of lead and silver from sulphur ores] 23,408/05; B. Platschick [Furnace] 23,526/05.

Incandescent Lamps: Siemens & Halske A.-G. [Manufacture of filaments of alloys of tantalum and tungsten] 23,097-8/05.

Instruments, &c.: Nalder Bros. & Thompson, F. H. Nalder, and O. Cox [Commutators for meters] 24,769/04.

Storage Batteries: H. Beckmann [Manufacture of lead peroxide] 22,807/99; L. N. Roselle [Plates] 24,689/04.

Switchgear, &c.: E. Greenfield [Flexible insulated metal conduit] 26,752/97; British Thomson-Houston Co. [H.-T. oil switch] 20,522/00; H. C. Smith [Pendant support] 23,379/05; W. McGeoch & Co. and W. L. Barber [Switch] 23,582/05; C. H. Robinson [Terminal] 23,662/05; H. Simmonds [Lamp-shade holder] 23,728/05.

Telephony, &c.: C. D. Abel (*Siemens & Halske A.-G.*) [Microphone] 23,619/05.

Traction: H. C. Heide (*G. M. Seeley*) [Signalling system] 23,278/05; A. E. Ostrander [Tube car construction] 23,305/05 and 23,381-6/05.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[*Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."*]

THE MANUFACTURE OF ELECTRICAL PLANT.—We have received a handsome bound volume containing an interesting account of the development of the business of the General Electric Manufacturing Co., of Sweden, whose representative, Mr. S. H. Busch, is now to be seen in London at Norfolk House, Laurence Poultney Hill, Cannon Street, E.C. The firm was founded in 1883, and in 1890 established its headquarters at Westeras, Sweden, where they possess very extensive works, many excellent points in the arrangement of which, as well as of the manufacturing methods in use, are made clear in the numerous illustrations which accompany the description. A brief historical sketch of the development of the dynamo is given, and it is mentioned that continuous-current engineering in Sweden practically dates from the first machine of Wenström in 1880. From those early machines there has been continuous progress, leading up to the designs of the large generators which the company are making to-day. It is impossible to particularise all the directions in which the activities of so large a firm lie, but turning over the pages we find illustrations and descriptions of a large variety of central station generating plant, converting plant, and motors applied to every class of work, an interesting example of which is for ship propulsion in conjunction with Diesel engines. The company have done a great deal in connection with large water-power equipments and transmission schemes, including the Trollhattan Falls and other well-known plants. A particularly fine machine illustrated is a 10,500-kw. alternator for Svaeglos (part of a 40,000-h.p. installation for the Notodden Nitrate Works), but five machines are on order of 17,000 k.v.a. at 10,000 volts for the Norwegian Nitrogen Co., of Christiania, for their plant near Rjukanfos. Large installations have also been carried out at the Domnarfvets Iron Works, the Gullspang-Munkfos Power Supply Co. Interesting details are also given of switchgear, including special rolling mill equipments, and an electric winding system for mines is described. Mention must also be made of the extensive electric tramway and railway work carried out by the company, including examples of the single-phase system. Electric cranes, transporting machinery, and lifts are also well represented.

BLASTING MACHINES.—The Sterling Telephone & Electrical Co., Ltd. (200 Upper Thames Street, London, E.C.) have sent us a booklet describing the various patterns of electric blasting machines manufactured by them. The latest of these was described on p. xxx of the Mining Supplement of our last issue. Machines of the magneto low- and high-tension type and others of the dynamo pattern are described and illustrated. Accessories and spare parts are also listed in this booklet, which contains much information with regard to electric shot-firing generally.

WIRING ACCESSORIES.—A new leaflet from the Sun Electrical Co., Ltd. (118 Charing Cross Road, London), contains a description of some of the uses of the neat little buckle clips and dowel pins for fixing conduit and lead-covered and other cables. Some new sizes are now listed.

METAL FILAMENT LAMPS.—A new list of Osram lamps is being issued by the General Electric Co. (71 Queen Victoria Street), containing particulars of the revised wattages and candle-powers, which we announced in Electrical Engineering, February 10th, p. 85. The lamps listed range from 10 watts 25 volts to the 1,000-c.p. lamp, which is made up to 260 volts.

PROTECTIVE DEVICES FOR TELEPHONE INSTALLATIONS.—Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), are issuing a new list of protective devices for telephone circuits, both for exchanges and subscribers' lines. These include various combinations of carbon block lightning arresters, line and safety fuses, and heat coils, both made up in strips and arranged singly. Cast-iron junction boxes are listed for these units, and among the accessories are various convenient tools for extracting fuses, &c. The list also deals with vacuum arresters, which can be used for protection both from lightning and from traction currents. Various arrangements of combined spark-gap and vacuum arresters mounted on porcelain bases with heat coils are standardised. Another feature is the series of non-interchangeable tubular fuses.

METRIC TABLES.—A useful card is being issued by the Newall Engineering Co. (Blackhorse Lane, Walthamstow), giving standard tables of tolerances and limits for force, driving, push and running fits in millimetres for diameters up to 150 mm. A copy of the card will be sent to any applicant.

ALTERNATORS.—A very complete list of standard alternating-current generators is included in a new pamphlet issued by Messrs. Bruce Peebles & Co., Ltd. (Edinburgh). These machines are manufactured in the usual types and for voltages of 200–6,600 volts, outputs being given, over a total of nine pages, for standard sizes suitable for three ranges of voltages both in 50- and 25-cycle machines. A general specification of the machines is given, with illustrations of actual sets with various forms of driving.

ELECTRIC DRIVING OF COTTON MILLS.—The Allgemeine Elektricitäts-Ges., whose agents in this country are the A.E.G. Electrical Co., Ltd. (121 Charing Cross Road, London, W.C.), have issued a booklet containing a series of photographs illustrating their system of individual drive for cotton and other textile machinery. Examples of belt, gear, and direct driving of blowing and carding machines with squirrel-cage motors are followed by photographs of gear-driven lapping machines. For doubling frames a special form of squirrel-cage motor, which starts gently without jerk is employed, with a gear-drive, and ring-spinning machines are gear-driven by squirrel-cage motors with a special arrangement of the stator windings to give two speeds by varying the number of effective poles. The latter motors are totally enclosed, and some are water-cooled. A list of fifty-five installations in textile mills by the company, aggregating over 17,000 h.p. is included in the booklet.

CABLES.—A striking pamphlet from Messrs. W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, London Wall, E.C.), contains particulars of a paper-insulated cable supplied to Marconi Wireless Telegraph Co., Ltd., for use at Clifden and Glace Bay. This cable is worked normally at 40,000 volts continuous current, but has been tested up to 130,000 for ten minutes. Another new pamphlet also got up in attractive style gives prices and particulars of "London" and "Henley" tapes.

WIRELESS CLUSTERS.—We have received a copy of the export catalogue of Benjamin wireless cluster fittings and electric lighting specialities from the Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.). Some of the newest of these fittings were described and illustrated in Electrical Engineering, February 10th, p. 90. A copy of the list will be sent to inquirers abroad upon request.

ACCUMULATORS.—Messrs. Richard Pape, Ltd. (Albion House, New Oxford Street), have sent us a copy of their latest catalogue of "Fors" accumulators, of which they are the manufacturers. Owing to the special arrangement of the plates, which are concentric cylinders separated by a porous diaphragm, exceptional durability as well as small size for the output is claimed The patterns listed range from small ignition and lighting cells for motor-cars to larger cells for yacht lighting, medical, and experimental work. Several forms of accumulator hand lamps are listed, including a substantial safety lamp for mines.

METAL FILAMENT LAMPS.—The Foster Arc Lamp & Engineering Co. are issuing an effective poster depicting the disgust of a meter reader on finding that the meter has hardly registered since the last quarter owing to the introduction of Foster metal filament lamps.

CANDLE LAMPS.—A new catalogue from the Lux Candle Co., Ltd., describes and illustrates the latest forms of the Lux patent candle, which consists of a long tubular lamp, over which is clipped the opal tube. The lamp only requires renewing, and another advantage is that the tube can be cleaned inside. Both carbon and metal filament lamps are made, the latter, however, only up to 80 volts.

CORRESPONDENCE

THE ELECTRICAL INDUSTRY.

To the Editor of Electrical Engineering.

Sir,—The undermentioned have decided to constitute themselves into a Provisional Committee to take such steps as may be found advisable in furtherance of the legislative, industrial, and commercial interests of electrical industries. Every effort will be made to work in co-operation with all existing electrical societies. Any member of the industry in sympathy with this movement is asked to communicate with the Hon. Secretary or with any member of the Committee. A further announcement on the subject will be made at an early date.

G. L. Addenbrooke.	E. Garcke.
A. Bruce Anderson.	J. Barber Glenn.
A. K. Baylor.	F. E. Gripper.
Lt.-Col. H. R. Beddoes.	H. Hirst.
E. Bergtheil.	J. G. Lorrain.
J. Cecil Bull.	J. A. Lycett.
E. Charrington.	W. C. Mountain.
A. N. Connett.	R. K. Morcom.
A. Dickinson.	W. M. Murphy.
H. Justus Eck.	H. B. Renwick.
W. B. Esson.	A. A. Campbell Swinton.
E. H. Freeman.	A. P. Wood.

R. Borlase Matthews, *Hon. Sec.*

Bank Buildings, Kingsway, London, W.C.,
March 7th, 1910.

FACTORY FIRES.

To the Editor of Electrical Engineering.

Sir,—Your issue of 3rd inst., reporting the fire at Messrs. Johnson & Phillips's works, mentions that water at sufficient pressure to reach the upper floor of a building only two storeys high was not available, and raises astonishment that this engineering firm should not have previously provided private fire-extinguishing measures of a more efficient character.

Yours faithfully,
J. H. Heathman.

Parson's Green, S.W., March 3, 1910.

LOCAL NOTES

ABERDEEN: *Supply to Tramways.*—The directors of the Aberdeen Suburban Tramways Co. have agreed to accept an offer of the Town Council for the supply of electrical energy to the tramways at 1¾d. per unit. This represents a reduction of about £400 per annum on the present bill of the company.

ACTON: *Street Lighting.*—The Acton U.D.C. is now experimenting with metal filament lamps for street lighting. Several experimental posts have been erected, and each lantern is provided with three 100-c.p. Osram lamps backed with a suitable reflector.

BERLIN: *Trolley Omnibuses.*—The *Westminster Gazette* states that it is proposed to run trolley omnibuses in the western suburbs of Berlin to join up with the lines of the Berlin tramway companies. The latter have refused to extend the tramways to the west.

BRIGHTON: *"Free" Wiring.*—In our last issue we mentioned that the Electricity Committee recommended the adoption of a proposal that local wiring contractors should wire premises, the Council charging the consumer an extra 1d. per unit, and paying this over to the wiring contractor. A long discussion took place upon this recommendation at the last meeting of the Council, but eventually it was rejected.

DUNDEE: *Electricity Works' Insurance.*—The Electricity Committee recommend that the new electricity works be insured to the extent of £40,000, and that a policy to the extent of £10,000 be taken out upon the sub-stations.

FARNHAM: *Provisional Order Revoked.*—The Board of Trade have revoked the Farnham Electric Lighting Order, 1905.

GATESHEAD: *Trailer Cars.*—The Gateshead & District Tramways Co. have applied to the Board of Trade for permission to use trailer cars on their system.

KENDAL: *Electricity Deficit.*—The electricity accounts for last year show a total deficit of £671.

LIVERPOOL: *Street Electric Lighting.*—An extension of the street electric lighting is to be carried out in Hardman Street at a cost of £250. The annual cost for maintenance is put at £4,983. At present, with gas, there is 2,460 c.p., but with the new lighting there will be 10,000 c.p.

MONMOUTH: *Electricity Supply.*—A London firm has inquired from the Corporation terms for a supply of electric power to the extent of 500 kw. for a calcium-carbide factory. As, however, the Monmouth Corporation works have not at present a maximum output of the quantity of electricity required by the proposed company, the suggestion has been made locally that the present works should be taken over by the company.

NEWPORT (Mon.): *Electricity Works.*—Although the report of Mr. C. P. Sparks upon the working of the Corporation electricity undertaking has been regarded as private, certain details of it are being publicly discussed by the Electricity Committee. For instance, Mr. Sparks does not approve of the policy of maintaining two generating stations, having regard to the area of supply. He recommends the concentration of all the plant at the Corporation Road power-house, with two 300-kw. sets in reserve at the Llanarth Street works. He also recommends the concentration of the whole of the staff at Corporation Road. Mr. Sparks also recommends the laying of mains for public lighting before there is any demand from private consumers. Mr. Sparks further suggests various increases in the charges, and a reduction of discounts to 2½ per cent. The Committee have at present come to a decision only on one point, viz., with regard to discounts, and they have decided to retain the present rate of 5 per cent. for accounts paid within one month.

PARTICK: *New Plant.*—A new 1,000-kw. reciprocating engine generating set was put into service last week. The total cost of the extension scheme was £21,328.

SALFORD: *Electric Supply.*—On and after April 1st users of electricity for power will only be allowed to use current for lighting purposes at the power rate up to 10 per cent. per quarter of their power consumption, instead of 15 per cent., as at present.

SOUTH AFRICA: *Bulawayo Electric Supply.*—After a long period of disagreement and litigation between the Council and the Bulawayo Waterworks Co. with regard to the supply of electrical energy by the latter, an agreement has at last been come to. The average price will work out at about 2s. per unit in the absence of any special contract. Osram lamps are being installed for street lighting.

WATFORD: *Railless Electric Traction.*—Inquiries have recently been made on behalf of the Urban District Council, on the Continent and elsewhere, in regard to railless electric traction. The Highways Committee, having considered the matter, reported at the last meeting that they were not prepared to recommend that railless electric traction be substituted for electric tramways at Watford. The report was adopted.

WOOLWICH: *New System of Charging.*—It has been decided to offer terms to long-hour consumers based upon their normal maximum demands to be ascertained by the Borough Electrical Engineer as distinct from the present maximum demand system now in force.

YORK: *Cost of Tramways.*—The Tramways Committee report that the loans authorised in respect of the tramways which are now approaching completion amount to £130,700. The contracts already entered into for the construction of the tramways, cars, widening works, &c., inclusive of the purchase of the old tramways company, amount to £115,605.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BELFAST.—The White Abbey Sanatorium recommend the installation of an electrical plant at an estimated cost of £4,143.

BLACKBURN.—The Electrical Engineer has presented a report on improvements and additions at the electricity works.

BURNLEY.—The Electricity Committee propose to borrow £5,000 to cover expenditure on mains for the next three years.

CANADA.—H.M. Trade Commissioner for Canada reports that the four principal electric supply undertakings in Quebec have amalgamated, and that an expenditure of about £205,000 is contemplated upon extensions of plant. The names of the General Manager and Electrical Engineer of the new organisation may be obtained by British firms interested from the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

FINCHLEY.—Application is to be made to the Local Government Board for sanction to borrow £10,000 for mains extensions, &c., to March 31st, 1912.

GORING AND STREATLEY.—The Goring and Streatley Electric Light & Power Co. propose to increase their generating plant and extend their mains.

IRELAND.—At the meeting of the Monaghan Council last week, it was decided to proceed with an electric lighting scheme.

NETHERLANDS.—Tenders are invited by March 21st by the Dutch Ministry of Finance for the installation of an electric light and power plant in the new building of the Royal Mint at Utrecht. Particulars from the Ministerie van Financien, Rijks Munt, Oude Gracht, Utrecht.

SCOTLAND.—A scheme for working the Ballachulish Estate Quarries by electricity is under consideration. The proposal includes the whole of the haulage and pumping works.

SOUTH AFRICA.—According to the *British and South African Export Gazette*, the New Modderfontein Gold Mining Co., Ltd., require a complete electrical plant.

SOUTH WALES.—The directors of North's Navigation Co. have decided to erect large electric power stations in connection with some new sinkings at Cwmdu.

STRETFORD.—The Resident Engineer is to report with reference to extensions of the generating plant.

SWANSEA.—Subscriptions are being invited for an issue of £1,011,800 3½ per cent. redeemable stock at 97½. The money is required for various municipal purposes, including extensions of the tramways and electricity undertakings.

WEDNESBURY.—The Council propose to borrow £2,095 for electrical extensions.

WEST HAM.—Application is to be made to the Local Government Board for sanction to borrow £55,000 to meet the additional capital expenditure in connection with the electricity undertaking for the next two years.

Miscellaneous

BOLTON.—The Electricity Committee require motors, meters, switches, transformers, and other accessories for the year to March 31st, 1911. (See an advertisement on another page.)

BRAY.—The Council require general stores for the Electric Light Works. Particulars from the Clerk to the Council, and tenders by April 5th. (See an advertisement on another page.)

BURNLEY.—Extensions of the tramways are contemplated, and the manager is to report.

EDINBURGH.—The Tramways Committee recommend that in lieu of the extension of the cable tramways, an electric tramway should be constructed along Slateford Road to the new markets at Gorgie. The recommendation has been adopted.

JAPAN.—H.M. Commercial Attaché at Yokohama reports the intention to equip Yokohama-Tokio Railway with electric traction, and also a proposal to construct an electric tramway alongside the present railway. It is also proposed to convert the Usui section to electric traction.

SOUTH AFRICA.—The *British and South African Export Gazette* states that the Cape Government is in the market for a number of electric motors.

SOUTHAMPTON.—Tenders are invited for a twelve months' supply of stores, fittings, &c., by the Tramways and Electricity Departments. Particulars from Mr. H. F. Street, General Manager, and tenders by March 14th.

The estimated cost of extending the tramways to Northam is £15,248, including overhead equipment, track, extension of car-sheds, &c. Application is to be made for the necessary loan.

Digitized by Google

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.—Church, Harcourt Street, W. Niven & Wigglesworth, architects, 104 High Holborn, W.C.

Shops and show-rooms, Bond Street, W. Paul Hoffman, architect, Capel House, New Broad Street, E.C.

S.E.—Rink, Lower Woolwich Road, S.E. W. H. Cornell, architect.

S.W.—Theatre, Garratt Lane, Earlsfield. Architects, Emden, Egan & Co., Lancaster Place, W.C.

PROVINCES.

AUCKLAND (Northumberland).—The Guardians have decided to install electric lighting at the workhouse infirmary.

AYR.—Premises, York Street (£1,700). Architects, W. Cowie, Ayr.

Restaurant and offices, Cattle Market (£1,500). J. Young, Borough Surveyor.

BELFAST.—Public abattoir (£32,000). Builders, H. & J. Martin, Ormeau Road, Belfast. City Surveyor, Belfast.

Theatre. Architects, Swanston & Syme, Redburn Wynd, Kirkcaldy.

BRISTOL.—Extensions to University (£5,300). Architects, Lingen, Barker & Sons, Leadenhall Street, E.C.

CHESTER.—Turkish baths (£2,500). Architect, W. T. Lockwood, Foregate Street, Chester.

Fire station (£3,000). Architect, J. Strong, Chester.

COVENTRY.—Additions, Leigh Mills. Architect, R. J. Meakin, Queen Victoria Road, Coventry.

DUNDEE.—Engineering laboratory at University (£11,000). Sir Rowand Anderson & Paul, architects, 16 Rutland Square, Edinburgh.

EDINBURGH.—Additions, George Heriot College (£5,000). J. Anderson, superintendent of works at College.

ELLAND.—School. Architect, W. S. Braithwaite, South Parade, Leeds.

GLOUCESTER.—The Gloucestershire County Council invite tenders for the wiring of the Shire Hall, Gloucester. Tenders to the Clerk to the Council, Shire Hall, by April 2nd.

HALIFAX.—Billiard saloon (£2,000). Architect, C. Williams, Halifax.

HUDDERSFIELD.—Works for W. Brown & Co., Crossland Avenue. Architect, J. Berry, Huddersfield.

ILFORD.—Secondary school, Heath Park (300 places). J. H. Nicholas, Secretary, Essex Education Committee, Chelmsford.

KEIGHLEY.—Dye works for Stockbridge Furnishing Co. (£1,500). Architect, Bradford Dyers' Association Offices, Bradford.

KILMARNOCK.—Dick Institute (£20,000). Architects, Ingram & Brown, King Street, Kilmarnock.

KIRKCALDY.—Buildings for Co-operative Society (£4,000). Architect, D. F. Smith, High Street, Kirkcaldy.

LINCOLN.—School, Spring Hill (£4,110). Architect, W. G. Watkins, Bank Street, Lincoln.

NORTHAMPTON.—Engineering works for Smith, Major, Stevens & Co. Ltd., Queen's Road, Battersea, S.W.

PONTYPRIDD.—Cottage hospital (£3,950). Architects, Evans, Williams & Evans, Pontypridd.

SHEFFIELD.—University college hall (£10,000). H. Frackingham, builder, Hoyle Street, Sheffield.

TORQUAY.—School. Architect, Education Committee, Torquay Town Council.

WEST HAM.—Bank and offices for Sir J. H. Bethell, M.P., Park House, Wanstead.

Prices of Metal Filament Lamps in Germany.—The list prices of the "Sirius" lamps manufactured by Messrs. Julius Pintsch, of Berlin, are reduced from to-day as follows:—25-50 c.p. 100-135 volt, from 3s. to 2s., and 50 c.p. 170-250 volt, from 3s. 6d. to 3s. each.

Edison Battery Tramcars.—According to our American contemporaries, a test is being made of a tramcar with Edison batteries in actual service on the 28th and 29th Street cross town lines in New York. If the tests are satisfactory, it is said that nineteen more cars will be ordered and the present horse cars discontinued.

The G.B. Surface Contact Stud System.—Mr. William Griffiths, who owns the patents of the "G.B." surface contact system of electric traction, with Mr. B. H. Bedell, the inventor of the system, are taking action against the *Daily Chronicle* and *Star* newspapers in relation to the publication of articles, alleged to be of a defamatory nature, at the time of the experiment with the system in the Mile End Road. A short time ago, in chambers, Mr. Justice Jelf decided that certain paragraphs in the pleadings for the defence should be struck out, mainly for the reason that they were contrary to the rules of pleading, and tended to delay the trial. Mr. Justice Jelf also ordered the defendants to deliver further and better particulars. An appeal against this decision was heard in the High Courts last week, and was eventually allowed.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Willans & Robinson, Ltd., has been accepted for a 1,500-kw. turbo-alternator and condensing plant.

COLCHESTER.—Messrs. Crompton & Co. are supplying a 275-kw. dynamo to the Corporation.

INDIA.—The Globe Electric Co., Ltd., recently received an order for 36 arc lamps for the Bengal Nagpur Railway Co. After inspection and tests, a repeat order covering a further 28 lamps has been placed with the same firm.

LONDON: *Battersea.*—The Council have accepted the tender of Kortings, Ltd., for the supply of an ejector condenser, valves, gauges, &c., for a turbo-generating set at £110.

Islington.—The Council have accepted the following tenders for annual supplies for the electricity department:—Motors and prepayment meters: British Westinghouse Co.; Bat Meter Co., Ltd. Cables: British Insulated and Helsby Cables, Ltd. Electrical sundries, lamps, arc lamp parts, &c.: Bristish Tungsten Lamp Co.; Bryant Trading Syndicate; General Electric Co.; Heap and Johnson; Johnson and Phillips, Ltd.; Falk, Stadelman and Co. Cable, terminal service, network boxes and tapes: Johnson and Phillips, Ltd.; W. Lucy and Co., Ltd.; British Insulated and Helsby Cables, Ltd.; Calender's Cable and Construction Co., Ltd.; British Bitumen Co.; General Electric Co., Ltd. Transformers and accessories: British Electric Transformer Co.; Ferranti, Ltd.; Sykes & Sugden, Ltd. Arc lamp carbons and globes: Sloan Electrical Co.; Geipel Co.

METROPOLITAN RAILWAY CO.—Messrs. Siemens Bros. Dynamo Works, Ltd., have secured the contract for "tantalum" lamps for station and sign lighting on the Metropolitan Railway.

SHEFFIELD.—The Council have accepted the following tenders:—British Electric Transformer Co., Ltd., five boosting transformers of 1,000-kw. capacity each, £2,195; J. P. Hall & Sons, Ltd., boiler feed pump (10,000 gallons per hour), £190; Tramway Supplies, Ltd., M. Bonser & Co., Brecknell, Munro & Rogers, Ltd., British Insulated & Helsby Cables, Ltd., and W. Wood & Co., annual supply to the tramways department of overhead-line material; India Rubber & Gutta Percha Telegraph Works Co., Ltd., Tasker, Sons & Co., Ltd., Sheffield Corporation Electric Supply Department, and T. A. Ashton, Ltd., electrical fittings for the Health Department

WEST HAM.—The Council have extended the contract with the British Insulated & Helsby Cables, Ltd., for the supply of cables from March 31st for twelve months.

WIGAN.—The Council has placed an order with Chamberlain & Hookham for 20 meters for the tramway cars at £65.

APPOINTMENTS AND PERSONAL NOTES

Mr. R. W. Weekes asks us to state that his connection with *The Electrical Engineer* as editor terminated in July last, and he has now no interest, editorially or financially, in that journal. Mr. Weekes is now devoting his time to his consulting engineering practice at Maxwell House, Arundel Street, Strand. He specialises in the equipment of factories with steam or electric plant.

Sir William Mather has placed £10,000 in trust, the income from which is to be distributed annually among the employees of Messrs. Mather & Platt.

Mr. J. E. Kingsbury, General Manager of the Western Electric Co., Ltd., has been presented with a solid silver rose-bowl by the employees on the occasion of his retirement from the company.

Mr. A. S. Black, Borough Electrical Engineer at Southport, will in future have full charge of both electricity and tramways undertakings, with Mr. T. J. Kendrew, the present tramways manager, as his deputy.

Alderman Sir Joseph Baxter Ellis has been presented with a silver cigar-box on the occasion of his retirement from the chairmanship of the Newcastle Tramways Committee. Lady Ellis has been presented with a rose-bowl on an oak stand.

Mr. James Swinburne has retired from the firm of Swinburne, O'Gorman & Baillie. He and the firm continue their respective practices at 82 Victoria Street, Westminster.

Reduction in the Price of Simplex Metal Filament Lamps.—As announced in our advertisement columns, substantial reductions have been made in the price of Simplex metal filament lamps. The most important alteration is that the list-price of the 50-c.p. 200- to 260-volt lamp has been reduced from 4s. to 3s. 6d. The smaller candle-powers at this voltage remain at 4s. as hitherto, so that in buying these lamps the consumer obtains an advantage by using the 50-c.p., which may be of some assistance to the central station man. The 16-c.p. 60- to 130-volt lamp has been reduced from 2s. 9d. to 2s. 6d., and the 25-, 32-, and 50-c.p. at this voltage from 3s. to 2s. 6d. There has also been a reduction of 9d. in the price of round bulb lamps: the 200-volt sizes are now obtainable at 3s. 9d., and the 100-volt at 2s. 9d. Readers of Electrical Engineering can obtain copies of the new list on application to Simplex Conduits, Ltd., 113–117 Charing Cross Road, W.C.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £62 5s. to £62 15s. per ton (last week, £61 15s. to £62 5s.).

TRANSFERENCE OF BUSINESS.—The business of the New Ignition Syndicate, Ltd., has been purchased by the Float Electric Co., Ltd., Britannia Works, 49A Adam Street, New Kent Road, London.

CANADIAN CUSTOMS.—An Order in Council has been approved by the Dominion Government, providing that the surtax hitherto imposed upon German imports is to be suspended in future, and that such imports will only be subject to the duties of the general tariff.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Llandudno & Colwyn Bay Electric Tramways Co., 3 per cent. on the ordinary shares for 1909; Liverpool District Electric Lighting Co., 4 per cent. for the December half-year.

Western Telegraph Co. second quarterly dividend of 3s. per share, free of tax, for year ending June 30th.

Brompton & Kensington Electricity Supply Co., 11 per cent. per annum on the ordinary shares for the December half-year, transferring £6,000 to reserve, £3,592 to depreciation, and carrying forward £8,533.

Stewarts & Lloyds, 10 per cent. on the preferred ordinary shares, and 1s. per share on the deferred shares for December half-year. Hove Electric Lighting Co., final dividend at the rate of 9 per cent. per annum, making 8½ per cent. for the year. Globe Telegraph & Trust Co., interim dividend of 2s. Direct Spanish Telegraph Co., 4 per cent. per annum on the ordinary shares for the December half-year.

British Insulated & Helsby Cables, Ltd., 6s. per share for December half-year, transferring £33,500 to reserve and depreciation; Vickers, Sons & Maxim, final dividend of 1s. per share, making 10 per cent. for the year, carrying forward £33,927; Gateshead & District Tramways Co., 6 per cent. for 1909; W. T. Glover & Co., 5 per cent. for 1909.

BUENOS AIRES LACROZE TRAMWAYS CO.—Subscriptions are being invited for an issue of £350,000 5 per cent. extension mortgage debentures at 90 per cent. The Anglo-American Debenture Corporation has guaranteed the issue.

GORING & STREATLEY ELECTRIC LIGHT & POWER CO.—Messrs. Brain & Brain, of 156 Friargate Street, Reading, are inviting offers for the purpose of £900 five per cent. mortgage debentures at 92 per cent. The money is required for mains and generating plant extensions.

WEST AFRICA.—An issue is announced of 94,993 £1 shares at par, and £80,000 six per cent. first mortgage convertible debenture stock, of the Lobito, Benguella & Catumbella Electric Light & Power Co., Ltd.

COMPANIES' MEETINGS AND REPORTS

MATHER & PLATT.—The net profit for 1909, after providing for depreciation, amounts to £106,367, in addition to £30,512 brought forward. Dividends of 10 per cent. are recommended upon both the old and new ordinary shares, in addition to a bonus of 2 per cent. The carry forward is £19,879, after placing £25,000 to reserve.

KENSINGTON & KNIGHTSBRIDGE ELECTRIC LIGHTING CO.—A balance of £1,756 is carried forward for 1909, after meeting the full dividends on the 6 per cent. and 5 per cent. preference shares, and 8 per cent. on the ordinary shares.

NOTTING HILL ELECTRIC LIGHTING CO.—There was a net profit of £20,859 for 1909. After meeting depreciation (£3,000), debenture and other interest (£2,440), and interest and sinking fund charges on Kensington and Notting Hill joint debenture stock, there is a balance of £11,609. A balance dividend of 4½ per cent. is recommended on the ordinary shares, an interim dividend of 3 per cent. having been paid in July. In addition to the full dividend on the 6 per cent. preference shares, a bonus of 1½ per cent. will be given.

CHARING CROSS, WEST END & CITY ELECTRICITY SUPPLY CO.—A dividend of 5 per cent. per annum is recommended on the West End undertaking for 1909, carrying forward £5,162. On the City undertaking there is a balance of £13,288, after meeting the preference dividend, which it is proposed to carry forward.

At the meeting last week a shareholder complained that the company was giving the preference to foreign firms for the supply of their machinery. He thought it rather suggested that there was an arrangement between the company and a foreign bank. In reply, the Chairman said that there was no financial arrangements which tied the company to any bank, either English or foreign. The position was that in the past the directors had found foreign machinery to be better and cheaper. The question, however, was one to which further consideration would be given.

METROPOLITAN ELECTRIC SUPPLY CO.—The net profit for 1909 was £49,377. A 5 per cent. dividend on the ordinary shares is recommended, carrying forward £877. The depreciation account has been credited with £15,000, bringing this to £258,855. The Company have acquired the Hanwell and Southall-Norwood Provisional Orders. At the meeting on Tuesday reference was made to the diminution in the revenue for 1909 of nearly £6,000. The chairman said this was principally due to the use of metal filament lamps. The company, however, looked for a large expansion of business in the use of electric heating apparatus.

CHELSEA ELECTRICITY SUPPLY CO.—A final dividend, making 4½ per cent. for 1909, is recommended. The sum of £12,530 is transferred to renewals and depreciation fund.

W. T. HENLEY'S TELEGRAPH WORKS CO.—A dividend of 15 per cent. is recommended on the ordinary shares for 1909, after transferring £10,000 to reserve. A balance of £32,395 is carried forward. At the annual meeting on Tuesday a portrait of Mr. George Sutton, Managing Director, together with a service of silver plate, was presented to him.

At the meeting last week, Mr. George Sutton, the managing director, said that the feature of 1909 was the extension of the company's foreign and colonial trade. China, Japan, South America, India, and the British Colonies had all contributed to the company's excellent balance-sheet, whilst in Africa they had had the best year since the war, and in Australia they had created a record. The one fly in the ointment was Canada, where they found it impossible to accept the conditions which were creeping into municipal contracts. The particular objection they had was to the condition that these contracts provided for no arbitration, and the contract money was placed entirely at the disposal of the engineer supervising the work. Such contracts they would never tender for. A portrait of Mr. Sutton and a service of plate was presented to Mr. and Mrs. Sutton at the close of the meeting, in recognition of the very valuable services he had rendered to the company. Mr. Sutton, it may be mentioned, is not leaving the service of the company.

ROSARIO ELECTRIC CO.—At meetings of the preference and ordinary shareholders on Monday it was decided to accept the offer made by the Société Financière de Transports et d'Entreprises Industrielles to purchase the company's business on the terms of paying £6 10s. for each £5 first preference share, and £9 each for each second preference and each £5 ordinary share. The total cash payment will be £518,000.

SOUTH LONDON ELECTRIC SUPPLY CO.—The report for 1909 shows a net profit of £14,125, and a dividend of 5 per cent. is recommended on the ordinary shares, carrying forward £1,125. The sum of £8,475 is set aside for depreciation. In spite of the effect of metal filament lamps, the revenue for the year exceeds that of 1908 by £2,061.

BRITISH ENGINE, BOILER & ELECTRICAL INSURANCE CO.—At the annual meeting last week, the Chairman stated that it was in connection with the insurance of electrical machines that the advantage of the company's system of periodical inspection was most noticeable. The ratio in breakdowns was higher for motors than for dynamos, and taking the two together for the past year it was 1 in 9 of the total number of machines insured. The use of alternating current in place of continuous current had been gradually extending, but while it might have been expected that breakdowns would have been diminished, according to the company's experience this was not the case.

COUNTY OF LONDON ELECTRIC SUPPLY CO.—A dividend at the rate of 6 per cent. per annum is recommended on the ordinary shares, carrying forward £3,163. The sum of £16,000 is transferred to depreciation. Reference is made in the report to the fact that steps are being taken to connect up the company's northern and southern districts under the powers under the London Electric Supply Act, 1908. It will be remembered that a short time ago the company placed proposals before the City Corporation for carrying the necessary mains across London Bridge, and through the City, but objection was taken to the route, and we understand that the matter was referred to the Board of Trade for arbitration.

CITY OF LONDON ELECTRIC LIGHTING CO.—A final dividend at the rate of 7 per cent. per annum is declared on the ordinary shares, carrying forward £25,668, after transferring £10,000 to a dividend equalisation fund. The sum of £45,000 is transferred to reserve.

Tramways and Light Railways Association.—At the recent annual general meeting, the following officers and council were elected:—Chairman, Hon. Arthur Stanley, M.P.; Vice-Chairman, James Devonshire; Members of Council, Wm. Anderson, George Balfour, W. Worby Beaumont, A. A. Blackburn, A. N. Connett, R. W. Cramp, Harry England, E. Hatton, Thos. B. Holliday, R. J. Howley, W. E. Ireland, C. W. Mallins, P. J. Pringle, J. R. Salter, H. M. Sayers, D. Sinclair, P. D. Tuckett; Hon. Solicitor, W. Morris, Jun.; Hon. Auditor, A. W. Chambers; Accountants, Messrs. Wright and Wake; Secretary, A. de Turckheim.

It is announced that a tramway congress, under the auspices of the Tramways and Light Railways Association, will be held in Dublin on Thursday and Friday, May 12th and 13th next.

SUMMARY

At the annual general meeting of the National Electrical Manufacturers' Association it was decided that an electrical exhibition be held at Olympia in October, 1911. (Page 178.)

By the courtesy of Major O'Meara, Engineer-in-Chief of the Post Office, we are enabled to publish a detailed description of the first submarine telephone cable with Pupin or "loading" coils. Our article includes illustrations of the method of inserting the coils in the cable, which is a 4-core 160 lb./300 lb. gutta-percha-covered cable. The coils are packed in position with gutta-percha cones, and covered in with gutta-percha sheet, and an ingenious method of extending the armouring over the joint is employed. The coils have an inductance of 0·1 henry, and are inserted 1 naut (1·15 miles) apart. (Page 179.)

The report that the fire at Messrs. W. Whiteley's, Ltd., was caused by the electrical installation, appears to have been quite unfounded. (Page 180.)

An important article on Central Battery Omnibus Telegraph Circuits, by Mr. H. H. Harrison, appears on page 181.

A Paper by Mr. A. Scott Younger, read recently before the Institution of Engineers and Shipbuilders in Scotland, describes arrangements for carrying out ship repairs by electric welding, and compares this system with autogenous welding, greatly to the advantage of the former. (Page 182.)

An arc lamp lowering arrangement is illustrated on page 182.

On Thursday last, a paper was read before the Institution of Electrical Engineers by Mr. Miles Walker, in which he described the effects of short-circuiting large alternators. As the armature current takes time to demagnetise the field, the former may on sudden short-circuit amount to from 20 to 30 times the full-load value. The author describes several different methods of holding the windings down against the mechanical forces resulting from this current rush, and gives some interesting oscillograph records. A second paper by the same author dealt with the question of salient pole *versus* cylindrical slotted rotors. The latter type is preferred by Mr. Walker, who describes a new method of making the end connections. In the discussion, interesting particulars of some remarkable forged steel rotors of American design were given. (Page 183.)

A series of experiments has been made by Mr. L. W. Wild on the effects of differences in A.-C. wave forms. The hysteresis loss in transformer iron was found to be directly proportional to the mean ordinate factor of the wave form, but apparently independent of the amplitude factor. The author considers that differences of the order of 7 per cent. in the total losses are likely to occur if attention is not paid to wave form. The breakdown strength of air was found to depend on the maximum value of the wave, but other results were obtained with transformer oils.

Digitized by Google

Meters of the induction-motor type were only very slightly affected by change of wave form. (Page 185.)

SOME particulars with regard to street lighting by metal filament lamps at Croydon are given on page 186.

THE Belfast Corporation are recommended to place an order with Messrs. Willans and Robinson, Ltd., for a 1500-kw. D.-C. turbo-generator for traction purposes. (Page 187.)

WE describe a new dry cell with a specially ventilated carbon and expanded zinc sheet, and a rice and salammoniac electrolyte. Some test results are given. (Page 187.)

A NEW set of rules for the arrangement and construction of lightning conductors has been drawn up by the Phœnix Fire Office. A new specification for earth plates has also been issued by the London County Council. (Page 187.)

AN experiment with a contract system of charging at Dundee has been unsuccessful.—A proposal on behalf of the Lancashire United Tramways Co. to purchase the Wigan Corporation Tramways has been rejected by the Council.—An electric supply scheme at an estimated cost of £215,000 is recommended by the City Electrical Engineer at Auckland (New Zealand).—The first section of the Bahia Blanca tramways has been opened.—The hire-purchase system of wiring is to be discontinued at Accrington. (Page 188.)

PLANT for a complete power-house is required at Aberdare; a 1,000 kw. turbo-alternator, and a 750 kw. rotary convertor, with switchgear, at Warrington; and a 500 kw. mixed pressure alternator and a 2,000 kw. turbo-alternator at Wolverhampton. Walsall Corporation propose to borrow £8,345, and the Wigan Corporation £36,000. Three electric cranes are required at Ghent (Belgium); carbon filament traction lamps, cables, meters, &c., at Glasgow; and lamp-posts and fittings at Grimsby. Tenders are invited for tramway construction at Southampton. (Page 189.)

A DIVIDEND of 10 per cent. is announced by the British Insulated & Helsby Cables, Ltd., 4 per cent. by the Newcastle-on-Tyne Electric Supply Co., and 10 per cent. by Messrs. Vickers, Sons & Maxim. (Page 191.)

AN ingenious lock nut, in which a few threads are replaced by a steel wire helix, is described. The helix is fixed at one end and tightens round the bolt when the nut turns in the left-handed direction. (Page 190.)

AMONG the specifications published by the Patent Office on Thursday last was one by Harland, Bowden and Co. for a line insulator with bolts through it for clamping on the cable.—W. Buchanan covers a commutating pole with a winding in the pole face to compensate for the armature field.—A process for hardening cast-iron for making permanent magnets is described by F. Burks.—Earthenware cooking appliances, with the heating element embedded in the walls of the vessels, are covered by N. Hosgood.—Application has been made for the revocation of a patent by E. Boddam for an electro-hydraulic lift system on the ground of inadequate manufacture in this country; and also of a patent by H. Aron for a multiple tariff meter with maximum demand attachments.—A patent for an electric primer for guns, and another by E. Preston and A. Gill covering details in the slipping belt train-lighting system, expire during the current week. (Page 194.)

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Member:* R. M. Wilson. *Associate Members:* A. C. Adams, H. M. Campbell, P. S. Fernandez, R. H. Handcock, C. G. Roach, B. Scheuer, F. E. Spencer, E. Turner, G. V. Twiss, E. A. Ullmann, A. V. Vowles, H. G. Weaver. *Associate:* J. H. Advani.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 17TH.

Institution of Naval Architects.

7.30 p.m. At Royal Society of Arts. "The Substitution of the Electric Motor for Marine Propulsion," by W. P. Durtnall.

Institution of Electrical Engineers.

8 p.m. At 25 Great George Street, London. Adjourned discussion on Mr. Miles Walker's Papers read last week.

SATURDAY, MARCH 19TH.

Royal Institution.

3 p.m. Afternoon Lecture VI., by Sir J. J. Thomson, F.R.S., on "Electric Waves and the Electromagnetic Theory of Light."

Junior Institution of Engineers.

3 p.m. Visit to the new engineering laboratory at Finsbury Technical College, London.

Institution of Mining Electrical Engineers.

3.30 p.m. Meeting of Nottingham Branch at University College, Nottingham.

4.0 p.m. Meeting of Cumberland Branch at Grand Hotel, Whitehaven.

Birmingham and District Electric Club.

7 p.m. Special Ladies' Night and Concert at the Colonnade Hotel, New Street.

TUESDAY, MARCH 22ND.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. Annual General Meeting at the University. "Some Properties of Switch and Transformer Oils," by W. Pollard Digby and D. B. Mellis.

WEDNESDAY, MARCH 23RD.

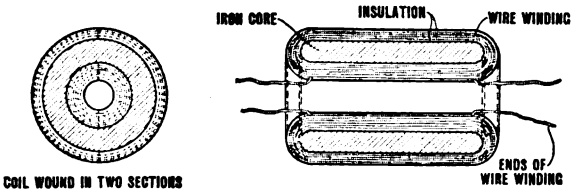
Institution of Mining Electrical Engineers: Newcastle Branch.

7.30 p.m. At Armstrong College. "Relative Merits of Alternating and Direct Current for Mines," by C. R. M. Young.

ANNUAL MEETING OF THE NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION

THE fifth annual general meeting of this Association was held recently at Balfour House, Finsbury Pavement, E.C., Mr. H. H. Berry in the chair. Before the report was considered, the Insurance Expert attached to the Association read his report, and explained the benefits to be secured in utilising this department of the Association. Many of the members had been able to obtain considerable reductions in premiums besides valuable aid in the adjustment and settlement of claims, &c. The committee's report was taken as read, and commented on by the Chairman.

Various suggestions as to increasing the utility of the Association were made. There was a consensus of opinion that the work done by the Association was insufficiently appreciated by manufacturers, and attention was drawn to the fact that much more could be done if the membership were increased. The report and accounts were approved and passed, and the following committee was elected for the current year:—H. H. Berry (Berry, Skinner & Co.), H. Bevis (Pirelli, Ltd.), H. W. Butler (Electrical Power Storage Co..), E. J. Clark (Hart Accumulator Co.), D. N. Dunlop (British Westinghouse Co.), T. J. Grainger (Sunbeam Lamp Co.), B. Longbottom (Electromotors, Ltd.), A. P. Lundberg (A. P. Lundberg & Sons), F. H. Nalder (Nalder Bros. & Thompson), H. Oppenheimer (International Electric Co.) A. P. Pope (Johnson & Phillips), B. Broadhurst (Brush Electrical Engineering Co.), and H. C. Siddeley (Lancashire Dynamo & Motor Co.). Messrs. Beaver and H. Stanley Marsh were elected hon. auditors. After some discussion, it was decided that the Association should hold an electrical exhibition in London at Olympia in October, 1911.



Telegraph Traffic and Movements of Cable Ships.—On the 9th inst. communication between Saigon and Bangkok was restored, while the routes *via* El Arich and Hanekin were down between Adana and Alexandretta and Diarbekin and Alep, as well as between Monssul and Bagdad. Telegraphic communication between Rome and Constantinople was in working order again on the 10th inst., and the Hanekin and El Arich routes were restored to working order on the 13th inst. Telegrams for British Borneo can only be accepted at sender's risk, while the same conditions rule on telegrams for the United States of Colombia, excepting those for Buenaventura. Telegrams for Cartagena and Santa Marta are subject to delay. Sender's risk also applies to telegrams to the Republic of Panama, excepting in the case of Colon and Panama. The cable steamer, *Mackay-Bennett*, arrived at Halifax, N.S., in the early part of the month, and left soon afterwards to repair the Canso Rockfort cable, while the new Newfoundland-Coney Island cable was broken some distance from the latter place. The repairs being completed, the ship again returned to Halifax. The *Contre Amiral Caubet* was busy on the main section of the Compagnie Française des Cables Télégraphique off Newfoundland.

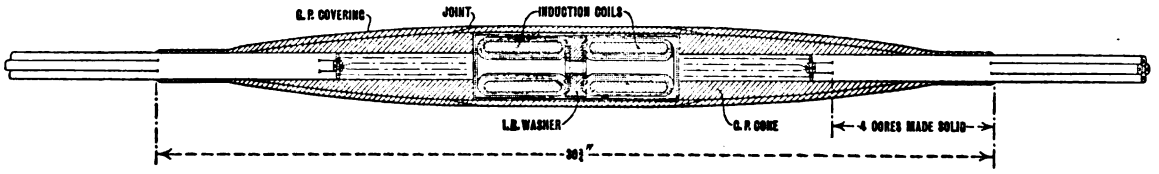
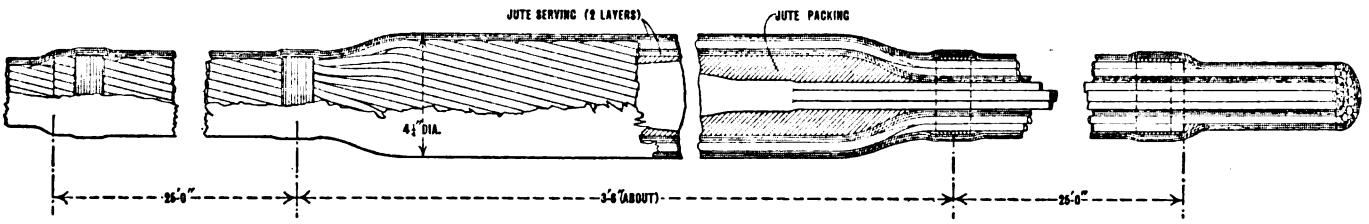
NEW TELEPHONE CABLE BETWEEN ENGLAND AND FRANCE

The First Submarine Cable with Pupin Coils



A NEW telephone cable will shortly be laid between England and France to supplement those now employed for the telephone service between London and Paris. As a result of negotiations between the two countries, it was decided that two new cables should be laid, each containing four wires (two circuits). One cable will be laid by each Government; but while the French cable will probably be more or less of the same type as those already in use, the



INDUCTION COIL (ABOUT ONE-THIRD SIZE).

British one (which is already manufactured and is waiting at Messrs. Siemens Bros. & Co.'s works at Woolwich for a favourable opportunity for laying it) embodies the most recent improvement in the design of long distance telephone lines, viz., the insertion of "loading" coils at intervals along its length. Instead of its scope being limited to conversations between London and Paris, it has been designed so that it will be possible to converse through it between Paris and all the large towns in the Midlands and North of England, and even to Glasgow, by utilising the existing land-lines. Tests show that the electrical properties of the cable predetermined by the designers have been accurately fulfilled, and it is reasonable to expect that, when once the cable is taken into use between Paris and London the extension of the telephone service to the North will be carried out as soon as the necessary traffic arrangements have been completed by the authorities. The cable will be laid by the makers, Messrs. Siemens Bros. & Co., from Abbots Cliff, halfway between Dover and Folkestone, to Cape Gris Nez.

This cable will be the first submarine cable in which "loading," or inductance, coils are distributed throughout its length on the Heaviside-Pupin principle. It is the outcome of the experimental work of Mr. W. Dieselhorst, the works manager of Messrs. Siemens Bros. & Co.'s cable works at Woolwich. It was Mr. Dieselhorst who laid the lead-covered cable with loading coils in the Lake of Constance in 1906, and he then realised the difficulty that would be experienced in dealing with lead-covered cable in submarine work owing to its great weight and the damage which would be caused to a lead cable in tidal waters. On his return to the Woolwich works he immediately started experiments on the insertion of loading coils in gutta-percha-covered cables, and a method of doing this, which is that in use in a slightly modified form in the new Anglo-French cable, was patented by him, in conjunction with his firm, in November, 1906 (British patent 25,306/06). An experimental cable made in this way at the Woolwich works was left in water for fifteen months, and occasionally subjected to pressures of four tons per square inch, corresponding to a depth of 2,500 fathoms of water. This cable was found to withstand these tests without injury, and was brought to the attention of the Post Office engineering saff. Finally, when tenders were invited for a loaded cable for laying across the English Channel, Messrs. Siemens Bros. & Co. were able to guarantee a standard cable equivalent length of 3·5 miles for the total length of 21 nauts (24·2 miles), and their tender was accepted. The tests of the cable after manufacture have shown that the actual cable has a standard cable equivalent of 3·28 miles, which is still better than the guaranteed figure. Without loading coils, a mile of the same cable has a standard equivalent cable length of 0·435 mile, and therefore the actual gain due to the addition of loading coils is equivalent, in its effect on the speech transmitted, to reducing the length of the cable 3·2 times. The cable is a four-core cable with conductors weighing 160 lbs. to the mile, insulated with 300 lbs. (per mile) gutta-percha, the resistance of the conductors per loop mile is 12·5 ohms, and the wire to wire capacity 0·12 m.f. per mile. The inductance coils, each of slightly less than 6 ohms resistance, with an inductance of 0·1 henry at 750 cycles per second, are placed at one naut (1·153 miles) apart. The actual attenuation constant of the cable is 0·140 per mile, while the cable without its inductance coils has an attenuation constant of 0·045 per mile. As the cable and coils were designed for an attenuation constant of 0·0147 after preliminary experiments had been made, the closeness to this figure is extremely satisfactory.

ARRANGEMENT OF COILS IN CABLE.
(Scale about one-sixth.)

METHOD OF SHEATHING OVER COILS.
(Scale about one-sixth.)

In the insertion of loading coils in a submarine cable, the mechanical problem is even more important than the electrical one, and the makers are to be congratulated on their solution of this. The coils have been

Digitized by Google

inserted so compactly that the part of the cable containing them can be paid over a 4 ft. sheave without damage. Our illustrations show the design of the coils, and the method of inserting. They increase the diameter of the gutta-percha core from about 1 in. to 3 ins., a gutta-percha cone is inserted at each end as packing, and gutta-percha sheet is wrapped round them and jointed to the gutta-percha of the core at each end.

Those of our readers who remember the description of Messrs. Siemens' patent in ELECTRICAL ENGINEERING some months ago, will note that an alteration is now made in the arrangements of the loading coils. Instead of four coils inserted one after the other, one for each of the four wires of the cable, two double coils are employed. Each double coil consists of two windings on the same iron core, and one winding is connected in series with each conductor. This has an advantage over four distinct coils, as the iron core experiences an ageing effect which affects its permeability, and may not be precisely the same in two cores. If separate coils on separate iron cores were used for the go and return circuit, the gradual change in permeability might disturb the even balance of the circuit, but by winding them on the same core the variations are automatically compensated. Between the silk-covered wire of the coils and the gutta-percha sheet there is a sheet of metal foil, not shown in the drawing; this was found to be a necessary precaution in the construction of the cable, and has been patented. An annular rubber distance-piece is inserted between the two sets of coils to give greater flexibility.

The method of armouring is extremely ingenious. At about 10 yards before the position of the coils is reached, the stranding-machine is stopped, and a second armouring is started on the top of the other one. When the bulge in the cable is reached the wires of the second armouring, which, of course, is given the same lay as the first, automatically place themselves between the other wires, so that the part of the cable with the increased diameter is covered with a single layer of the armouring wires, and at about 10 yards on the other side of the coils the additional wires are cut and bound up as before.

Major O'Meara, the Engineer-in-Chief to the Post Office, is to be congratulated in having adopted this type of cable in the face of much criticism by Continental experts. It has been stated freely that the high specific inductive capacity of gutta-percha would render a cable insulated with this material unsuitable for loading with coils, and that the calculations employed in the design would therefore be falsified. The tests already alluded to have shown, however, that this is far from being the case, and some tests made by the Post Office engineers last October and November on some of the Danish Government "continuously loaded" cables show that the coil method of loading is far more effective. The "continuous loading" consists of covering the copper conductor with a close spiral winding of thin iron wire throughout its length. Obviously this cannot increase the inductance to the same extent as the insertion of coils at intervals, and at the same time it materially increases the capacity of the cable. Actual measurements against standard cable compared with the values calculated for the same cables as those under test, but without the continuous iron winding, showed that the improvement due to the "continuous loading" was about 60 per cent., whereas with coil loading an improvement of from 250 to 370 per cent. has been shown to be practicable in the Post Office cables in this country—the former by experiments with gutta-percha cables, and the latter with paper-insulated cables.

At the Physical Society of London, on February 25th, Prof. Perry read a mathematical Paper in which he endeavoured to show that a general method of calculation of the attenuation on telephone lines, applicable to any "contrivance" consisting of a combination of resistances, inductances, capacities, and leakances, could be deduced, which could ultimately be taught to quite unmathematical people. Major O'Meara, who opened the discussion, in the course of his remarks quoted the test results for the new Anglo-French submarine telephone cable, which in the above article we have, by his courtesy in placing information at our disposal, been able to amplify by giving details of the actual construction of the cable. He also mentioned that the question of leakance was certainly of very great importance. It was owing to the very large part that leakance played that their first experiments were not successful. In America they had commenced to load aerial wires, and so large a part does this leakance play that in that country telephone engineers had been obliged to abandon the use of glass insulators, and to substitute the highest grade of porcelain insulators to meet the difficulties which had been met with owing to an insufficient allowance for the part this factor played. Mr. A. W. Martin, of the Post Office Engineering Staff, who made the tests on the Danish cables mentioned above, and has done extremely valuable work in connection with this subject, contributed both to the theoretical and practical side of the discussion, and was followed by Messrs. B. S. Cohen and G. M. Shepherd, who are engaged in similar experimental and research work with the National Telephone Co. Mr. Cohen stated that Prof. Kennelly's formulæ and methods, published in his Paper at the St. Louis Congress, and in other Papers since that date, were now adopted by many telephone engineers, and were rapidly becoming standardised. Dr. Alexander Russell (Faraday House), and Dr. J. A. Fleming (University College), also spoke.

THE FIRE AT WHITELEY'S

AN outbreak of fire occurred about mid-day on Monday in the basement of the turnery department of Messrs. William Whiteley's, Ltd., at No. 151 Queen's Road. A report was immediately published by the evening papers stating that the fire was due to "the fusing of an electric wire," but it appears that this supposition was entirely unfounded. The first thing that our representative saw on visiting the scene of the fire early in the afternoon was that the room which had been burnt out had already been fitted with temporary electric lighting, to assist the work of the salvage men. Mr. William Whiteley, one of the directors, expressed the opinion, in conversation with our representative, that there was nothing to point to the fire having been caused electrically. It was much more likely, he said, that the outbreak occurred in some other way, and a probable cause was the dropping of a lighted match or cigarette-end down one of the gratings in the street pavement, which admitted air and light to the room in question. The engineering staff of Messrs. Whiteley's are also of this opinion.

The room in which the fire broke out is about 30 ft. square and contained baskets, wicker chairs, and brooms. Smoke was seen issuing from the room, and immediately the fireproof doors in the party walls on either side were closed. The Grinnell sprinklers did their work well, as although the stock in the room was almost completely destroyed, the heat was sufficient to start the sprinklers in the neighbourhood, and this prevented the fire from spreading. Fortunately the ceiling was fireproof. The whole of the basement is lit by electric light, as is indeed the whole of the premises, there being a private generating plant. The room in question contained four pendants in the centre. The wiring is, of course, destroyed, but outside the room the cables are practically intact, in spite of the great heat. There were no fuses in the room, the fuses for the circuit in question being placed with others some distance from the room. As has already been mentioned, within a very short time of the extinction of the fire the room was temporarily lighted by flexible extensions from adjacent points in order to assist the work of the salvage men.

Mr. H. W. Cox.—In the House of Commons this week, the Prime Minister stated that he would give most sympathetic attention to any representations which may be made in favour of granting Mr. H. W. Cox a Civil List pension. It will be remembered that Mr. Cox has suffered, and is still suffering, severely from X-ray dermatitis as a result of his early work with X-rays.

Royal Institution.—Among the Friday evening discourses after Easter are the following:—April 22nd, "The Telegraphy of Photographs, Wireless and by Wire," by T. Thorne Baker; May 13th, "Radioactivity as a Kinetic Theory of a Fourth State of Matter," by Prof. W. H. Bragg. Among the afternoon lectures are two by Prof. J. A. Fleming, F.R.S., on Saturdays, June 4th and 11th, at 3 p.m., on "Electric Heating and Pyrometry."

CENTRAL BATTERY OMNIBUS TELEGRAPH CIRCUITS

By H. H. Harrison.

THE type of circuit illustrated in Fig. 1 is now well known and doing good service in various parts of the world. It is perhaps not too much to say that the arrangement is an extremely ingenious

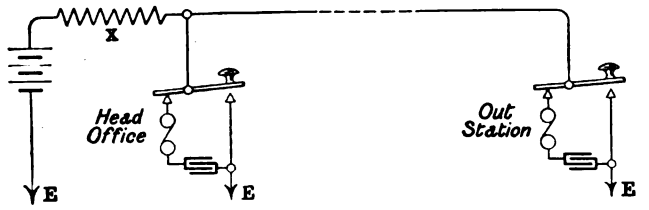

Fig. 1.

modification of the ordinary closed circuit system, as, while retaining all the advantages of this, there is no permanent current on the line except that due to leakage.

In common with all closed circuit systems, it is adversely affected by leakage, the strength of the signals varying to a greater extent when signalling inwards (*i.e.*, towards the central battery) than when signalling in the outward direction. Some complaints having been received from abroad as to its intermittent failure when applied to lines with variable insulation, the writer was instructed by the British Insulated & Helsby Cables, Ltd., to look into the matter, and the result is, by their permission, given below.

From theoretical reasons it was evident that the adoption of a fixed resistance of 3,000 ohms, either for a given line subject to widely varying insulation resistances or for lines of differing lengths and

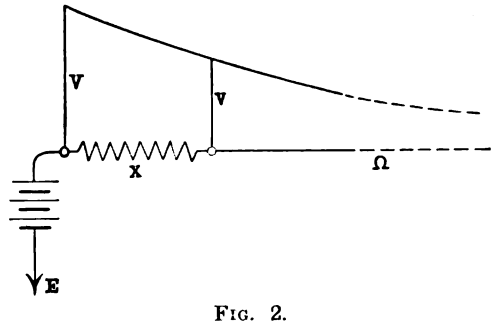

Fig. 2.

constants, is not suitable, and the following result shows that there is a theoretical best value to give this resistance in terms of the line constants.

Referring to Fig. 2, x = the fixed resistance and $\Omega = r$, the measured conductor resistance of the line, with the terminal out-station key depressed (*i.e.*, the far end of the line to earth). Also, $\Omega = R$, the measured insulation resistance of the line with the out-station key released, insulating the far end of the line, the normal condition.

In the latter case,

$$\frac{v}{V} = \frac{R}{x+R} \text{ or } v = V\frac{R}{x+R} \quad . \quad . \quad . \quad (1)$$

If the terminal out-station key is depressed, the potential v changes to v_1, and

$$\frac{v_1}{V} = \frac{r}{x+r} \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

The difference (1) − (2) is the fall of potential, producing a signal at the head office, and, putting v equal to unity, is

$$\frac{R}{x+R} - \frac{r}{x+r} \quad . \quad . \quad . \quad . \quad . \quad (3)$$

Multiplying across and rearranging, this becomes

$$\frac{Rx - rx}{x^2 + Rx + rx + Rr} \quad . \quad . \quad . \quad . \quad (4)$$

which is a maximum when $Rr = x^2$.

or, $x = \sqrt{Rr}$

That is, the best value for the fixed resistance is equal to the geometric mean of the measured conductor and insulation resistances of the whole line.

Fig. 3 is plotted for a fifty-mile line of 100 lb. copper wire, having a conductor resistance of 8·782 ohms per mile and an insulation resistance of 200,000 ohms per mile. The full-line curve gives v for varying

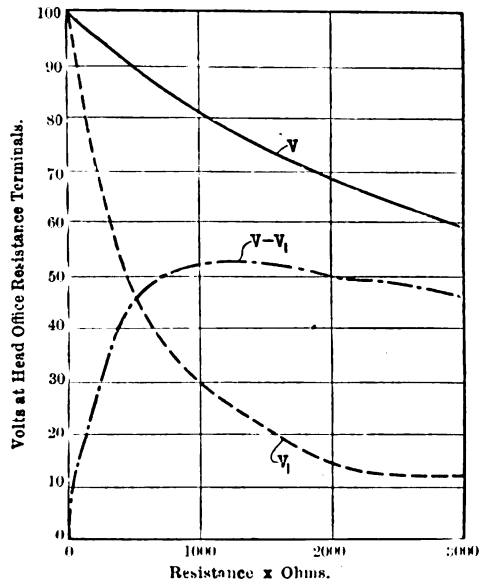

Fig. 3.

values of x; the dotted curve the corresponding values of v_1; and their differences (to which the strength of the signals at the head office is proportional) are given by the chain-dotted curve. The maximum difference is attained with $x = 1{,}340$ ohms, which is equal to $\sqrt{423 + 4{,}200}$, the geometric mean of the measured conductor and insulation resistances.

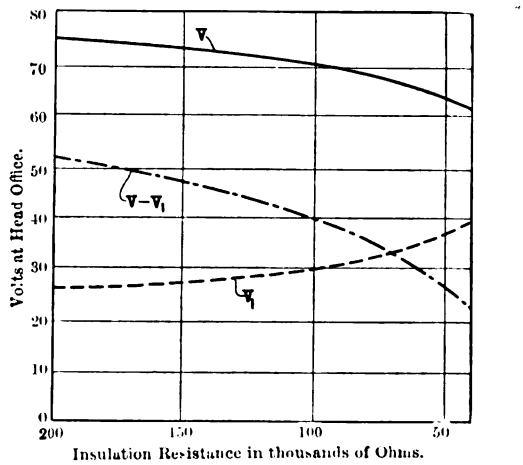

Fig. 4.

Fig. 4 is plotted for the same line with varying values of insulation resistance, x being given its appropriate value as indicated above. The strength of signals at the head office is thus the maximum obtain-

D

Digitized by Google

able for any insulation within the limits for which the curves are drawn, and is, as before, given by the ordinates of the curve $v - v_1$. It is seen to decrease with the fall in the insulation resistance, which is what is to be expected.

The foregoing shows conclusively that the important consideration is the strength of the incoming signals at the head office, and the most favourable conditions are only assured by the adoption of an adjustable in place of the fixed resistance x.

The strength of the outgoing signals can always be doubled by adopting a reversing key in place of the

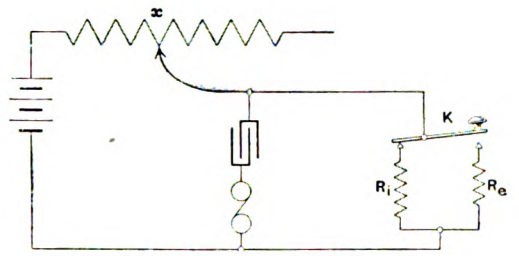

FIG. 5.

simple Morse key, and making slight modifications in the circuit at the battery end.

In order to try a number of variations of the circuit rapidly and conveniently, and to study the influence of line variation on them, the writer used the arrangement shown in Fig. 5, which explains itself.

ELECTRIC WELDING IN SHIP REPAIRS

A PAPER entitled "Steamship Repairs by Electric and Autogenous Welding" was read by Mr. A. Scott Younger on Tuesday, Feb. 22nd, before the Institution of Engineers and Shipbuilders in Scotland. The carrying out of ship repairs by welding, he said, was not practised in this country to anything like the same extent as on the Continent, and he proceeded to a description of the arc-welding process developed for this purpose by Mr. O. Kjellberg, of Gothenburg, as in use by three separate welding companies in different districts in Sweden.

The apparatus in use at Gothenburg was installed on board an old barge which could be towed alongside any steamer requiring repairs. It contained a complete welding outfit, with sufficient cable to pass on board the steamer and long enough to reach inside of the boilers if necessary. The cables were in duplicate, so that repairs could proceed at two places at the same time. The barge, or floating workshop, was about 80 ft. in length × 20 ft. in breadth, fitted with a small marine type of boiler which supplies steam to a de Laval turbine driving two D.C. dynamos and exciter. The voltage could be varied from 50 to 120. At the fore end of the barge there was a workshop having an anvil and vice benches, and generally suitable for carrying out small repairs. There was also a steam-driven air compressor for supplying compressed air to pneumatic tools which were used for preparing the surfaces for welding, or dressing off after the operation. The anvil block is a slab of steel 10½ in. wide by 2½ in. deep, laid across two wooden trestles, and the negative terminal from the dynamo is clamped to it. The positive pole is the holder, and is held in the hand of the operator. The handle, of course, is insulated, and the current passes through the tongs in the jaws of which the steel rod used for welding is held. This rod is about $\frac{3}{16}$ of an inch in diameter, and is specially prepared, being coated with a substance, the composition of which is secret, but which appears to be of the nature of a flux. This coating would also appear to get over the usual difficulty of welding with carbon electrodes that the resulting material becomes too hard by absorbing carbon from the electrode. The parts to be worked on are first welded at one spot to the anvil as one would use sealing-wax with paper. The welding heat is said to penetrate only $\frac{3}{4}$ mm. into the material, and the temperature of the arc can be regulated to suit the work from 2,000° F. to 4,500° F., partly by apparatus connected with the dynamo and partly by the coating on the rod. Of course, the heat is gradually conducted away, but it is generated so rapidly that while a portion is at welding heat, it is possible to touch the plate 3 to 4 in. away.

The Paper gives results of a number of tests of sample bars, showing the excellence of the welds produced, and passes on to a description of methods adopted in making repairs to boilers, &c., in place. In making good a leak between the lap of two plates, as in boiler work, it is usual to add a fillet of iron. This was done at the rate of 11 in. in 2½ minutes. In butt welding the edges of the plates to be joined are chamfered, and the work consists in filling up the right-angled grove thus formed. A practical rate of working for a plate of ⅜ of an inch thick was found to be about 10 ft. per hour. The current required was 13·5 kilowatts at 90 volts, and 150 amperes. The method can be applied to almost all other boiler repairs, cracks can be filled up in furnaces, manholes can be restored where wasted, and leaky rivets and pitted holes made good. The method is equally applicable to machinery and general ship repairs, such as repairing cracks in crank shafts and adding metal on worn parts of rudder, pintles, &c., and mending stern posts.

The second part of the Paper dealt with autogenous welding, but, in comparing the two methods, the author points out that the test results from the electric welding are more favourable, and considers that the electric process could be used in cases where the oxy-acetylene method would be inadmissible.

ARC LAMP LOWERING GEAR

THE accompanying illustration represents a street arc lamp standard at Ealing, which has been fitted with the centre carrier form of lowering gear, specially designed by the London Electric Firm (George Street, Croydon) for this class of work. In this particular case the posts were converted by altering the

ARC LAMP STANDARD WITH LOWERING GEAR AT EALING.

existing carriers to take lowering gear. The range of the firm's designs includes arrangements whereby practically every class of fitting can be converted. Other examples of the centre carrier type of lowering gear are to be seen in Westminster, Oxford Street, Upper Regent Street, as well as at Croydon, Cardiff, Eastbourne, Grimsby, Rawtenstall, and at Melbourne (Australia).

Regent Street Polytechnic.—The annual conversazione of this Institution was held on Friday last. The medals, prizes, and certificates gained by the students during the past year were distributed by Albert Dykes Spicer, Esq., a member of the governing body.

Parliamentary.—In the House of Commons on Thursday, the Board of Trade introduced a Bill constituting the London County Council the purchasing authority of the following London electric supply companies:—Kensington & Knightsbridge Electric Co.; Westminster Electric Supply Corporation; St. James & Pall Mall Electric Lighting Co.; Central Electric Supply Co.; Notting Hill Electric Lighting Co. These companies were not included in the London Electric Supply Act, 1908, which constitutes the London County Council the purchasing authority of the remaining electric supply companies in London

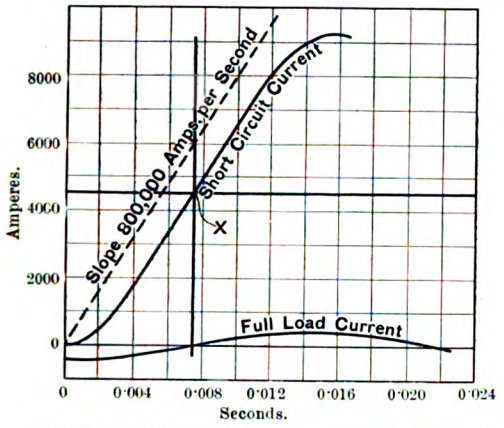
SHORT-CIRCUIT EFFECTS AND TURBO-ALTERNATOR CONSTRUCTION

ON Thursday last, Mr. Miles Walker (British Westinghouse Electric & Manufacturing Co.) read two Papers on these subjects before the Institution of Electrical Engineers in London. The first Paper was entitled "Short-circuiting of Large Electric Generators, and the Resulting Forces on Armature Windings." If an alternator while running at full speed and fully excited is suddenly short-circuited, the current may rise to more than 20 times its full-load value, for there is no time in the first 1/100 part of a second for the field to be demagnetised by the increased armature current. The rate at which the current rises is chiefly determined by the self-induction of the armature winding, or rather by that part which is due to the flux leaking between armature and field windings; but as the eddy currents in the pole-face produced by the rapid rise in current maintain the flux almost at its full value, they must first die down. The leakage flux is often in turbo-generators only 5 per cent. of the total flux, so that the rate of rise of the current in one of the phases which happens to be near its maximum E.M.F. at the instant of short circuit would, if the pole-flux were constant, be 20 or 30 times as great as the rate of rise from zero at full load.

In a 5,500-kw. 3-phase generator with four solid salient poles revolving at 1,000 r.p.m., the total flux per pole amounts to 78,000 kilolines, and the maximum instantaneous value of the E.M.F. generated in one phase at the moment when the pole



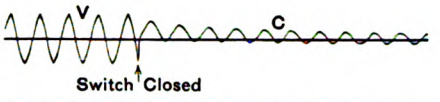


FIG. 1.—CURVE OF ARMATURE CURRENT AT INSTANT OF SHORT-CIRCUIT AS COMPARED WITH FULL LOAD CURRENT LAGGING 90°.

is opposite it is 9,000 volts. The resistance per phase is 0·056 ohm. The leakage flux amounts to 2,500 kilolines per pole for the full load current of 288 amps., or 3·2 per cent. of the total flux per pole. The factors determining the rate of rise of the current on short circuit are the leakage flux already considered, and the reaction due to the eddy currents in the pole-face. The self-induction of the eddy-current paths can be transferred for the purposes of calculation to the armature winding, and, when multiplied by the ratio of transformation, has a value about 2·4 times that of the armature winding opposite the pole. The total leakage may, therefore, be taken as 21·2 kilolines per ampere in the present case, and the rate at which the current would begin to rise works out at 800,000 amperes per second. Fig. 1 shows the way one would expect the short-circuit current to rise in this machine, leaving out of account the effect of the distributed capacity. The zero line of the curve depends upon the instant at which short-circuit occurs, *e.g.*, if the machine is short-circuited when the pole is opposite the phase, the zero line must be drawn through X. As stated above, the current will then rise at the rate of 800,000 amps. per sec., but the maximum current will be only 4,700 amps., and the curve will be more symmetrical about the zero line than that shown in Fig. 2, where short-circuit occurred when the phase voltage was about zero.

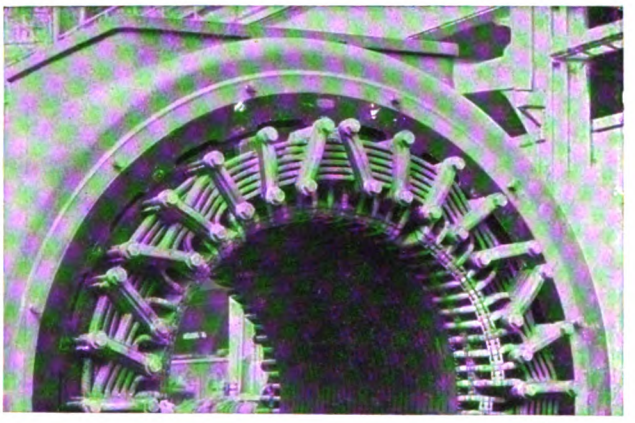
Fig. 2 is an oscillograph record of the short-circuit current of a large machine. Curve V shows the voltage before the short circuit. At the instant of short circuit the voltage falls to zero and the current curve springs into being; the highest current recorded was 3,100 amperes. As indicated in Fig. 1, the current rises to such a high value during the first half of a cycle that the pole which passes during the next half cycle is hardly sufficient to bring it to zero. It then rises and falls in waves of gradually diminishing amplitude, until after a lapse of several seconds it assumes the normal short-circuit value. The value of the current at the first peak is in this case about 32 times full-load current. The value of the eddy current in the pole-face can be readily calculated, and in

V = Terminal volts across phases : 1 cm. = 16,500 volts.
C = Current : 1 cm. = 15,000 amperes.
Time Scale : 1 cm. = 0·075 second.

FIG. 2.—OSCILLOGRAPH RECORD OF ARMATURE CURRENT ON SHORT-CIRCUIT.

the above case appears to have been about 150,000 amperes. With laminated field poles, the exciting current increases at short-circuit as the diminution of the pole flux produces a forward E.M.F. With solid poles, however, the exciting current is decreased as the eddy currents induced in the body of the pole momentarily assist the field current, causing it to sink in value.

The author then considers the magnitude of the forces acting on armature coils, and due to these very heavy current rushes. He shows by calculation that, with an early form of winding



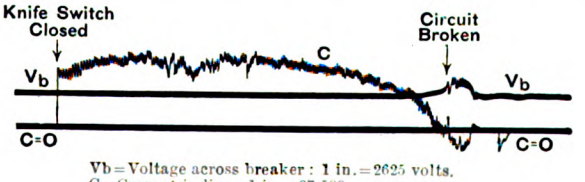


FIG. 3.—WINDING OF 6,000-K.V.A. THREE-PHASE GENERATOR (BRITISH WESTINGHOUSE CO.)

which was completely wrecked by throwing the generator on to the bus-bars when it was out of step, the actual force on short-circuit would be 1,100 lbs. per foot run for the worst coil. He then illustrates several different arrangements for clamping down the end-connections. In a method employed by the B.T.-H. Co., a substantial ring, supported on brackets, and cast with them, is provided immediately behind the winding. This ring is well insulated, and the formed winding is braced to it by means of circular metal bands placed over

Vb = Voltage across breaker : 1 in. = 2625 volts.
C = Current in line : 1 in. = 37,500 amperes.
Time Scale : 1 in. = 0·06 second.

FIG. 4.—OSCILLOGRAPH RECORD OF CURRENT AND VOLTAGE WHEN AN 800-KW. ROTARY IS SHORT-CIRCUITED THROUGH A SHORT LENGTH OF FEEDER.

wooden clamps which are shaped to hold the coils. In another method employed by the same firm for securing a barrel-wound armature, there are two rings wound with a considerable thickness of insulating material and held by brackets cast with the frame. The winding is braced to the insulated rings. Fig. 3 shows the winding of the 6,000 K.V.A. three-phase generators

Digitized by Google

built by the British Westinghouse Co. for the London County Council.

Finally, the author turned to continuous current machines, dealing briefly with such effects as the twisting off of shafts and the leaping of cables; and in connection with the effects of opening suddenly a circuit carrying a heavy current, described the results of tests made on an 800 kw. 600-volt rotary converter. Fig. 4 shows an oscillograph record of what happened when the rotary was short circuited through a short length of feeder cable consisting of 270 feet of 61/12 s.w.g. The maximum current reached was 14,000 amperes.

The second Paper dealt with the design of field magnets for turbo-alternators. The author points out that the ideal arrangement for a rotating field is to have the copper on the outside of a nearly cylindrical iron rotor. With the salient pole-type, there is a space between the poles which is not utilised at all, and that is the very space where the copper should be. This span can be utilised for ventilation, but it is frequently occupied by bronze coil supports. This arrangement also reduces the cross-section of the pole, and with it the output of the machine. The advantage of the cylindrical type is that by placing the winding in slots a greater part of the periphery can be used both for flux and ampere-turns. To get good regulation it is necessary that the ampere-turns

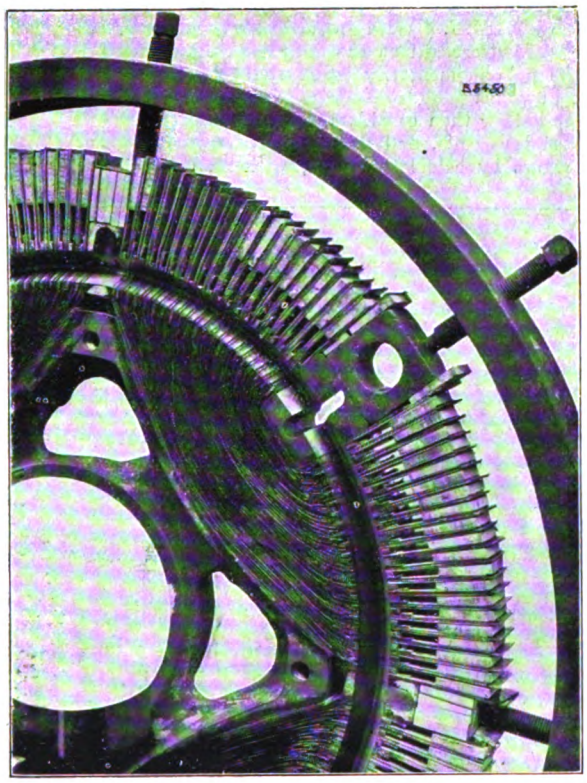

Fig. 5.—Method of Assembling End Connectors.

on the rotor at no load should be greater than the ampere-turn of the armature, and consequently, the interference with the magnetic circuit caused by the slots is beneficial, and takes the place of an increased air gap. It is found that copper placed in slots can carry twice as many amperes per square inch as copper in a wound coil 2½ in. in thickness. Further, the iron below the slots offers such a large cross-section that there is space for a number of large holes from one end to the other for supplying air to the radial ducts.

The main difficulty, continues the author, with the early cylindrical field magnets was the supporting and cooling of the end connections. Where the exciting current is small, say, 50 to 100 amperes, at a high pressure, the best method is to use a number of concentric coils with a metal ring over the ends at each end of the rotor. In the latest method of the British Westinghouse Co., illustrated in Figs. 5 and 6, the rotor is wound with bars, and the end connections consist of copper straps, insulated from one another, and assembled so as to form a solid fan-shaped block. Four of these blocks are mounted on a saddle and V-shaped grooves are cut, as shown in Fig. 5. The whole is then assembled between steel cheeks having V-shaped projections, mica V-rings being placed in the grooves, just as in the construction of a direct-current commutator.

Mr. Walker then deals with the effect of slots on the field form, pointing out that, as ripples in the E.M.F. wave may, by resonance, give rise to dangerous pressure rises on capacity loads, it is best to employ semi-enclosed slots. With regard to regulation, comparative curves for salient pole and cylindrical field machines are given, showing that on account of the high saturation in the body of the pole in the former type, the curve bends over much sharper, whereas in the cylindrical field type the highly saturated teeth act like a long air-gap,

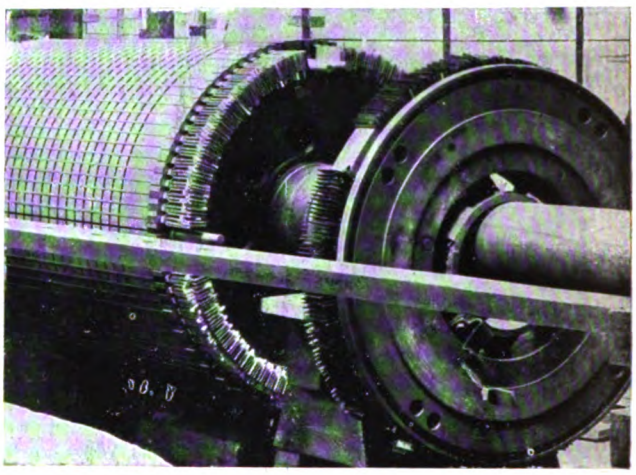

Fig. 6.—Fixing End-connectors to Field Bars.

the curve ascending at a steeper angle. Another important advantage of the cylindrical type is that it is easy to arrange it so as to embody the author's compensating principle, and make the armature reaction strengthen the field. With this arrangement it is possible to get good regulation (2 per cent. at unity power factor and 12 per cent. at 0·8 power factor) with the ampere-wires per inch of periphery as high as 1,000. It is also possible to employ a flux density in the air-gap as high as 11 Kapp lines per square inch.

Discussion in London.

Mr. W. A. Chamen (South Wales Electrical Power Distribution Co.), said he had a two-pole 3,000 kw. alternator running at 1,500 r.p.m., and designed by Mr. Miles Walker. Although there had been one or two short circuits, the machine had never broken down. One-inch studs, holding the clamps, had been bent in various directions, however, and the coils had been pushed slightly out of place. After Mr. Miles Walker's investigations, he looked forward to even this being made impossible. The leaping of cables referred to reminded him of what happened in the days of copper-strip mains. He had a bad short circuit on mains of this class in Glasgow, due to this leaping. He had replaced them with lead-covered concentric cables, and there had, of course, not been any movement since.

Dr. Silvanus P. Thompson, F.R.S., said that many years ago, in connection with the breakdown of some Mordey alternators, he had expressed the opinion that the current at the time of a short circuit was 20 to 30 times the ordinary full load current. That opinion, which was based on the mechanical results of short-circuiting, was greatly disputed at the time by Mr. Raworth, who stoutly maintained that the short-circuit current was only two or three times the full-load current, an opinion based on actual experiments in running up with the armature short-circuited. He had not been able to satisfactorily explain the discrepancy until he saw this Paper. Mr. Miles Walker's idealised construction, in which the copper was on the outside of the rotor, reminded him of what was said years ago, that as the use of field-magnet windings was really to drive the magnetic flux across the air gap the exciting coils ought to be wound round the air gap and not round the magnet poles. Eikemeyer tried to do this. He was right theoretically, but purely mechanical considerations proved that it was not possible. The area of iron was proportional to the diameter and length of the rotor, and the cross-section of copper was proportional to the square of the diameter, and independent of the length. These two factors should be multiplied to get the duty of the rotor, which was proportional to the cube of the diameter, and to the first power of the length. This showed that it was much more important to increase the diameter than to increase the length. An increase of length of five per cent. increased the duty of the rotor five per cent., but an increase of diameter of five per cent. increased the duty by 15 per cent. He did not think that Mr. Miles Walker's compensated winding had yet been really appreciated. It was no small gain to be able to increase the specific loading of the armature to 1,000 ampere wires per inch of periphery, and it was shown that it might go even higher without the demagnetisation

Digitized by Google

becoming sufficient to make the machine a bad one from the point of view of regulation. With regard to ripples in the E.M.F. wave-form, they could be eliminated if the slots in the armature were not made exactly parallel to those in the rotor.

Mr. H. M. HOBART, on the question of short-circuit current, said he tested some 5,000-kw. machines in a Continental works about six years ago. These had laminated pole shoes, but the magnet cores were solid, and the current in the field circuit increased to about three times the normal short-circuit value at the moment of short circuit. This was an opposite result to that obtained by Mr. Walker, but the machines were very different. They were 5,000 kw., 500 r.p.m., 20 pole. The circumstance, however, showed that this phenomenon was known several years ago. A feature of the tests which were made was that it took 20 to 40 seconds for the current to fall from the initial short-circuit value as detected by an ordinary rough switchboard instrument—eight to ten times the rated current—down to the normal short-circuit value—about three times the rated current.

Mr. J. S. COOPER (British Westinghouse Co.) said the question of holding the armature winding against short-circuit forces was closely connected with the question of open *v.* closed slots, and it might further be said to have only arisen in connection with turbo-generators with small numbers of poles. An advantage of Mr. Walker's field construction was that there were no joints in the magnetic circuit. This advantage was also shared by the forged steel method of construction, but not by those designs in which either the poles or the teeth were keyed on to the rotor body. The speaker then described some remarkable American designs of forged steel rotors. In the first of these, the shaft was forged in two pieces, with half the rotor on each, the two halves being fixed together by bolts through the pole pieces. With this construction the shaft was integral with the poles, and the weakness caused by cutting out V-pieces which penetrated too near the shaft in other designs, was avoided. In another design the rotor was in three pieces—a central piece, and the shaft in two halves, each with a flange which bolted on to the centre-piece. In a two-pole rotor of this construction it was possible to carry the field windings right across the rotor from one pole face to the other, as there was no shaft in the way. In this machine, the bronze flanges were fixed to the body of the rotor by short, heavy screws. The two ends of the shafts were machined so as to end in a bevel-wheel form, with dovetail teeth, and the flanges were cast on to these. This, he said, looked a little bold at first sight, but it had proved very satisfactory in practice. In some cases, instead of having a cast on construction, the flange was bored out and the shaft was either pressed in or the flange shrunk on to it. This construction had had the important effect of raising the critical speed of the rotor. In ordinary designs, with the shaft running right through, the critical speed was met with at about two-thirds or three-quarters the normal speed. The above solid construction had proved so rigid, however, that in machines of between 2,000 kw. and 3,000 kw., running at 3,600 r.p.m., the critical speed was not passed through in running up. On the other hand, there was the disadvantage that a machine of this character was larger for the same output than a machine with cylindrical field construction. Mr. Walker's compensating device was exceptionally well suited for machines with cylindrical field construction, and a number of them were running satisfactorily in parallel with machines of ordinary construction.

The discussion will be continued to-night (Thursday).

DISCUSSION AT MANCHESTER.

The first of the above Papers was read on Tuesday, March 8th, at Manchester, where the discussion was opened by Mr. M. B. FIELD (Ferranti, Ltd.), who said it was gratifying to know the confidence with which the designers and owners of the alternators used made such drastic tests. He had carefully measured up some of the oscillograph records, and had discovered considerable speed variation within the very short period of short-circuit.

Mr. W. CRAMP (Manchester University) said that if an E.M.F. were applied suddenly to an inductive circuit of constant permeability, the maximum current that could flow was about twice the normal. In the case of a generator, however, the great initial current rush was due to the varying permeability accounted for by eddy-currents and the moving poles. In order to decrease this rush, he would suggest making the permeability more constant by using a cylindrical rotor, lower saturation, and a smaller flux per pole. Further, the higher the frequency, the higher, according to theory, should be the initial rush. In practice, however, it was thought to be smaller.

Prof. E. W. MARCHANT (Liverpool University) first referred to some experiments on a 2,000-kw. turbo-alternator at Liverpool. From the self-induction of the armature winding, he had estimated the instantaneous short-circuit current to be approximately fifteen times the full-load current, which agreed fairly closely with Mr. Walker's figures. Mr. Walker had mentioned that it took about a second for the exciting current to fall from its normal value to the lowest value due to the effect of armature reaction. This reminded him of an experiment made by the late Dr. Hopkinson on an 11-in diameter core with ballistic coils embedded in the iron. The coil in the centre was not affected until 20 seconds after energising the external exciting coil.

Mr. G. W. WORRALL (Liverpool University) pointed out that the experiments consisted in short-circuits following open-circuit. He thought that short-circuiting a loaded generator would give different results, as the rate of rise of the short-circuit current would be influenced by the rate of change of the load current at the instant of short-circuit. Secondly, the phase relation between the load current and the position of the poles would also have an effect. He had seen sheets of mica sewn up in canvas bags, used for the purpose of clamping down the windings.

Mr. G. D. SEATON (Willans & Robinson, Ltd.) complained that turbo-generators still suffered from three defects, namely, going out of balance, not running concentrically, and short-circuit troubles.

Dr. E. ROSENBERG (British Westinghouse Co.) said that turbo-generators suffered less on short-circuit than reciprocating engine machines, on account of the comparatively small diameter, stiff yoke, and large air-gap. In any case, the damage was limited to the windings and couplings. The damage done on short-circuit was sometimes due to a generation of high voltage in the winding at the moment of high current. In the case of a shunt-wound D.C. machine, the exciting current was maintained several seconds when the armature was short-circuited, as the field resisted the demagnetising effect of the armature. There might even be an increase in field current, although there was no voltage impressed from outside. Further, a high voltage was induced between points on the commutator, and there was little doubt that the arc round the commutator on bad short-circuits was started mainly in this way.

Mr. A. H. EVEREST (British Thomson-Houston Co.) pointed out that the decrease in armature inductance due to saturation on short-circuit would increase the short-circuit current to above that calculated. Referring to surges in the rotor, he described the case of a salient pole machine with field windings of edge-wound copper strip, which flashed across one coil when the machine was accidently thrown upon a short-circuited feeder. It was important that the reactance of machines should be fairly large to reduce the short-circuit current rush, and to improve the regulation, a Tirrell regulator might be used.

EFFECTS OF DIFFERENCES IN A.C. WAVE-FORM.

AN interesting Paper by Mr. L. W. Wild, of the Westminster Electrical Testing Laboratories, on the production, measurement, and effect of variable wave form has been accepted by the Institution of Electrical Engineers for publication in the *Journal* as an original communication. The author first describes the method he adopted for obtaining a series of wave forms with widely different characteristics from a single alternator by combining three waves from three different windings in various proportions. The methods of determining the amplitude and mean ordinate factors of the various wave-forms are then described. The amplitude factor is obtained by dividing the maximum ordinate of the wave by the R.M.S. voltage, and the former was determined with the aid of a rotating contact maker, and an electrostatic voltmeter shunted by condensers; the condensers were charged once in every revolution, and the voltmeter registered the voltage at the instant at which contact was broken. To obtain the mean ordinate of the wave-form, a direct-current moving-coil voltmeter was used in series with a rectifying commutator, so that the voltmeter registered the mean ordinate of the half wave. The R.M.S. value was taken simultaneously with an electrostatic voltmeter, the ratio of the two giving the mean ordinate factor.

The relative effects of the different waves on transformer iron losses was first investigated, and the author concludes that the statement that the loss is less for a peaked than for a flat-topped wave is not always true. The loss depends not upon the amplitude factor, but upon the mean ordinate factor to which it is directly proportional. Thus for "Stalloy" transformer stampings, worked at a nominal maximum density of 10,000 lines per sq. cm. at a frequency of 50 cycles, the total loss was 0·682 watts per lb. for a mean ordinate factor of 0·87, increasing proportionately to 0·745 watts per lb. for a mean ordinate factor of 0·915. The total loss per lb. for Sankey "armature" iron increased from 1·215 watts to 1·312 watts within the same limits of mean ordinate factor. The values seemed to be quite unaffected by the amplitude factors. Tests were made at different frequencies, and the curves connecting the total loss per lb. per cycle with the frequency were pure straight line curves even up to 100 cycles, showing that the loss per cycle can be divided into two parts, a constant one, the hysteresis loss, dependent upon wave form, and a loss proportional to the frequency, the eddy-current loss, which is independent of the wave-form. These experiments also showed that Lohys iron has a smaller hysteresis loss than armature iron, but a greater eddy-current loss; below 60 cycles, Lohys iron has the lesser loss, above 60 cycles, armature iron. The low eddy-current loss claimed for

Digitized by Google

Stalloy is confirmed, and it is shown to have a lower hysteresis loss also. The percentage of eddy-current loss varies from 9 per cent. for Stalloy at 25 cycles, up to 50 per cent. for Lohys at 100 cycles. The hysteresis loss was increased by about 10 per cent. in the case of all three kinds of iron by increasing the mean ordinate factor from 0·872 (a peaked wave) to 0·914 (a flat-topped wave), a difference of 4·8 per cent. The percentage difference in the total loss effected by this change in the mean ordinate factor is reduced as the frequency is increased, owing to the predominance of eddy-current losses. At 100 cycles, armature iron is affected only 5·9 per cent., Lohys 5 per cent., and Stalloy 7·2 per cent. Concluding this section, the author states that differences of the order of 7 per cent. are likely to be found by different authorities in the total losses if due attention is not paid to wave-form.

Turning to the effect of wave-form on dielectric strength, Mr. Wild points out that the breakdown of an insulating material is not always directly related to the maximum value of the E.M.F. wave. If the insulation resistance is low, there may be a sufficient leakage current passing to heat up the material to a serious extent, and this leakage would depend more upon the R.M.S. voltage. The presence of dielectric hysteresis and capacity also complicates matters. Experiments made by the author showed that for air the breakdown depends entirely upon the maximum value, the results also confirming the dielectric strengths given by Mr. E. A. Watson in his recent Papers. The results of experiments on transformer oils were most erratic, but it seemed that high viscosity is generally accompanied by high dielectric strength. Wilcox light dynamo oil appeared to depend upon the maximum value of the wave for its breakdown, resin oil upon the R.M.S. value, and Duckham transformer oil upon something half-way between the two. In order to test whether leakage had any effect upon the results, a sensitive wattmeter was inserted in circuit, but no deflection was observed up to the point of breakdown, and consequently it does not appear that the breakdown was accelerated by local heating in any case. Further, it was found that the resin oil had the highest, and the Wilcox the lowest insulation resistance, which is exactly in the reverse order to that required to account for the results.

Finally, the effect of wave-form on the readings of six modern induction-motor meters was tried. These were B.T.H., Aron, Westinghouse, Ferranti, Siemens, and Alva meters, and were all rated at 10 amp. 110 volts, 50 cycles. The effect was found to be so small as to be of little or no consequence. The percentage effect on changing over from a peaked to a flat-topped wave was in some cases an acceleration and in others a retardation, but never greater than 0·8 per cent. for unity power factor, and generally only about 0·3 per cent. No explanation is offered, but the effect is thought to have something to do with the iron losses.

Manchester Municipal School of Technology.—The award of the James Prescott Joule Commemorative Silver Medal (presented by Sir W. H. Bailey) will be made in September next by the Manchester Education Committee. The medal (in silver) will be awarded for the best essay dealing with physical science or engineering, preference being given to subjects concerned with the transformation of energy. The competition is confined, for the present year, to past and present students of the Manchester Municipal School of Technology whose ages are not less than sixteen years nor more than twenty-six years. Essays should be sent in to the principal not later than July 1st.

Fire at a Paris Generating Station.—The statements in some of our contemporaries last week to the effect that a generating station belonging to the French Thomson-Houston Co. at Port à l'Anglais, near Vitry, had been damaged by fire to the extent of some £32,000, were not quite correct, in that the station in question is not the property of the French Thomson-Houston Co. (although they were the main contractors for its equipment), but belongs to the Cie. Générale de Distribution d'Energie Electrique. We are in a position to state that the cause of the fire was in no way electrical. The fire caused an interruption of the tramway service on the Eastern & Bastille and Montparnasse lines.

Prices of Metal Filament Lamps in Germany.—We have already announced the reductions in prices by Julius Pintsch, and by Siemens & Halske, following the original reductions by the Allgemeine Elektricitäts-Gesellschaft. The Deutsche Gasglühlicht Aktien-Gesellschaft (Auergesellschaft) have now reduced the German list prices of Osram lamps as follows:—The 16, 25, 32, and 50-c.p. 90–139-volt lamps are now 2s. each, and the 50-c.p. 170–260-volt lamps are 3s. each. The Bergmann Elektricitäts-Werke have made similar alterations in their list prices; the 25, 32, and 50-c.p. 100–130-volt lamps are reduced to 2s., and the 50-c.p. 200–250-volt lamp to 3s. For the other sizes the prices are as before. It will be noticed that the Osram is the only 16-c.p. 90–139-volt lamp at 2s. In this country reductions have been made by the Electrical Co., Ltd., and by Simplex Conduits, Ltd., as already notified in our columns.

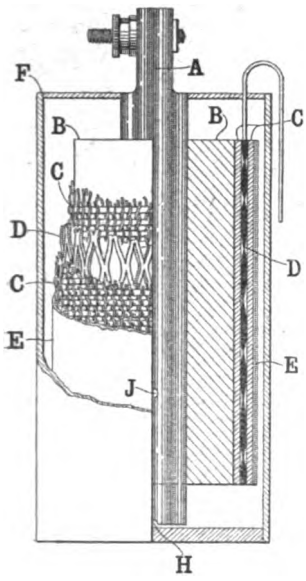
OSRAM STREET LAMPS AT CROYDON

A LARGE proportion of the main and side streets in and around Croydon are now being lighted by means of Osram lamps. High candle power lanterns have been fixed on all the tramway routes apart from the main road, in most cases on alternate trolley poles, but in some instances on small arc poles. The average distance apart is 65 yards, and the height of the reflector 20 ft. 3 ins. Each lantern is provided with three 110-watt Osram lamps, in spring suspended lamp-holders. Rather less than half of the lamps are extinguished at midnight.

For the side street lighting lamp posts are placed at an average distance of 75 yards apart, and a single 88-watt Osram lamp is fixed with a conical vitreous enamelled reflector at 12 ft. from the ground.

Mr. A. C. Cramb, the Borough Electrical Engineer, reports that the average life of these lamps since their installation has been highly satisfactory.

Tramway Assessment in London.—The Islington Borough Council, supported by a number of other Metropolitan Borough Councils, has asked the London County Council to convene a conference to discuss the basis upon which the tramways in London should be rated.



Tantalum Lamps on Board Ship.—The electric lighting of many of the large floating palaces which are being constructed for passenger traffic is as complete as that of many hotels and restaurants on land, and Messrs. Siemens Brothers Dynamo Works, Ltd., have recently carried out a striking example of marine electrical illumination which, as regards the saloon of the steamer, resembles in every way that of the dining-room of a first-class hotel. Everything is, of course, rigidly fixed, so that there may be no disorder caused by the "roll" of the ship. In this instance "tantalum" lamps are installed for illumination in small fittings fixed to the ceiling at equal distances apart. For ventilation several electric fans are installed, and the best possible lighting effect is obtained, whilst the temperature can be regulated exactly as required. The tantalum lamp, by reason of the strength of its wire-drawn filament, is particularly suited to ship lighting, and Messrs. Siemens Brothers have designed numerous fittings for this class of work, of which they will be glad to send particulars to all who apply.

Photometry.—Tuesday's meeting of the Illuminating Engineering Society at the Royal Society of Arts, London, was devoted to the subject of lamp photometry. Dr. S. P. Thompson, who was in the chair, opened the discussion with a brief lecture on photometers, illustrated with experiments, and concluding with a lucid exposition of the "flicker" method for the comparison of lights of different colours. Prof. Vernon Harcourt, to whom the pentane standard is due, described some experiments made many years ago at South Foreland for the purpose of comparing gas, oil, and electric lamps in lighthouses. The difficulties due to the differences in colour were then overcome by the use of a star disc and a white background illuminated alternately by the two sources to be compared. Prof. J. A. Fleming (University College) emphasised the disadvantages of flame standards, and suggested that the National Physical Laboratory should set up a molten-platinum standard, as proposed by Violle, but heated by an electric induction furnace. He mentioned that artificially aged incandescent filament lamps prepared for secondary standards fifteen years ago had never shown any variation over 0·5 per cent. Mr. A. P. Trotter said that he had had occasion to inspect the photometer rooms in colleges and manufacturers' works, and he had been amazed at the antiquated apparatus used in the former. Further, every text-book described the Bunsen grease-spot inaccurately. He showed a series of models made by himself for educational purposes to illustrate the various photometers. Mr. J. Patterson (National Physical Laboratory) said, in reply to Dr. Fleming, that it was possible to reproduce the pentane standard with an accuracy of ±0·1 per cent., and it could be used commercially. The colour of the platinum standard was redder than the pentane and the Hefner units, and this would rule it out. At the N.P.L., to lessen the colour difficulty in testing metal filament lamps, they had made comparisons in steps by first testing 4-watt against 3½-watt carbon lamps, then 3½-watt with 3-watt, then 3-watt carbon lamps with 2½-watt metal filament lamps, and so on up to metal filament lamps taking 1½ watts per c.p. Dr. Sumpner (Birmingham Municipal Technical School) thought that the candle-power of filament lamps was best expressed as the candle-power at right angles to the filament. Prof. Morris (East London Technical College) said that he had obtained as good results from a carefully prepared Bunsen grease-spot screen as from the most modern apparatus.

IMPROVED DRY CELL

MR. J. T. SZEK has called our attention to the results which have been obtained with a new form of zinc-carbon dry cell, covered by British patents Nos. 8,660/07 and 18,082/07.

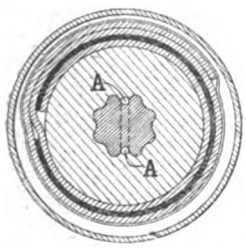

FIG. 1.—ELEVATION AND SECTIONS OF "SZEK" DRY CELL.

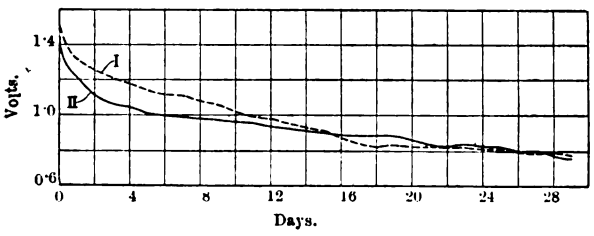
The carbon electrode is corrugated and a depolarising mass of manganese peroxide, graphite, and other substances is pressed round it. As shown in Fig. 1, two vertical air passages, *A*, are left between the carbon and the depolariser, *B*, and these are connected together by a hole in the carbon at *J*, and at the bottom by a horizontal passage, *H*. The object of these is to enable the air to reach the depolariser and revive its activity. The electrolyte consists of a paste of sal-ammoniac and flaked rice. This is spread over a loose-woven fabric, *C*, which is then wound round the depolariser, and on both sides by a sheet of expanded zinc, *D*, which is bent round in the form of a cylinder. We are informed that zinc of exceptional purity is employed, so that no amalgamation is necessary. Finally, the whole is covered with treated paper, *E*, and inserted in a *papier-mâché* case, *F*.

Fig. 2 illustrates tests made by the Electrical Standardising and Testing Institution, Faraday House, on two Szek dry cells weighing 4 lbs. each. Curve I. represents the results for a new cell, and Curve II. for a cell which had been stored for fourteen months previous to the discharge. The cells were discharged continuously through a resistance of 10 ohms, and the terminal volts read every day. Other life curves which we have seen show equally good results.

Fig. 3 shows an interesting curve plotted from the results of



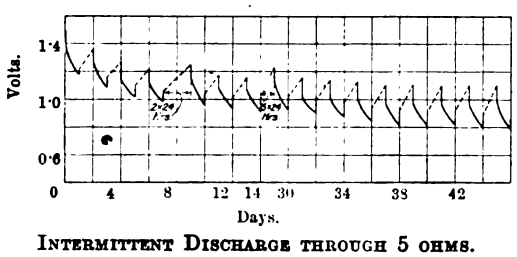


FIG. 2.—CONTINUOUS DISCHARGE THROUGH 10 OHMS.
(I. New Cell. II. Cell stored fourteen months previous to discharge.)

an intermittent discharge test on a 4-lb. Szek cell. The cell was discharged for 24 hours continuously through 5 ohms, then

INTERMITTENT DISCHARGE THROUGH 5 OHMS.
(Twenty-four hours continuous discharge after twenty-four hours' rest.)

allowed 24 hours' rest, then run again for 24 hours, and so on. The cell was made in December, 1908, and the test started May 30th, 1909.

Cells of this type can be obtained in small quantities from Mr. J. Szek (53/54 Chancery Lane, London, W.C.), who is already preparing to manufacture them on a larger scale.

WILLANS' IMPULSE D.C. TRACTION TURBO-GENERATORS

PARTICULAR interest is attached to the decision of the Belfast Corporation, as announced in our last issue, to extend their tramway generating plant by the addition of a 1,500-kw. Willans' Impulse "Disc and Drum" type turbine, coupled to a direct-current dynamo, in view of the strong opposition to the adoption of direct-current turbines when the previous contracts were settled during February, 1907. On that occasion two 1,000-kw. units were required, and the feeling expressed in many quarters at that time was in the direction that direct-current turbo-dynamos were not sufficiently reliable for tramway purposes. After the matter had twice been referred back from the Council to the Tramway and Electric Lighting Committee, it was finally decided to place an order with Messrs. Willans & Robinson for the supply of the two 1,000-kw. direct-current sets. These units have now been in daily operation for two years, and the performance of the dynamos (which were considered the doubtful factor) compares favourably with the best results obtainable with dynamos running at more moderate speeds.

In the light of this experience, Mr. Bloxam, the Belfast City Electrical Engineer has recommended his Council to install a further unit of 1,500-kw. capacity, and as it is intended to obtain this output from one dynamo (and not by installing tandem dynamos, as has previously been the case when dealing with this output) the present unit will be the largest single direct-current turbine set installed in this country, the largest sets at present being the two 1,200-kw. units which Messrs. Willans & Robinson, Ltd., have in hand for the Admiralty for the Devonport Dockyard.

LIGHTNING CONDUCTORS

A NEW series of rules for the erection of lightning conductors has been drawn up by the Phœnix Fire Office, and embody the results of consultations between Mr. S. G. Castle Russell (Electrical Adviser to the Phœnix Assurance Co., Ltd.), with Sir Oliver Lodge and Mr. Killingworth Hedges (Hon. Sec. to the Lightning Research Committee, 1901-1905).

The rules are prefaced by a short discussion of the general principles of lightning protection, distinguishing between the "A" flash (as defined by the Lightning Research Committee), which strikes pointed conductors in preference to others, and the "B" discharge of much greater suddenness, against which complete security can only be attained by a "birdcage" system of conductors. For an ordinary building, however, a sufficient approach to ideal conditions can be arrived at of taking advantage of the extent of metalwork outside it, and adding a few other conductors. It is also pointed out that a building with trees adjacent to it, or dominated by a steeple or other lofty building, must not be considered as immune.

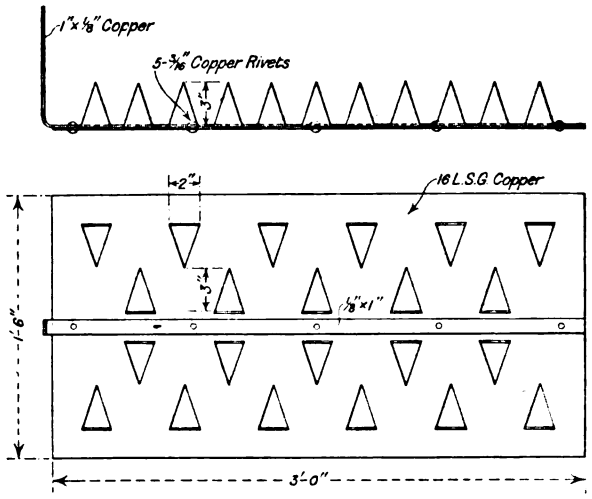
The material of conductors is required to be either copper tape at least 1 in. by ¼ in., or stranded copper or galvanised or sherardised iron rope of equivalent area. Copper is recommended as less subject to deterioration, but it is admitted that iron is electrically more efficient, as it carries off the discharge with less disruptive effect. Conductors should be kept away from the wall to avoid accumulation of dirt, and sharp bends and joints should be avoided. It is recommended that conductors should be protected at earth level by galvanised iron tubing or casing carried 5 ft. above the surface, and that those running underground to the earth plate should be embedded in a wooden trough filled in solid with bitumen. Vertical conductors should be connected to all elevated and exposed masses of metal, but church clocks may be protected by a screen of outside conductors.

Elevation rods of copper or galvanised iron should be fixed at least 2 ft. above that portion of the building to which they are attached, or in the case of chimney stacks the rod must be at least 1 ft. above the highest chimney, and should be provided with three or more points.

The number of conductors and area of protection depends on the size of the building and the comparative heights of its structural parts. There is no special area below an elevation rod which can be considered as actually protected; so that "area of protection" really cannot be defined, and no definite rule can be laid down as to the number of rods necessary to protect a building. The consideration of the extent of protection afforded must bear some relation to the value and importance of the building concerned. It should be the practice to provide at least two or more rods on any building. It should be noted that any chimney stack is liable to be struck; each, therefore, should have its own elevation rod connected to the nearest conductor leading to earth. Special attention should be paid to kitchen chimneys, as a column of hot air will often be selected as a path for the flash.

Digitized by Google

Full instructions are given as to the preparation of each connections, either by means of a copper plate buried in damp earth, by the tubular earth system, or by connection to the water mains. If a copper plate is used, it should not be of less than 3 sq. ft. in area, and not less than ¼ in. thick, and rectangular in shape, with saw edges, and surrounded with broken coke or graphite. The use of copper plate is not recommended unless it can be sunk into the earth at such a depth as to ensure it always being in water or in moist earth.



The tubular earth system is as follows: A perforated pipe furnished with a steel spike is driven into the ground until it reaches moisture, and is then lengthened up to the surface to a casting which marks the position of the earth. The copper conductor is enclosed in the pipe, and carried to the bottom of the tube which is packed with granulated carbon. A connection is made by means of an iron or lead pipe to the nearest rain-water pipe, so that a small quantity of rain is diverted to insure moisture, or a similar pipe may be opened up into a funnel shape at the surface of the ground, so that rain will enter, or water can be poured down. The earth resistance of each of the earth connections should not exceed 5 ohms. For the purpose of testing, a special disconnection joint should be made in the conductor near the ground level, so that the earth can be tested separately from the system of the conductors on the building by disconnecting the joint. A test and examination should be made annually.

Some special notes are given as to the requirements of churches and factory chimneys. In the case of the latter, the elevation rod should take the form of a circular band of metal round the top of the shaft, preferably below the actual outlet, and furnished with long spikes. The points should be fixed at an angle of about 45°, pointing outwards; or an arch of metal, provided with points, may be fixed across the mouth of the chimney.

It is recommended that after a church or other uninhabited building has been struck by a flash, or whenever there has been a flash in the near neighbourhood, an examination should be made to see that no ignition of gas has occurred, owing to the puncture of a compo pipe by a residual spark causing and igniting an accidental leak.

A new specification for earth plates has been issued by the London County Council. The new plate, which is a double plate with a branching tape, is shown in the accompanying figure. It possesses the characteristics of that recently proposed by Sir Oliver Lodge in connection with the Elan Valley works protection from lightning scheme. The new specification reads as follows:—

"The earth plate to be of copper No. 16 gauge; the conductor to be riveted and soldered the full length of the plate; the joints to be thoroughly washed free of acid, and protected by a thick coat of tar; each plate

LONDON COUNTY COUNCIL EARTH PLATE.

to have four rows of triangular tongues formed out of the plate itself—two outer rows of six and two inner rows of five—so that the tips of tongues in adjacent rows point in opposite directions, each tongue 3 inches long, and tapering from 2 inches to a point; the tongues to be bent at right angles, and point upwards when the earth plates are laid in position."

LOCAL NOTES

ACCRINGTON: *Hire Purchase Wiring.*—It was announced at the Council meeting last week that the practice of wiring premises on the hire purchase system was not working satisfactorily. The Chairman of the Electricity Committee suggested its discontinuance and the substitution of a deferred payment system. Under this, 10 per cent. of the cost of installation will be charged each quarter.

ARGENTINE: *Tramways.*—The first section of electric tramways in Bahia Blanca has just been opened.

BURSLEM: *Mixed-pressure Turbine.*—The new 600-kw. mixed-pressure turbine, which has been installed at the Council's electricity works, was formally started up last week. Exhaust steam from the three reciprocating sets is made use of as far as possible, the deficiency being made up with live steam direct from the main steam range. The turbine was constructed by Messrs. Belliss & Morcom, and the generator by Messrs. Siemens Bros. & Co. An additional B. & W. boiler, with an evaporative capacity of 10,000 lbs. of steam per hour, has also been installed.

DUNDEE: *Electricity Works Assessment.*—Mr. H. Richardson, the City Electrical Engineer, has raised the question of the assessment of the electricity undertaking. Mr. Richardson complains that whereas the Gas Department receives 75 per cent. reduction on their mains, the Electricity Department in a a few cases only were allowed a reduction of 25 per cent. Bearing in mind that the underground work of the electricity undertaking now amounted to a cost of nearly £100,000, it is pointed out what a serious matter this is. The Convener of the Electricity Committee states that the only thing to be done is to instruct the Town Clerk to insert a clause in the next Provisional Order promoted by the Council to deal with the question.

Contract System of Charging.—Mr. Richardson has reported that an experiment in charging for the lighting of tenements at a fixed price per lamp according to the rental has not proved satisfactory, and he recommends its discontinuance.

New Loans.—Negotiations are being carried on between the officials of the Scottish Office and the Electricity Committee concerning an application for additional borrowing powers in connection with the electricity departments.

Underground Telegraph Wires.—A deputation from the Dundee and Aberdeen Corporations waited upon the Postmaster-General on Monday to urge the extension of the underground telegraph system to the North of Scotland. Whilst admitting the strong claims which Dundee and Aberdeen have for the extension required, the Postmaster-General said that so far as this year was concerned, the Post Office had been unable to include any provision in the Estimates for this purpose.

FROME: *Proposed Transfer of Electricity Works.*—It is proposed to transfer the Electricity Works from the Council to Messrs. Edmundson's Electricity Corporation, Ltd., who at present run the works on behalf of the Council. Last year the undertaking involved a loss of £2,000.

HARROW: *Fire at Electricity Co.'s Works.*—A fire occurred on Sunday morning at the works of the Harrow Electric Light & Power Co. Fortunately, it was confined to the offices and showrooms, which are separated from the generating plant, and thus the supply of electricity was not interfered with. The whole of the offices and showrooms, with the exception of the Board room, were destroyed.

HORNSEY: *Electric Lighting Profits.*—Although the electricity undertaking last year made a profit, the accumulated loss on past years, which has been met out of rates, amounts to £7,189. A long discussion took place at the last meeting of the Council upon a proposal to transfer £1,000 to the relief of rates in part liquidation of the sum outstanding. The present accumulated balance is only £1,075, and this was used as an argument against making any contribution to the rates at present, as, obviously practically the whole of the working capital would be absorbed. Eventually the Electricity Committee were authorised to transfer a sum not exceeding £1,000 to rates.

LINTHWAITE: *Tramway Track Repair.*—Under the agreement with the Huddersfield Corporation, who run cars in this district, the Council have to maintain the track, and under a recent arbitration they were ordered to relay the track by the end of May. It is now stated that the cost of this will be about £11,000, and, deducting the rent received from the Huddersfield Corporation, there will be a sum of £1,500 per annum for twelve years to raise for sinking fund, interest, and repairs. It is estimated that this will amount to an extra rate of 1s. in the £. Five years ago the Huddersfield Corporation offered to take over the track for a payment of £5,000, but this offer was refused.

NEWPORT (Mon.): *Electricity Works.*—Mr. C. P. Sparks's report on the working of the Corporation electricity under-

Digitized by Google

taking has been passed and adopted by the Council. He made twenty recommendations, the gist of which was briefly given in our last issue, and they have all been adopted except that an amendment has been made on an unimportant point with regard to discounts on accounts.

NEW ZEALAND: *New Power-house.*—Mr. A. Wyllie, the Auckland City Electrical Engineer, has presented a report in which he recommends the erection of a new power station at an estimated cost of £215,000.

REDRUTH: *Defective Lighting.*—Owing to the unsatisfactory nature of the public electric lighting, the Town Council have decided to enforce the penalty clause in their agreement with the Urban Electric Supply Co.

TURKEY: *Electric Lighting and Traction.*—It is stated that the Turkish Minister of Public Works has drawn up a general memorandum relating to electric lighting and traction, and with a view to granting concessions for electric tramways and electric lighting and power plants, a circular has been sent to the principal towns in Turkey requesting the local authorities to state their views on the matter.

WIGAN: *Proposed Purchase of Tramways.*—A proposal has been placed before the Corporation to purchase the Corporation's tramway system. The Lancashire United Tramways Co. were interested in the proposal, and Mr. J. R. Salter, the General Manager of the company, made the offer under instructions from the Hon. R. Stanley, who is Chairman of the Lancashire Co. The local papers state, however, that at a private meeting of the Corporation the offer was refused.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ABERDARE.—Tenders are invited for a complete power house, including two direct-current generating sets (200-kw. and 100-kw.), balancer, booster, switchboard, 500-ampere hour-cables, &c. Particulars from Mr. Stephen Sellon, 36 Victoria Street, London, and tenders to the Clerk by April 9th.

GLASGOW.—Tenders are invited for the supply of cables, meters, and arc-lamp carbons for the year to May 31st, 1911. Particulars from the City Electrical Engineer, and tenders to the Town Clerk by March 29th.

HEREFORD.—The Electricity Committee have been authorised to spend £1,000 on cable extensions.

WALSALL.—In order to meet the demands upon the electricity undertaking during the coming winter an application is to be made to the Local Government Board for sanction to borrow £8,345.

WARRINGTON.—A 1000 kw. turbo-alternator, a 750 kw. rotary converter and switchgear are required by the Corporation. Particulars from the Borough Electrical Engineer, and tenders by March 22nd.

WIGAN.—A Local Government Board inquiry was held last week to inquire into an application by the Corporation for sanction to borrow £36,000. The money is required for extensions at the Wigan power house, and alterations at Pemberton.

WOLVERHAMPTON.—The Electricity Committee require a 2,000-kw. turbo-alternator, and a 500-kw. mixed pressure alternator. (See an advertisement on another page.)

Miscellaneous

BELGIUM.—The Ghent Municipal Authorities invite tenders by April 2nd for three electric cranes. Particulars from Monsieur le Maire, l'Hôtel de Ville, Ghent.

DUNFERMLINE.—The Dunfermline & District Tramway Co. propose to proceed this summer with the extension of their tramways from Kelty to Lochore, and to Rumblingwell from the present terminus in Dunfermline.

EDINBURGH.—Tenders are invited for the supply of bitumen, arc-lamp globes, conduits, &c., for the Electricity Department for one year. Particulars from the City Electrical Engineer, and tenders to the Town Clerk by March 28th.

GLASGOW.—Tenders are invited by the Tramways Department for 20,000 85-volt 16 c.p. carbon filament traction lamps. Particulars from the General Manager, and tenders to the Town Clerk by March 22nd.

GRIMSBY.—The Electricity Committee require 300 cast-iron lamp posts, 285 swan necks and fittings, and 300 double pole fuse boxes. Particulars from the Borough Electrical Engineer, and tenders by March 21st.

SOUTHAMPTON.—Electric light is to be substituted for gas in the whole of the schools at an estimated cost for wiring of £804. The Works Committee has passed a scheme for the conversion of 596 additional gas lamps to electric light.

The Corporation invite tenders for the construction of tramways. (See an advertisement on another page.)

YARMOUTH.—The Sub-Committee which have gone into the question of street electric lighting recommend that the whole of the gas lamps be converted into 80 c.p. electric lamps, and they estimate that the total saving by the conversion will be £295 per annum. The work will take two years to carry out.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.—Rebuildings, 19 Berkeley Street, Piccadilly, W. (£18,500). Architects, Richardson & Gill, 46 Great Russell Street, W.C.

N.W.—Electric theatre, Cricklewood Broadway, N.W. Builder, A. Bretzfelder, 180 Cricklewood Broadway, N.W.

PROVINCES.

AYR.—House, Dunure Road (£5,000). Architect, J. K. Hunter, Ayr.

CARLISLE.—Theatre. Sidney Bacon, architect, Carlisle.

CHELMSFORD.—School (£13,000). Builders, H. Potter & Son, Chelmsford.

EDINBURGH.—School (£20,000). Architect, A. D. Robinson, School Board Offices, Edinburgh.

EXETER.—Additions and alterations, St. Luke's College (£5,200). Architect, J. Jerman, 1 Bedford Circus, Exeter.

EXMOUTH.—Additions to hospital (£2,000). Architect, E. E. Ellis, Imperial Road, Exmouth.

HALIFAX.—Arcade and shops (£4,000). Architect, C. Williams, Halifax.

ILFORD.—Church and school, Kildowan Road. Architects, Smee & Houchin, Byron House, Fleet Street, E.C.

KETTERING.—School. Education Sec., County Hall, Northampton.

PORTSMOUTH.—Two blocks, hospital. G. E. Smith, 145 Victoria Road, Southsea.

ROCHDALE.—Extensions, Town Hall (£17,000). Architect, P. W. Hathaway.

ROTHERHAM.—Smallpox hospital, Kimberworth (£5,000). Borough Engineer, Rotherham Town Council.

SALFORD.—Tenders are invited for the wiring of the Wellington Street Boys' School, Pendleton. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by March 31st.

YARMOUTH.—New pier pavilion for the Britannia Pier Co., Ltd.

WEST HAM.—Enlargement of Fyfield Industrial and Truant School. F. E. Hilleary, Sec. West Ham Education Committee.

TENDERS RECEIVED AND ACCEPTED

BUCKINGHAM PALACE.—A further order has, we understand, been placed with the General Electric Co., Ltd., for the supply of 100 and 210-volt 32-c.p., half-obscured Osram Lamps for use in Buckingham Palace to the order of his Majesty's Office of Works.

CARLISLE.—The tenders of the British Insulated & Helsby Cables, Ltd., for cables at £1,128, and of the Albion Clay Co., Ltd., for ducts at £428 have been accepted.

EDINBURGH.—The Tramways Committee recommend the acceptance of a tender by Messrs. Dick, Kerr & Co., Ltd., at £12,265, for the construction of an electric tramway connecting the present cable tramways with the new markets at Gorgie. The line is to be completed by May 14th.

GENERAL POST OFFICE.—Messrs. Siemens Bros. Dynamo Works, Ltd., have received a large contract from the G.P.O. for tantalum lamps for all voltages from 25 to 250 volts.

An order has also been placed with the General Electric Co., Ltd., for the supply of filament lamps of 16, 25, 32, 50, 100, 200, 300, and 400 c.p. for the ensuing six months. It may be mentioned that the General Electric Co. has held this contract for the past year.

INDIA.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained another very large contract for street lighting fittings for a municipality in an Indian State.

LONDON: *London County Council.*—The Highways Committee recommend the acceptance of the tender of Messrs. Hurst, Nelson & Co., Ltd., for 79 sets of window operating gear for bogie cars at £7 12s. 6d. per set, and 11 sets for single truck cars at £6 per set.

The tender of the Edison & Swan United Electric Light Co. for the supply of insulating materials to December 31st, 1910, is recommended for acceptance.

Hammersmith.—The Council received the following tenders for six 100 kw., one 200 kw., and one 250 kw. transformers:—Johnson & Phillips, £553 15s.; Lahmeyer Electrical Co., £819 2s.; General Electric Co., £892; British Westinghouse Co., £892; Spagnoletti, Ltd., £907; British Electric Transformer Co. (accepted), £919; British Thomson-Houston Co.,

Digitized by Google

£942; General Electric Co., £942 10s.; Siemens Bros. (100 kw. transformers only), £898 5s.; Ferranti, Ltd. (100 kw. transformer only), £439. The Committee, in reporting on the matter, said it was most important to have regard not only to the prices, but also to the comparative circuit losses, regulation, and weight. On these tests the most favourable tenders received were those of the General Electric Co., the British Westinghouse Co. (who quote for the same machine), and the British Electric Transformer Co. The Engineer reported that in his opinion the higher price quoted by the last-mentioned company was more than counterbalanced by the reduction in circuit losses, and the better regulation obtained.

For a 30-h.p. motor the tender of the Electric Construction Co., at £60, was accepted. For annual supplies the following tenders were accepted:—City Glass Co., arc lamp globes and lamp shades, £22 17s. 9d.; Liverpool Electric Cable Co., insulated wire (for cables only), £104 0s. 10d.; General Electric. Co., items other than cable, £18 16s. 1d.; Pryke & Palmer, packing and jointing materials, £4 9s. 6d.; Lucy & Co., Ltd., joint boxes, disconnecting boxes, &c., £374; British Thomson-Houston Company, meters.

Marylebone.—The Council have accepted the tenders of Messrs. Aubert, Grenier & Co., and the Standard Cable Manufacturing Co., Ltd., for the supply of cable, and of Messrs. Lucy & Co., Consolidated Electric Works & Appliances, Ltd., Callender's Cable & Construction Co., Ltd., Messrs. Sykes & Sugden, Ltd., and the British Insulated & Helsby Cables, Ltd., for cut-outs, house service boxes, and fittings and disconnecting boxes.

PLYMOUTH.—The Council have accepted the following tenders for annual supplies for the electricity undertaking:—British Insulated and Helsby Cables, Ltd., cables, £93 8s. 5d.; Crompton & Co., Ltd., Conradty carbons, £3 16s. 6d. per 1,000 ft.; Ferranti, Ltd., house meters, average price, £1 12s. 4d.; British Electric Transformer Co., transformers, average per kw., £1 14s. 5½d.; Adams British Oil Co., cylinder oil, 1lb., 1s.; C. & C. Wakefield, grease, No. 3, 2½d. The tender has also been accepted of Walter Scott, Ltd., for 100 tons of tram rails, joint and anchor, plates, at £8 per ton, and fish plates, £10 per ton.

ROSARIO.—It is stated that the municipality have sent an order to Germany for 300 arc lamps for street lighting.

SOUTHEND.—The Corporation have placed an order with the Brush Electrical Engineering Co., Ltd., for six single truck tramcars at £504 5s. each. The cars are guaranteed for three years.

SOUTH AMERICA.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a very large contract for street lighting fittings of special design for a district in South America.

SOUTH MANCHURIA RAILWAY CO.—Mr. N. Yoshino, Chief Mechanical Engineer to the South Manchuria Railway Co., who is now in England, has placed an order with the British Vacuum Cleaner Co., Ltd., for a large vacuum cleaning equipment driven by an 8-h.p. electric motor.

STALYBRIDGE.—The Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board have placed a repeat order with Messrs. Ed. Bennis & Co., Ltd., Little Hulton, Bolton, for four stokers and compressed-air furnaces (Lancashire boilers), for their generating station, Tame Valley.

As is now generally known, Messrs. Willans & Robinson, Ltd., of Rugby, have recently placed on the market a turbine of the plain impulse type, and also a turbine of the impulse "disc and drum" type; these two types of turbine, in conjunction with their well-known Willans-Parsons turbine, being intended to meet the varying requirements with which turbine manufacturers are daily confronted. Orders for turbines of the plain impulse type are at present under construction for the Ashton-under-Lyne Corporation, Messrs. Charles Moore & Co., and others; whilst turbines of the impulse "disc and drum" type are in hand for the Belfast Corporation, Calcutta Electric Supply Corporation, Bridlington Corporation, and others.

Wireless Telegraphy.—It is stated in a daily contemporary that Mr. G. Marconi has invented an apparatus called the telephonotypographe, the object of which is that a wireless telephone message may be written at the receiving station without the aid of an operator.

A Reuter telegram from Berlin states that as the result of five weeks' experiment on the Tegel flying ground, the feasibility of the use of wireless telegraphy on all three types of airship employed in the German army, viz., the Zeppelin, the Gross, and the Parseval, has been successfully demonstrated.

Mr. Marconi is at present at Glace Bay, superintending the installation of the new Transatlantic wireless station, and it is expected to be in working order shortly.

The Bill introduced in the Canadian Parliament requiring wireless apparatus to be installed on all vessels of 400 tons and over, was rejected in Committee, on the ground that it was premature.

It is stated that H.M.S. *Dreadnought* is being fitted with a new wireless telegraph equipment, which will enable communication to be carried on between Whitehall, Portsmouth, and Malta.

APPOINTMENTS AND PERSONAL NOTES

Mr. F. M. Denton has been appointed to the post, rendered vacant by the resignation of Dr. C. V. Drysdale, of Associate-Head of the Electrical Engineering and Applied Physics Department of the Northampton Polytechnic Institute, London, E.C. Mr. Denton received his technical training at the Central Technical College, London, obtaining the diploma in 1901. On leaving the College, he spent a year and a half in the works of Messrs. Elliott Bros., London, and subsequently was for two and a half years at the Oerlikon Works in Switzerland, where he was engaged in design and other work. From the Oerlikon Works Mr. Denton was brought back to the Central Technical College to a position on the staff of the Electrical Engineering Department, which he occupied for one year, and at the expiration of this engagement he went to the United States to join the staff of the General Electric Co. at Pittsfield, Mass., and at Schenectady. After occupying these positions for one year, he was two and a half years ago appointed lecturer in electrical engineering at the new Carnegie Technical Schools at Pittsburg, a position which he still occupies, and is resigning to take up his London appointment.

Mr. H. Richardson, the Dundee City Electrical Engineer, has been presented with a silver match box, which was subscribed for by his staff, to mark the occasion of the opening of the Carolina Port power station.

Councillor A. Arbuthnot Murray has resigned his membership of the Edinburgh Town Council. Mr. Murray was convener of the Electric Lighting Committee for three years.

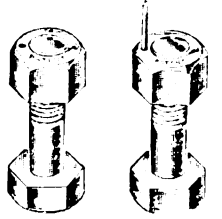
MISCELLANEOUS CITY NOTES

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register of Joint Stock Companies:—Electric Laundry Co., Electric Royalties Co., Hampstead Electric Supply Co., Midland Electrical & General Engineering Co., Pioneer Electric Light & Power Co. of China, and S.M. Van Hinden Electrical Co.

VICTORIA FALLS & TRANSVAAL POWER CO.—A Reuter telegram from Berlin states that 5 per cent. debentures amounting to £900,000 have been issued by the leading Berlin banks at 101.

DIVIDENDS ANNOUNCED.—Sao Paulo Tramway, Light & Power Co., quarterly dividend of 2½ per cent. Winnipeg Electric Railway Co., 2½ per cent. for the March quarter. Scarborough Electric Light Co., 3 per cent. for 1909. Richmond (Surrey) Electric Light & Power Co., 6 per cent. for 1909.

Canadian General Electric Co., 1¾ per cent. for March quarter. Davis & Timmins, 8 per cent. for 1909.



MORTGAGES AND CHARGES.—Particulars have been filed of the following:—Electric Vehicle Co., £2,000 debentures of an issue of £20,000 debentures created in November, 1909; no trustees. "Electrician" Printing and Publishing Co., £1,000 debenture, charged on the company's undertaking and property, including uncalled capital; holders—Messrs. Coutts & Co. Western Telegraph Co., supplemental trust deed, dated January, 1910; to secure £239,650 four per cent. debenture stock; trustees—Right Hon. Viscount Midleton and Sir John Wolfe Barry.

NEW YORK TELEPHONE CO.—An issue is being made in London of £2,500,000 4½ per cent. bonds at 97½

VERA CRUZ ELECTRIC LIGHT, POWER & TRACTION CO.—This company are offering £250,000 5 per cent. first mortgage debentures at 91½.

NEW AUTOMATIC LOCK NUT

A MOST ingenious lock nut is being introduced by the Automatic Lock Nut Co., Ltd. (Carlton House, High Street, Birmingham). It is entirely automatic in its action, and locks in all positions when on the bolt. The accompanying illustrations show a nut in position and one being removed. The nut has a few of the threads removed at the top, and to replace these a steel wire is coiled around in the interior, the grooves between the turns coinciding with the thread of the bolt. One end of the wire is fixed outside the nut at the top as shown, and the other end is free. It will be readily seen that when screwing on the nut, the steel wire helix is pushed round from the fixed end and is kept loose on the bolt, but that directly any attempt is made to screw the nut in the reverse direction, the helix is pulled round from the fixed end, and grips the bolt. Any vibration tending to unscrew the nut also effects a tightening of the helix, so that it should be useful on A.-C. apparatus. To unlock the nut, all that is necessary is to push an ordinary nail, cotter-pin, or piece of wire, down the small hole on top of the nut, and the latter will screw off. The nail or pin fixes the free end of the helix, and makes it move round when the nut is unscrewed, thus preventing it from tightening on the bolt. The nut is quite self-contained, and the locking arrangement cannot injure the thread of either nut or bolt.

Automatic Lock Nut.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 10s. to £62 per ton (last week, £62 5s. to £62 15s.).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—W. S. Jenkinson, electrical engineer, Rodborough Street, Stroud, Glos., has been adjudicated bankrupt.

A meeting of the Geneva Tramways Co. will be held at Salisbury House, London Wall, London, E.C., on March 30th, at 3 p.m., to hear the liquidator's account of the winding-up.

A meeting of the Adams-Randall Telephone Patents Co., Ltd., will be held at 194 Dashwood House, London, E.C., on Tuesday, March 22nd, at 3 p.m., to receive the liquidator's account of the winding up.

Allan McAlpin, trading as MacAlpin & Co., electrical engineers, 44 Cank Street, Leicester, and Cumbergate, Peterborough, has been adjudicated bankrupt.

The Electric Ignition Co. is to be wound up voluntarily.

Mr. B. P. Alnatt, chartered accountant, 2 Forbury, Reading, has been appointed trustee in the bankruptcy of Messrs. Felgate & Storey, electrical engineers, 10 Queen Victoria Street, Reading.

A supplemental dividend of 1s. 11¾d. in the £1 will be paid at the Official Receiver's Office, 13 Winckley Street, Preston, on March 18th, in the bankruptcy of R. Foster and W. Baker, trading as the Nelson Electrical Engineering Co., Stott Street, Nelson.

HIGH-TENSION INSULATORS.—The Locke Insulator Manufacturing Co., of Victor, N.Y., have purchased the plant and business of the Lima Insulator Co. In future the insulators turned out by these two works will be sold under the name of "Victor." Messrs. Wm. Geipel & Co., of 72a, St. Thomas Street, London, S.E., continue to act as European agents.

A NEW METAL FILAMENT LAMP.—Messrs. Siemens Brothers Dynamo Works Lamp Department at Dalston, inform us that they are about to place upon the market a range of high- and low-voltage high candle-power metal filament lamps of an efficiency of approximately 1 watt per c.p. 100 c.p. lamps will very shortly be on sale, and we learn that lamps of 200, 300, 400, and 600 c.p. are to be expected at a somewhat later date. We understand that full details will be forthcoming in the course of a week or two, as regards price, size, &c. Their new lamp is to be styled the "Onewatt" Lamp.

CANADIAN AGENCIES WANTED.—A London firm manufacturing a new patent porcelain insulator for telegraph, telephone, light and power purposes wish to enter the Canadian market.

A firm in the English Midlands wish to appoint Canadian agents for the sale of lightning conductors.

A commercial traveller with Colonial experience is desirous of representing in British Columbia some United Kingdom electrical and engineering firms.

Particulars of the above may be obtained at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

NEW WORKS.—Messrs. D. H. Bonnella & Son, Ltd., 58 and 60 Mortimer Street, London, W., inform us that owing to increase of business their works will be removed on and after March 25th, to larger and more convenient premises situated at Newton Works, Whitfield Place, Tottenham Court Road, W.

PEEBLES' STAFF BALL.—The staff of Messrs. Bruce Peebles & Co., Ltd., held their annual ball at the North British Station Hotel, Edinburgh, on Friday evening last. Amongst those present were several of the directors, as well as branch managers, outside representatives, and agents of the company. About 150 ladies and gentlemen were present, and a most enjoyable evening was spent.

COMPANIES' MEETINGS AND REPORTS

BUENOS AYRES TRAMWAYS (1904).—The available balance for 1909 was £65,842, and a dividend of 5 per cent. for the year is recommended. A large portion of the company's income is the annuity from the Anglo-Argentine Tramway Co., as a result of the amalgamation of tramway companies in Buenos Ayres.

WASTE HEAT & GAS ELECTRICAL GENERATING STATIONS.—The net profit for 1909, after providing £4,000 for depreciation, was £12,523. A dividend of 7 per cent. is recommended, carrying forward £3,603.

ELECTRICAL DISTRIBUTION OF YORKSHIRE.—There was a net profit for 1909 of £184, which is carried forward. During the year the company acquired the Sowerby Bridge Electric Lighting Order from the Council.

ASCOT DISTRICT GAS & ELECTRICITY CO.—There was a profit of £374 on electricity account for 1909.

NORTHAMPTON ELECTRIC LIGHT & POWER CO.—There was a net profit of £4,701 13s. for 1909. After meeting the full dividend on the 5 per cent. preference shares and 5½ per cent. on the ordinary shares, a balance of £1,053 is carried forward. A change-over was made during the year from non-condensing to partial-condensing, and a considerable reduction of working costs has been effected.

ABERDEEN SUBURBAN TRAMWAYS CO.—The report for 1909 recommends that the net profit of £1,270 be carried forward. Reference is made to the dispute with the Aberdeen Corporation regarding the price to be paid for electricity for working the trams. The present position is that the Corporation have offered 1·75d. per unit with a minimum supply of 140,000 units, and this offer is now under consideration by the Board. The company took exception to the award of Mr. W. H. Patchell, who sat as arbitrator to settle the price, and ordered them to pay a standing charge of £900 per annum, irrespective of the quantity of electricity used. Counsel's opinion is that the award is illegal, having regard to the terms of the reference. An agreement, however, has now been arrived at.

OXFORD ELECTRIC CO.—There is a net profit of £11,952 for 1909, and a dividend of 7 per cent. per annum is recommended on the ordinary shares. Notwithstanding the increased use of metal filament lamps, the revenue exceeded that of the previous year.

TELEGRAPH CONSTRUCTION & MAINTENANCE CO.—The net profit for 1909 was £85,768. The sum brought forward was £104,111. A dividend of 17½ per cent. for the year is declared, carrying forward £111,444.

BOURNEMOUTH & POOLE ELECTRICITY SUPPLY CO.—The report for 1909 recommends a dividend at the rate of 6 per cent. per annum on the ordinary shares, carrying forward £1,076. The sum of £4,000 has been transferred to depreciation, repairs, and renewals.

HASTINGS & DISTRICT ELECTRIC TRAMWAYS CO.—The report for 1909 shows a net profit of £8,642. The directors consider that in previous years an insufficient sum has been set aside for depreciation, and they recommend that £8,000 should be transferred to depreciation account, and the balance of £642 carried forward. At the meeting on Tuesday, the high cost of fuel was referred to. A cheap quality of coal is now being used in conjunction with mechanical stokers. The expenditure per car mile was reduced from 6·11d. to 5·53d.

O. C. HAWKES.—There was a net profit of £4,720 for 1909. After meeting the 5 per cent. preference dividends, a balance of £470 remains, which is to be carried forward.

BRITISH INSULATED & HELSBY CABLES.—After transferring £8,500 to special reserve, and £5,000 to debenture stock redemption, a final dividend at the rate of 10 per cent. for 1909 is recommended, carrying forward £42,263.

MADRAS ELECTRIC TRAMWAYS (1904).—The directors recommend placing £3,000 to depreciation and renewal fund, and the payment of a dividend at the rate of 5¼ per cent. for the year. The sum of £663 is carried forward.

COUNTY OF DURHAM ELECTRICAL POWER DISTRIBUTION CO.—After meeting the 5 per cent. preference dividends, and transferring £6,000 to depreciation and reserve, a sum of £2,620 is carried forward. The connections during the year increased by 5,688 h.p., the total now being 35,024 h.p.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.—The net profit for 1909 was £81,298, and a 4 per cent. dividend is recommended on the ordinary shares, transferring to depreciation £16,500, and carrying forward £2,923. The new power station at Dunston-on-Tyne will be in operation before the end of the current year. The total connections amount to 129,219 h.p., which is an increase of 17,735 h.p. during the year.

WINCHESTER ELECTRIC LIGHT & POWER CO.—The directors recommend a dividend at the rate of 6 per cent. per annum for 1909, transferring £1,000 to depreciation, and £1,200 to reserve. The Winchester Corporation have given 12 months' notice of their intention to purchase the company's undertaking.

CHELSEA ELECTRICITY SUPPLY CO.—At the annual meeting last week, Sir I. Courtenay, the chairman, expressed the opinion that when the disturbance caused by the introduction of metal filament lamps has settled down, he saw no reason why the company should not increase their earnings sufficiently to pay increased dividends.

MELTON MOWBRAY ELECTRIC LIGHTING CO.—At the meeting last week, the small falling off in gross revenue was attributed to the fact that the company lost the street lighting contract from August last. But although there was a decrease of £29 on the gross revenue account, the net revenue account increased by £126. Mr. W. J. New, who presided, said that the moral to which this pointed was there is very little to be got out of street lighting.

BROMPTON & KENSINGTON ELECTRICITY SUPPLY CO.—There was a net balance of £37,103 for 1909, and the directors recommend placing £3,604 to depreciation, £6,000 to reserve, and the payment of a dividend of 10 per cent. for the year. The sum of £8,521 is carried forward.

COUNTY OF LONDON ELECTRIC SUPPLY CO.—At the meeting on Monday, Mr. J. B. Braithwaite, the chairman of the company, said that the total generating costs of the company, including repairs, were 0·706d. per unit. In spite of metal filament lamps, their units sold last year increased by 8·3 per cent., but he warned the shareholders not to expect larger dividends in spite of the sales going up and the expenses going down. The Board did not set aside to depreciation as much as they would like, and the first improvement in profits must go to this fund.

BRITISH SOUTH AFRICA CO.—The report for 1909 states that the Victoria Falls and Transvaal Power Co. has now completed its first two new power stations on the Witwatersrand. These have ben in commission for several months and are giving excellent results, working at a higher efficiency than was originally calculated. The construction of a third large station of 100,000 h.p. has been commenced and the supply from this station will begin in October next. The Company will then have about 130,000 h.p. of plant available for service. The following mining groups have contracted to take their electrical supplies from the Company:—Consolidated Gold Fields, Eckstein, Rand Mines, Albu, Barnato, Consolidated Mines Selection and Neumann. Minimum contracts for twelve years have been entered into with the different mines, and the latest reports indicate that the installation of electrical power on the Rand will prove a most successful undertaking.

MANSFIELD & DISTRICT TRAMWAYS.—After transferring £1,200 to reserve, the directors recommend a dividend of 2½ per cent. on the ordinary shares for 1909. The extension of the tramways to Crown Farm Colliery is to be put in hand during the current year.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register of Joint Stock Companies: Adelaide Electric Tramways; Automatic Electric Co.; Bettwsycoed Electric Lighting Co.; Burmah Electric Works Syndicate; Cleminson Electric Lamp Attachment; Diamond Electric Lamp; Electrical & Hardware Co.; Electrical Bleaching Co. (1904); Electromotion Corporation; Manchester & Liverpool Electric Railway Syndicate; Perth Electric Lighting Co.; River Po Electric & Power Syndicate; Tavistock & District Electric Supply Co.; Wynne's Electric Closed Tube Tramways.

NEW COMPANIES

HOLSWORTHY GAS & ELECTRIC SUPPLY CO.—8 Fore Street, Holsworthy, Devon. Capital, £10,000. To acquire Holsworthy Gas Co., and the electric supply business of W. H. Barkell, of Holsworthy.

W. P. THEERMAN & CO.—263 Oxford Road, Manchester. Capital, £5,000. To acquire business of W. P. Theerman, electrical engineer and contractor. Subscribers: W. P. Theerman and J. S. Roylance, electrical engineers.

BRITISH ELECTROMETALLURGICAL PRODUCTS CO., 25 Victoria Street, London. Capital £100,000. To adopt an agreement with the Electrometallurgical Syndicate, Ltd., &c. Subscribers: W. L. Madgen, Falcon Works, Loughborough; J. J. Steinitz, Falcon Works, Loughborough; C. J. Head, W. D. Rock, J. R. Easton, R. O. Ahliss, and W. G. Jarrett.

WEST NAPLES TRAMWAYS & VALPORTORE RAILWAY CO., 57 Gracechurch Stret, London. Capital £50,000. To acquire a concession granted to A. Capuano for the construction of electric tramways between Naples, Soccavo, Pianura, and certain other places.

FLUORUNDUM FLAME CARBONS.—Registered by Jordan & Sons, Ltd., 116 Chancery Lane, London. Capital £5,000. To acquire from T. M. Lewis and H. S. Hatfield licenses to manufacture and use certain inventions relating to enclosed arc lamps and electrodes.

J. B. MARR & CO.—53 Victoria Street, London. Capital, £1,000. Electrical Engineers, &c.

BRITISH SCHOOL OF TELEGRAPHY, 179 Clapham Road, London.—Capital, £1,500. To carry on schools for training persons in wireless telegraphy, telephony, &c.

ELECTRACITES, 37A Duke Street, St. James's, London. Capital, £10,500. Manufacturers of and dealers in electrical and other machinery.

APPLEBY CRANE & TRANSPORTER CO., 57 Victoria Street, London. Capital, £150,000 in 100,000 preferred ordinary and 50,000 ordinary shares. To acquire the business of Messrs. Appleby's, Ltd. (in liquidation), and to carry on the business of dealers in electric cranes, &c.

SLAG POWER, 638 Salisbury House, London Wall, London. Capital, £20,000. Generators of power by electricity or otherwise.

PERCIVAL BROS., 11 Snargate Street, Dover. Capital, £1,000. To take over the business of electrical, mechanical, and illuminating engineers, now carried on by R. G. Walker and H. S. Roberts.

SOUTH BRAZILIAN RAILWAYS CO.—Registered by Gilbert Samuel & Co., 5 and 6 Great Tower Street, London. Capital, £150,000 in £4 shares. To acquire a tramway concession known as the "Empresa Ferro Carril Curytibana," Curytiba, Parana, Brazil.

VACA FALLS CO.—Registered by S. D. Perks, 36 New Broad Street, London, E.C. Capital, £35,000. To construct railways, tramways, electric light, telephony, telegraphic, and similar undertakings.

CECIL HODGES & CO.—Registered by W. T. Hick, 2 Church Court, Clements Lane, London, E.C. Capital, £1,000. To carry on the business of electricians, engineers, suppliers of electricity, &c.

R. J. RODD.—Registered by Foss, Bilbrough, 5 Fenchurch Street, London, E.C. Capital, £1,000. Electrical and mechanical engineers.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[Readers applying to any of the under-mentioned firms for copies of the catalogues or pamphlets referred to are requested to mention "Electrical Engineering."]

DRILLING MACHINES.—An illustrated leaflet describing a new pattern of standard and table for use in conjunction with the standard types of electric hand drilling machines manufactured by the Oerlikon Co. has been issued by Mr. G. Wuthrich (Oswaldestre House, Norfolk Street, London). This is supplementary to the general drilling machine list of the firm.

ELECTRIC DRIVING OF WEAVING MACHINERY.—An illustrated booklet from the Allgemeine Elektricitäts Gesellschaft (agents in this country: The A.E.-G. Electrical Co., Ltd., 121 Charing Cross Road, London, W.C.) describes the individual drive of looms, and gives a list of over 140 weaving establishments of different kinds employing in all some 16,000 motors. The illustrations show a number of examples of looms driven by small three-phase squirrel-cage motors on spring supports with either belt or gear drive. In many cases a clutch of some kind is employed so that the motor may run continuously.

LIGHTNING ARRESTERS.—Another illustrated booklet from the same firm contains a detailed description of the construction and operation of aluminium cell lightning arresters and excess pressure dischargers. Their use in conjunction with the ordinary horn dischargers for protecting various kinds of systems is described, and instructions as to their maintenance are included.

ELECTRIC LOCOMOTIVES.—Two leaflets received from the above firm comprise lists of the full- and narrow-gauge electric locomotives supplied to various railways and works, with illustrations in each case of some of the more important designs. These include shunting, works and mines locomotives, with trolley and accumulator supply.

ELECTRIC POWER IN AGRICULTURE.—Three further leaflets from the A.E.G. give illustrated descriptions of various examples of electric driving in agricultural operations. These include threshing machines, grain cleaning machinery, chaff cutters, oil-cake breakers, &c. Portable motors, complete with starters and leather covered cables, on wood sleighs or carriers, are illustrated. The motors are totally enclosed for protection against dust and rain.

AUTO-TRANSFORMERS.—The Foster Arc Lamp & Engineering Co. have issued a revised list embodying their latest designs of small auto-transformers for metal filament lamps. We are informed that considerable improvements have been made in the apparatus, and the no-load losses have been considerably reduced, while at the same time the regulation and efficiencies have been improved. The standard sizes range from 5 to 100 amperes on the secondary at 25, 50, and 100 volts, and all ordinary supply voltages and frequencies can be met. Standard sizes can be despatched within two days. The company's automatic transformer switch, which works entirely without batteries, is described, as well as the small transformer for bell ringing from alternating supply circuits.

New Generating Station in Copenhagen.—According to *Engineering*, a new generating station ultimately aggregating 180,000 h.p. is to be constructed at the Kallebadstrand watercourse. The initial equipment is to be three 7,500 h.p. turbo-generators. As the site will not be available till 1911, extensions to the existing stations are to be made in the meantime. Our proposal as to taking power from the Trollhättan water power station in Sweden has also been under consideration, but no arrangement has been arrived at.

Railway Electrification in France.—The Midi Railway Co. in France have placed an order with the Société Anonyme Westinghouse, Havre, for the electrical equipment on the single-phase system of the Montrejean-Pau section, about 70 miles, and contemplate the conversion of about 200 miles of line. According to *Engineering*, 30 motor-coaches each with from 125 h.p. motors and one 1,200 h.p. 80-ton locomotive have been ordered. The line pressure is to be 12,000 volts, and a frequency of 15 cycles per second will be employed.

District Railway Rolling Stock.—Some further details are given in the *Railway Gazette* of the new rolling stock which is on order for the Metropolitan District Railway. With the exception of the interior mouldings, which will be of fireproofed mahogany, they will be constructed entirely of steel, and they will thus differ from the present cars, the bodies of which are mainly of non-inflammable timber. The exterior will be quite smooth, no rivets showing. The seating capacity will be the same as in the present trailers, but slightly more room will be given, and there will be no divisions between the seats, which will be a little wider and tilted towards the back. Middle doors will be retained, but glazed screens on each side of them will protect passengers from draught. The bogie-trucks will be of more substantial design, and will have a longer wheel-base, but the electrical equipment will be the same, and the Sprague-Thomson-Houston control equipment will again be employed.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 10th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

843/09. **Line Insulator.** G. H. BOWDEN, F. C. ANDERSON, C. A. ATCHLEY, and G. BULL. A porcelain insulator is provided with a semi-circular peripheral groove to receive the cable. Bolts pass through the insulator above and below the groove, and hold the cable by means of grooved clamps. The latter may be provided with terminals for making connections to kicking coils, &c. Two claims, one figure.

3,195/09. **Lamp-shade Retainer.** W. CROOKELL. A device for fixing shades or reflectors to lamp-holders comprises a spiral spring, the lowest and innermost coil of which is provided with embayments to permit it to pass over lugs on the lamp socket. Two claims, two figures.

3,906/09. **Train Lighting.** SIEMENS BROS. DYNAMO WORKS, LTD., F. G. BROADHEAD, and S. HAWKINS. When the direction of travel is reversed, the brushes of the dynamo are shifted 180° by means of friction discs controlled by a governor on the armature spindle. A quick-acting switch worked by this device operates a solenoid multiple switch controlling the dynamo field and armature circuits. A change-over switch for use in a two-battery system is also described. Six claims, eight figures.

3,917/09. **Cable Armouring.** E. WITZENMANN. A flexible metallic tubular armouring consists of a metal band of [illegible] section wound helically so that the edges of adjacent coils interlock. The band is wound on tightly so that the insulation is forced up into the section in the form of a screw thread, thus preventing longitudinal movement of the armouring. One claim, three figures.

4,374/09. **Commutating Poles.** W. BUCHANAN. In order to obtain a uniform commutating field in machines with commutating poles, a number of open or closed slots are made in the latter. These contain a winding which neutralises the M.M.F. of the armature. Two claims, five figures.

5,360/09. **Cast-iron Permanent Magnets.** F. BURKS. This patent covers the process referred to on page 170 of our last issue. The magnet is cast in porous grey iron and is heated to a temperature of 2,000° F., and then immersed in a bath consisting of salt, cyanide of potassium, nitric acid, and prussiate of potash dissolved in water. The cyanide hardens the iron, which is then ready for magnetising. Two claims.

7,029/09. **Cooking Appliances.** N. HOSGOOD. Cooking utensils of earthenware, china, &c., have a heating element consisting of a resistance wire embedded in the vessel during manufacture. To prevent fracture due to expansion of the wire, a soft asbestos cord, which yields when the wire expands, is wound in with the wire. Alternately, the wire may be made hot and allowed to cool while the clay is plastic, thus producing a wide channel in the clay. Five claims, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: GEB. SIEMENS & Co. [Electrodes] 21,374/09; CHRISTOPH and KLEIN, 22,768/09.

Distributing Systems: THOMAS [Power transmission] 1,582/09.

Dynamos, Motors, and Transformers: STANSFIELD and HATT [Voltage regulation of variable-speed generators] 4,181/09; SIEMENS BROS. DYNAMO WORKS, LTD., and KLOSS [Starting induction motors] 6,956/09; GRAFTON and JOHNSON & PHILLIPS, LTD. [A.-C. generators] 13,059/09; PRÖTT [Motor] 15,317/09; MILTON [A.-C. generator] 27,033/09; FRIED. KRUPP A.-G. [Regulating D.-C. generators] 27,245/09.

Electric Ignition: VANDERVELL, 534/09; TWIGG, 5,955/09; R. BOSCH, 25,236/09, and 30,049/09.

Electrochemistry: JOHNSON (*Badische Anilin & Soda Fabrik*) [Manufacture of nitrates] 10,867/09.

Incandescent Lamps: MESZAROS, FAWNS, and MCCRACKEN [Metal filament lamps] 22,273/09.

Instruments and Meters: THORPE [Electrolytic meters] 4,258/09; MCCLELLAND and FERRANTI, LTD. [Maximum demand indicator] 5,459/09; JOHNSON [Electrical torsion-meter] 13,010/09.

Storage Batteries: TAYLOR [Charging arrangements] 24,643/08.

Switchgear, Fuses, and Fittings: BROOK and HIRST [Automatic switches for motor-starters] 4,093/09; THORPE [Electrolytic device] 4,258/09; LACEY [Safety device for controllers] 5,223/09; W. T. HENLEY'S TELEGRAPH WORKS Co. and NICHOLS [Fuse carriers] 12,744/09; JENKINS [Hand-lamps] 20,882/09; MYGATT [Glass shades] 21,995/09; SIEMENS BROS'. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges.*) [Fuse fittings] 25,733/09.

Telephony and Telegraphy: CEREBOTANI [Telegraph type-printing machines] 1,551/09; BURSTYN [Telephone diaphragms] 4,329/09; NIKIFOROFF [Relay for weak A.-C. currents] 4,480/09; SIEMENS & HALSKE A.-G. [Telephone exchanges] 28,825/09, and [Connections of telephone apparatus] 999/10.

Traction: SCHOFIELD, EDWARDS, and TICKELL [Signalling] 4,600/09; ECCLES and HADFIELD [Trolley retrievers] 11,326/09.

Miscellaneous: ROSENBERG [Medical vibrator] 4,133/09; BLUEMEL and SHILL [Dispatch tubes] 16,004/09; WALDEN [Escapement] 24,632/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: SIEMENS-SCHUCKERTWERKE GES. [Polyphase commutator machines] 1,611/10.

Incandescent Lamps: WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK GES., 2,983/10 and 3,610/10.

Miscellaneous: STACHOW [Magnetic separators] 3,314/10; LUX [Electrical control of valves] 3,697/10.

Applications for Revocation

19,483/05. **Electric Lifts.** E. M. T. BODDAM. Application has been made under Section 27 of the Patents Act for the revocation of this patent on the ground of inadequate manufacture in this country. The specification describes an electro-hydraulic lift system in which the lifting cylinder is connected by a pipe to the main cylinder, the latter containing a piston operated by an electrically-driven screwed shaft. The valves connecting the two cylinders are controlled by a handrope or electromagnetically. An automatic controller for the motor is described, and this is mechanically connected with the spindle of the controlling valve.

9,289/08. **Meter.** H. ARON. (Application under Section 26.) The patent is for a 2-rate or multiple-rate meter, the counting mechanisms of which operate separate maximum demand indicators.

Applications for Amendment

19,520/03. **Control of A.-C. Motors.** C. F. SCOTT. The British Westinghouse Electric & Manufacturing Co., Ltd., wish to amend this specification to limit its scope.

5,055/08 and 15,105/09. **Aluminium Solder.** A. NIELSEN. The patentee wishes to correct some clerical errors.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

6,053 of March 18th, 1896. **Primer.** THE MORRIS TUBE AMMUNITION & SAFETY RANGE Co., LTD., C. CUTHBERTSON, and W. H. STENTIFORD. A primer for firing guns, consists of an insulated pin fixed in a cup containing the explosive. A platinum wire connecting the pin with the edge of the cup is brought to a red heat, when the striker touches the pin.

6,329 of March 21st, 1896. **Train-lighting.** E. J. PRESTON and A. B. GILL. Details in a system with slipping-belt, dynamo, and automatic switches.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: BRITISH THOMSON-HOUSTON Co. (*O. N. Wiswell, U.S.A.*) [Cover for globe of enclosed lamps] 23,288/99.

Distribution Systems, &c.: E. T. GREENFIELD [Armouring cables] 24,655/98 and 23,998/05; E. W. SERRELL [Transmission-line poles] 20,995/00; BRITISH THOMSON-HOUSTON Co. (*C. P. Steinmetz, U.S.A.*) [Conductors insulated with cellulose] 21,293/00; G. CONGER [Line poles] 23,990/01.

Dynamos, &c.: T. VON ZWEIGBERGK [Single-phase commutator motors] 25,386/04.

Electrometallurgy, &c.: H. G. TURNER [Furnace linings] 26,065/02.

Incandescent Lamps: L. KAMM [Nernst projector lamp] 25,708/04.

Storage Batteries: T. PESCATORE and TUDOR ACCUMULATOR Co. [Plates] 21,233/00.

Switchgear, &c.: O. RENNERT [Switches and indicators] 25,671/02, and 25,748/02; W. BAXTER [Electromagnets] 22,365/03; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Rheostats] 25,849/03.

Telephony and Telegraphy: E. T. GREENFIELD [Armouring of submarine cables] 24,655/97; E. W. SERRELL [Metal poles] 20,995/00; G. CONGER [Metal posts] 23,990/01; J. A. FLEMING and MARCONI'S WIRELESS TELEGRAPH Co. [Transmitting key] 25,382/03; S. G. BROWN [Cables with twisted iron and copper conductors] 25,669/03.

Traction: E. A. CAROLAN (*General Electric Co., U.S.A.*) [Automatically stopping trains] 26,036/02; E. H. JOHNSON [Automatic brakes for cars with regenerative control] 25,362/03; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Air brakes] 25,856/03; BRITISH THOMSON-HOUSTON Co., H. S. MEYER and B. HOPPS [Electric power transmission system for road vehicles] 25,636/04; M. B. MOUNTAIN, G. M. GIBSON, and A. F. HEAD [Spring suspension of motors] 24,058/05.

Miscellaneous: H. J. DOWSING [Light bath] 23,536/01; H. SUTCLIFFE [Cable drum] 23,773/01.

SUMMARY

A committee of the House of Lords will commence consideration of a number of London tube railway Bills on Thursday, April 7th. The second reading debate on the London Electric Supply Bill was adjourned in the House of Commons on Tuesday. (Page 196.)

In Mr. W. P. Durtnall's electrical method of ship propulsion, two alternators are run at constant speed, and are connected in cascade in such a way that the frequency of the current they supply to an induction motor driving the propeller can be varied. A clear description of the system is given in connection with a Paper read by Mr. Durtnall at the Institution of Naval Architects last Thursday. In the discussion which followed, the Hon. C. A. Parsons expressed doubt as to whether the system would be conducive to economy. (Page 197.)

A new pattern of condenser in which the air pump is dispensed with, and the air extracted by the circulating water on the ejector principle, has been introduced. (Page 198.)

In compliance with a correspondent's request, we explain the terms "standard cable equivalent" and "attenuation constant" occurring in an article on the new Anglo-French cable last week. (Page 198.)

The electrical equipment of Smith's Docks, North Shields, present an interesting example of the advantages of power taken from a large system. A continuous current supply is obtained from the Tynemouth Corporation station, where a bulk 3-phase supply from the Newcastle-upon-Tyne Electric Supply Company is converted, and a three-phase supply is also available. The whole of the hydraulic and compressed air installations are now worked electrically, and electric pumping is extensively used. (Page 199.)

The discussion of Mr. Miles Walker's two Papers on short-circuit effects with turbo-alternators and the relative merits of salient-pole and cylindrical rotors was resumed in London on Thursday last. Mr. A. H. Law described some short-circuit tests on a Parsons set in the Carville power station, Newcastle. The staying of the end connections was discussed by Dr. Kahn, who also stated that the sudden short-circuit current of an asynchronous machine was only about six times the full load current. Mr. J. H. Rider described a short-circuit which resulted in the sixteen one-inch bolts of a coupling being sheared through. Mr. G. G. Stoney said that a short-circuit at full pressure was not really a severe enough test, as the shock was greater when a machine was paralleled dead out of phase. A method of reducing the shock due to bad paralleling was described by Mr. G. W. Partridge. Mr. J. T. Irwin pointed out that the author, in his calculations, had neglected the forces due to the reaction of the coils against the stray flux from the field, which would be very much increased on short-circuit. (Page 201.)

Mr. R. Orsettich has read a Paper before the Birmingham and Glasgow Local Sections of the Institution of Electrical Engineers, on standardisation of elec-

Digitized by Google

trical machinery, in which he outlined the influence of various commercial, mechanical and electrical considerations on the selection of types and design of a series of standard continuous and alternating current machines. (Page 203.)

A NEW form of speed reducing gear was described in a Paper read recently by Mr. P. P. Sandford before the Dublin Local Section of the Institution of Electrical Engineers. (Page 205.)

THE report of the past year's work at the National Physical Laboratory contains many items of interest. Tests have been made to determine the losses in insulating material under alternating dielectric stress. Difficulty is being experienced in setting up tungsten lamp sub-standards for high efficiencies owing to the fluctuations in the light emitted. (Page 205.)

IN a paper read before the Yorkshire section of the Institution of Electrical Engineers, Mr. W. B. Woodhouse discussed the design of overhead lines, and gave a series of working curves and data, with illustrations of road-crossings, &c., used by the Yorkshire Electric Power Co. (Page 206.)

MR. J. S. PECK, of the British Westinghouse Co., has been elected Chairman of the Manchester Section of the Institution of Electrical Engineers. (Page 207.)

THE Chesterfield Corporation have decided against the use of top-covered tramcars.—A proposal by the Merthyr Electric Traction & Lighting Co. to erect overhead wires for the supply of electricity in Dowlais is objected to, and a Board of Trade inquiry has been held.—The Liverpool Tramway accounts for 1909 show a net profit of £82,354.—A decision by the Conciliation Board in relation to the L.C.C. tramway employees involves an additional expenditure of £12,000 per annum.—It is stated that the proposed resolution of the West Hartlepool Corporation to purchase the undertaking of the Hartlepools Electric Tramways Co., is *ultra vires*. (Page 208.)

A 500-KW. convertor is to be installed at Bristol, and a 750-kw. single-phase generating set at Bedford.—A £20,000 electric supply scheme is contemplated at Dundalk, and extensions are proposed as follows:—Falkirk, £12,000; Poplar, £1,766; Woolwich, £4,529; Norwich, £17,783.—The Auckland City Council have approved of the scheme for a new electricity works at the cost of £215,000.—Huddersfield Corporation require 1,000 meters; flame arc lamp carbons are wanted at Hackney; and stores at Wallasey, Colwyn Bay, and Bolton. (Page 209.)

THE Scarborough Electric Supply Co. are giving a trial to the Norwich system of charging.—At the meeting of the Brompton & Kensington Electric Supply Co. last week it was stated that the rates and taxes of the company now amount to nearly 25 per cent. of the dividends paid. (Page 210.)

AMONG the specifications published by the Patent Office on Thursday last was one by T. McClelland and Ferranti, Ltd., for a maximum demand attachment to meters comprising a pointer moved round by the action of a series solenoid on an iron core.—A method of obtaining a high starting torque from large induction motors without the use of resistances by combining two machines is described by Dr. M. Kloss, of Siemens Bros. Dynamo Works.—W. H. Nichols, of W. T. Henley's Telegraph Works Co., covers a fuse carrier, comprising a fibre body with peripheral apertures for the escape of the flame and hot gases and baffles to prevent these reaching the contacts.—A core mixture for flame arc lamp carbons is patented by Gebr. Siemens & Co.—A patent by S. Marietti for fixing metal filaments into tubular supports has been granted in spite of opposition, but that by the Glühlampenwerk Anker-Ges. for fixing filaments by depositing a metal covering on their ends has been refused.—Among the expiring patents is one by A. Graham for a telephone instrument with a rotary Hunnings transmitter, and another by J. Hawkyard and J. Braddock for a prepayment meter mechanism. (Page 212.)

PARLIAMENTARY INTELLIGENCE

IT is announced that a Select Committee of the House of Lords will sit on Thursday, April 7th, to consider the London Electric Railways (Amalgamation), the Baker Street & Waterloo Railway, the Charing Cross, Euston & Hampsted Railway, Metropolitan District Railway, and Metropolitan Railway Bills.

The second reading of the London United Tramways Bill has been postponed until Monday, April 4th.

Mersey Railway Bill was read a third time in the House of Lords on Monday.

Mr. Field has given notice of rejection, on the second reading, of the Rhondda Urban District Council (Tramway Extensions) Bill.

The Bishops Stortford, Harlow, and Epping Gas and Electricity Bill was passed by a Select Committee of the House of Lords last week. The Bill proposes the consolidation of a number of gas undertakings in the Bishops Stortford district, and the incorporation of a new company with a capital of £240,000 for the supply of gas and electricity. The Bishops Stortford Council opposed the Bill, but an agreement was arrived at on the terms that the Council shall be entitled to purchase the electrical undertaking of the company in Bishops Stortford at the expiration of twenty-one years, or subsequently at periods of seven years. The Bill was read a third time in the House of Lords on Tuesday.

The Farnham Gas and Electricity Bill was passed by a Committee of the House of Lords last week. It provides for the incorporation of a company with a capital of £60,000 for the supply of electricity and gas. The Bill was read a third time in the House of Lords on Tuesday.

In answer to questions in the House of Commons last week, Mr. Haldane, the Secretary of State for War, stated that the War Department had decided to extend the electric light installation at Aldershot to a number of other camps in preference to gas. The Aldershot Gas Company tendered, but it had been decided that it would be more economical to extend the War Department's electric light installation, which would, moreover, provide a more satisfactory illuminant.

L.C.C. Tramways.—The Standing Orders Committee have struck certain tramways out of the L.C.C. Tramways Bill owing to absence of local consents. The tramways concerned were in the boroughs of Kensington, Hammersmith, Paddington, Hampstead, St. Marylebone, Islington, Lambeth, and Camberwell. The Bill was read a second time in the House of Commons on Tuesday.

London Electric Supply Bill.—This Bill, which provides for the purchase of the five West End electric supply companies which were omitted from the London Electric Supply Act of 1908, came up for second reading in the House of Commons on Tuesday. The debate upon it was adjourned.

Institution of Mining Electrical Engineers.—A meeting of the Manchester Branch of the Institution of Mining Electrical Engineers will be held on Saturday, April 2nd, at 6.30 p.m., to consider the special rules relating to the use of electricity in mines.

Obituary.—At Langside, Glasgow, on the 17th inst., the death took place of Douglas Sheppard, of Messrs. Siemens Bros. & Co. Mr. Sheppard was a native of New Zealand, and was educated out in that country, completing his education there at Canterbury College. He afterwards came to this country, and was for some considerable time at King's College, leaving there to join the staff of Messrs. Siemens Bros., Stafford. Eventually he became chief of the outside staff for Glasgow and the West of Scotland under Mr. Bell, of the Glasgow office. Mr. Sheppard was known practically all over the country as an expert on turbo running and tests, and was extremely well liked and thought very highly of by his many friends and acquaintances, those who knew him best predicting a very brilliant future for him.

Telegraphic Traffic and Movements of Cable Ships.—The cable between Tourane and Amoy was restored on the 15th inst. On the following day the cables between Para and Maranham and between Ceara and Pernambuco became interrupted, and messages had to be sent by land lines. The Western Telegraph Co., however, had a cable steamer on the spot, with the result that the Ceara-Pernambuco section was restored on the 18th inst. The French cable steamer, *Pouyer-Quertier*, succeeded in restoring the section between Paramaribo and Cayenne on the 19th.—The Saigon-Bangkok line became interrupted on 20th inst. The Turkish administration has given notice that code telegrams are again admitted, but not those in cypher.—The German South American Telegraph Co. has completed another link of its connections to South America by the opening on the 21st inst. of the cable between Teneriffe and Monrovia in Liberia.

APPLICATION OF ELECTRICITY TO SHIP PROPULSION

At the Institution of Naval Architects on Thursday, Mr. W. P. Durtnall read a Paper in which he described the latest developments of his system of applying electricity in the propulsion of vessels. He pointed out that although the steam turbine has been successful in competing with the reciprocating engine for ship propulsion on the basis of fuel used per shaft horse-power, yet it labours under an important disadvantage. To be efficient, a steam turbine must be run at a high constant speed, but as the propeller, to be efficient, must run at a comparatively low speed, a compromise has to be arrived at, with the result that the propeller speed used is not the most economical, and the turbines must be of great length and diameter, so that the use of superheated steam is precluded.

To overcome this difficulty Mr. Durtnall has developed a system in which the steam turbine drives an electric generator at a constant speed, chosen to give the highest efficiency, and the propeller is driven by a slow-speed motor whose speed can be varied. He employs a simple squirrel-cage three-phase motor as being the most mechanical for transmitting the very large power required, and he varies the speed of this by changing the frequency of the current supplied to it.

On the main turbine shaft a 3-phase alternator with a revolving field magnet is fixed, and also the rotor of a second alternator, which he calls a "transformer generator." Assuming that the main alternator is a four-pole machine and second alternator a two-pole machine, the connections for obtaining the different speeds are as follows:—

For the first speed ahead, the stator of the first alternator is connected to the rotor of the second one (through slip-rings) in such a way that it produces a rotating field in the opposite direction to that in which the set is being driven mechanically. Thus if the speed is 1,000 r.p.m., the frequency of the main alternator will be 33⅓ cycles per sec., and the frequency of the second alternator if excited with direct current would be 16⅔ cycles per sec. But as this second machine is excited with 3-phase current at 33⅓ cycles per sec. it creates a rotating field in the opposite direction; the resultant rotating field in this second machine corresponds to a frequency of 16⅔ cycles per sec. in the contrary direction to the rotation of the rotor, and this is the frequency of the current led from the stator terminals of this machine to the motor. If the induction motor driving the propeller is wound for 42 poles, the speed of the motor, allowing a 1½ per cent. slip, will be 46·8 r.p.m.

For the second speed ahead, the alternator stator is connected directly to the induction motor without the intermediary of the generator transformer; the frequency is therefore 33⅓ cycles per sec., and the speed of the motor will then be about double, say, 92·8 r.p.m., allowing for a slip of 2½ per cent.

For the third speed ahead, two of the three phases of the generator stator are reversed, before connection to the slip-rings of the generator transformer, and thus the rotating field, with which the latter is excited, is now in the same direction as the direction of rotation. The result is an increase of the frequency of this second machine, instead of a decrease as in the case of the first speed, and the frequency of the current generated in its stator will be three times that at the first speed. Allowing a still further slip, say, 3½ per cent., the speed of the motor will be 138 r.p.m.

It is seen that the generator always runs at constant speed, so that the efficiency of the turbine is high.

For reversing, two of the three phases of the connections to the motor are reversed, the connections of the generators being the same as before for all three speeds. Thus the motor turns in the reverse direction, and the torque is high for the first speed astern, in view of the low frequency of 16⅔ cycles per sec., the full output can be developed on reversing, and the first speed astern position of the controller can be used as a very powerful brake.

Assuming a 7,000 b.h.p. turbine with steam at 180 lbs. per sq. in. and 150° F. of superheat, and with a vacuum of 28·5, Mr. Durtnall estimates the steam consumption as follows:—

	Shaft Horse-Power.	Combined Efficiency of Generator and Motor.	Steam Consumption.
First Speed (46·8 r.p.m.)	600	77 per cent.	18·4 lbs. per shaft h.p.-hr.
Second Speed (92·8 r.p.m.)	1,500	83 ,,	13·85 ,, ,, ,,
Full Speed (138 r.p.m.)	6,160	88 ,,	11·66 ,, ,, ,,

The estimated steam consumptions are without allowing for the steam used in the auxiliaries. The combined efficiencies of generator and motor, Mr. Durtnall gives as "guaranteed."

In changing the speeds, the (series) field of the exciter of the main generator is short-circuited before the change is made in the connections between the generator and transformed generator, and all the changes in the connections are made automatically in the control gear. The controller can be operated directly from the bridge.

Besides its mechanical strength and simplicity of construction, the induction motor possesses another advantage, viz., that it is impossible for it to race. In heavy seas, with a lightly immersed propeller, the motor will simply run up nearer to the speed of synchronism, which, of course, it cannot exceed.

In the Paper, some examples are worked out to show the gain in steam consumption claimed for the system. For instance, the author takes a twin-screw cargo boat, fitted with 2,000 i.h.p. triple expansion engines, which, at the full speed of 100 r.p.m., would consume 15 lbs. of steam per i.h.p.-hour, or, say 17·65 lbs. per shaft horse-power-hour. If high-speed turbines on Mr. Durtnall's system are substituted, he estimates that the consumption will be 15 lbs. per shaft horse-power-hour with saturated steam, or 13·9 lbs. with superheated steam.

In the Paper, a modification of the system for use with internal combustion engines is described, in which the generator and the generator-transformer are driven by separate engines, both of the same size. This the author suggests as an alternative for slow-speed cargo vessels in which the direct-coupled internal combustion engine is not suitable owing to its high speed. The example he takes is with two 500 b.h.p. engines running at 350 r.p.m., the generator being an eight-pole machine, the transformer-generator a four-pole machine, and the motor wound for 34 poles. With the three methods of connection described in the previous example, the motor speeds, allowing for slip, would be 40·25, 80, and 120 r.p.m. respectively, and on the second speed it would be only necessary to run one engine, the one driving the ordinary alternator.

For small cargo boats, the combination of a reciprocating engine and a mixed pressure turbine is suggested as another alternative. The reciprocating engine runs, say, at 500 r.p.m., and drives a four-pole alternator, a two-pole transformer-generator, and the exciter, all mounted on the same shaft. The mixed pressure turbine runs at 1,550 r.p.m., and drives a two-pole non-synchronous alternator. For the first two propeller speeds, the reciprocating engine exhausts direct to the condenser, and the connections are as in the case of the first two examples, the turbine set not being employed. For full speed, the engine exhausts into the turbine, and some live steam is also sent into the turbine, so that it runs approximately at its rated speed. The stator of the main alternator is then connected to the rotor of the generator-transformer, just as in the other cases, and the frequency corresponds to a motor speed three times the first speed. The reciprocating engine alone is not sufficiently large to supply the full power at this speed, and, therefore, the non-synchronous alternator, driven by the mixed pressure turbine, is connected in parallel with it. The sizes of the two machines in

Digitized by Google

the example taken in the Paper are 250 b.h.p. for the reciprocating engine, and 730 b.h.p. for the turbine.

The question of the comparative weights of the ordinary engine plant and the turbo-generator plant and accessories is only discussed in the case of one of the examples taken in the Paper, viz., that of a twin-screw Atlantic liner wtih 5,000 i.h.p. quadruple expansion engines. For a similar vessel, equipped on Mr. Durtnall's system, he estimates a saving of 3 per cent. in weight of the engine-room plant, and of 13 per cent. to 17 per cent. in boiler weight, in addition to which he mentions the saving in weight of coal at the start of the voyage, owing to the higher efficiency.

A discussion on the Paper was opened by the Hon. C. A. Parsons, who stated that the losses in propeller and turbine efficiency in fast turbine liners were not so serious as the author imagined. In such vessels the propellers had an efficiency within 2½ or 5 per cent. of the efficiency of any propeller, and the steam consumption of the turbines was within 3 per cent. of fast-speed land turbines. For the vessels, therefore, he said, there was no advantage in gearing, whether by electrical or other means. There was thus, in the case of fast vessels, only a gain possible for cruising speeds. For slow-speed vessels, on the other hand, there was undoubtedly a large field for gearing, but, while the combined efficiency of the generator and motor might be taken at 85 per cent., he had developed a helical gearing (described in a Paper before the Institution on Friday) which had a 98½ per cent. efficiency. It was not correct, Mr. Parsons continued, to say that there was a critical speed for turbines, as the curve was very flat, and fairly wide variations on either side were possible, without diminishing the efficiency, if the turbine were designed for the average speed; nor should too much store be set upon superheat, as the superheaters would not last, owing to possible priming and the deleterious action of the salt in the water. Moreover, reciprocating engines could also be run at higher efficiency with superheated steam. Finally, he criticised the general principle of electric driving in two respects. In the first place, if the combined efficiency was 85 per cent. the 15 per cent. was lost as heat, and this would increase the already great difficulties of ventilation, and, secondly, if there were a short-circuit of one of these large machines in such a confined space, everyone in the engine-room would be killed by copper poisoning.

Mr. C. G. Deane spoke in favour of Mr. Durtnall's proposals, and elicited from Mr. Parsons the explanation that the 3 per cent. difference in efficiency between land and marine turbines was without superheat, and assuming that each was run at its rated speed. He pointed out that additional turbines for cruising speeds were utilised. Mr. Futtinger said that he had studied the question of electrical gearing in conjunction with the A.E.G. and Brown, Boveri & Co., but the idea was abandoned on account of the weight of the plant and the difficulty of operating. He was now trying a hydraulic method of gearing. Mr. Holzapfel said that he had made inquiries, both here and on the Continent, for an electrical reversing gear, but had not found one to meet with his requirements. He understood, however, that Mr. Durtnall's motors would work under water, and suggested that they might find useful application for electric winches. Mr. R. J. Walker also expressed his opinion that the use of electric propulsion on the system proposed would mean increased weight.

Mr. Durtnall in his reply said that a 600 h.p. vessel on his system was under construction, and he would publish the actual results of the trials, whether they proved to be for or against electrical propulsion.

CONDENSERS WITHOUT AIR PUMPS

A NEW pattern of condenser, by the use of which the usual air pump is dispensed with altogether, is being introduced into this country by Messrs. Michael Pal & Co. (Parliament Mansions, Victoria Street, London, S.W.). Circulating and condensed water pumps are required, but the air is extracted from the air chamber by the circulating water on the ejector principle. The cold circulating water is drawn from the cooling tower tanks by a centrifugal pump, which imparts to it sufficient head to overcome the tube friction and to raise it to the top of the towers. The water enters the condenser with a somewhat higher velocity than is usual, and first passes through an ejector apparatus in the air chamber, which entraps the air, causing it to be carried out of the condenser with the circulating water. This arrangement is said to be suitable for any kind of steam plant, especially where a high and steady vacuum is required. Several such condensers are at work in Germany, and we are informed that one installed at Charlottenburg gave on test a vacuum of over 95 per cent. Both the pumps, that for circulating the cold water and that for the extraction of the hot condensed water, may be of the centrifugal type, and this fact, coupled with the absence of an air pump, reduces to a very large degree the liability of stoppages.

Although the circulating water pump is necessarily somewhat more powerful than in ordinary condenser plant of equal capacity, the total power required for the auxiliaries is said to be reduced. The chief advantages claimed for the system are the low running costs and the greater safety of working. Further, there is said to be a saving in first cost and in floor space. Messrs. Michael Pal & Co. use this condenser in conjunction with their exhaust steam-turbine plants, where a steady vacuum is of great importance. These plants include a special form of heat accumulator which ensures a continuous supply of low-pressure steam at even pressure, however variable the delivery of exhaust steam. Further, an automatic live steam valve is fitted to the accumulator, and this comes into action directly the supply of low-pressure steam is below a predetermined minimum, and admits live steam to the accumulator to maintain the supply to the turbine.

CORRESPONDENCE

To the Editor of ELECTRICAL ENGINEERING.

TELEPHONE CABLE TERMS.

SIR,—Not being a telephone engineer, and having no pretension to expert knowledge in all the branches of science, I do not mind confessing that I find your very interesting description of the new telephone cable on the Heaviside-Pupin principle (which is known to me) not altogether easy to follow. Would it be asking too much if I inquired as to the exact meaning of "the standard equivalent cable length" of a mile of cable, and how it is calculated (or measured)? Also, what is the exact meaning of the "attenuation constant per mile of a cable"? Taking a common-sense meaning, it would seem that the *less* the attenuation constant is, the *better* the cable. This cannot be the right view, since you state that the cable without its coils had an attenuation per mile of 0·045, while with the coils this was reduced to 0·0140.

It is possible that an explanation of these points would be welcome by more than one of your readers.

I am, yours faithfully,

Cairo House, Balcaskie Road, Eltham, March 20, 1910. M. E. J. GHEURY.

[For convenience in specification and testing, the British Post Office and the National Telephone Company have agreed upon a "standard" cable of certain resistance, capacity, and inductance, which is used as a basis of comparison when specifying or testing telephone lines or cables. This "standard" cable is a dry-core cable, the wires of which have a loop resistance of 88 ohms per mile and an average mutual electrostatic capacity of 0·054 m.f. per mile between wire and wire of each pair, and an average insulation of not less than 200 megohms per mile between wire and wire of each pair, all measurements being made at 60° F. The same standard, we believe, is also employed by the American and other telephone administrations. Thus the expression occurring in our article that the new telephone cable between England and France has a standard cable equivalent of 3·28 miles, means that it would affect the speaking properties of a circuit to the same extent as 3·28 miles of the "standard" cable as defined above.

The attenuation constant of a "loaded" cable of high insulation, such as the new Anglo-French telephone described, is expressed by the formula $\alpha = \frac{R}{2}\sqrt{\frac{K}{L}}$ where R = resistance in ohms, K = mutual capacity (in farads), and L = inductance in henries.—ED. *E.E.*]

Siemens-Schuckert Continuous-current Meter.—The Board of Trade have approved of the Siemens-Schuckert continuous-current meter type G.K., and of the means provided for fixing it.

Central Battery Telephone Exchange at Bootle.—On Saturday, March 12th, at 3 p.m., the National Telephone Co. transferred the subscribers connected to its Bootle exchange to a new central battery equipment installed in new premises at Exeter Road, Bootle, Liverpool, which have been specially designed. The new equipment has been manufactured and installed by the Western Electric Co., Ltd., of North Woolwich, and is of the No. 1 C.B. type, consisting of fourteen subscribers' positions giving accommodation for 1,080 lines, four incoming junction positions, and one exchange testing position. The equipment is of similar design to those previously described in ELECTRICAL ENGINEERING.

THE ELECTRICAL EQUIPMENT OF SMITH'S DOCKS, NORTH SHIELDS

THE North Shields branch of the Smith's Docks Co. consists of three dry docks ranging from 300 ft. to 435 ft. long, and two pontoon docks 365 ft. and 435 ft. long respectively. In addition to these docks for repairing purposes, there is an extensive shipyard for building steam trawlers, medium-sized cargo boats, and other small vessels, while across the river at South Shields a further set of three dry docks for repairing purposes is in operation. Increasing business recently suggested to the firm the removal of the shipbuilding branch to Middlesbrough, where extensive new works are now in operation, and the devoting of the space thus left at North Shields to greater repairing facilities, a 600-ft. graving dock being in contemplation.

This company is of very old standing, although it has been known by its present name only since 1891. It is really an amalgamation of Messrs. T. W. Smith and Messrs. H. S. Edwards and Sons, founded in 1782 and 1786 respectively. The policy of the firm has always been to keep up with engineering progress, and even before the amalgamation took place electricity was being used to pump out one of the floating pontoons. This was before the days of municipal supply, so that a private plant was put down to operate the pumps electrically. Last year, on the advice of Mr. C. W. Fairweather, consulting electrical engineer to the firm, it was decided to change over and take electrical supply from the system of the Tynemouth Coroporation Electricity Department. The steam equipment, fed by three marine boilers, was scrapped, such hydraulic and pneumatic systems as were in use were operated electrically, and, wherever possible, without incurring too much expense in changing over existing electrical machinery, a three-phase supply system was introduced. Where this was not possible, a D.-C. supply was taken from the town mains. The practical effect of power available from the central station plant is that all three docks can be used at one time, and three ships can be docked together, whereas it was formerly necessary to hold one ship back in order to spread the pumping over a longer period and lighter duty.

The system of electrical distribution is divided between a D.-C. supply from the Tynemouth Corporation main station, which is now being operated as a transforming station for transforming the high-tension three-phase bulk supply from the Newcastle-upon-Tyne Electric Supply Co. to a three-wire low-tension D.-C. distribution at 440 and 220 volts, and a three-phase 40-period supply. The sub-station for this latter supply is erected on the premises, and the three-phase motors which are operated from this centre are, with the few exceptions mentioned later, of the squirrel-cage induction type. In connection with the pumping of the two large graving docks mentioned above, a pump-room is installed on the pier between the docks, the whole of the plant being underground.

The installation consists of two main twin horizontal Worthington pumps each of 16 in. diameter, direct driven by a 150 h.p. Westinghouse A.-C. motor, an 8 in. drainage pump, operated by a 25 h.p. Westinghouse A.-C. motor, to drain the docks after pumping, while for ballast purposes a 17½ h.p. A.-C. motor operates an 8 in. delivery ballast pump, and a 2 h.p. A.-C. motor drives a small priming pump. Space is economised as much as possible by placing the centre line of each combination parallel to the axis of the pier, but inverting the relative position of the motor and pump in one set, so as to bring the two sets close together. The lighting for this room is taken from one phase to earth. It has been found possible to empty the smaller of the two docks completely in an hour-and-a-half when using both sets of pumps, while the larger one takes two to two-and-a-half hours according to the size of the vessel which is being docked. For opening and closing the gates of both these docks a capstan made by Messrs. Clarke, Chapman & Co. is used, the arrangement of chains being such that one of these passes through an eye on one gate to a bolt on the other, the tension of this chain, therefore, drawing both gates close together. Another chain, divided at a point along its length into two separate chains, is suitably arranged for throwing the chain wheels into and out of gear with the drive, which is accomplished by a 25 h.p. slip-ring motor.

In connection with these docks, a Ransomes and Rapier jib crane of 15 tons capacity, at a radius of 45 feet, is also in operation on the three-phase system, having motors of 30, 20, 20, and 10 h.p. for lifting, derricking, slewing, and traversing respectively. On this pier is also a fitters' shop, driven by a 30 h.p. Westinghouse motor. The supply for this crane is taken from a plug box some ten yards away through a flexible armour-covered cable to the crane, and fed through a hollow vertical shaft, on which the crane superstructure rotates, to slip-rings, from which it is taken to the switchboard. Each gear is equipped with an electromagnetic and foot brake for use in cases of emergency.

The other purposes of the three-phase supply are for operating

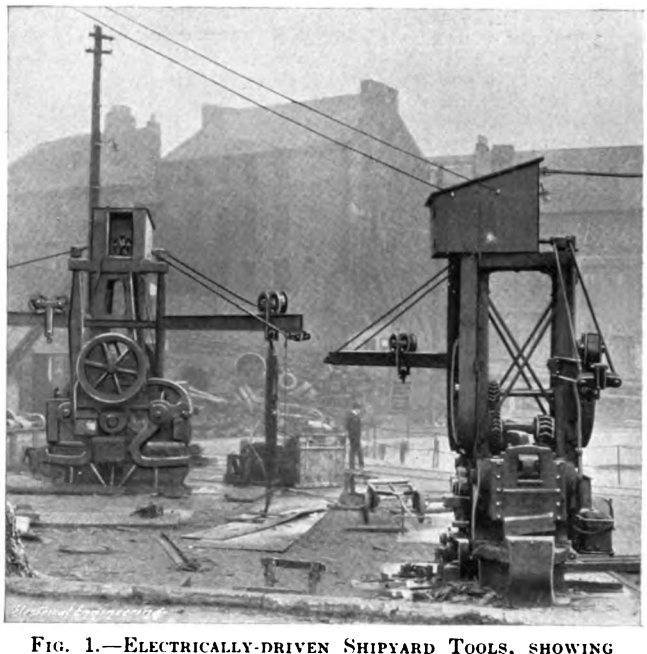

FIG. 1.—ELECTRICALLY-DRIVEN SHIPYARD TOOLS, SHOWING OVERHEAD WIRING.

20 and 15 h.p. Westinghouse motors respectively for punching machines erected in the open for working large plates, the motors being mounted on the top of the machines and supplied by an overhead pole construction, which is clearly shown in Fig. 1, and two 65 h.p. Westinghouse slip-ring motors for driving air compressors, which supply power for working pneumatic tools for the ships being repaired in the docks. Each of these slip-ring motors is controlled automatically by a liquid starter operated by a small motor which is thrown on and off the line by a switch controlled by the air pressure in the air receiver. The pressure at which this switch operates can be adjusted by altering the weights attached to the movable blade of the switch. Fig. 2 gives a photograph of the air-compressor room, and shows this automatic gear very plainly.

A D.-C. supply, of which there are four services direct from the Corporation mains, is used for driving motors for the blasts in the coppersmiths' and blacksmiths' hearths and machine tools; and also for the flame-arc lamps which are used throughout the yard for outside lighting and for the enclosed lamps for inside illumination.

In the shipyard, which forms the middle section of the area covered by the firm, a number of tools are driven by D.-C. motors. Among the heavier machinery may be mentioned a joggling machine driven by a 40 h.p. D.-C. motor, a large punch

Digitized by Google

and shears driven by a Westinghouse D.-C. motor, shown in Fig. 3, and large mangles for straightening plates operated by a 17 h.p. D.-C. motor. As the work on the last machine is very fluctuating, a large-scale ammeter is installed in view of the man using the controller, so that he can regulate the rate at which work is being done. A fine plate-planing machine 22 feet in length, is driven by a 30 h.p. Westinghouse A.-C. motor. Close to this machine is a drilling and counter-sinking machine for working on the plates, driven by a 7½ h.p. A.-C. motor.

An interesting feature in the shipbuilding department is the main switchboard, controlling the power circuits, on a platform 30 feet above the ground, and closed in from the shop by glass windows, so that the operator has a full view of every machine in the department. Double-pole fuses and switches are provided for each circuit, together with main switch and fuses, and necessary voltmeters and ammeters.

At the entrance to the pontoon department is situated No. 6 graving dock, which is used for docking the smaller boats. The pumping equipment, which is capable of emptying the dock in about 2½ hours, is contained in an underground room at the side of the dock, and consists of a centrifugal pump, with a capacity of 6,000 gallons a minute against a head of 26 feet, direct-connected to a 70 h.p. Westinghouse vertical A.-C. motor operated by an autostarter, and small draining and priming pumps direct-driven by A.-C. motors. One of the main features of interest in connection with the pontoon department, which also forms one of the outstanding features of the works as viewed from the river, is a travelling jib crane on the wharf side, which is used for such purposes as placing very large propellors, &c., on boats lying alongside the quay. It was constructed by Messrs. Ransomes & Rapier to lift 25 tons at a radius of 43½ ft., and is operated by 4 D.-C. motors of 40 h.p.

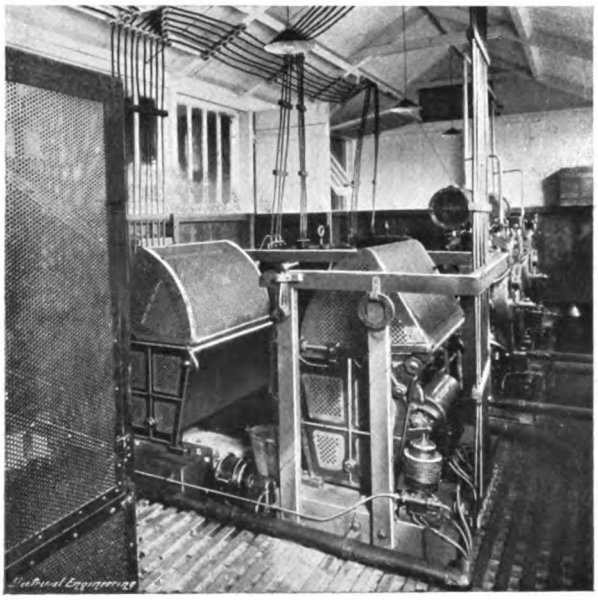

Fig. 2.—Automatic Liquid Starter for Hydraulic Pumps.

for the hoist, 20 h.p. for derricking, 10 h.p. for travelling, and 15 h.p. for slewing.

An extensive fitting shop is in operation in connection with the pontoons, some of the machines, such as lathes and drilling machines, being of considerable power. Amongst these may be mentioned a 4-tool lathe with a bed taking work up to 40 ft. in length, and a planing machine of 10 ft. by 4 ft. These two machines, together with three other lathes, are operated by a 50 h.p. Westinghouse induction motor, which also drives, by means of a rope, belt and friction clutches, a 20-ton overhead travelling crane. The smaller machines in this shop are driven from a shaft by a 30 h.p. Westinghouse motor, whilst the joiners' shop, which is used for ship repairing work, is operated by a 15 h.p. Westinghouse motor.

In the hydraulic house, adjacent to this department, is installed a pump for working the accumulator for the hydraulic system of the works, which is maintained at a pressure of 900 lbs. per square inch. The pump is driven by an 85 h.p. Westinghouse slip-ring motor, which, with the exception of the air compressor plant, one capstan, and one crane equipment, is the only slip-ring motor in the place. It is provided with an automatic liquid starter for starting against load, being controlled by the rise and fall of the accumulator. A 50 h.p. Westinghouse A.-C. motor drives the compressor for the pneumatic hammers and rivetters in the docks, which are supplied at a pressure of 40 lbs. per square inch. In this connection it may be mentioned that the hammers in the blacksmiths' shops were recently converted from steam to pneumatic drive. The blacksmiths' department in this section comprises a series of 20 fires, the blast for which is maintained by a Roots blower, driven by a 10 h.p. Westinghouse A.-C. motor.

Fig. 3.—Electrically-driven Punching and Shearing Machine.

Two other motors, each of the same capacity, operate punching and shearing machines, and a mangle and drilling machine in the high shed (pontoon department). There are, amongst other heavy machinery, a fine set of rolls by Messrs. Hugh Smith & Sons, capable of taking plates up to 30 ft. in length, driven by a 55 h.p. D.-C. motor. In this section the same arrangement of main switchboard is adopted, namely, an elevated gallery at such a height that the whole of the machinery can be seen at one time by the operator, isolated from the dirt and dust of the shop by glass partitions. For the purpose of pumping out pontoons Nos. 7 and 8, a series of four and eight pumps are respectively installed, each pump having a delivery pipe of 18 in. diameter, and being operated by a 60 h.p. Westinghouse A.-C. motor. It may be taken that any further extensions of this set will be carried out by means of three-phase power.

The whole of the A.-C. electrical equipment consisting of three-phase motors, autostarters which are of the oil-immersed type, controllers, and automatic liquid control and electro-magnetic brake gears, was supplied by the British Westinghouse Electric & Manufacturing Co., Ltd. The wiring was carried out by Messrs. Warren, Beattie & Co., of Middlesbrough.

Faraday House Old Students' Association.—The annual dinner of the Faraday House Old Students' Association has been postponed until Friday, April 29th.

Electrically-driven Spirit Pump.—At Messrs. James Buchanan & Co.'s premises in Holborn an electrically-driven pump has been installed, and is put to a novel use. It is arranged to pump various whiskeys from barrels in the basement of the building to large vats on the top floor, so as to obtain certain blends of the spirit. A special suction is provided for adding the required quantity of water to give the liquor the proper density, and the pump is also arranged to discharge air into the vats in order to effect the blending. In view of the nature of the liquor the inside of the pump is tinned, as also is the inside of the copper pipe which has been fitted for conveying the whiskey from the basement to the top floor. The pump, which is capable of dealing with no less than 130 gallons of whiskey per minute, is of Merryweathers' "Hatfield" pattern, and is driven from an electric motor by means of a silent chain, the whole being mounted on bed plate and forming a very compact set.

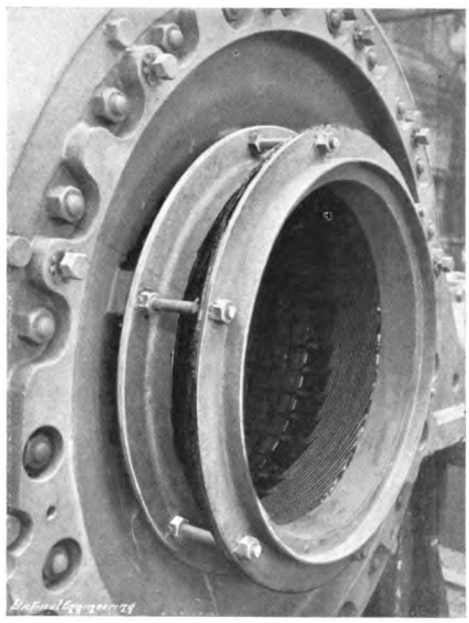
SHORT-CIRCUIT EFFECTS AND TURBO-ALTERNATOR CONSTRUCTION

THE discussion of the two Papers on the above subjects, read by Mr. Miles Walker before the Institution of Electrical Engineers in London, on March 10th, was resumed on Thursday last. An abstract of the two Papers and of the discussions in Manchester and London on March 8th and 10th respectively, was given in ELECTRICAL ENGINEERING, March 17th, page 183. In the first Paper the author described the effects of short-circuiting large alternators, pointing out that as the armature current took time to demagnetise the field, it might on sudden short-circuit amount to from 20 to 30 times the full load value. The second Paper dealt with the question of salient pole *versus* cylindrical slotted rotors, the author expressing a preference for the latter type.



Mr. A. H. LAW (Messrs. C. A. Parsons & Co.), who showed a number of slides illustrating short-circuit effects obtained with a 4,000-kw. alternator in the Carville power house of the Newcastle-upon-Tyne Electric Supply Co. It was short-circuited twice at a pressure of 5,800 volts. The end windings were tied up with lead wires to the frame, and after the test these wires were all found to have slackened about $\frac{3}{2}$ in. According to the oscillograph records, the current rose to nearly 8,000 amperes in about $\frac{1}{20}$ second, and fell in about one second to only slightly above its normal value, but even at four seconds it did not reach the normal value. The method of supporting the coils in the alternator was to have bolts passing through the coils, and, in addition, massive cast-iron clamps were fastened to the coils and carried round to the frame. It was the intention, however, to substitute cast steel, which would then give a factor of safety of about 2½. He knew only of one alternator which had given trouble on short-circuit. This was a 2,000-kw. machine. The supports were damaged considerably, but the windings were not broken down, and the alternator ran for some weeks before the damage was repaired. In another case, a 1,500-kw. two-pole machine was paralleled entirely out of phase with several larger machines through a mistake in coupling up the synchronising lamps, but it withstood the shock without breaking down. He did not agree that two-pole windings were more difficult to support than four-pole windings. It was true that the former had twice the stress in them, but there was twice the length on which to fit clamps. In his remarks upon keeping down the short-circuit current, the author suggested the use of a semi-closed slot deep below the periphery. Did this really present advantages? It was true that it increased the self-induction of the winding, but did it not produce additional voltage drop. Was it not better to increase the self-induction by putting additional wires on the armature than to increase the leakage across the top of the slots? Some makers, including Parsons, preferred to use completely enclosed slots, because it undoubtedly limited the short-circuit current. Messrs. Parsons had recently designed a 1,500-kw. machine running at 3,000 r.p.m. in which it was expected that the momentary short-circuit current would not exceed 12-14 times the full-load value, whilst at the same time the regulation would be within 8 per cent. when throwing on full-load current, with a power factor of 0·8. In conclusion, the speaker mentioned the case of a short-circuit on a Parsons D.-C. turbo-generator with compensating windings in the pole pieces, through the plates in the tank used as an artificial load for testing accidentally coming into contact with each other. The result was that the windings pulled themselves in about ¼ in. on either side and made the walls oval, the bolts holding the pole pieces were torn away, and the armature was pulled up so rapidly that the commutator sheared the lugs and went on half a turn alone.

Dr. M. KAHN (Brush Electrical Engineering Co.) said that as the coils consisted largely of insulating material, it was necessary to employ very heavy clamps, and not to be afraid of getting them close up to the winding. An ordinary barrel winding or the so-called butterfly connections were the most suitable windings. With bolts going right through the winding, the most valuable feature of the barrel winding (namely, all the bars lying close to one another) was lost. It was better to use a supporting ring, with a flanged ring on the opposite side. The supporting ring is bolted to the other ring by bolts outside the winding, as shown in the accompanying figures. With this construction all bars lie flat against one another, so that the attraction between bars cannot produce any deformation of the winding. In addition, the current in one layer flows in an opposite direction to the current in the other layer. When the coils are not packed close together, there should be packing pieces between the mica tubes on the straight part where the coils leave the slots. These can be made in halves, both halves being screwed together so that they grip the tubes. It is advisable to make the inner supporting bolts of non-magnetic material, as otherwise they get hot. Former wound coils with

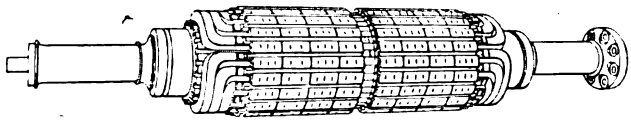
SUPPORTING RINGS FOR TURBO-ALTERNATOR END-CONNECTIONS. (BRUSH ELECTRICAL ENGINEERING CO.).

solid conductors offer more resistance to deformation than coils of flexible cable, and the open slots which are necessary will not cause ripples if they are inclined at an angle to the axis of the machine. If an asynchronous machine is short-circuited, the

METHOD OF SUPPORTING END-CONNECTIONS OF BARREL WINDING (BRUSH ELECTRICAL ENGINEERING CO.).

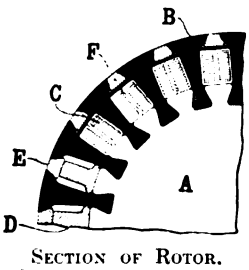
volts are counterbalanced by the reactance voltage, and the short-circuit current is only about six times the full-load current. In addition, the short-circuit current automatically cuts off the magnetising current of the machine.

Mr. J. H. RIDER (Chief Electrical Engineer, L.C.C. Tramways) mentioned one or two bad short-circuits. One was on a 3,500-kw., 94 r.p.m., three-phase generator, due to bad paralleling. The coils were of the open type, unsupported at the ends, and practically the whole of the end windings collapsed inwards. All the mica tubes were broken, and, of course, the machine broke down. Another was on a 5,000-kw. Dick-Kerr turbo-alternator, coupled to the turbine with a coupling in which were sixteen one-inch bolts. The instant the short-circuit took place, the whole of these bolts were sheared through, but not a single clamp or coil of the alternator moved. This was excellent testimony to the construction of the alternator, which was a four-pole machine running at 750 r.p.m. In comparison with the simplicity of the clamps on this machine, he rather wondered at the large number which were being put upon the Westinghouse machines now being erected at the L.C.C. Greenwich power house (see ELECTRICAL ENGINEERING, March 17th, p. 183, Fig. 3). It did not seem that there was safety in the number of clamps so much as in the positions in which they were



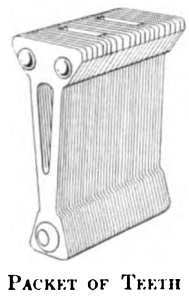
Digitized by Google

placed. If coils, after short-circuits, generally went inwards, then no useful purpose was served in placing large clamps outside the coils. With regard to the relative advantages of salient-pole and cylindrical rotors, was it a fact that the fields of the latter required more excitation? The above-mentioned Westinghouse generator, which had the same number of stator slots, the same number of turns in the stator coils, and the same speed, required nearly 50 per cent. more energy than the Dick-Kerr salient-pole type generator working alongside it. With regard to Mr. Walker's compensating device, how would a machine with this work in parallel with machines without it?



Mr. E. H. RAYNER (National Physical Laboratory) showed some oscillograph records of the effects of switching on a transformer on an actual unloaded cable network. The voltage curve was, of course, symmetrical, and showed very slight ripples, but the current curve gave evidence of the same effect noticed by Mr. Walker, viz., a shifting of the zero line and pronounced ripples for some considerable period after switching in. He then referred to the large quantity of heat which had to be dissipated in the stator in the case of high-speed turbo-alternators, and estimated that in the 5,000-kw. machine referred to in the Paper, this would amount to some 5 kw. per phase. This had to be got rid of, through a comparatively short length of metal, but through several thicknesses of insulating material.

Mr. G. G. STONEY (Messrs. C. A. Parsons & Co.) said that a short-circuit test at full pressure was hardly sufficient. A machine ought really to be thrown in out of phase with all the other machines running in parallel with it. According to Mr. Walker, however, this was the worst case that could take place, so perhaps as a regular test it would be excessive.



Mr. P. W. TURNER (A.E.G. Foreign Department) described the construction of the A.E.G. turbo-alternator rotors for high peripheral speeds. (See ELECTRICAL ENGINEERING, Jan. 27th, 1910, p. 58.) Machines of 3,000 kw. had been constructed to run at 3,000 r.p.m. The central portion of the rotor is forged solid with the shaft, and these have been made up to a weight

ROTOR OF A.E.G. TURBO-ALTERNATOR.

SECTION OF ROTOR.

PACKET OF TEETH STAMPINGS.

of 28½ tons. The teeth are quite separate, and are fitted in dove-tail slots. Metal wedges *F* forced in above the coils *C* lift up the roots of the teeth *B* against the sides of the dove-tail slots. Iron wedges *E* are placed above the iron bars *D* in the middle slots. The teeth are made in 6-in. lengths, and are tested to 28 tons per square inch at the fracture, but the working stresses are only 4 to 5 tons per square inch. Bolts go through the stampings and short-circuit them. The coils consist of strip copper insulated with mica. They are built up with the teeth external to the rotor core, and the whole is then slid into position.

Mr. G. W. PARTRIDGE (Chief Engineer, London Electric Supply Corporation) thought that consulting engineers might allow as much as 27-30 per cent. pressure drop on load instead of 16-18 per cent., especially when automatic regulators were used. Instead of using choking coils to limit the short-circuit current as mentioned in the Paper, better results might be obtained with resistances. He recommended the use of two oil switches in series on each generator, the first controlled by an instantaneous relay, and the second by a time-limit relay. When synchronising, the first switch would be left open and the synchronising would be done on the second, in which case, should the machine be put in out of phase, the resistance would limit the current. When paralleled, the first switch would also be closed. Then, in the case of a short-circuit, this switch would come out instantaneously and the resistance would then serve to limit the current. Perhaps, however, the quickest relay would take about ¼ second to act, and consequently the first rush of current would not be prevented. He was paralleling in the above manner in connection with the supply to the London, Brighton & South Coast Railway, and it acted very well.

Mr. J. T. IRWIN (Central Technical College) suggested that Mr. Walker had overlooked, when considering the forces on the coils, the effect of the stray fields from the rotor. Assuming that under normal conditions the field strength per pole was three times the armature strength, then, with an armature current of 20 times the normal, and lagging 90 degrees, as was the case at short-circuit, it would be necessary, in order to maintain the field flux, that the ampere turns of the eddy current in the pole face should amount to some seven times the normal. This would mean that the leakage flux would be seven times greater. Estimating the leakage of the machine taken by Mr. Walker, he came to the conclusion that the leakage flux on short-circuit would be at least as high as the flux due to the current in the stator coils, and that the effect of these two fluxes would be added, with the result that the forces would be at least twice as great as those estimated by Mr. Walker.

Mr. MILES WALKER, in reply, dealt first with Mr. Irwin's remarks. The additional leakage due to the eddy currents in the pole would, he agreed, contribute considerably to the forces acting upon the winding. In answer to Mr. Law as to why he did not test his machines at higher than one-third full voltage, he said he was afraid of cracking the bed-plate. Apart from this, there was the risk of stripping the turbine blades. Several more modern machines had been short-circuited since at full voltage, and had stood the test well. Some consulting engineers now specified that the machines must be short-circuited as part of the test. He still thought a two-pole winding was more difficult to stay. By dividing the coils up into smaller batches, the forces were not so great. With regard to the harmful leakage mentioned by Mr. Law in connection with the form of slot proposed to reduce the short-circuit current, it would perhaps be better to make the slot wide at the top as well as deep. As to the number of clamps, also mentioned by Mr. Rider, machines with half the number had shown a movement of the coils, although they stood up; he thought the extra number advisable. The coils did not always go inwards; it depended on the direction of the current. Dealing with Mr. Rider's query as to why a machine with a cylindrical rotor required more exciting current, Mr. Walker stated that extremely strong field magnets were put in in order to obtain better regulation. The extra current required was not a serious matter in relation to the very much better regulation. Paralleling compensated with non-compensated machines had been tried with success in Glasgow, where a 4,000-kw. compensated machine was run in parallel with non-compensated machines, and ran perfectly well. The reason was that the compensated machine was not compensated for wattless load, and it was the wattless current that helped in the parallel running. The compensated machine tended to take up rather more than its share, not of the load, but of the wattless current, as it tended to hold its volts up better than the other machines. This did not affect the parallel running, but only the power factor of the particular machine. In fact, A.-C. machines in parallel must of necessity share the load in proportion to the output of their engines, although with D.-C. machines this was not the case. He did not understand Mr. Rayner's remarks about the 5-kw. loss. This would mean one per cent. copper loss, which was high for a turbo-alternator. Mr. Partridge's suggestion would certainly save the machine if the operator made a bad parallel, but when the resistance was short-circuited it would be of little use in limiting the short-circuit current, because all the damage was done long before even an instantaneous acting current breaker would come out.

Several written communications to the discussion have been received. Dr. R. POHL (Phœnix Dynamo Manufacturing Co., Ltd.) favours the salient-pole rotor as giving the required output with the smaller expenditure of material. Highly saturated teeth are being employed in salient-pole rotors, and high current densities can be obtained with sub-divided field coils of copper strip wound on edge. The slightly larger leakage factor is of little importance. The smaller weight, mean length of turn, distance between bearings, and the greater accessibility render the salient-pole type the most suitable in all cases except for bi-polar machines. External choking coils may be used to limit the short-circuit current, and these also protect the stator end coils against pressure rise.

Mr. J. C. MACFARLANE (Crompton & Co.) refers to the fact that the extra stray flux from the field on short-circuit reacts on the stator coils, and may account for the very heavy forces observed. He agrees that the cylindrical rotor is the best, as the iron takes up the heat from the copper and dissipates it from its large circumferential surface. To increase this surface, which is the most valuable to dissipate heat, a core may be constructed of alternate packets of discs of different diameter. An experimental core of this kind, with only twice the circumferential surface of a plain core, got rid of 25 per cent. more heat than a plain core of the same dimensions and for the same temperature rise. This percentage could easily be raised to 100. By having teeth of different lengths, a helical passage could be made which would drive air along the surface.

Mr. A. G. ELLIS (Alioth Co., Basle) points out that the teeth in the interpolar space of a cylindrical rotor carry only a small part of the total flux and correspond to the interpolar spaces in the salient-pole type.

STANDARDISATION OF ELECTRICAL MACHINES

A PAPER entitled "Some Notes on Standardisation of Electrical Machines" was read by Mr. R. Orsettich before the Glasgow Local Section of the Institution of Electrical Engineers on March 8th, and was also discussed by the Birmingham Local Section on March 9th. The author defined standardisation as selecting for manufacture a definite number of types and sizes as answering average requirements, and in designing them in such a way that they are eminently suited for production in large quantities. To carry out successfully the production of machines on a large scale there should be as few types as possible, and as many parts as possible in common amongst the different types, also, the aim of the design should be concentrated on the production of perfectly interchangeable and mechanical details, even if the cost of machining is somewhat high, with a view to reducing the cost of assembling the different parts, which can only be done individually.

Commercial considerations require a sufficient number of standard sizes to minimise the likelihood of being underbid by firms happening to have a size nearer the requirements, notwithstanding the larger total capital outlay and small turnover for each type. The recommendations of the Standard Committee, who went into this matter very thoroughly, have unfortunately not met with complete success, because they reduced the number of sizes below what had been accepted as normal practice by a number of firms. In the author's opinion, a line of standard continuous-current machines between 1 h.p. at 2,000 r.p.m., and 100 h.p. at 1,000 r.p.m., there should be from eighteen to twenty types, and practically the same number for a line of three-phase motors between 1 h.p. at 1,500 r.p.m., and 100 h.p. at 750 r.p.m. These numbers are based on an approximate output of some 500 machines per year of the smaller size up to about 25 machines per annum of the larger size. Special machines cannot be entirely avoided, but they should only be undertaken at prices which should not only cover the expense of designs, drawings, and patterns, which are usually included, but the extra attention required in following it through the shop, the delay caused by stopping important work at the machine tools, the extra adjustments in fitting a new design together, and the risk of alterations after test, due to its novelty.

Some remarks were made on the organisation of stores of standard materials, and for usual conditions it was recommended that in addition to parts common to several types, parts belonging to individual types should be manufactured in advance and kept in stock, because of their requiring either a long time to obtain the material, or because the machining has to be done with special care or with expensive appliances.

Passing on to considerations of mechanical design, it was advised that for continuous-current machines where the types of the frame and the number of poles is settled beforehand, a separate diameter should be used for each length unless the manufacture is very small indeed. For alternating-current machines, where the same frame can be used for two or more lengths of core or different numbers of poles, it will be quite satisfactory to have two lengths for each diameter. The length of the commutators should be made sufficient to carry the amperes corresponding to a voltage of 230, with the maximum output allowed for in the standard list. As commutators are intended to be kept in stock as finished articles, it will not be advisable to reduce this length when the motor is supplied for higher voltages, especially as the excess in length will be reduced when narrow brushes are used for a higher voltage. The question of using a longer commutator than standard for very low voltages has to be considered, and space has to be allowed for this purpose on the shaft of the machine.

The frame, made of cast-iron for the sake of quick delivery, should be shaped in such a way so as to be suitable for use as a semi-enclosed machine. The construction of the frame is affected by the question of the commutating poles. In machines with fairly large diameters it will be possible to retain round poles. The commutating poles will then have to be fixed either on flat facings on the inside of the shell bolted on from the outside, or secured by one large central bolt forged in one piece with the commutating pole. In the case of machines with small pole-pitch, square main poles will generally be necessary, and they can be laminated with advantage. The method of fixing will then be by machining all round the internal cylindrical surface of the shell, and bolting the poles to it from the outside. It is not advisable to cast-weld the laminations in the iron of the frame, as is often done for round poles.

With regard to bearings, the shield type was recommended for small machines, and the necessity of arranging these so that they can be turned round without any alteration when the motor is to be fixed to wall or ceiling was mentioned. Some form of reduction gear should be standardised for each size of motor. In speaking of armature construction, the author said that a separate spider should not be used for armatures of less than 10 in. diameter, as the value of the stampings which are saved is not sufficient to balance the cost of the spider, and the ventilation is handicapped.

The design of brush-holders lends itself better than any other part to thorough standardisation. The opinions of the users are divided very much between the box and radial types, and it is advisable to arrange for both types of brush-gear to be exchanged for one another whenever required.

The general standardisation of large units cannot be carried out to the same extent as for the small units. It is, however, possible to institute a system of sizes, and to select the most suitable size out of this series when estimating or when executing any order. A standard series of direct-current machines is started with, say, 25 in. or 28 in. bore diameter, and will extend up to, say, 120 in. by differences of 4 in. to 5 in. in the smaller sizes, up to 10 in. in the larger ones. The length of the core can be made of two different dimensions, say, 10 in. and 14 in., thus giving about thirty standard types. In settling the dimensions of the frame one could keep the flux per pole practically constant or increasing very slightly only, and increase the number of poles in proportion to the diameter. This practice is quite suitable for slow speeds, but has the disadvantage of giving too many bars on the commutator when using lap winding. It will therefore be advisable to increase the flux per pole at the same time as the number of poles.

For large alternating-current machines a similar system of standardisation can be adopted, but more latitude is allowed on account of the possibility of varying the length of the core without affecting the pattern of the frame or of the magnet-wheel. Between a diameter of 2 ft. and a diameter of 10 ft. approximately 12 diameters will be found sufficient, the gap in between the smaller sizes being approximately 5 in. and the larger ones 12 in. On account of the varying number of poles to suit the various periodicities and speeds, it will not be advisable to make complete dies for the stampings of the stator, but it will be more suitable to arrange independent cutting dies for the inside and outside diameters, so that deep or shallow stampings can be produced. The poles should be made out of stampings, and here again a line of standard poles can be conveniently designed to suit a number of pole-pitches.

In passing on to electrical considerations in design it was pointed out that the art of practical designing for manufacturing should consist not in fixing in every instance the very best dimensions that can give the correct output, efficiency, regulation, and temperature rise, at an apparently satisfactory price, but in trying to obtain a design which will give an equally satisfactory commercial machine, made up with existing elements, patterns, dies, tools, &c. Thus the adoption of two lengths of core for each diameter is a disadvantage from a purely electrical point of view. When using a long core as required for laminated poles, it will be found again that this is not quite as satisfactory as a round core, but if in order to obtain a suitable ratio to give the room required for round poles one had to go to the expense of adopting a much larger diameter, there is no doubt that the little sacrifice in the electrical design will be fully repaid in the cheapening of the production of the machine and in increasing its field of application. In alternating-current machines the inducement to use long cores would be larger than for continuous-current machines, but the effect of the length of core will have to be accurately investigated on account of the altered conditions of the leakage. This will, however, be met best by adopting machines with long cores for fewer poles, and narrow machines for slow speeds, as they have necessarily a shorter pitch.

The stampings of the continuous-current machines should be arranged for one, or at the maximum two numbers of slots only, and these can be provided with such a wide range of windings as to cover all practical requirements. The number of commutators for a given type of stampings should not be more than two at the most, and should be arranged in such a way that the higher number of bars can be used for 500 volts with the slowest speed, and, therefore, with the largest number of turns per commutator bar, and the lower number of bars should be still sufficient to give the highest speed at the lowest voltage.

The fixing of the windings for the different outputs should be done by starting from the best possible average output of the machine, and by systematically trying all possible combinations of coils in the slots, without alteration to the number of com-

Digitized by Google

mutator bars. The armature coils must, of course, be wound in such a way that the same coil can be connected up in "wave" or "lap" windings according to the requirements.

The question of stocking complete armature coils suitable for standard winding is a difficult one to settle, as a stock of this kind has only a limited life. The tape covering, after being varnished, becomes oxidised and brittle, so that it would be impossible to place the coils in any slot, even with the greatest care, if the coils have been made many months beforehand.

The question of the carbon brushes to be stocked is a trying one, as it is only by having a large variety of carbons that sometimes it is possible to work in a type to give a certain output, and in this direction the high conductivity brushes and those made by the Morgan Crucible Company have done much to help the designer. On the contrary, the brushes with graded resistance, also issued by the same company, have not met with so much success, on account of their unsatisfactory behaviour when heating up, and of the difficulty of not being able to reverse the direction of the machine without changing round all the brushes.

In fixing the winding of two- or three-phase machines, the suggestion is often made of leaving the coils disconnected, to meet a large number of voltages by grouping together the poles in one or more parallel circuits, or by connecting either in star or mesh. It will, however, be found in practice that they are only suitable for exceptional cases, because the stocking of a motor which is not completely wound is not a satisfactory arrangement. The machine has to be returned to the winding department for connecting up on receipt of the order, and is often not in its best condition if it was kept in stock for months with a large number of loose connections hanging from it. The best solution appears to be to wind rotors completely for a given number of poles, and stock the motors in all the components without winding the stator.

Discussion at Glasgow.

Prof. F. G. Baily (Heriot Watt College, Edinburgh) asked why, if standardising had reached such perfection with the larger manufacturers, did it generally take two months to obtain a machine? He thought that electrical manufacturers had something to learn from their older brothers, the steam-engine makers; in their case, however, the range of sizes was comparatively small, and undoubtedly this factor made for the cheapening of production. He was inclined to wonder whether all the types and sizes put forward by the ordinary motor maker were necessary. Also it appeared to him that it would be more satisfactory if certain makers specialised in small plant and other makers in the larger sizes upwards, as was done in the production of oil engines. Prof. Baily thought that all classes of electrical plant should be standardised much more than is the custom, and said that the number of variations and differences in comparatively small and unimportant details of design was positively appalling. It was often objected that over-standardisation led to fixity of type, but standardisation encouraged change, as there were so few patterns to alter

Mr. Campbell McMillan (Electric Control, Ltd.), referring to special machines, said that there was often a deadlock between the customers and the makers due to one side or the other, or both, taking up an obstinate attitude. Mr. McMillan thought that the best policy for the maker to adopt was not to refuse to supply special machines or to supply them at ordinary rates, but to insist on a large portion of the extra cost of their production being charged, and to point out that he could not be responsible for delay. One could not be too firm, however, as the new machine might happen to be the forerunner of a new design which might eventually become very popular.

Mr. J. R. Barr (Heriot Watt College, Edinburgh) devoted considerable time to a minute criticism of the author's statement that it was inadvisable to alter the length of commutator and armature for different voltages. He claimed that the retention of one length of core for either high or low voltage was not in accordance with modern practice, and suggested that entirely different lengths of core should be used in the case of 500-volt and 250-volt machines. He further suggested that the overall dimensions of a machine for any given output need not be altered, as with a lower voltage one needed a proportionately long commutator and short armature, and in the case of high-voltage machines a short commutator and long armature. In his opinion the correct procedure was to settle the lengths of core first and afterwards the diameter, and gave various academic rules for fixing the proportions of design.

Mr. W. L. Spence (Messrs. Spence & Ionides) took exception to Mr. Orsettich's description of "rain-proof" motors as "enclosed ventilated," which latter term he would apply to machines with air-cooling tubes and a fan. The use of the same end shields for both A.-C. and D.-C. machines he thought was wrong, as it rendered the interior of the machine particularly inaccessible and cramped the design of other parts. Mr. Spence was of opinion that the cylindrical end covers were best. He noticed that the author had not touched on the question of ball-bearings. In his opinion they should only be used at the commutator or slip-ring end, and not at the pulley end, but he did not think that they would give satisfactory results on heavy drives. He disagreed entirely with the author's views on spiders; he thought that they should be used down to the smallest possible sizes of machines, as they very considerably simplify the process of winding and entirely obviate the risk of having a well-ground and centred shaft spoilt by being dented by a hammer or otherwise while in the winding shop. Mr. Spence was surprised at the author's opinion that any type of good brush-holder was admissible; in his opinion the rocking-arm type of brush-holder has many serious defects, and would not compare with the box type of holder for sparkless running.

Mr. Orsettich, in reply, said that the buyer very rarely made concessions to the manufacturer. In one case 40 machines were rejected by a railway company owing to the depth of the wearing surface of the commutator being $\frac{1}{8}$ in. less than that specified. In another case an insurance company rejected several machines on account of the insulation in the slots not being as specified. The specification called for 45 per cent. mica and 55 per cent. of fibre, and the total thickness was not specified. In the actual machines the thickness of mica was 55 per cent., and of the fibre 45 per cent. Mr. Barr's suggestion that the length of the core should be altered for different voltages was quite out of the question under manufacturing conditions. With regard to Mr. Spence's remarks, an objection to cylindrical end shields was that the tendency was for the feet to be too cramped owing to the reduced length of the frame. In one new line of motors which the author's firm were producing, however, they were adopting this principle. He was not at all in favour of ball-bearings, but he could not agree with Mr. Spence's condemnation of the rocking type brush-holders. The principal objection to the box-holder was the chattering and noise which they often gave rise to.

Discussion at Birmingham.

Mr. S. P. Smith (General Electric Co.) held that the two chief factors to be considered were labour and material, and the question was which should be sacrificed in order to lower the cost of a machine. The material usually cost more than the labour, therefore the designer should cut down the cost of the material and use good labour. This did not mean that inferior material should be used, as in his experience the best material was the cheapest. He considered that finality had not been reached as regards ventilation and insulation, and saw no reason why, if suitable materials were used, the capacity of machines should not be increased by permitting a temperature rise of, say, 170° F. instead of 70° F., as is usual at present.

Mr. N. B. Rosher (Messrs. Moffett & Rosher) remarked that in his opinion the number of types and varieties of machines which a manufacturer had to stock was excessive and unreasonable, especially with respect to A.-C. machines, as there were at least 16 different frequencies in use at the present time. With regard to the position of the slip-rings, he agreed with the author that the best position was outside the bearing bracket, but this had the slight disadvantage that when a rotor had to be taken out it was necessary to remove the slip-rings from the shaft unless the bearings were split. He asked the author to state his views as to the use of ball-bearings, and also as to the most suitable metal for slip-rings. On the subject of terminals he was in favour of a cast-iron terminal box, which could be screwed to either side of the magnet frame at will. As steel conduit is so frequently used for running the cable to the motor, the best arrangement was to connect the conduit to the terminal box by flexible metallic tube. With reference to Mr. Smith's plea for a 170° F. temperature rise, Mr. Rosher stated that machines are regularly supplied for special work to one of the Government departments with a permissible temperature rise of 180° F.

Mr. A. E. Gott considered that motor speeds at the present day were too high. He asked for information respecting split frames and bearings, and described a standard form of terminal board which could be used for any kind of motor, and which he had found to be very satisfactory in practice.

Mr. A. C. Anderson thought that there should be two lengths of core for each diameter, and referred to satisfactory experience with enamelled wire for field coils of small motors.

Mr. A. Willmott (Electric & Ordnance Accessories Co.) preferred the use of steel castings to iron, and said that a proper code system for all parts and material and thorough inspection during manufacture was essential if the costs were to be kept down.

Mr. Holt (Messrs. H. B. Brooks) held that conservative rating of machines was desirable. In his experience the life of patterns was from four to five years, or only as many weeks if the castings were bought out, therefore the cost of patterns should be reduced. He had found enamelled wire satisfactory for field coils, but no good for armatures where the wire has to be bent and worked upon to any extent.

Mr. Orsettich, in reply, said that either malleable iron or phosphor bronze were used by his firm for slip-rings, usually with carbon brushes. His experience of ball-bearings was all against their use for electrical machines. He defended the stocking of high-speed motors on the score that they are asked for by purchasers. With regard to split frames and bearings

Digitized by Google

his view was that they should be split when two men cannot lift an armature or when the armature exceeds 14 in. in diameter. On the subject of steel castings, he held that a firm which possessed an iron foundry would naturally use iron castings, otherwise if the castings had to be bought he agreed in the use of steel castings.

A NEW REDUCTION GEAR

MR. P. P. SANDFORD read a Paper on March 10th before the Dublin Local Section of the Institution of Electrical Engineers, in which he described a new speed-reducing gear designed by Mr. J. A. Liddle, of 28 Rutland Street, Edinburgh, originally designed for an electric capstan, but capable of a variety of applications.

The gear is on the sun and planet principle, and consists in driving one train of gears or planets by a spur pinion or sun wheel on the spindle of the prime mover. These planets run round inside a fixed ring with internal teeth, and carry with them the gear cage in which they are housed. All the planets and gear cages rotate in the same direction, giving a rolling instead of a sliding motion. The gear cages each drive succeeding cages by a central pinion or sun wheel fixed to one side until the desired reduction or acceleration in speed is obtained. This reduction or acceleration is directly proportional to the square root or power of the number of sets of gears. The reduction or increase of speed of the first set of gears is multiplied as the root or power of the number of succeeding sets of gears. This reduction or increase of speed is obtained with spur wheels and pinions, whose diameters do not differ to any extent, if at all, and this gives very important results. These pinions are carried on studs, which are supported at both ends, and run in an oil bath.

Tests have shown efficiencies up to 80 per cent. with moderate powers, and the efficiency is said to increase with the load, and owing to the way in which the load is balanced great advantages are claimed over ordinary gearing both as regards strength and silence.

Discussion.

Mr. T. Tomlinson asked for some further particulars of the differences in design for horizontal or vertical shafts. He thought that good circulation carried away the heat generated by the motor better in the vertical than in the horizontal pattern, also that the friction was less in the former case except as regards the footstep bearing.

Mr. Mark Ruddle (City Electrical Engineer, Dublin) thought that the vertical motor practically halved the friction loss, but with the pattern of reduction gearing advocated he hardly saw how the efficiency increased with the power transmitted. He hardly saw how the friction decreased with the load; the efficiency of such gears usually depended upon the size of gear and the power transmitted.

A member asked how the efficiency compared with ordinary spur gearing, and thought that the author's gear did not appear to be particularly efficient, although the design was compact and practical.

Mr. Sandford, in reply, said that the efficiency of spur gearing varied very widely in actual practice, depending according to the conditions under which it was run. He had known instances where it was as high as 97 per cent., but such an efficiency was seldom maintained in practice. The cost of ordinary gear was usually so high as to render its use prohibitive in a great many instances, whereas the gear he had described was considerably cheaper. The first set of this gearing had been developed for use on an electric capstan, and the manager informed him that it could not be damaged, although it was out-of-doors in all weathers and received unskilled attention. The men working the capstans took great delight in breaking new ropes to show what the capstan could do. The saving due to the use of a smaller motor running at a higher speed would often counterbalance the cost of the gear. Additional bearings were required in the case of the gear for horizontal use which slightly reduced the efficiency.

THE NATIONAL PHYSICAL LABORATORY

THE General Board of the Laboratory met at Bushey House, Teddington, on Friday last, and several visitors were also present. After the meeting, at which the report of the work for the past year was accepted, the members of the Board, with the visitors, made an inspection of the laboratories.

The report covers a wide range of subjects, and we can only make brief mention of those of particular interest to our readers. The electrostatic wattmeter referred to in the last report (see Electrical Engineering, March 25th, 1909, p. 287) was in use early in the year. A large number of observations have been made with a similar instrument, up to 10,000 volts, of the loss of energy in insulating materials under dielectric stress. The results confirm those of other experimenters. With varnished cloth the loss increased with a rise in temperature, and a rapid heating up took place just before breakdown. A complete description of the 20-kw. H.T. apparatus mentioned in last year's report is given. Fine adjustment from comparatively low pressures up to 100,000 volts is possible with this apparatus. An investigation has been made into the dielectric strength of ebonite. That made from pure Para rubber gave a value as high as 150,000 volts per millimetre.

Besides a large amount of work on flame standards, the photometric department have carried out a series of tests with a view of establishing a set of electrical sub-standards. At present, however, though the metalised carbon filament lamps at 3 and 2 watts per candle are satisfactory, it has not been possible to utilise tungsten lamps except at an efficiency too low to obviate the colour difficulty when testing metal filament lamps. In all, over 890 carbon and metal filament lamps, three arc lamps, and one quartz mercury vapour lamp were tested during the year.

Much has been done in connection with telephone work. A variety of loading coils and other inductive coils have been tested, and a study has been made of the effect of the high frequencies of telephone work. The effect of leakage on the effective resistance has also been investigated. Attention has also been given to submarine telephone cables, and tests have been made of the permeability of iron strip for lapping the conductors to increase their self-inductance. The lapping of the strip affected it adversely, but the permeability was improved by annealing the complete conductor in hydrogen. A number of tests have been made of the losses in transformer iron with stampings assembled into a square with interleaved joints. The results agreed well with those obtained by the ring method.

A series of tests was made on a large accumulator by the D.P. Battery Co. A cable was tested at various temperatures from 0° to 100° C. The insulation resistance decreased considerably as the temperature rose, but the values during cooling agreed closely with those taken during heating. A standard series of tests is being arranged for dry cells. At the request of the Wiring Rules Committee of the Institution of Electrical Engineers, a number of heating tests have been made on cables with different coverings, and in various conduits and casings. The results are now being considered by the committee. An additional test has been specified for the insulating materials for the Admiralty, viz., that the material should be exposed to the heat from an arc at various distances of between 2″ and actual contact for five minutes at each distance, the surface resistance being measured after each exposure and after the material had cooled.

A Crompton motor-alternator of 15 K.V.A. for supplying an induction furnace presented by the English Gröndal Kjellin Co., has been added to the equipment of the thermometric department, and a new apparatus for the comparison of thermo-couples has been completed.

In connection with the usual exhaustive work dealing with units and standard cells, a large Lorenz apparatus, made entirely of phosphor bronze, is being installed for the purpose of making an absolute determination of the ohm. The general test work has increased considerably. Although there have been fewer ammeters and voltmeters tested than in the previous year, the number of meters tested has increased very much. Remarkable increases in the number of primary cells and fuses tested are noticeable.

Bergmann Works in Canada.—It is stated in the Canadian papers that the Bergmann Elektricitätswerke of Berlin intends to erect works in Canada, primarily for the manufacture of tungsten filament lamps, and eventually for the manufacture of electrical goods and apparatus generally.

Coherers.—Dr. W. H. Eccles read a Paper before the Physical Society on March 11th, describing an investigation into the relations between the energy given to the detector in the form of electrical vibrations and the energy delivered by the detector, as direct current, to the circuit of the indicating instrument. The detector under examination was placed in a circuit containing suitable inductance and capacity, which was secondary to a primary circuit. The primary could be set into electrical vibration by breaking a known current in it. The response of the detector was measured by comparing the sound in its telephone with the sound produced in the same telephone by interrupting a measurable direct current. The power delivered to the detector and to the telephone was determined by extrapolation from measurements on stronger currents with the thermogalvanometer. The results of experiments on coherers made of oxidised iron wire dipping into mercury, and on coherers made of a clean iron point touching an oxidised iron plate, show that in a self-restoring coherer the current increases more and more rapidly as the E.M.F. is raised, till, in general, a point of inflexion is reached, and then the current increases more slowly. If W represents the power in watts delivered to the coherer, and w the power passed to the telephone circuit, then $w = m(W - a)$ where m and a have values settled by the magnitude of the current through the detector. The quantity m for a good low resistance iron-mercury coherer has been found to be as high as 0·06; while a is usually near $1{\cdot}0 \times 10^{-4}$ watt. The author puts forward the hypothesis that the properties of an oxide coherer may arise solely from the temperature variations caused in the minute mass of oxide at the contact by the electrical oscillations and by the applied E.M.F.

OVERHEAD LINE CONSTRUCTION

A PAPER entitled "Some Notes on Overhead Line Construction" was read before the Yorkshire Section of the Institution of Electrical Engineers at Leeds on Wednesday, February 23rd, by Mr. W. B. Woodhouse (Chief Engineer to the Yorkshire Electric Power Co.). In his introductory remarks, the author said that the legal restrictions here were much more onerous than those of other countries, and that amendment of the present conditions was much needed on modification of the veto possessed by local authorities, compulsory wayleaves, and less stringent Board of Trade regulations.

Regarding the choice between copper and aluminium for conductors, it was remarked that a comparison of the relative costs of these on the basis of resistance was obviously not sufficient to decide the choice; the strength and cost of the supports must also be regarded. Copper had for many years been used for overhead conductors, but a satisfactory specification for hard-drawn copper wires had not yet been generally agreed upon. Such a specification should indicate the breaking stress, the ratio of the stress at the elastic limit to the breaking stress, the ratio of stress to strain within the elastic limit, and the behaviour of the metal under torsion and under repeated bending.

The Board of Trade figure, he pointed out, included a factor of safety of five for the safe stress. So long, however, as the present factors of safety are required by the Board of Trade, the author considers that aluminium is not likely to be extensively used here. The ratio of the diameter of an aluminium cable to that of a solid copper wire of equal resistance per unit length is (for sizes of copper wire from No. 8 to 4/0) 1·44 : 1.

Mr. Woodhouse then proceeded to a detailed method for the determination of sag at any temperature, allowing for wind pressure and elasticity, and embodied the results, together with information as to strength of wooden poles in the set of working curves given in Fig. 1. The way in which these can be

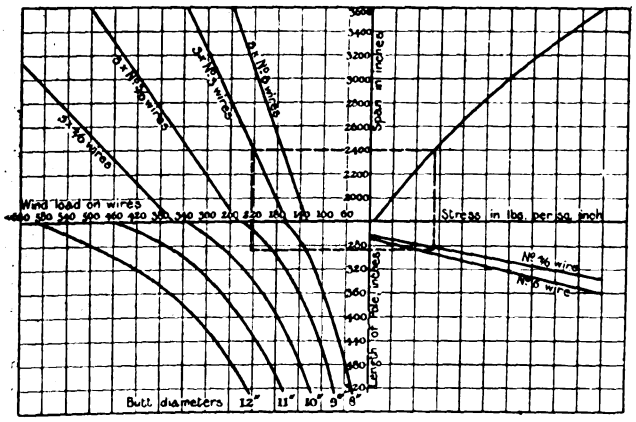

FIG. 1.—WORKING CURVES FOR TRANSMISSION LINE DESIGN.

used to steady the effects of varying the span or the size of the poles is best seen by an example. Thus, if three No. 3 wires are to be used the span is assumed at any likely figure, say 200 ft. (it may be fixed by physical conditions). Reference to the second quadrant and the line corresponding to three wires of No. 3 gives the wind load on wires which is equal to the net pole-strength required. The minimum head room being 20 ft., reference from the first to the fourth quadrant gives the maximum summer sag and therefore the length of pole required (20+summer sag)=height to point of loading (24 ft.). Following the abscissa from this point into the third quadrant to its intersection with the ordinate representing the net strength required gives, if the point falls on a "diameter" curve, the size required (namely, diameter=9·5 in.); if it falls between curves the next larger diameter must be chosen.

It may be noted that the heights corresponding to the intersection of an ordinate in the third quadrant with the "diameter" curves will give the scantlings of a series of poles of varying height and equal net strength.

For spans up to 100 yards wooden poles are cheaper than iron, for longer spans lattice-work iron towers may show an advantage in cost. Wooden poles are usually of red fir, winter felled, and creosoted. The poles should be well seasoned before creosoting, and, if properly treated, will have a life of 15 to 20 years under average conditions. The taper of the poles is a matter beyond our control, but it is advisable to use only poles having a maximum strength of rupture at the ground section, as in course of time this part of the pole will decay most rapidly. Assuming the load concentrated at the pole-top, the proportion of taper to secure this is that the diameter at the top should be not less than two-thirds of the diameter at the ground. The depth to which it is necessary to set the poles in the ground depends, of course, on the nature of the soil—usual practice is to allow from 5 to 8 ft.

The previous consideration has dealt only with normal stresses. Of abnormal stresses the breaking of all wires in one span, and the consequent loading of the support by the unbalanced tension in the remaining spans, is the most important. It is obvious that a support which is elastic in the direction of the wires will in such a case reduce the tension. The advantages of flexible poles in line construction have been pointed out by Mr. A. P. Trotter, and a method of analysing the above case given (Proc. Inst.C.E., Vol. CLXIX., p. 183). In addition to the flexibility of the poles there are many modifying circumstances tending to prevent the wrecking of a number of spans due to such a cause as the above.

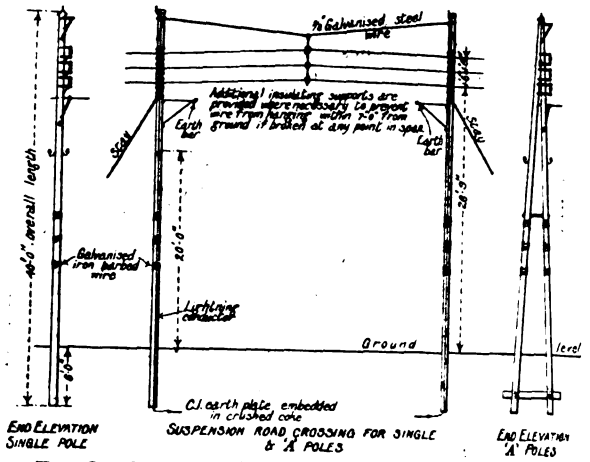

FIG. 2.—CATENARY ARRANGEMENTS AT ROAD CROSSING.

The special work required at angles, road, and railway crossings, will, however, considerably add to the designer's duties. In such cases as road crossings, safety and security are of paramount importance, and there are many types of cradles and supports in use; the type of road crossing adopted by the writer is a catenary suspension (Fig. 2); cradles are unsatisfactory and unsightly, and this suspension appears to possess advantages. The type of railway crossing approved by one of the principal railway companies is given as an example of sound but simple construction (Fig. 3).

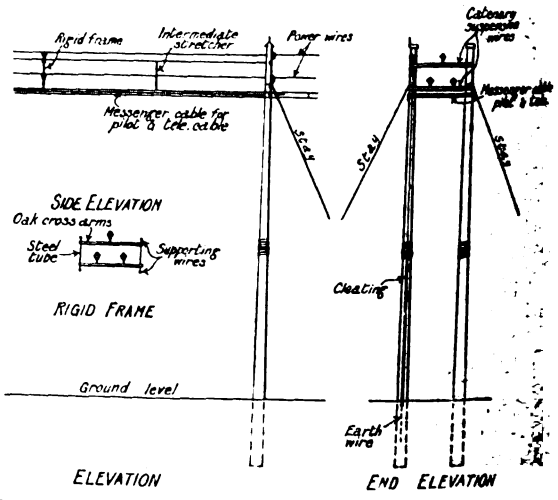

FIG. 3.—CATENARY ARRANGEMENT AT RAILWAY CROSSING.

The choice between a bracket and a cross-arm depends on the spacing and relative position of the wires. A symmetrical spacing is, of course, the best, but for moderate distances this is not of so much importance as the distance between wires; the minimum distance is determined by the possibility of short circuits due to birds or the swaying of the wires. Some tests made by the writer to determine the amount of the latter

Digitized by Google

showed that a No. 4/0 wire spanning 50 yards with a 3 ft. 6 in. sag swung 3·5 in. each way during a severe gale.

The total cost of an overhead line may be divided into four parts:—Cost of wires, supports, labour, and wayleaves capitalised.

The cost of wires per mile is decided entirely by electrical considerations and with a portion of the labour costs is independent of the number of supports. The cost of supports per mile varies with the number, some items being increased in cost with an increased span and some decreasing. If the number of supports per mile is decreased the poles must be stronger to meet the extra weight and wind load, they must be longer to maintain the same head-room against the increased sag of the wires, and the foundations must be made more secure. The brackets, arms, insulators, stays, &c., must be stronger and the labour of erection per pole is increased. Against these increases per pole, however, we must set the decreased number of supports, and therefore for any particular line there is a most economical span to be found. Using single poles under the present Board of Trade rules, a span exceeding 100 yards is not economical.

DISCUSSION.

Mr. W. EMMOTT (Halifax) considered that a certain amount of flexibility in the supports was a desirable feature, as if the poles were too heavy the wires were more liable to break.

Mr. WILSON HARTNELL (Leeds) remarked that the really important matter was the question of what could be done to lessen the legal difficulties which at present stand in the way of the erection of H.-T. overhead construction in this country. Legislation should facilitate instead of hinder the erection of such lines, so that they could be constructed more economically in sparsely populated districts, where the danger is slight.

Prof. G. D. ASPINALL PARR (Leeds University) dealt with the design of insulators, and asked if Mr. Woodhouse tried glass instead of porcelain. He understood that the difficulty of the alkaline glaze had been surmounted in the States, so that they could be used for high pressures in damp atmosphere.

Mr. H. H. WRIGHT (Halifax) wished to know what system of protection against lightning the author adopted, and he described a water-jet method he had seen in Norway on a 30,000-volt line.

Mr. H. E. YERBURY (Electrical Engineer, Sheffield Corporation Tramways) agreed that easier conditions should be granted where the line is carried over arable land, &c. He was in favour of the Board of Trade having power to make final decisions in cases of obstruction. Lattice-work poles appealed to the speaker, but painting was an important item to consider.

Mr. WOODHOUSE, in reply, said that the really serious question was the restrictions they had to fight against. It would be much better if some form of compulsory wayleaves could be adopted in open country, as now they were entirely dependent on the personal prejudice of the landlord. He had not used glass insulators in the open, but his experience on high-tension switchboards has not been happy. For outside work the strength and cheapness of porcelain was preferable. He had used the horn type of lightning protector, but no type could be relied on to act infallibly in every case.

Dublin Section of the Institution of Electrical Engineers.—A conversazione of the Dublin section of the Institution of Electrical Engineers was held at the rooms of the Royal Dublin Society last Saturday, when, in addition to music and lantern lectures, &c., demonstrations were given of electric cooking and Röntgen rays.

Tax on Electricity in Greece.—According to the *Elektrotechnische Zeitschrift*, a tax is about to be imposed by the Greek Government on electricity and gas used for lighting and heating. The amount is fixed at 10 per cent. of the cost of production. It appears that only domestic lighting and heating are concerned, as gas and electricity used for industrial and public purposes are exempt.

British Westinghouse Engineers' Club.—The fourth annual dinner of this Engineers' Club was held at the Grand Hotel, Manchester, on Friday last, and was attended by about two hundred members of the staff. Mr. J. S. Peck presided, and Mr. Newcomb Carlton, managing director of the company, was present. Mr. D. N. Dunlop, sales manager of the supply department, proposed the toast of the company, coupled with the name of Mr. Carlton, who, in his reply, regretted some of the limitations placed by trade unions on productive output, and said that it was in the interests of employers and employees alike that both should work together. Mr. Blunt, general sales manager, proposed the toast of the works organisation, to which Mr. Lange, managing director of works, replied. Mr. Tearle and Mr. Peck also spoke, and several members of the staff contributed to an excellent programme of music.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

[READERS APPLYING TO ANY OF THE UNDER-MENTIONED FIRMS FOR COPIES OF THE CATALOGUES OR PAMPHLETS REFERRED TO ARE REQUESTED TO MENTION "ELECTRICAL ENGINEERING."]

METAL FILAMENT LAMPS.—A revised price list from the Electric & Ordnance Accessories Co. (Aston, Birmingham) gives notice of reduction in the prices of "E.O.A." metal filament lamps.

CABLES.—A pamphlet from Messrs. W. Geipel & Co. (Vulcan Works, St. Thomas Street, S.E.) describes the properties of "Firmacit" cables, which are covered with a special acid and alkaline vapour-proof material rendering them particularly suitable for overhead work and for use in chemical works, dye works, oil refineries, mines, &c.

ELECTRIC OVEN.—A leaflet from Messrs. F. A. Wilkinson & Partners, Ltd. (Harpenden, Herts) describes an electric oven for cooking and hot water supply. This is a development of the Wilkinson heater described in ELECTRICAL ENGINEERING, May 13th, 1909, p. 541.

EXHAUST STEAM PLANT AND COOLING TOWERS.—A book is to hand from Michael Pal & Co. (Parliament Mansions, Victoria Street, London, S.W.), describing the low-pressure turbine plants with exhaust steam accumulators on the Schwarz system for which they are sole agents for the United Kingdom and colonies. A large number of diagrams and photographs are included, as well as a description of a complete plant at the Hibernia Colliery. Various patterns of jet and surface condensers are described, including a new condenser without an air pump, referred to elsewhere in this issue. A large number of cooling towers are illustrated. These are constructed either entirely of impregnated wood or with an exterior iron frame, the latter construction enabling higher and stronger towers to be built. The book concludes with an illustrated description of cooling and cleaning plant for blast furnace gases. This comprises a special design of washing tower, and, where very clean gases are required, as, for example, for running internal combustion engines, a centrifugal cleaner in which the gas is mixed with water in the form of a fine spray, which causes all the dust particles to increase in weight by taking up water and to fall out of the stream of gas.

Wireless Telegraph Notes.—It is stated that the Grand Trunk Pacific Railway Co. have asked the Canadian Government for authority to erect wireless telegraph stations across the mountains to connect Edmonton with Prince Rupert.

At the annual meeting in London last week of the Association of Chambers of Commerce, a motion by Major S. Flood Page, expressing the opinion that it is desirable that all passenger ships for oversea traffic should be fitted with wireless telegraphy, was passed. The Executive Council was requested to urge the Government to introduce a Bill making this compulsory.

It is stated that the Argentine Government is considering a plan, in connection with other interested nations, for the establishment of wireless telegraphic communication with Europe, Asia, and Africa. The proposed stations will extend from Tierra del Fuego in the southernmost part of the Republic, along the Argentine, Uruguayan and Brazilian coasts to the Fernando de Noronha, Cape Verde, and Madeira Islands to Gibraltar, and from thence to the countries of Europe along the Atlantic and Mediterranean coasts, and from the Mediterranean coast to Asia and Northern Africa.

The Zanzibar Government have issued regulations providing that no wireless telegraph station may be erected in Zanzibar except under licence. Persons establishing wireless telegraph stations without such licence are liable to a fine not exceeding £100, or to imprisonment for a term not exceeding twelve months, or to both, and in either case forfeiture of the apparatus.

The Admiralty are contemplating the installation of a wireless telegraph station at Scarborough.

20,000-h.p. Turbo-alternator for Paris.—The French house of the firm of Brown, Boveri & Cie. (Baden, Switzerland) has received an order from the Compagnie Générale de Chemins de fer et d'Electricité for a 20,000-h.p. turbo-alternator complete with surface condenser plant. The set will run at 750 r.p.m., and will generate three-phase current at 25 cycles, 10,250 volts. This set, which will be the largest yet constructed in Europe, will be installed in the St. Denis central station, Paris.

Manchester Local Section I.E.E.—At the annual general meeting of the Manchester Local Section of the Institution of Electrical Engineers on Tuesday, Mr. J. S. Peck (British Westinghouse Electric & Manufacturing Co., Ltd.) was elected Chairman, in succession to Mr. S. J. Watson, Chief Electrical Engineer to the Bury Corporation. The Vice-Chairman is Mr. W. Cramp, and the Committee are as follows: C. J. Beaver, Dr. F. H. Bowman, A. A. Day, A. P. M. Fleming, J. Frith, Prof. E. W. Marchant, T. L. Miller, S. L. Pearce, Dr. E. Rosenberg, Prof. A. Schwartz, C. D. Taite, and A. P. Wood. The Hon. Sec. and Treasurer is Mr. H. W. Wilson.

Digitized by Google

LOCAL NOTES

BELFAST: *Tramway Centre Poles.*—At the weekly meeting of the Electrical and Tramways Committee on the 21st inst., the General Manager of the tramways reported that the alteration from centre poles to side poles in certain streets had been carried out with very satisfactory results.

BIRMINGHAM: *Proposed Tramway Extensions.*—Residents of the Harborne & Quinton districts have petitioned the City Council to extend the tramways there.

CHESTERFIELD: *Top Covered Cars.*—A motion that the Tramways Committee should prepare an estimate of the cost of fitting top covers to the cars, was negatived at the last meeting of the Council. It was pointed out that the cost of top covers would be £1,700, and that it was doubtful whether the present motors were large enough for the extra weight. Further, the undertaking was only just making a profit, although the cars ran at a loss for four days of the week. Week-end traffic was the only thing the committee had to look to, and the present state of the finances would not permit of any large capital expenditure of this character.

DOWLAIS: *Opposition to Overhead Wires.*—Although the Council have given consent to the Merthyr Electric Traction & Lighting Co. to erect overhead wires for the supply of electricity in Dowlais, the local Chamber of Commerce objected, and consequently a Board of Trade inquiry has had to be held. Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, held the inquiry on the spot on Thursday, and reserved his decision. For the opponents to the scheme, the Electrical Engineer at the Dowlais works was called, and expressed the opinion that the climatic conditions of Dowlais were not suitable to overhead wires, the place being very exposed and swept by violent storms.

DUDLEY: *New Storage Battery.*—The new storage battery which has been installed at the Corporation Electricity Works was put into operation last week. When the undertaking was started in 1899, the generating plant consisted only of two 150 h.p. sets, but additions have gradually been made, and the present capacity is now 2,500 kw. The motor load now aggregates 1,100 h.p.

EASTLEIGH: *Provisional Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1904.

HUCKNALL TORKARD: *Provisional Order Revoked.*—The Board of Trade have intimated their decision to revoke the Council's electric lighting order.

HULL: *Underground Telegraph Cable.*—Provision has been made in the Postmaster-General's current estimates for the cost of carrying an underground cable from Leeds to Hull. The Hull Chamber of Commerce has been working at this matter for several years.

KINGSWOOD: *Overhead Wires.*—The Kingswood Electric Supply Co. are still negotiating with the Council concerning the erection of overhead wires. The company have repeatedly assured the Council that the carrying out of the scheme largely depends upon the ability to adopt overhead wires, as the cost of underground wires in such a scattered area would be prohibitive.

LINTHWAITE: *Cost of Repairing Tramway Track.*—With reference to our note last week concerning the cost of repairing the tramway track in Linthwaite, which the Council has been ordered to undertake, the Huddersfield Tramways Committee have rejected an offer to take over the track for £5,000.

LIVERPOOL: *Tramway Accounts.*—The gross profit from the Corporation tramways for 1909 was £192,522, and after meeting capital charges there is a net profit of £82,354, an increase of £7,780. The sum of £54,903 is transferred to reserve, renewals, and depreciation, and £27,451 to relief of rates. Working expenses show a decrease of £6,866 15s. The number of passengers carried during the year was 121,532,940, a decrease of 394,943 over 1908. The experiment with running first-class cars is being continued, and they are to be run on a further section. The department has 546 cars in stock, and an ordinary day's service consists of 407.

LONDON: *London County Council: Tramway Employees.*—Sectional Committee of Conciliation Board No. 1, which deals with disputes between the Council and its tramway employees, has given a decision concerning certain matters of detail regarding Sunday labour, spread overtime, recognition of signing on and off time, and holidays. The result will be an increased expenditure of £12,000 per annum. The Highways Committee, after very careful consideration, are satisfied that the Board has arrived at its decision after being convinced that its proposals are fair alike to the Council and to the men. They therefore recommend the Council to adopt them.

Fulham: Loans.—The Finance Committee of the L.C.C. have sanctioned a loan of £3,868, mainly for additional boilers. A mild complaint is made that the work had been completed before the loan was sanctioned.

Hammersmith: Street Lighting.—The Finance Committee of the L.C.C. have sanctioned a loan of £2,000 in connection with the use of Osram lamps for street lighting. We referred to some of the results of the change in our issue for March 3rd, p. 155.

Marylebone: Loan.—A loan of £4,500 has been sanctioned by the Finance Committee of the L.C.C. as balance of cost of a site acquired for electrical purposes.

MACCLESFIELD: *Provisional Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1901.

PENZANCE: *Electric Supply.*—As the Penzance & District Electric Supply Co. have failed to put the Electric Lighting Provisional Order which they hold for Penzance into effect, the Board of Trade have informed the Council that they propose to revoke it. The Electric Lighting Committee will report at the next meeting of the Council.

WEST HARTLEPOOL: *Proposed Purchase of Tramways Co.*—In a short article in our issue for March 10th, p. 171, we mentioned, in connection with the supply of electrical energy to the Hartlepools Electric Tramways Co., that the West Hartlepool Corporation intended to promote a Bill in Parliament for the purchase of certain of the company's lines. It was also intended to include in the Bill an application for running powers over other routes, and also powers to make certain extensions. The Hartlepool correspondent of the *Yorkshire Daily Post* now learns that the resolution authorising the Bill to be promoted is not operative. It was arrived at by a majority of two, but there were only twenty-eight members of the Council present at the meeting. Altogether the Council is constituted of thirty-two members, but it is necessary for a resolution of this character to be passed by a majority of the whole Council.

WORCESTER: *Street Lighting.*—Mr. C. M. Shaw, the Borough Electrical Engineer, has been experimenting with street electric lamps, and reports some very satisfactory results. He proposes to take over forty-four additional street gas lamps and convert them to electricity.

YORK: *Electric Tramways.*—By the opening of an extension of the electric tramways from Nessgate to Dringhouses, the total length of line now being worked is four miles. The completion of the system is being pushed forward rapidly.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BEDFORD.—The Electricity Committee require a 750-kw. single-phase generating set. Particulars from Borough Electrical Engineer, and tenders by March 28th.

BOHEMIA.—The Patzau Municipal Authorities have decided to erect electricity works.

BRISTOL.—A 500-kw. converter is to be obtained at an estimated cost of £1,225.

CUBA. The Legislature has sanctioned the erection of an electricity works at Polondron, Province of Matanzas. Señor Antonio Larraz, of Bolondron, has the concession.

DUNDALK. A Local Government Board inquiry was held last week regarding a loan of £20,000 for a municipal electric lighting scheme.

FALKIRK. The Council contemplate extensions to the electricity undertaking at an estimated cost of £12,000. Mr. W. W. Lackie, Chief Engineer to the Glasgow Corporation, has been appointed Consulting Engineer for the new works.

INDIA.—Detailed plans are in preparation for a municipal electric lighting scheme.

LONDON: *Poplar.*—A loan of £1,766 has been sanctioned by the Finance Committee of the L.C.C. for electric lighting purposes.

Woolwich.—A loan of £4,529 has been sanctioned by the Finance Committee of the L.C.C. for mains extensions.

NEW ZEALAND.—The Auckland City Council have adopted the scheme of Mr. A. Wyllie, City Electrical Engineer, for the erection of electricity works, at an estimated cost of £215,000. The scheme provides for four 3,000 kw. D.-C. generators and two 1,000 kw. A.-C. generators, the various estimates being as follows:—Buildings and sites, £65,300: boiler-house, £26,100; engine-room, £58,800; sub-stations, £10,000; mains, £46,000. This sum, it is estimated, will cover the whole of the capital expenditure during the next five years. The Council already possess a small generating station, which was erected in 1906.

NORWICH.—The Electricity Committee recommend a loan of £17,785 for electrical extensions. It is intended to instal an exhaust steam turbine.

TAVISTOCK. Messrs. Drake & Gorham have placed before the Council a proposal to erect electricity works. A ratepayers' meeting has decided in favour of such a scheme.

Digitized by Google

Miscellaneous

ABERDEEN.—Portions of the tramway track are to be relaid at an estimated cost of £11,226.

BOLTON.—Stores are required by the Electricity Department. Particulars from Borough Electrical Engineer, and tenders by March 31st.

COLWYN BAY.—Tenders are invited for stores for the Electricity Department by April 9th.

GOVAN.—The Electricity Committee require stores. Particulars from Borough Electrical Engineers, and tenders by March 29th.

H.M. OFFICE OF WORKS.—Tenders are invited from manufacturers only for the supply of metal filament lamps of British manufacture. Particulars from Storekeeper, H.M. Office of Works, 12 Lambeth Palace Road, London, and tenders to the Secretary, Storey's Gate, London.

HUDDERSFIELD.—The Electricity Department requires 1,000 single-phase A.-C. meters. Tenders by March 31st. Particulars from Borough Electrical Engineer.

LONDON: *Hackney.*—The Electricity Department require 80,000 pairs of yellow flame arc lamp carbons. Particulars from the Town Clerk, and tenders by April 7th.

SOUTHAMPTON.—The Council invite tenders for rails, poles, cast-iron pole bases, granite setts, &c. (See an advertisement on another page.)

WALLASEY.—Tenders for stores for the Electricity Department are invited by April 18th. Particulars from the Borough Electrical Engineer.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

AUCKLAND (Durham).—A resolution in favour of adopting electricity in the workhouse infirmary has been passed.

BARKING.—School. Secretary, Education Committee.

Skating rink. Builder, A. Blake, Wakering Road.

CHESTER.—School, Victoria Road (£3,000). Thos. Mayers, builder, Rowton.

DARLINGTON.—Additions, Workhouse (£3,500). Pallister & Son, Crook, Durham.

DUNFERMLINE.—Workshops and offices, Woodhead Street (£3,000). Normand & Thomson, 21 Queen Anne Street, Dunfermline.

EDINBURGH.—Coach works, McDonal Road (£2,750). Architects, P. R. McLean, 24 St. Andrew Square, Edinburgh.

Cox's factory, Gorgie Mills (£2,500). Architects, G. Beattie & Son, 136 George Street, Edinburgh.

EXETER.—St. Luke's College (£5,000). Builders, G. Setter & Son, Exeter.

GATESHEAD.—School (£4,000). Builder, F. W. Purser, West Street, Gateshead.

KING'S NORTON.—Baths (£7,000). Architect, J. P. Osborne, 95 Colmore Row, Birmingham.

LIVERPOOL.—Works, Pall Mall. Architects, R. Owen & Sons, Crosshall Street, Liverpool.

NEWCASTLE.—Children's institute (£7,000). Shewbrooks & Hodges, Grainger Street West, Newcastle.

STOKE-ON-TRENT.—Theatre and entertainment hall, Church Street, for the King's Hall Co., Birmingham.

TENDERS RECEIVED AND ACCEPTED

LONDON: *London County Council.*—The contract for the supply of the whole of the compressors for the construction of the main sewer from Battersea to Deptford has been awarded by Messrs. Griffiths & Co., the main contractors, to Messrs. Reavell & Co., Ltd., of Ipswich. There are in all 24 compressors to be installed at the various shafts and to be electrically driven, some by single-phase motors through automatic clutches of Messrs. Reavell's construction, some by two-phase motors through gears, and some by continuous-current motors directly coupled to the crankshafts of the compressors.

The tender of the Standard Engineering Co. for smiths' shop equipment for the second portion of the central car repair depôt is recommended for acceptance at £1,366 13s.

The tender of Messrs. Walter Scott, Ltd., for the supply of 2,000 steel fishplates at £10 10s. per ton is recommended for acceptance.

Battersea.—The Council have accepted the following tenders for annual supplies to the electricity department:—Oils, Price's Patent Candle Co.; engine-room stores (with the exception of packings), Pryke & Palmer; packings, R. Beldam & Co.; Nernst lamps and globes, Electrical Co., Ltd.; carbon filament lamps, British Thomson-Houston Co., Ltd.

Poplar.—The Council received the following tenders for extensions to meet next winter's load:—Cables: Western Electric Co., Ltd. (accepted), £3,959; W. T. Henley & Co., £4,080; Callenders Cable Co., £4,097 10s.; Siemens Bros. & Co., £4,106; British Insulated & Helsby Cables, £4,145 17s.

Switchgear:—Johnson & Phillips, Ltd. (incomplete), £471 3s.; British Westinghouse Co. (accepted), £484 5s.; Ferranti Ltd., £485 17s.; British Thomson-Houston Co., £516.

Converting plant:—British Westinghouse Co., Ltd., motor-generators, £2,700; Bruce, Peebles & Co. (accepted), motor-converters, £2,785; British Westinghouse Co., Ltd., rotary converters, £2,810; British Thomson-Houston Co., Ltd., motor-generators, £3,115; Dick, Kerr & Co., motor-generators, £4,160.

WATFORD.—The following tenders are accepted:—W. T. Henley's Telegraph Works Co., Ltd., twelve months' supply of cables; W. Cory & Son and E. Foster & Co., twelve months' supply of coal; Babcock & Wilcox, Ltd., fitting new close pattern links for chain grate stokers, £66.

The Midland Railway Co. have placed an order with the British Vacuum Cleaner Co., Ltd., for a 40,000 cubic feet of air per hour capacity plant, for the special purposes of cleaning a whole composite main line train in half an hour. This plant is capable of dealing with two tons of dust every 60 minutes. It is driven by a 16 h.p. electric motor, and is arranged so that 20 men may be using cleaning implements at one time. The same firm have also been favoured with orders from the North-Eastern Railway Co. for a complete installation at their station hotel, York, and from the Great Central Railway, Great Western Railway, and the Portuguese Railway at Lourenço Marques, for the new portable electric cleaners, which are driven by motors of one-third horse-power and upwards.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £61 5s. to £61 15s. per ton (last week, £61 10s. to £62).

ELECTRICAL INSTALLATIONS, LTD.—We are informed by Messrs. Electrical Installations, Ltd., of Bassishaw House, Basinghall Street, that they have no connection whatsoever with a firm of similar name who called a meeting of their creditors in Manchester last week.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—J. G. Bauer, trading as the Electrical & General Engineering Co., 17 Gracechurch Street, London, has been adjudicated bankrupt. The first meeting of creditors will be held on April 1st at 12 noon at Bankruptcy Buildings, Carey Street, London, where the public examination will take place at 11 a.m. on April 28th.

W. C. Ellis, electrician, Applegate Street, Leicester, has been adjudicated bankrupt.

Mr. L. W. Wykes, 24 Friar Lane, Leicester, chartered accountant, has been appointed trustee in the bankruptcy of Alan McAlpin, electrical engineer, 44 Cank Street, Leicester.

CANADIAN AGENTS WANTED.—A London firm wish to appoint energetic and reliable agents in all the principal cities of Canada for the sale of their machinery, tools, electrical apparatus (both scientific and commercial), power generators, &c. Full particulars from the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W.

HIGH-TENSION INSULATORS.—Messrs. Feld Bros. & Co., Ltd., 25 Budge Row, London, have taken over the sole agency for Great Britain of Messrs. Rosenthal & Co., Bavaria, for their high-tension insulators.

CHANGE OF ADDRESS.—The Engineers' Department of the North Metropolitan Electric Power Supply Co. has been removed to the Manor House Offices, Seven Sisters Road, Finsbury Park, N.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Colne & Trawden Light Railway Co., full dividend on the 6 per cent. preference shares for 1909; Gateshead & District Tramways Co., 6 per cent. on the ordinary shares for 1909.

METROPOLITAN ELECTRIC TRAMWAYS.—Subscriptions have been invited for an issue of £250,000 five per cent. debenture stock at 91. The company are now operating 53 miles of tramways and light railways in the North Metropolitan area, forming a complete network of lines connecting the suburban districts of Middlesex and Hertfordshire with London.

NEW PUBLICATIONS

Practical Curve Tracing. By R. Howard Duncan. (London: Longmans Green & Co.) 5s.

The Depreciation of Factories, Mines and Industrial Undertakings, and their Valuation. By Ewing Matheson. Fourth edition. (London: E. and F. N. Spon.) 10s. 6d.

COMPANIES' MEETINGS AND REPORTS

OXFORD ELECTRIC CO.—At the annual meeting on Thursday, Sir Henry Mance, the Chairman, stated that the contract with the Corporation for street lighting has been extended for another four years, and the company had promised to introduce some of the latest and best forms of arc lamps. It was creditable, he thought, to the engineering staff that, notwithstanding the fact that they had generated 60,000 more units, the expenditure on coal had been rather less than in the previous year.

VICKERS, SONS & MAXIM.—The profit for 1909, including the sum brought forward from 1908, was £474,716, and the directors recommend a dividend at the rate of 10 per cent. upon the ordinary shares. The net profit was less than in the pervious year.

BROMPTON & KENSINGTON ELECTRICITY SUPPLY CO.—At the meeting last week, it was stated that although there was an increase of 10,976 lamps connected during 1909, the revenue declined to the extent of £2,300. This result was mainly due to metal filament lamps. Owing, however, to economies in working, the net decrease in revenue was only £713. During the year a new switchboard has been erected at a cost of about £3,000. Mr. H. R. Beeton, who presided, also drew attention to the growth of rates and taxes. These now amounted to a sum equal to nearly 25 per cent. of the dividends, and forced the company to charge the public 10 per cent. more for current than would otherwise be the case.

RIO DE JANEIRO TRAMWAY LIGHT & POWER CO.—An interim report has been published, in which an increase in the rate of dividend from 4 per cent. to 5 per cent. is foreshadowed. The earnings for last year amounted to £626,000, or an increase of £65,000. A further 62,000 shares are to be issued at par, existing shareholders having the right to apply for one share for every five now held.

CITY OF LONDON ELECTRIC LIGHTING CO.—Mr. J. B. Braithwaite presided at the annual meeting last week, and mentioned that the capital expenditure during 1909, viz., £58,940, was heavy on account of extensions of plant and offices at Bankside. It would also be heavy during the current year. Parsons turbines were being installed, in addition to an economiser.

LIVERPOOL DISTRICT LIGHTING CO.—The net profit for 1909 was £3,448, and the directors recommend a dividend of 4 per cent. for 1909, after setting aside £975 for depreciation.

BRITISH INSULATED & HELSBY CABLES.—It was stated at the meeting on Monday that the diminution of gross profit for 1909, viz., £131,767 against £193,831 for 1908, was largely due to the smaller volume of business done. Two causes were put forward, (1) the introduction of metal filament lamps rendered it necessary for supply authorities to extend their mains, (2) the total cessation of new tramway enterprise. Further, owing to the approach of the purchase by the Government of the National Telephone Co., both these concerns, who are large customers of the company in normal times, have been very sparing with their orders. But for the recent expansion of the company's business into channels not strictly coming within their special business as cable-makers, the depression would have been more severely felt.

BOURNEMOUTH & POOLE ELECTRICITY SUPPLY CO.—Mr. A. H. Sanderson, presiding at the annual meeting on Thursday, said that metal filament lamps had been more rapidly adopted in Bournemouth than in most other places. The reason was that there were no factories in Bournemouth, and the company, having to rely upon its lighting business, was exceptionally susceptible to such economies as might be effected by the new lamps. In the circumstances, the Board had thought it wise to increase their charge of lighting by ½d. per unit, and so far there had been no indications of the loss of any consumers in consequence.

SCARBOROUGH ELECTRIC SUPPLY CO.—At the annual meeting on Thursday, it was stated that the directors proposed to give a trial to the Norwich system of charging for electricity upon the basis of a standing charge of 15 per cent. on the rateable value of the premises supplied, *plus* 1½d. per unit for all energy consumed.

FOLKESTONE ELECTRICITY SUPPLY CO.—The net profit for 1909 was £7,691, and after transferring £4,300 to depreciation, a dividend at the rate of 5½ per cent. for the year is recommended, carrying forward £341. The company have taken over the consumers of a private supplier of electricity in Folkestone.

NEWCASTLE-ON-TYNE ELECTRIC SUPPLY CO.—At the annual meeting on Monday, Dr. J. T. Merz, the Chairman, said that the receipts for the present year, compared with the same period for last year, were 10 per cent. better. The unsettlement in the coal trade had had a serious effect upon trade on the north-east coast, but so far as the company's supplies of coal were concerned, provision had been made so that the directors did not think the output from the works would be seriously affected, even if the coal dispute were to get worse.

GALLOWAYS.—At the annual meeting last week, Mr. C. Leonard Agnew, the new Chairman, stated that when he had taken over the Chairmanship of the company he found the management of the whole business very slack. The directors had formed themselves into a permanent sitting Committee of Inspection, and they hoped, with hard work, to bring the company round to its old position in the engineering world. It had been decided to electrify both the company's works, and good progress had been made with the Knott Mill Works during the latter part of last year, from which important savings were expected. A scheme for the reduction of the company's capital from £330,000 to £166,064 was withdrawn by the Board after considerable opposition at the meeting. Under this scheme it was proposed to reduce the value of the ordinary shares from £10 to 1s. each.

NEW COMPANIES

LOBITO, BENGUELLA & CATUMBELLA ELECTRIC LIGHT & POWER CO., 16 Victoria Street, Westminster, S.W. Capital, £200,000. To generate electric power at the Falls on the Catumbella River, Province of Benguella, Angola, Portuguese S.W. Africa, and elsewhere, and to adopt an agreement with the Peninsular Development Syndicate. The first directors are Sir Robert H. Drummond Hay, C.M.G.; H. Reeve, C.M.G.; A. S. Collard; B. D. Fox; and F. W. Kerr.

WRIGHT ELECTRIC SALES CO., 5 Upper Mill Hill, Leeds. Capital, £2,000. To take over the business of electrical engineer and dealer in electrical appliances carried on by H. J. Wright.

MAXIM LAMPS WORKS, Shernhall Street, Walthamstow. Capital, £8,000. To take over the business carried on by the Receiver for the debenture holders of the Maxim Electrical Co., Ltd. The subscribers are F. Taussig, 46 Stanwick Mansions, W. Kensington, electrical engineer; and J. F. Poynter, 56 Shernhall Street, Walthamstow, electrical engineer.

WALKER, HORROCKS & CO., Cornwall Buildings, 45 Newhall Street, Birmingham. Capital, £5,000 (2,500 preferred ordinary shares). To carry on business of suppliers of electricity, &c.

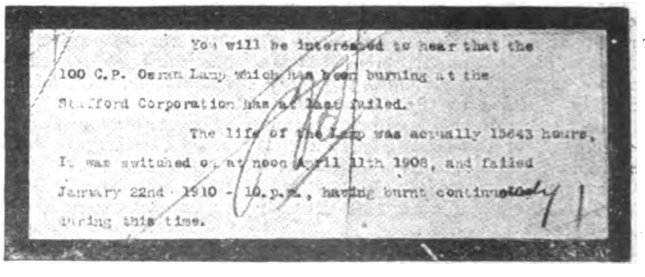
PONTELEC WELDING PATENTS. Registered by Waterlow Bros. & Layton, Ltd., Birchin Lane, London, E.C. Capital, £30,000 (10,000 seven per cent. cumulative preference shares). To acquire and use inventions relating to electric welding, and to adopt an agreement with the Universal Electric Welding Co. of America, L. S. Lachman, E. B. Koopman, and M. Lachman.

DAWLISH ELECTRIC LIGHT & POWER CO., Warren Cottage, The Warren, Starcross, Devon. Capital, £10,000. To supply electrical energy in Dawlish.

FORS ACCUMULATOR FOREIGN PATENTS, 110 Strand, London. Capital, £3,000 (952 preference shares). To acquire certain foreign patents granted to H. F. Joel.

SURFACING MACHINERY, 14 Lower Essex Street, Birmingham. Capital, £10,000 (7,500 preferred shares). To acquire an invention relating to improvements in the manufacture of electric rotary floor surfacing, scrubbing, and polishing machines.

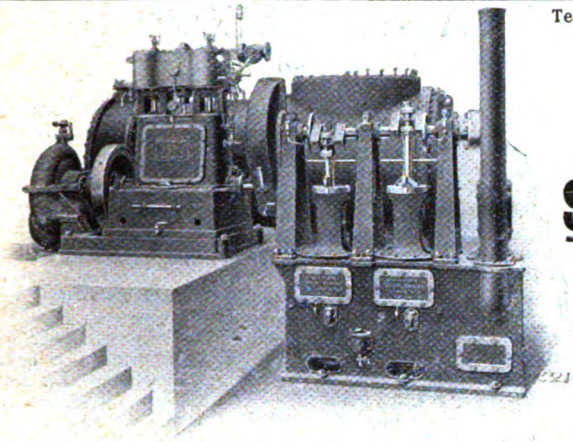
APPOINTMENTS AND PERSONAL NOTES



Mr. P. E. Smith, who is in charge of the Electrical Standards Division at the National Physical Laboratory, is proceeding to Washington in April as the British representative at a conference to complete the work of the International Conference on Units of 1908. Great Britain, France, Germany, and the United States will be represented.

The Battersea Borough Council received 122 applications for the position of commercial assistant to the Electricity Department at £2 a week with commission. Mr. C. W. Woodhead, Wilberforce Road, Finsbury Park, was appointed.

The will of the late Mr. Charles Emmott, who was a director of the Cleveland & Durham County Electric Power Co., Ltd., has been sworn at £24,500, with net personalty at £12,780.



The Maidstone Electricity Committee are to appoint an additional meter inspector and general assistant at a salary of 30s. per week.

IN MEMORIAM

You will be interested to hear that the
100 C.P. Osram Lamp which has been burning at the
Stamford Corporation has at last failed.
The life of the lamp was actually 15643 hours,
It was switched on at noon April 11th 1908, and failed
January 22nd 1910 - 10 p.m., having burnt continuously
during this time.

The above is a reproduction from a letter received by the General Electric Co. (Osram Lamp Department). The lamp in question is the same one that was referred to in ELECTRICAL ENGINEERING of February 10th (page 85), and has at last burnt out. It was running the whole time on its proper voltage, and gave a good light up to the end of its 15,643-hours' life.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 17th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

4,258/09. **Electrolytic Meters.** W. B. THORPE. This specification covers the electrolytic meters and time-limit relays described in ELECTRICAL ENGINEERING, October 14th, 1909, p. 891. The connections of the various resistances, and the means of producing and recording the successive explosions of the evolved gases in the case of the meters, are described. Fifteen claims, four figures.

5,459/09. **Maximum Demand Indicator.** T. MCCLELLAND and FERRANTI, LTD. An iron core attached to a pointer is drawn into a series solenoid. The pointer returns to the zero position when the current ceases to flow through the solenoid, but leaves a second free pointer to indicate the maximum. A pawl and ratchet device, mechanically connected with the counting mechanism of the main meter, serves to retard the movement of the main pointer. Three claims, three figures.

6,956/09. **Starting Induction Motors.** SIEMENS BROS. DYNAMO WORKS, LTD., and Dr. M. KLOSS. In order to obtain a large starting torque from two asynchronous motors, the rotors have been mechanically and electrically coupled together, and acted on by two stators the phase of the fluxes in which could be adjusted 180 electrical degrees with respect to each other. The rotor E.M.F.'s therefore opposed each other. According to the present invention, the motors are made of unequal output, so that though the currents in the two rotors are equal, the E.M.F.'s are different. With 180° phase displacement, the smaller motor acts as a generator, while the larger one gives a high starting torque with a small supply and low losses. If more convenient, a transformer may be interposed between the two rotors. The arrangement is described as particularly suitable for ship propulsion. Six claims, two figures.

12,744/09. **Fuse Carrier.** W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., and W. H. NICHOLS. The several fuse wires are threaded through a wide fibre cylinder lined with asbestos and fixed to binding screws on the copper end plugs which are integral with the tongues. The holes at the ends are only large enough to let the fuse wires pass through, but additional peripheral passages are provided, so that when the fuse blows, the flame passes out through these on to a flange at each end, which directs the hot gases on to a shield of fibre. A construction is described in which the cylinder has an aperture for the introduction of the wires and choking material. A sleeve is rotated round the cylinder to close up the aperture. Three claims, three figures.

20,882/09. **Hand Lamp.** H. B. JENKINS. The flexible cable is led into a gland which is externally threaded and screws into a stuffing box. The lamp holder screws into the other end of the stuffing box. The handle is bored to take the gland and stuffing box. The cable is gripped by a split bush of vulcanised fibre contained in the stuffing box, and closed on the cable by the pressure of the gland. Two claims, three figures.

21,374/09. **Arc Lamp Carbons.** GEBR. SIEMENS & Co. To increase the light emitted from flame arc carbons, they are made of a sheath of pure carbon and a core consisting of 60 per cent. of a mixture of molybdates and tungstates of cerium, lanthanum, or didymium, 20 per cent. of iron tungstate and 20 per cent. of the fluorides of the rare earths to ensure uniform vaporisation and quiet burning. Tar or waterglass may be used as a binding medium. Three claims.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: JABURG, 7,471/09; GEIGER, 17,909/09; BLOXAM (*Geb. Siemens & Co.*), 20,311/09; TIMAR [Striking mechanism] 27,560/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: NAVARRO [Cable supports and insulators] 27,757/09.

Dynamos, Motors, and Transformers: MOSER [Alternating-current generators and boosters] 5,003/09 and 8,345/09; MURPHY [Current rectifier] 5,081/09; CROMPTON & Co., MACFARLANE and BURGE [Regenerative control apparatus] 5,168/09 and 21,113/09; SIEMENS BROS. DYNAMO WORKS and KLOSS [Suppressing harmonics in generator E.M.F. wave-forms] 13,041/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) 19,210/09; R. BOSCH [Insulation of windings] 22,479/09; ALLGEMEINE ELEKTRICITÄTS GES. [D.-C. motor-generators] 24,306/09; SCHULZ [Unipolar turbo-dynamo] 2,814/10.

Electric Ignition: HALL, 12,286/09.

Electrometallurgy and Electrochemistry: JUSTICE (*Consortium für Electrochemische Industrie Ges.*) [Manufacture of peroxide of hydrogen] 22,019/09.

Switchgear, Fuses, and Fittings: ADDISON [Automatic transformer switch] 5,427/09; MORGAN [Conduit clips] 6,493/09; BRAMPTON and OSBORNE [Conduit fittings] 10,348/09; KEY ENGINEERING Co. and ANDREWS [Conduit] 10,607/09; ZAMBONI and STERLING [Lamp reflectors and shades] 15,208/09; KENNEDY-MCGREGOR [Switches] 15,578/09; SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Mercury switch for automatic railway signalling] 25,962/09; FALK, STADELMANN & Co. and CHARLES [Fixing lamp globes] 27,472/09; STERLING TELEPHONE & ELECTRIC Co. (*Telephon Fabrik A.-G. vorm J. Berliner*) [Switches] 28,184/09.

Telephony and Telegraphy: DE BINGHAM [Telegraphic recording apparatus] 27,862/08; HEYWORTH [Secret telephone transmitters] 5,114/09; CLEMENT [Telephone exchange] 18,950/09; CARBONELLE [Transmission of half-tone illustrations] 19,516/09.

Traction: CROUCH and ETCHELLS [Train-lighting and heating systems] 25,844/08; CROMPTON & Co., MACFARLANE and BURGE [Regenerative control] 5,168/09 and 21,113/09; SIEMENS & HALSKE A.-G. [Shunting waggons] 23,533/09.

Miscellaneous: ETCHELLS [Safety switches for lift gates] 6,495/09; BARKER [Synchronous running of phonographs and cinematographs] 8,858/09; LE BLANC [Electrical control of searchlights] 12,970/09; SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Electric control of clocks] 18,005/09; GRAY (*Seabolt*) [Electric clock-winding mechanism] 21,940/09; VON MEYENBURG [Vacuum cleaner] 24,368/09; JONES [Fire alarms] 30,305/09.

The following Specification is open to Inspection at the Patent Office before Acceptance, but is not yet published for sale.

Electric Ignition: MUELLER [Magneto generator] 17,664/09.

Opposition to Grant of Patents

14,483/08. **Metal Filament Lamps.** S. MARIETTI. This patent has been granted in spite of opposition. The specification describes tubular supports and leading-in wires, and a method of fusing in the filaments. (See ELECTRICAL ENGINEERING, Aug. 5th, 1909. Vol. V., p. 714.)

20,915/08. **Metal Filament Lamps.** T. MCKENNA (*Gluhlampenwerk Anker-Ges.*). This patent has been refused as the result of opposition. The specification, abstracted in ELECTRICAL ENGINEERING, Nov. 4th, 1909, Vol. V., p. 950, describes the fixing of filaments to leading-in wires by first depositing a soft metal covering on the ends of the former electrolytically.

3,604/09. **Depositing Metal on Metal.** A. SANG. The opposition to the grant of this patent has failed. (See ELECTRICAL ENGINEERING, Jan. 6th, 1910, p. 16.)

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

6,579 of March 25th, 1896. **Telephone.** A. GRAHAM. A rotary Hunnings transmitter is mounted in a case with a fixed receiver, and a movable shutter is connected with the transmitter, so that when it is moved in order to use the instrument, the transmitter is rotated, and the carbon shaken up. A switch for cutting out both receiver and transmitter when the shutter is closed is also described.

6,985 of March 31st, 1896. **Prepayment Meter Mechanism.** J. HAWKYARD and J. BRADDOCK. The coin is dropped through a slot into a fixed cylinder, and then connects together a slotted rotary sleeve and a slotted core provided with an external handle.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: C. W. ATKINSON [Isolating faulty sections] 25,903/04.

Dynamos, &c.: H. TRAUN [Vulcanised rubber insulating collars for shafts, &c.] 28,736/97; M. DERI [A.-C. commutator motors] 26,870/02; V. I. FEENY (*C. Wirt, U.S.A.*) [Metal brushes] 26,445/04.

Electric Ignition: M. S. NAPIER, 26,488/03.

Electrometallurgy, &c.: SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Primary cells] 23,813/99; O. IMRAY (*Hoeder Bergwerks Verein*) [Furnace] 26,145/03.

Incandescent Lamps: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Fitting caps to bulbs] 26,292/04.

Instruments, &c.: C. D. ABEL (*Compagnie Anon. Continentale des Compteurs de Gaz*) [D.-C. motor meter] 24,470/01; H. H. LAKE (*R. Arno, Italy*) [Three-phase meters] 26,673/02.

Storage Batteries: EKSTROMER ACCUMULATOR Co. and E. L. OPPERMANN [Plates] 25,902/04.

Switchgear, &c.: L. HIGGINBOTTOM, J. H. HINDLE and T. MANNOCK [Lift motor control and brake] 28,457/97; E. A. CAROLAN (*General Electric Co., U.S.A.*) [Rheostat] 26,382/02; J. Y. JOHNSON (*Elektrizitäts A.-G.*) [Excess voltage protective device] 26,058/03; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Switch] 26,172/04.

Telephony, &c.: W. P. THOMPSON (*Ges. für Drahtlose Telegraphie*) [Tuning in wireless telegraphy] 26,367/04.

Traction: F. SCHEINIG [Rail-joint] 21,805/00.

Miscellaneous: H. H. LAKE (*Soc. L. Gaumont & Cie.*) [Synchronous running of phonographs and cinematographs] 26,187/02.

SUMMARY

A Paper read recently in America describes a device which has been used successfully for the production of H.T. insulators. (Page 214.)

The following books are reviewed in this issue:—"The Dynamo: its Theory, Design, and Manufacture," by C. C. Hawkins and F. Wallis; Fowler's Electrical Engineer's Pocket Book, Fowler's Mechanical Engineer's Pocket Book, and "The Ideal Code Condenser," by A. Kolkenbeck. (Page 215.)

The contract for lifts for the Royal Line Building, Liverpool, includes seventeen electric lifts, travelling at speeds up to 400 ft. per min. (Page 215.)

An article by Mr. C. C. F. Monckton describes experiments on the use of spark gaps in compressed air for wireless telegraph transmission. (Page 216.)

In a Paper read recently before the Yorkshire Local Section of the Institution of Electrical Engineers, on the rating and testing of motors for intermittent work, Dr. R. Pohl pointed out the misleading nature of tests consisting of short runs on full load, and the harmful effect of this method of rating on design. He suggested an equivalent intermittent test, and an alternative system of short test runs at a reduced voltage and current calculated to give the same temperature rise as the actual cycle of operations. (Page 217.)

A relay with time attachment for use in connection with lift bells, actuated by the trains on tube railways, is described on page 218.

The new generating station at Carolina Port, Dundee, which was opened recently, is equipped with two 2,000-kw. 6,000-volt turbo-alternators, and presents a good example of remote control high-tension switchgear. Particular interest also attaches to the arrangements for condensing water supply from the river, which includes specially arranged electrically-driven pumping plant a short distance away from the station. (Page 219.)

The British Thomson-Houston Co. will shortly be placing on the market metal filament lamps with drawn tungsten filaments of very great strength. (Page 220.)

The Highgate Hill tramway has been opened under electric traction by the London County Council. A special form of brake has been designed for use on the hill. (Page 221.)

The Willans-Impulse "Disc and Drum" type steam turbine differs from the Willans-Parsons turbine in that a single impulse disc is substituted for the high-pressure part of the drum. The steam is expanded to atmospheric pressure in nozzles before reaching any part of the rotor. (Page 221.)

Some further reductions are being made in the price of metal filament lamps. (Page 221.)

Mr. H. F. Street (Borough Electrical Engineer, Southampton) has presented a report advocating a charge of ½d. per unit for heating and cooking. (Page 221.)

Among the specifications published by the Patent Office on Thursday last were two by Crompton & Co.,

Digitized by Google

Ltd., J. C. MacFarlane, and H. Burge for a system of regenerative control, in which the working motors are connected across the supply mains in series with the dynamo of a Ward-Leonard motor-generator. Special shunt windings are arranged on the working motors to give them a series characteristic, and a series winding on the dynamo limits the current which may be taken from the mains.—A flame arc lamp without feeding mechanism or supporting stops is described by H. J. Jaburg.—The patent covering the Key Engineering Co.'s system for laying cables on the solid system in fibre tubes is also published.—A method of eliminating the circulating currents due to the third harmonic in three-phase alternators, connected in parallel with earthed neutrals, is covered by Dr. M. Kloss. An equal and opposite E.M.F. of the same frequency and magnitude is introduced into the local circuit by means of an auxiliary three-phase transformer.—A patent by J. O. Elmore for the manufacture of tubes by depositing metal electrolytically on a rotating mandrel in a tank of special construction, expires during the current week, after a life of fourteen years. (Page 222.)

THE Electric Lighting Act, 1909, comes into force to-morrow (Friday). (Page 223.)

AN article by Mr. E. P. Austin deals with the conditions which arise when power supply is carried out from traction circuits. Various troubles are occasioned by the sudden variations of voltage, and these are best met, in the author's opinion, by commutating-pole motors. The influence of the position of a fault relative to the motor is discussed, and notes are given as to the construction of suitable fuses for use under these conditions. (Page 223.)

THE repair and maintenance of the overhead equipment of the Aberdeen tramways has been transferred from the electrical engineer to the tramway manager. —Metal filament lamps are to displace carbon filament lamps, and possibly arc lamps, for street lighting in Ayr.—The "fixed price" system of charging for electric supply is to be adopted by the Weymouth Council.—A special grant is to be made from the Halifax tramway profits to assist the Finance Committee.—Through tramway running has been inaugurated between Accrington, Rawtenstall, and Bacup.—The Luton Electricity Committee, by a transfer of £846 to the general district rate, have repaid the sum required to meet early losses on the undertaking. (Page 224.)

NEW plant is required by the Liverpool District Lighting Co., Walthamstow Council, and Hammersmith Borough Council.—Grimsby Council propose to spend £2,000 on street lighting.—An electric lighting plant for a New Zealand theatre is to be purchased in London. (Page 224.)

AFTER taking £25,000 from reserve fund to meet special expenditure, the report of Messrs. Willans & Robinson for the December half-year of 1909, shows a loss of £7,267.—The report of the Underground Electric Railways Co. of London for the December half-year shows a profit of £463, after meeting interest on all classes of bonds. (Page 226.)

Telegraph Traffic.—Direct communication between Saigon and Bangkok was restored on the 25th inst., and the Fao route was restored on the 27th inst. The only interruption to record is that of the El Arich route, which failed in two places, viz., between Adana and Beyreuth, and between Alep and Beyreuth.

Railway Engineering.—A special railway number of *Cassier's Magazine* has been issued. Among the articles of especial interest to our readers is one by T. Rich on the development and design of the electric locomotive, copiously illustrated with photographs and diagrams of electric locomotives old and new. J. S. Hobson contributes an article on railway signalling practice in America, dealing with a number of electric and electro-pneumatic systems, and current British practice in the same field is described in a fully illustrated article by J. F. Gairns. G. Pendlebury writes on tramway repair works. The New York tunnels and their construction, railway workshops, and machine tools are the subjects of other articles.

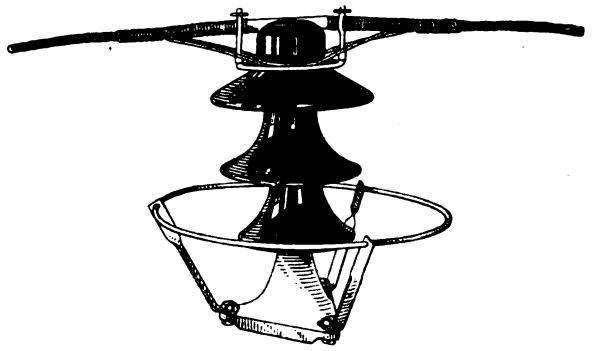
ARRANGEMENTS FOR THE WEEK

SATURDAY, APRIL 2ND.

Institution of Mining Electrical Engineers: Manchester Branch.
6 p.m. At Grand Hotel. To consider Special Rules Relating to the Use of Electricity in Mines.

TUESDAY, APRIL 5TH.

Institution of Electrical Engineers: Manchester Students' Section.
7.30 p.m. Supper and Smoking Concert at Grand Hotel.



Faraday Society.
8 p.m. At Institution of Electrical Engineers, 92 Victoria Street, London. "The Electrical Theory of Dyeing," by Prof. W. W. Haldane Gee and W. Harrison.

THURSDAY, APRIL 7TH.

Institution of Electrical Engineers.
8 p.m. At 25 Great George Street, Westminster, London. "The Progress of Electric Braking on the Glasgow Corporation Tramways," by A. Gerrard.

THE PROTECTION OF H.T. INSULATORS

IN the course of a Paper read recently before the American Institute of Electrical Engineers, Mr. L. C. Nicholson described a device which is used with a considerable measure of success on the 60,000-volt transmission lines of the Niagara, Lockport & Ontario Power Co. for the protection of insulators from the destructive effects of power arcs over their surface initiated by lightning discharges. Experience has enabled insulators to be made more and more puncture-proof, but the author points out that even if all insulators were capable of resisting puncture, they would continue to be shattered by a power arc following a flash over. A device to meet this need was therefore developed. The arrangement now used is shown in the accompanying illustration, and consists of two metal rings concentric with the insulator, a lower one which is situated near the base being considerably larger in diameter than the insulator parts, and supported by earthed metal risers attached to the pin;

H.T. INSULATOR, FITTED WITH ARCING RINGS.

and an upper one somewhat larger than the neck of the insulator, just opposite the tie-wire, suspended from the transmission cable, and electrically connected to it.

These rings serve as electrodes, to which the power arc automatically transfers immediately after its formation between the tie-wire and pin, over the surface of the insulator. When holding between these rings, the arc is removed sufficiently from the insulator to prevent injury to the porcelain by heat.

Experiments have shown that the lower arcing ring would take the arc immediately after its formation to the pin (which was accomplished by means of a fuse from tie-wire to pin, placed well up under the insulator parts), almost irrespective of the location of the ring with reference to the base of the insulator.

The upper ring was found necessary to prevent burning of the tie-wire. In experimental tests a 30,000 kw. 1,200 ampere arc was withstood without any damage to the insulator, and since the arcing rings have been in use on the actual lines, there has been an extraordinary diminution in the number of insulators disabled.

REVIEWS OF BOOKS

The Dynamo: its Theory, Design, and Manufacture. By C. C. Hawkins and F. Wallis. Two volumes. Fifth edition. 1,134 pp. 9 in. by 6 in. 594 illustrations. (London: Whittaker and Co.) 21s.

"Hawkins & Wallis" has long been known as one of the standard works on current generating machinery, but, unlike some "standard works," it has not been allowed to stand still and rest upon its past reputation. When we take down from our bookshelves a copy of one of the earlier editions, we are struck by the change in size which has been necessitated to keep pace with advances in the subject, as the old single volume had only just over 500 small pages, as compared with the eleven hundred odd larger pages of the two new volumes. The revision, however, has not consisted merely of addition, as in the successive editions much that had become obsolete has been expunged. Since the book was first written, dynamo design has not only progressed, but it has also in some ways narrowed down into more definite channels. As pointed out in the preface, whether for continuous or alternating current, the drum armature with toothed core has so far displaced all other types that it has become superfluous to consider at length any other varieties. In consequence, the ring, disc, and other arrangements almost disappear from the pages. Extensive new developments, however, more than take their place.

In speaking of the new matter, particular mention should be made of the treatment of the theory of commutation, which is largely based on the researches of Arnold, the full study of the commutating pole now so widely used, and the new matter concerning the problems of mechanical construction, &c., introduced by the high speeds necessitated with steam turbine drive. The range of the book is too wide for us to deal in detail with every chapter, but in speaking of the general arrangement it may be said that a very happy combination has been arrived at between the clear expositions of elementary principles, the mathematical treatment of theory, and the indication of methods to be employed in the practical designing office. The book has become less of a general text-book and more of a designer's work of reference, but embodies the experience of a practical designer who is at the same time a student of the science and literature of the subject. The main characteristics are thoroughness and clearness of style, and excellent use is made of diagrams and drawings to illustrate the points discussed. These have evidently had much more care devoted to their preparation than is often the case with technical books.

There is no marked division in the subject-matter between the two volumes. The first, after treating of general principles, makes a start upon continuous-current machinery, but the most valuable chapters on armature reaction, commutation, and the heating of dynamos are reserved for the second volume. After these follows a chapter headed "The Design of Continuous-current Machinery," in which questions of output and speed in relation to diameter and length of core are dealt with, together with a few pages on measurement of losses; and the continuous-current dynamo section closes with some notes on the working and management of these machines. The five succeeding chapters deal with the alternator; and in the last, some descriptions are given of typical machines of both kinds. This is no mere collection of catalogue illustrations with suitable inscriptions, but goes into matters of detail in typical modern practice, and works out data relating to actual machines in a way characteristic of the thoroughness of the whole work.

Although his name still appears on the title-page, Mr. F. Wallis has been prevented by the calls of other duties from taking part in the rewriting of the book, so that the larger proportion of the present work is from the pen of Mr. Hawkins alone.

Fowler's Electrical Engineer's Pocket Book, 1910. 575 pp. 6¼ in. by 3¾ in. **Fowler's Mechanical Engineer's Pocket Book, 1910.** 654 pp. 6¼ in. by 3¾ in. (Manchester: Scientific Publishing Co., Ltd.) 1s. 6d. each.

These two engineering pocket books, of which revised editions for 1910 have just made their appearance, are too well known to need detailed descriptions. Both have been revised to a considerable extent, and in the case of the mechanical volume the principal directions in which expansion has taken place are in relation to economy of power plant and the use of mechanical and electrical appliances in mining. Although this volume is principally intended for mechanical engineers, electrical matters receive some attention, and it is quite a sign of the times that the Home Office Rules on electricity in mines should be included in the mechanical and not the electrical volume. A glance through the Electrical Engineer's Pocket Book, however, shows that in most respects it is thoroughly up to date, except, perhaps, as to metal filament lamps, as apparently the compiler has not yet heard of 200-volt tungsten lamps of less than 40 c.p., or of 200-volt tantalum lamps at all. Here and there in the testing sections the proportion of space given to old-fashioned and modern methods is not quite what it might be. These and similar small faults do not, however, detract from the utility of the excellent collection of tabular and descriptive matter or its easily accessible arrangement.

The Ideal Code Condenser. By Alfred Kolkenbeck. 11 pp. 13 in. by 9 in. (London: The Central Translations Institute, 16 Eastcheap, and Salisbury House, London Wall, London.) One guinea.

This is a special code system in the form of a 13-figure code, which enables several existing codes to be employed at the same time at the rate of two phrases to one code word, while the recipient is informed from which code to read each part of the message. In addition to this an automatic check is conveyed as a safeguard against mutilations. The system has been thoroughly tested, and it is claimed that all the combinations are pronounceable. All the instructions are printed in English, French, and German in parallel columns.

A LARGE ELECTRIC LIFT INSTALLATION

The lift equipment of the new Royal Liver building at Pierhead, which is being carried out by Messrs. R. Waygood & Co., Ltd. (Falmouth Road, S.E.), is the subject of the largest lift contract ever placed in this country.
